Committee Staff Procurement Backup Book
FY 2004/2005 BIENNIAL BUDGET SUBMISSION

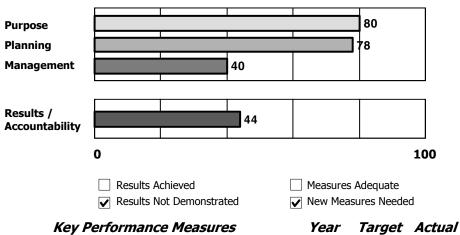

**OTHER PROCUREMENT, ARMY Communications and Electronics** 

Budget Activity 2

**APPROPRIATION** 

### **Program:** Communications Infrastructure

**Agency:** Department of Defense--Military **Bureau:** Department of Defense--Military

.,			
Long-term Measure: DoD is preparing long-term performance metrics, to include system capacity, performance, and user satisfaction. (New measure, target under development)			
Annual Measure: Percent of time that the Non-Secure Internet Protocol	2000	> 98.5%	99.63%
Router Network (NIPRNET) access circuit is available. NIPRNET is the unclassified IT system.	2001	> 98.5%	99.50%
·	2002	> 98.5%	
	2003	> 98.5%	
Annual Measure: Number of bases upgraded by the Army Installation	2001	5	5
Information Infrastructure Modernization Program (I3MP)	2002	8	8
	2003	5	

### **Rating:** Results Not Demonstrated

**Program Type:** Capital Assets

#### **Program Summary:**

The communications infrastructure program includes all networks and systems for transmission of voice, data, and video information for the Department of Defense, with a total investment of about \$5.4 billion in 2003. This analysis includes base level communications activities of the military services, DoD's long distance communications, and the Defense Information System Network (DISN), managed by the Defense Information Systems Agency (DISA), which provides world wide communications capabilities to military personnel. The DISN includes the Global Infrastructure Grid (GIG) Bandwidth Expansion program, which will increase bandwidth connections to over 90 military bases, and the DoD Teleport program, which will improve satellite communications connections.

Overall, the PART reveals that DoD does not manage its communications infrastructure on an enterprise or department-wide basis. Best industry practice suggests a communications infrastructure should be managed with an enterprise approach rather than in a piecemeal fashion by component. The PART assessment also suggests that DoD should develop common performance measures to be used across the entire department for this program. Additional findings include:

- 1. The program's purpose is clear, owing to the unique military requirements of these systems.
- 2. The program performs well on planning because it has established clear short-term goals and has taken meaningful steps to address strategic planning deficiencies. It has not, however, established long-term performance measures.
- 3. While the program does collect performance information and is working to address management deficiencies, it lacks clearly defined long-term performance objectives and does not measure program efficiency or effectiveness.
- 4. The program results section also shows some weaknesses. Here again the PART highlighted the lack of long-term outcome goals.

In response to these findings, DoD will develop common metrics to assess program performance across the department.

#### **Description:**

The Army Acquisition Executive (AAE) signed an Acquisition Decision Memorandum in May 2002 directing termination of the BCIS program and cancellation of all associated contracts. At the May 2002 Army Systems Review, the Chief of Staff, Army (CSA) supported the program termination for affordability reasons but stated the requirement for a combat identification system in the current force still exists. The CSA directed Army Staff (G3) and Training and Doctrine Command (TRADOC) to provide him with a recommendation on fielding alternatives of BCIS to the current force at some quantity below the Army Procurement Objective total deemed unaffordable. Project Manager Objective Force Technology tasked PM Target Identification and Meteorological Sensors to co-chair a Future Combat System (FCS) Combat Identification (CID) Working Group to recommend a FCS Block I CID solution and explore solutions for FCS Block II.

The Combat Identification Panel (CIP) program was Congressionally funded in FY03 in the Combat Identification procurement line. The FY03 funding will procure 8,000 cloth CIPs which are thermal reflective markers for use with thermal sights and viewers operating in the 3 to 12 micron wavelength band. Thermal sights found in the M1A1 Abrams Tank, AH-64 Apache Helicopter and the Air Force Low Altitude Navigation and Targeting Infrared for Night (LANTIRN) system operate in this band. The cloth CIP, now more accurately known as the Thermal Identification Panel (TIP), is used primarily for through-sight, air-to-ground combat identification of friendly forces. Normal installation is on the top of the vehicles or draped over a combat load. They are visible from 3 to 7 kilometers, depending on terrain.

Survivability is one of the seven tenets of the Army Transformation strategy and CIPs represented an integral part of that strategy as it works to reduce incidents of fratricide.

#### **Justification:**

There is no funding request for FY04/05.

WIN-T is the integrated high-speed and high capacity communications network for the Objective Force (OF). It will be focused on moving information in a manner that supports commanders, staffs, functional units, and capabilities-based information-all mobile, agile, lethal, sustainable, and deployable. Future Combat Systems (FCS), Joint Tactical Radio Sytem (JTRS), satellite terminals and other DoD C4I programs are relying on WIN-T for seamless integration into the DoD Global Information Grid (GIG). WIN-T will be optimized for offensive and joint operations, while providing the Theater Combatant Commander the capability to plan, prepare, and execute multiple missions and tasks simultaneously with campaign quality utilizing a mobile throughput feature. It will be a framework, which will set standards and protocols for OF infospheres while interfacing with and/or replacing equipment in legacy and interim forces. The WIN-T program is essential to the OF and outmodes Mobile Subscriber Equipment (MSE) and Tri-Services Tactical Communications (TRI-TAC) capabilities.

The WIN-T program supports the Objective transformation path of the Transformation Campaign Plan (TCP).

#### **Justification:**

FY 04/05 procures the nuclear test monitoring and verification areas covers science, technology and procurement items to include prototype sensor particulate and noble gas detection equipment and associated field station infrastructure for automated, remote operation. Items such as infrasound sensors, digitizers for infrasound sensors, radionuclide counters and seismometers will be used to install infrasound and radionuclide equipment at approved US locations and will transmit data back to the Center for Monitoring Research for analysis and retransmission. Funds will be spent on completing infrasound and radionuclide stations and replace seismic station equipment. Items to be procured in support of the stations include automated particulate and noble gas samplers, high purity germanium detectors and seismic monitoring devices. In addition, equipment will be procured such as communication devices, cabling, meteorological equipment, infrasound sensors, digitizers for infrasound sensors, radios and towers for data transmission, radionuclide counters, maintenance monitoring computers, seismometers, portable data loggers, vaults to protect equipment.

This program provides funding for the Joint Communications Support Element (JCSE). JCSE is a unique, completely mobile, multi-service communications unit. It is designed to meet the simultaneous communication requirements for two deployed Joint Task Force (JTF) Headquarters and two deployed Joint Special Operation Task Forces (JSOTF) Headquarters as defined by the communication architecture contained in the Chairman, Joint Chiefs of Staff (JCS) Manual 6231. JCSE equipment requirements are approved and validated by the JCS, the Combantant Commanders, Services and other Defense Agencies. This program supports the Legacy-to-Objective transition path of the Transformation Campaign Plan (TCP).

### **Justification:**

The FY 04/05 program procures equipment that contains the latest mature technology available to meet the current and future communication requirements of the warfighting Combantant Commanders. Equipment to be procured includes, mobile satellite systems, commercial off the shelf (COTS) switches, and network equipment (including data terminal equipment and upgrades).

The Defense Satellite Communications System (DSCS) provides super high frequency (SHF) wideband and anti-jam (AJ) satellite communications supporting critical national strategic and tactical command, control, communications and intelligence (C3I) requirements. It must be survivable during trans- and post- nuclear attack to support communications essential to national survival. The DSCS supports the Army warfighter as well as the unique and vital Department of Defense (DOD) and non-DOD users, as approved by the Joint Staff and/or Secretary of Defense (SECDEF). The DSCS is used in conjunction with the Terrestrial Transmissions of the Defense Information System Network (DISN) and other communications systems to provide end-to-end communications. The DSCS provides long-haul service between the Continental United States (CONUS) and overseas locations.

This program is designated as a DoD Space program.

#### **Justification:**

FY04/05 procures hardware for the Wideband Antijam Modem System (WAMS). FY04/05 DSCS Modification of in-service (MIS) procures the installation of AN/GSC-52 Modernization Kits (MOD Kits). FY04/05 also procures equipment components for the Mod Kits. FY04/05 DSCS-SHF Wideband Terminal procures the remaining Ka-Band terminals and initiate the fielding of the Ka-Band terminals. FY/04/05 DSCS Operations Control System (DOCS) procures hardware for the Integrated Monitoring & Power Control Sub System (IMPCS), Gap filler Satellite Configuration Control Element (GSCCE), Replacement Radio Frequency Interconnecting System (RFIS) and Objective DSCS Operations Center (ODOC) programs. FY04/05 also procures software and annualized engineering, system integration, post production software support and fielding. FY/04/05 Digital Equipment procures the fabrication of racks and components and their integration into DSCS. FY04/05 Interconnect Facility (ICF) will continue to accomplish DISA and JCS directed satellite ground terminal relocations supporting alignment of US forces worldwide. FY04/05 National Command Authority (NCA) procures the upgrade of Direct Communications Link (DCL) between the President of the United States and leaders from Russia/Ukraine/Belarus/Kazakhstan. FY04/05 DSCS SHF Wideband Terminal procures the remaining terminal and installs the terminals procured in FY02 and FY03.

The AN/TSC-85 and AN/TSC-93 Tactical Satellite (TACSAT) Service Life Extension Program (SLEP) and Upgrade Program is required to meet the current communications requirements of the Warfighter within the Ground Mobile Forces (GMF) segment of the Defense Satellite Communications Systems (DSCS) and is required to insure TACSAT Operational Readiness until FY12. The Upgraded Terminals will provide the deployed Warfighters the ability to take advantage of the satellite connectivity and to provide the means for the GMF ground segment to pass effective data rates and establish effective user communication networks. These Upgraded TACSAT Terminals will support the increased communications requirements of the Combatant Commanders. This system supports the Legacy to Objective transition path of the Transformation Campaign Plan (TCP). Funding for FY03 and prior were in the DSCS Mod In Service line (SSN BB8416).

#### **Justification:**

FY04/05 procures equipment components for the AN/TSC-85 and 93 Upgrade Program.

MODIFICATION TITLE: AN/TSC-85/93 Modernization [MOD 1] 0-00-00-0000

MODELS OF SYSTEM AFFECTED: AN/TSC-85/93

#### DESCRIPTION/JUSTIFICATION:

The AN/TSC-85 and AN/TSC-93 Tactical Satellite (TACSAT) Service Life Extension Program (SLEP) and Upgrade Program is required to meet the current communications requirements of the Warfighter within the Ground Mobile Forces (GMF)segment of the Defense Satellite Communications Systems (DSCS) and is required to insure TACSAT Operational Readiness until FY12. The Upgraded Terminals will provide the deployed Warfighters the ability to take advantage of the satellite connectivity and to provide the means for the GMF ground segment to pass effective data rates and establish effective user communication networks. These Upgraded TACSAT Terminals will support the increased communications requirements of the Combatant Commanders. This system supports the Legacy to Objective transition path of the Transformation Campaign Plan (TCP). Funding for FY03 and prior were in the DSCS Mod In Service line (SSN BB8416).

Justification: FY04/05 procures equipment components for the AN/TSC-85 and 93 Upgrade Program.

The National Command Authority (NCA), Special Communications Link program and the required modernization effort exists through a bi-lateral agreement for a 10-year user equipment modernization. This essential Priority 0 effort supports unique internal requirements that provide critical communications to support continuing peaceful relations between the U.S. President and Russia/Ukraine/Belarus/Kazakhstan leaders. The program includes the Direct Communications Link (DCL), Continuous Communications Link (CCL) and the Government-to-Government Communications Link (GGCL). Communications are for diplomatic peacekeeping, arms control and treaty verification purposes.

#### Justification:

FY04/05 procures the upgrades for the Direct Communications Link (DCL) between the President of the United States and leaders from Russia/Ukraine/Belarus/Kazakhstan.

The Jam Resistant Secure Communications (JRSC) provides communications connectivity that will survive jamming and high altitude nuclear events which cause High-Altitude Electromagnetic Pulse (HEMP) and other perturbed atmospheric conditions. The other identified anti-jam systems have already been acquired. The WAMS will enable strategic and tactical forces under the command of the U.S. to have interoperable voice and digital data satellite communications capability under jamming and nuclear scintillation, while using non-processing transponders of the DSCS III, NATO or SKYNET 4 satellite systems. This system supports the Legacy to Objective transition path of the Transformation Campaign Plan (TCP).

### **Justification:**

FY04/05 procures WAMS hardware as well as the Post Production support platform.

These modifications will modernize the aging AN/GSC-52 Medium Terminal (MT) so that all Defense Satellite Communications System (DSCS) Super High Frequency (SHF) strategic earth terminals use common electronics and logistics support. The result will extend the life of the terminals, increase readiness, reduce training and logistics support, conserve energy and improve maintainability. This modernization effort will eliminate system obsolescence, modernize existing equipment and provide component commonality with other existing strategic terminals. Additionally, the procurement of the ground segment in support of Wideband Gapfiller Satellite System (WGS) commences. The AN/TSC-85 & 93 Tactical Satellite (TACSAT) Service Life Extension Program (SLEP) and Upgrade Program is required to meet the current communications requirements of the warfighter within the Ground Mobile Forces (GMF) segment of DSCS. This system supports the Legacy to Objective transition path of the Transformation Campaign Plan (TCP). Funding for the AN/TSC-85 & 93 modifications are now reflected in the GMF Enhancements justification material (SSN B08701).

### **Justification:**

FY04/05 procures the continuation of the installation of the AN/GSC-52 Modernization Kits.

The Defense Satellite Communications System (DSCS) is a subset of the entire Defense Communications System (DCS). The Army DSCS provides the procurement of the ground segment portion of all strategic satellite communications systems. This equipment accepts voice frequency and digital data from other terrestrial ground systems, i.e., telephone, telephone switching centers, Defense Data Network (DDN), Defense Switched Network (DSN), Secure Voice Communications and microwave and converts the aggregate user signals into a digital signal which is then transmitted to its recipients utilizing DSCS satellites that are in geostationary earth orbits for worldwide coverage. This long haul strategic military communications system equipment maximizes the use of multiplexing, modulation, and coding techniques in order to maximize satellite utilization. This equipment is integrated into the Digital Communications Satellite Subsystem (DCSS) which is a system of electronic equipment and racks integrated into vanized or fixed configurations. DCSS equipment will be required to support the Transformational Communications Program - SATCOM (TCP - SATCOM). The baseband racks support the Joint Chief of Staff (JCS) validated Combatant Commanders/Service long haul communication requirements and Enduring Freedom initiatives. The DCSS provides the maximum efficiency in long-range communications by integrating all digital communications network control and anti-jam secure communications in one system. The DCSS provides for the fabrication of racks and equipment to field the Strategic/Tactical Gateways, the primary means of interoperable communications providing tactical warfighters global connectivity with each other and with strategic commanders, Combatant Commanders, and the Pentagon.

This system supports the Legacy transition path of the Transformation Campaign Plan (TCP).

#### **Justification:**

FY04/05 procures baseband racks and their integration into the DSCS. FY04 continues the upgrade of the DCSS power distribution system which has been in the field since the 1970s. This upgrade will eliminate existing personnel safety hazards. FY04 continues to fund Multiplexer Integration and DCSS Automation System (MIDAS) which provides backward compatability with the existing tactical infrastructure while providing technology insertion. FY04 continues to procure the baseband equipment necessary to support the Wideband Gapfiller Satellite Program, which provides wideband communications to the warfighter during all levels of conflict. FY04/05 continues the procurement of the Enhanced Bandwidth Efficient Modem (EBEM) which provides greater utilization of limited satellite resources.

This program executes the Army's responsibility to install and relocate strategic Defense Satellite Communications System (DSCS) satellite communications earth terminals procured by Product Manager, DSCS Terminals and digital communications equipment procured and packaged by Assistant Project Manager, Digital Communications Satellite Subsystem. For the Army, this program also designs, procures and installs the interconnection facility to interface this equipment with existing Technical Control and Special User Facilities. This system supports the Legacy to Objective transition path of the Transformation Campaign Plan (TCP).

### **Justification:**

FY04/05 procures equipment in support of the Defense Information Systems Agency (DISA) and Joint Chiefs of Staff (JCS) directed satellite ground terminal relocations supporting the realignment of US forces worldwide. Changes in overseas manning, troop dispositions, and reach-back requirements necessitate a flexibility in the deployment of the strategic ground resources. In addition, sustaining the Defense Satellite Communications System (DSCS) systems requires marginal or obsolete systems to be replaced by newer equipment.

The Defense Satellite Communications System (DSCS) Operations Control System (DOCS) provides for the management of DSCS & Wideband Gapfiller earth terminal and satellite resources which are required for rapid and efficient reaction to operational needs in support of the warfighter. DOCS is made up of a number of semi-automated subsystems which configure, monitor, maintain, and restore all communications links, and automatically control operations over these links. The Objective DSCS Operations Center (ODOC) will modernize the existing DOCS subsystems to provide improved satellite communications to Ground Mobile Forces and Strategic users. It will replace the existing (largely manual) control system, provide greatly enhanced responsive system control and increase overall system availability with associated reductions in operations and maintenance costs. DOCS supports control of the satellite payload, satellite communications network planning, satellite communications link performance monitoring, and control of ground satellite terminals. DOCS assures reliable satellite communications networks to support unique user mission requirements vital to national security under stressed and unstressed conditions. This system supports the Legacy to Objective transition path of the Transformation Campaign Plan (TCP).

#### **Justification:**

FY04/05 procures hardware quantities for the Integrated Monitoring Power Control Subsystem (IMPCS), Gapfiller Satellite Configuration Control Element (GSCCE), Replacement Radio Frequency Interconnecting System (RRFIS), and Objective DSCS Operations Center (ODOC) programs. FY04/05 also procures software, engineering, system integration, post production software support, and fielding support of current and prior year procurements.

Wideband Gapfiller Satellite (WGS) program is required to meet the current and emerging communications requirements of the warfighter and to augment the DSCS III/Service Life Extension Program (SLEP) Ground Communications System. The Ka-Band terminals will provide the deployed Warfighters the ability to take advantage of the increased satellite connectivity and provide the means for the WGS Control Segment to control Gapfiller payloads and user communications networks. The new Ka-Band terminals will support the increased communications requirements of the Combatant Commanders. This system supports the Legacy transition path of the Transformation Campaign Plan (TCP).

NOTE: FY02/03 costs are shown in the BB8416 Mod-of-In Service Equipment P-Forms.

# Justification:

FY04/05 procures the remaining Ka-Band terminal and initiates the fielding of the terminals.

PM WIN-T is currently embarking on a procurement to satisfy critical operational requirements for tactical SHF capability as articulated in validated Operational Needs Statements (ONS). The requirements will be satisfied via the SHF terminal, multi-band SHF terminal, providing C, X, and Ku-Band satellite communications capability, and operating over commercial and military SHF satellites. The SHF terminal will satisfy tactical, highly mobile, command and control, intelligence, fire support, air defense and logistics wideband communications requirements in support of Army and multi-service users. The SHF terminal will be integrated on the Expanded Capability Vehicle (ECV) and will be upgradable to Ka-Band capability. This program is designated as a DoD Space Program. This system supports the Legacy transition path of the Transformation Campaign Plan (TCP).

#### Justification:

FY04/05 procures 11 tactical SHF terminals and fields prior year procurements. HQDA has validated the operational need and directed procurement of an SHF terminal to meet near term reachback requirements. The SHF terminal will provide critical wideband communications capability which will significantly enhance the warfighter's intra- and inter-theater communications.

The Enhanced Manpack UHF Terminal (i.e., EMUT and also known as SPITFIRE) program replaces the existing inventory of single channel Satellite Communication (SATCOM) radios to add Communications Security (COMSEC), and Demand Assigned Multiple Access (DAMA) capability to support all DoD, Special Operations Forces (SOF) and other Agencies. The SPITFIRE is a small, lightweight manpack radio that provides the reach-back capability between the forward deployed force and the Continental United States sustaining base required to support power projection. The Joint Staff (JS) has mandated that all UHF satellite manpack terminals be secure and have DAMA capability. The Army has designated the SPITFIRE terminal as the standard UHF Satellite Terminal. The SPITFIRE possesses the UHF DAMA capability which allows more efficient use of limited satellite resources. Additionally, the SPITFIRE Terminal has been selected to provide Narrowband Range Extension of both voice and data to Mobile Tactical Vehicles. The unique Narrowband Range Extension capability, through the SATCOM-On-The-Move (SOTM) functionality, allows extension of both voice and data to occur in moving vehicular platforms (versus stationary). This program is designated as a DoD Space Program. This system supports the Legacy transition path of the Transformation Campaign Plan (TCP).

#### **Justification:**

FY04/05 funding will field SPITFIRE prior year procurements to the Stryker Brigade Combat Teams (SBCTs). In addition, the funds will be used to field upgraded modules and acquire SOTM capability for the Army's transformation requirements.

The Navstar Global Positioning System (GPS) is a passive, space-based, radio positioning and navigation system providing precise, three-dimensional position, navigation, velocity and timing information to warfighters. The Navstar GPS program is designated as a DoD Space Program and the United States Air Force (USAF) is the executive service. The USAF develops GPS User Equipment (PE 35164F) at the GPS Joint Program Office (JPO) with Army participation. The Army's Navstar GPS program provides for management, procurement, fielding, and support of GPS User Equipment developed by and largely procured through the Joint Program Office. GPS User Equipment consists of a family of receivers supporting both handheld and host platform environments. GPS receivers provide critical information to commanders, staff and Soldiers enabling increased lethality, dominant maneuver, precision strike, situational awareness, battlefield distribution and information dominance/superiority functions that will enhance the technologies to support the Objective Force. Current GPS User Equipment support Army aviation (Miniaturized Airborne GPS Receiver, Stand Alone GPS Receiver, and Cargo Utility GPS Receiver) and both ground users and host vehicles (Precision Lightweight GPS Receiver [PLGR]). Future GPS User Equipment will be in both handheld (Defense Advanced GPS Receiver) and platform embedded (GPS Receiver Applications Module) forms. This is a Legacy-to-Objective capability supporting all axes of the Army Transformation Campaign Plan. This program has been designated as a DoD Space Program.

#### **Justification:**

FY04/05 procures the Defense Advanced GPS Receiver (DAGR), funds the software upgrade to the Cargo Utility GPS Receiver (CUGR) and the Stand Alone GPS Receiver (SAGR), continues to support the PLGR in the field via warranty, provides for engineering and technical support, and Product Management Operations.

Secure Mobile Anti-Jam Reliable Tactical Terminal (SMART-T) is a multi-channel satellite terminal required to support a Force Projection Army. The SMART-T provides a range extension capability for the Army's Mobile Subscriber Equipment (MSE) and emerging Warfighter Information Network - Tactical, a critical requirement to support current and future combat operations. The SMART-T provides a robust, protected satellite interface to permit uninterrupted communications as our advancing forces move beyond the line-of-sight of terrestrial systems. The SMART-T improves the battlefield Command, Control, and Communications capability. SMART-T provides connectivity between MSE Node Centers (NC), Large Extension Nodes (LEN), Small Extension Nodes (SEN), and Remote Radio Access Units (RAU), to support Echelons Corps and below as well as Special Contingency Operations. The prime mover is a High Mobility Multi-Purpose Wheeled Vehicle (HMMWV) configured with all the electronics and the self-erectable antenna. The SMART-T operates at the Extremely High Frequency (EHF) band and receives in Super High Frequency (SHF) band. The terminal operates at both Medium Data Rate (MDR) and Low Data Rate (LDR). The terminal is designed for unattended operation. SMART-T provides the security, mobility, and anti-jam capability required to defeat the threat to assured communications and satisfy the critical need for robust, secure, beyond line of sight communications. SMART-T provides low probability of interception and low probability of detection (LPI/LPD) to avoid being targeted for destruction, jamming, or eavesdropping. The SMART-T provides fully interoperable communications with the MILSTAR terminals of other services. SMART-T terminals are being upgraded to support Advanced EHF (AEHF) satellites. The AEHF upgrade to SMART-T provides a four-fold increase in communication capacity over the current SMART-T. The upgraded AEHF SMART-T supports communications on the AEHF Waveform, and retains full backward compatibility with LDR and MDR Wavef

#### **Justification:**

FY04/05 procures 91 SMART-T terminals and supports fielding, logistics, and training for prior year procurements.

The SCAMP BLK I Terminal provides a manportable, four simultaneous channel, full duplex data/half duplex voice communications and data transfer system at 2400 bps each. These satellite terminals are employed by units that require range extension for command and control communications. Block I provides priority tactical ground users with the capability to transmit and receive intelligence, command, and control traffic from a base station. It transmits in the Extremely High Frequency (EHF) band and receives in the Super High Frequency (SHF) band. It provides Low Data Rate (LDR) secure voice at 2400 bps and secure data at 75-2400 bps, as well as interface with Common Hardware/Software devices such as the Lightweight Computer Units and the Hand-Held Terminal Unit. The SCAMP BLK I is fully interoperable within the Army C4I Technical Architecture. The terminal has embedded COMSEC and TRANSEC with set -up and tear-down in less than 10 minutes. In addition to operation on Milstar satellites, the SCAMP BLK I will operate on all satellites which utilize the MIL-STD-1582C/D LDR waveform. It operates in environmental conditions that include smoke, aerosol, rain, fog, snow, haze and dust, and operates in the transmit, receive or stand-by mode throughout an entire mission (typically 30 days). SCAMP BLK I is the first EHF manportable terminal and provides direct support to the tactical warfighter mobile forces with greater anti-jam protection, lower probability of intercept, and lower probability of detection. Army Block I terminals are designated for Commanders at Division and Above levels. SCAMP Block I provides manportable EHF/LDR communications using the on-orbit satellites, and future launches. This program is designated as a DoD Space Program. This system supports the Legacy transition path of the Transformation Campaign Plan (TCP).

#### Justification:

FY04 funds Contractor Technical Services Option and Warranty Review Board efforts.

The Single Channel Anti-Jam Manportable (SCAMP) Block II Program supports the upgrade of the existing SCAMP Block I terminals with an Advanced Extremely High Frequency (AEHF) capability in support of the AEHF Satellite Program. The SCAMP System Enhancement Program (SEP) supports the requirements in the Joint AEHF Operations Requirement Document (JORD) and provides worldwide secure, low probability of intercept and detection, and assured voice and data communications for the Joint warfighter. SCAMP SEP will transmit in the Extremely High Frequency (EHF) band and receive in the Super High Frequency (SHF) band and will operate over Milstar, other MIL-STD-1582 compatible payloads and the future AEHF payload, providing secure voice and data services. SCAMP SEP will transmit and receive intelligence, situational awareness, as well as command and control traffic. SCAMP SEP provides up to 64 Kbps Uplink (narrowband) and up to 128 Kbps Downlink AEHF capability to units, Division Headquarters and Above, and Special Operations Forces that require increased data rates for range extended command and control communications. A future SCAMP Block II Manpack program effort will be procured in the out years. This program is designated as a DOD Space Program. This system supports the Legacy to Objective transition path of the Transformation Compaign Plan (TCP).

#### Justification:

FY05 procures and installs retrofit kits to upgrade the SCAMP Block I terminals with an AEHF capability.

Global Broadcast Service (GBS) is a Joint Service program that responds to the need for a high-speed, one-way broadcast of high volume multi-media information such as imagery, maps, weather data, logistics, air tasking orders, etc., to users worldwide. GBS is an integral part of the Defense Information Infrastructure (DII) and part of the overall DoD MILSATCOM architecture. The DoD GBS initiative was formalized by a Joint Acquisition Decision Memorandum, 27 Mar 96. The need for the GBS communication system was validated by the Joint Requirements Oversight Council (JROC) in a Joint Mission Need Statement, dated 3 Aug 95, and the updated Joint Operational Requirements Document, dated 23 May 01. The GBS Phase II concept was validated by use of a GBS Phase I demonstration system in support of the Bosnia peace mission and Joint Warfighting Interoperability Demonstration (JWID) 95. The Army supports the Air Force GBS Joint Program Office (JPO) for the Transportable Ground Receive Suite (TGRS) and the Theater Injection Point (TIP).

The GBS TGRS consist of a small satellite tracking and receiving antenna, which receives and demodulates the RF downlink signal into a bit stream for the receive broadcast management computer to decrypt and distribute to end users. An in-theater injection capability via the Theater Injection Point (TIP) will broadcast vital Combatant Commanders/Commander Joint Task Force in-theater information to in-theater TGRS. The Army's Authorized Acquisition Objective is a total of three TIPs and 551 TGRSs. This program is designated as a DoD Space Program. This system supports the Legacy to Objective transition path of the Transformation Campaign Plan (TCP).

#### Justification:

FY04/05 procures 80 Internet Protocol (IP) TGRS and IP replacement equipment for TGRS previously procured.

This program provides a tactical satellite communications capability to meet critical Ground Mobile Forces (GMF) Command, Control, Communications, Computers and Intelligence (C4I) needs not satisfied by conventional terrestrial communications systems. The GMF are those components of the Army, Navy, Air Force, Marine Corps, Special Operations Forces and Joint Communications Support Elements engaged in land, tactical air combat, and amphibious operations ranging from single-service crisis missions to mutually supportive joint-service combat scenarios. Mod Of In-Svc Equipment (TACSAT) funds the upgrades to Army tactical satellite communications equipment. This program is designated as a DoD Space Program. This system supports the Legacy transition path of the Transformation Campaign Plan (TCP).

### Justification:

FY04/05 procures 38 Secure Enroute Communications Package - Improved (SECOMP-I) Block I systems. This system is a lightweight, highly compact, communications system which is designed to easily roll on and off aircraft and utilize exisiting radios. This system is designed for the use of Corps/Joint Task Force (JTF)/Army forces commanders and staff while deploying to a theater of operations onboard aircraft or while dismounted for ground operations. It provides long range, beyond line of sight and Very High Frequency (VHF) secure voice and data for Command, Control, Communications, Computers and Intelligence (C4I).

#### INDIVIDUAL MODIFICATION

Date:

February 2003

MODIFICATION TITLE: SECOMP-I [MOD 1] 1-84-07-0019

MODELS OF SYSTEM AFFECTED: Not Applicable

### DESCRIPTION/JUSTIFICATION:

This program provides a tactical satellite communications capability to meet critical Ground Mobile Forces (GMF) Command, Control, Communications, Computers and Intelligence (C4I) needs not satisfied by conventional terrestrial communications systems. GMF are those components of the Army, Navy, Air Force, Marine Corps, Special Operations Forces and Joint Communications Support Element engaged in land, air combat and amphibious operations ranging from single-service crisis to mutually supportive joint-service combat missions. Mod Of In-Svc Equipment (TACSAT) funds the upgrades to Army tactical satellite communications.

FY04/05 funds procure 38 Secure Enroute Communications Package - Improved (SECOMP-I) Block I systems. SECOMP-I is a lightweight, highly compact, communications system designed to easily roll on and off aircraft and utilizes existing radios. The system is designed for the use of Corps/Joint Task Force (JTF)/Army commanders and staff while deploying to a theater of operations on-board aircraft or while dismounted for ground operations. It provides long range, beyond line of sight and Very High Frequency secure voice and data for C4I. The estimated system life is 15 years.

### DEVELOPMENT STATUS/MAJOR DEVELOPMENT MILESTONES:

The SECOMP system is currently operational as a non standard Army system. Based upon the users positive evaluation/feedback of the system, the Army has decided to produce SECOMP-I systems. A DA Directed Procurement was awarded in FY02. These funds procured ten (10) limited capability SECOMP-I(-)s to meet an urgent user requirement. The full capability SECOMP-I program will begin in FY03 with an LRIP award of 14 systems.

Note: There are no costs to install the system into aircraft. As a result, the "Installation Schedule" below is not required.

The Global Command and Control System-Army (GCCS-A) provides the Army's interface to the Joint Staff Global Command and Control System (GCCS) program. GCCS-A provides automated command and control tools for Army Strategic and Theater Commanders to enhance warfighter capabilities throughout the spectrum of conflict during joint and combined operations in support of the National Command Authority (NCA).

GCCS-A is being implemented in accordance with the GCCS concept of Common Operating Environment (COE) and the Army Battle Command System (ABCS) Capstone Requirements Document (CRD). The GCCS-A is the integration of software, hardware and communication architecture. GCCS-A is the Army's Strategic and Theater Command and Control (C2) System. It provides readiness, planning, mobilization and deployment capability information for the strategic commanders. For Theater commanders, GCCS-A provides Common Operational Picture (COP) and associated friendly and enemy status information, force employment planning and execution tools (receipt of forces, intra-theater planning, readiness, force tracking, onward movement, and execution status), and overall interoperability with Joint, Coalition and the tactical Army Battle Command Systems (ABCS). It will support major Army commands (MACOMS), Army Commanders in Chiefs (CINCs), Army Commands and Components, and Army elements within the Pentagon. The GCCS-A will support all staff sections within a headquarters that support all phases of conflict and Stability and Support Operations (SASO). Continuing emphasis will be on upgrading previously fielded hardware to ensure consistency and compatibility with current technologies. This system supports the Legacy to Objective transition path of the Transformation Campaign Plan (TCP).

#### **Justification:**

FY04/05 procures software support for previously fielded software at all Army-managed, worldwide command and control sites and procures hardware upgrades for all Army sites and Joint Commands for which the Army has been given responsibility for Joint hardware in accordance with Joint Publication 5100.3, dated 15 Nov 99. Support and fielding is mandatory in order for the Army to remain in lockstep with GCCS milestones, and support the Army Battle Command System.

The Army Data Distribution System (ADDS) is a Command, Control, Communication and Intelligence (C3I) program consisting of several data radio systems: Near Term Digital Radio (NTDR), Enhanced Position Location Reporting System (EPLRS), and Joint Tactical Radio System (JTRS). EPLRS is a critical mobile wireless data communications backbone for the Army's Tactical Internet. EPLRS provides embedded situational awareness/ position navigation. EPLRS mobile networks are used by Army Battle Command System(s) (ABCS) and Force XXI Battle Command Brigade and Below (FBCB2) host computers for situational awareness and command and control. It has been designed specifically to meet the data communication requirements of the Army Battlefield Command System (ABCS) and sensor systems. EPLRS includes the approved Net Control Station (NCS) downsizing initiative and EPLRS Net Manager (ENM). The JTRS Cluster 1 program will enable the Army to acquire and field a family of affordable, scaleable, high capacity, interoperable radio sets based on a common JTRS Software Communications Architecture (SCA). The JTRS is a key enabler of the Army Transformation and will provide critical communications capabilities across the spectrum of operations in a Joint environment. These systems support the Legacy-to-Objective transition path of the Transformation Campaign Plan (TCP).

### **Justification:**

EPLRS: FY04/05 procures 711 EPLRS Radio Sets (RSs). FY04/05 continues the fielding of prior year hardware procurements to the 3rd, 4th and 6th Stryker Brigade Combat Teams (SCBTs), 3rd Armored Cavalry Division, Army National Guard III Corps, and III Corps Troops. FY04/05 funding will also provide New Equipment Training (NET), kit procurement, integration, Engineering Change Orders (ECOs), life cycle software engineering and program management support. FY04/05 includes procurement and fielding of ENMs. FY 04/05 also includes fielding support for NTDR Tactical Operations Center (TOC) radios.

JTRS Cluster 1: FY05 procurement procures radios for Multi-service Operational Test and Evaluation (MOT&E) and fielding to the SBCTs. MOT&E assets will be fielded to SBCTs after test. Quanties also support Aviation recapitalization.

REMARKS: CECOM - Communications Electronics Command

For JTRS Army Cluster 1 Ground and Aviation Sets, LRIP award is Fixed Price Incentive with Successive Target Options negotiated as part of the System Demonstration and Development Contract with Boeing (FY05 & FY06).

The JTRS Army Cluster 1 Ground sets consists of 2 through 9 channel capability. Most of the sets in the near term are 4 channels or greater. The Army Cluster 1 Aviation sets consists of the configurations for Army Rotary Wing (8-channel requirement) and the A2C2S (16-channel requirement).

The Full Rate Production division of assets for JTRS Cluster 1 will be competitively awarded in FY07 and out.

The Multifunctional Information Distribution System Low Volume Terminal (MIDS LVT) is a subsystem of a tactical platform's communication system, which enables the platform to exchange tactical digital information with other platforms equipped with a MIDS terminal or Joint Tactical Information Distribution System (JTIDS) Class 2 terminal. The MIDS LVT provides tactical digital information exchange among fighter aircraft, airborne command and control, Ground Air Defense and shipboard platforms. The Army variant, MIDS LVT(2), operates in a Time Division Multiple Access (TMDA) mode. It consists of three Line Replaceable Units (LRUs) (Main Terminal, Power Supply Assembly and Cooling Unit) mounted on a mounting plate which will fit into an existing JTIDS Class 2M mount making the MIDS LVT(2) and JTIDS Class 2M terminals physically and functionally interchangeable.

This system supports the Legacy-to-Objective transition path of the Transformation Campaign Plan (TCP).

#### Justification:

FY04/05 procures system project management and some software support for the MIDS LVT(2) terminals for various platforms including Phased Array Tracking to Intercept of Target (PATRIOT), Theater High Altitude Air Defense (THAAD), Joint Range Extension (JRE) and Forward Area Air Defense (FAAD) formerly known as Short Range Area Defense (SHORAD).

The Single Channel Ground and Airborne Radio System (SINCGARS) VHF-FM Radio Communications System provides the primary means of command and control for combat/combat support/combat service support units. The SINCGARS radio provides state-of-the-art communications in manpack, vehicle, and airborne configurations. Its Frequency-Hopping and jam resistant capabilities offset current threat jamming techniques. SINCGARS continues its evolutionary development with the fielding of the Advanced SINCGARS System Improvement Program (ASIP) radio. The SINCGARS ASIP radio provides for enhanced data and voice communications while using commercial Internet Protocols. The SINCGARS radio is an essential component of the Tactical Internet enabling commanders to conduct operations on the digitized battlefield. The family of SINCGARS radios is employed on such systems as the Bradley M2A3, PATRIOT, ABRAMS M1A2SEP, and the Longbow Apache. Funding through FY 06 buys 245,888 of the total requirement of 252,091 radios (97.5%). This system supports the legacy transition path of the Transformation Campaign Plan (TCP).

### **Justification:**

FY04/FY05 procures and fields ground ASIP radios for high priority National Guard units, Brigade Combat Teams (BCT), and procures SINCGARS Test Sets (AN/GRM-122).

A total of 16,475 NON-ICOM radios were declared obsolete in June 2001.

FY03 includes a \$34,000,000 Congressional add as follows:

\$22,100,000 was provided from the Defense Emergency Response Fund (DERF) for acquistion and fielding of 500 High-Frequency (HF) radios, \$10,500,000 SINCGARS radios and \$1,400,000 AN/GRM-122 radio test sets.

Acquisition Objective of Airborne radios was increased by 363 to a revised quantity of 9,611 on 30 Sep 2002.

The Single Channel Ground and Airborne Radio System (SINCGARS) VHF-FM Radio Communications System provides the primary means of command and control for combat/combat support/combat service support units. The SINCGARS radio provides state-of-the-art communications in manpack, vehicle, and airborne configurations. Its Frequency-Hopping and jam resistant capabilities offset current threat jamming techniques. SINCGARS continues its evolutionary development with the fielding of the Advanced SINCGARS System Improvement Program (ASIP) radio. The SINCGARS ASIP radio provides for enhanced data and voice communications while using commercial Internet Protocols. The SINCGARS radio is an essential component of the Tactical Internet enabling commanders to conduct operations on the digitized battlefield. The family of SINCGARS radios is employed on such systems as the Bradley M2A3, PATRIOT, ABRAMS M1A2SEP, and the Longbow Apache. This system supports the Legacy transition path of the Transformation Campaign Plan (TCP).

#### Justification:

The FY02 funding completed the buy of the previous Army Acquisition Objective (AAO) of 9,248 radios.

In FY02, the AAO was increased by 363 radios to a revised quantity of 9,611.

Joint Tactical Area Command Systems funding supports the Legacy Systems of the Area Common User System-Modernization Plan (ACIS-MP) which is comprised of the Communication Networks, which evolved from the original Tri Service Tactical Communications and Mobile Subscriber Equipment. The Communication System Control Element(CSCE) and Network Planning Terminal (NPT) provide critical management functions for the tactical to strategic communications links through control and management of switching and radio networks. Radio Sets,AN/GRC-222 and AN/GRC-226 provide the necessary bandwidth to transmit voice and digital information. Quick Erect Antena Mast(QEAM) allows rapid setup/tear down and movement on the tactical battlefield. This system supports the Legacy transition path of the Transformation Campaign Plan (TCP).

For FY03, a new requirment has been added to the BA1010 line - ARS-6 which is a piece of the Positioning Locator System (PLS). Funds were provided to award a contract with American Competitive Institute (ACI) to upgrade existing PLS electronics to state of the art, reduce the cost of system procurement and maintenance, add needed capability for the PLS to talk to the next generation survival radio - the Combat Survivor Evader System (CSEL) and to upgrade PLS to operate with Air Force and Navy AN/PRC-112 HOOK radios.

#### Justification:

CECOM/JTACS System Branch Allocation - FY 04/05 funds are required to provide Level II Project Management of equipments transferred from PM JTACS/WIN-T to CECOM.

The ACUS Mod Program funds the ongoing and planned modifications to the Area Common User System (ACUS) and supports its migration to the Army's Warfighter Information Network (WIN) Tactical systems architecture by recapitalizing legacy systems. WIN-Tactical is the architecture that will seamlessly link diverse information resources into a network the Army warfighters can use on the 21st Century's digitized battlefield. The ACUS-Modernization Plan (MP) includes ongoing modifications/upgrades and the recapitalization of the Mobile Subscriber Equipment (MSE) system at Echelons Corps and Below (ECB) and the Tri-Service Tactical Communications (TRI-TAC) system at Echelons Above Corps (EAC). The Switch Modernization effort is the production and fielding effort to upgrade selected legacy area common user system switches with Asynchronous Transfer Mode (ATM) capable switches. The Radio Modernization effort provides an increased transmission capacity between switches to move voice, video, and data for the digitized battlefield III Corps and for the entire Army. The Tactical High Speed Data Network (THSDN) technology insertion provides for the more efficient use of available bandwidth and increased throughput to support high speed data access through TRI-TAC/MSE to the Brigade Tactical Operations Center (TOC). Other modifications include the Secure Wireless LAN (SWLAN) which provides secure wireless connectivity between mobile command post platforms; Network Operations Center-Vehicle (NOC-V), which integrates Commercial Off the Shelf (COTS) and Government Off the Shelf (GOTS) hardware and software to the TOC; Battlefield Video Teleconferencing (BVTC) which provides internet working of video terminals; Brigade Subscriber Node (BSN) which is an integrated switching/transmission shelter providing voice/data/video capabilities for the Stryker Brigade Combat Team (SBCT); and Information Assurance (IA) enhancements which provide for perimeter security protection and defense-in-depth management. The Baseband Node (BBN) is a tec

The ACUS Mod Program supports the Legacy transition path of the Transformation Campaign Plan (TCP).

JUSTIFICATION: FY04/05 procures Army recapitalization efforts through the ACUS MP and provides	s systems eng	ineering, integ	ration, testing, and necessary	production/contractor engineering support. The ACUS is an area switched					

FY04/05 procures Army recapitalization efforts through the ACUS MP and provides systems engineering, integration, testing, and necessary production/contractor engineering support. The ACUS is an area switched communication system that is comprised of the Echelons Above Corps (EAC) communication network, which evolved from the original TRI-TAC concept, and the Echelons Corps and Below Mobile Subscriber Equipment (ECB MSE). The Army recapitalizes Army signal units, via a Signal Battalion equivalent, by restoring legacy assemblages, providing selected upgrades to add warfighting capability improvements, and inserting new technology. This will provide increased bandwidth and data capacity, dynamic allocation to support video and data, and information security. (As an example, the 1st CAV Division's Signal Battalion (13th) consists of six Node Center Switches (NCS), twenty-four Small Extension Nodes (SENs), thirty-one Line-Of-Sight (LOS) Radio Assemblage V1, twenty-four LOS Radio Assemblage V3, and one LOS Radio Assemblage V4.) FY04/FY05 will continue to support the Army's Transformation Initiatives by inserting new technologies [Brigade Subscriber Node (BSN), Battlefield Video TeleConferencing (BVTC), Secure Wireless LAN (SWLAN), Network Operations Center-Vehicle (NOC-V)] into the Army's Stryker Brigade Combat Teams (SBCTs). At the same time, the Digitized III Corps at Fort Hood [Asynchronous Transfer Mode (ATM), High Capacity Line of Sight Radios (HCLOS), Information Assurance (IA), Battlefield Video TeleConferencing (BVTC), Secure Wireless LAN (SWLAN), Network Operations Center-Vehicle (NOC-V) into III Corps] will complete its fielding. In addition, HCLOS and Tactical High Speed Data Network (THSDN) (8MBPS) continue procurement and fielding of XVIII Corps signal units. Acquisition and fielding of Baseband Nodes (BBN) in support of JTF/JFLCC will begin in FY04.

This line is required to fully fund the Transformation Campaign Plan (TCP), the acquisition of 400 AN/PRC-150C HF and 1812 AN/PRC-148 AM/FM Radios for Stryker Brigade Combat Teams (SBCT) 3,4,5 and 6, sustainment of USARPAC/SETAF C4ISR programs and HQ DA-G8 Distant Learning Center, Integrated Theater Signal Battalions (ITSB) and for Total Package Fieldings (TPF) of displaced equipment, containerized Joint Worldwide Intelligence Communications System (C-JWICS) and Pentagon/C-JWICS support contracts. TPF includes the recovery, testing and operational checkout of DA controlled Communications-Electonic Systems.

#### **Justification:**

The primary efforts to be funded in FY04/05 are execution of the Transformation Campaign Plan (TCP) for the USARPAC effort, DA government and contractual personnel, HF Radios for the Stryker BCTs and residual SINCGARS Cascade TPF (units delayed because of lack of availability of kits/equipment). Funds for the USARPAC C4ISR mission and systems, RDEC engineering support and laboratory requirements and Interactive electronic technical manuals and Pentagon support contract. Funds for the Advanced Multiband Secure Squad and HF/VHF Radios, AN/PRC-150/148 for SBCT 3,4,5 and 6, SETAF c4ISR systems and mission, Containerized Joint Worldwide Intelligence Communications System(C-JWICS) and Pentagon/C-JWICS support contracts. HQDA-G8 directed TPF of displaced C-E systems and equipment. This includes the recovery, testing and operational checkout of equipment. This includes salaries, TDY expenditures of both government and contractual personnel and the HQDA-G8 distance Learning Center located at Fort Monmouth, NJ

This program procures modernization and enhancement items that benefit Soldiers by improving their lethality, survivability, mobility, command and control, and sustainment. The Soldier Intercom (SI) and the Integrated Laser White Light Pointer (ILWLP) are two items currently being procured under this program. (1) The SI is a small voice radio with a tethered speaker/microphone for use by individuals within a squad to coordinate their movement. SI will allow squad members to communicate more effectively while conducting day/night combat operations over short distances without relying on hand and arm signals, particularly in Military Operations in Urban Terrain (MOUT). The SI is an inexpensive means of coordinating squad communication and consists of a receiver/transmitter, antenna, speaker/microphone and carrying case. SI is an interim solution for Infantry intrasquad communication until Land Warrior is fielded. (2) The ILWLP is an integrated laser/white light device that can be weapon-mounted or hand-held. When weapon-mounted, it will provide the Soldier with the capability to accurately aim his weapon during periods of darkness at the maximum effective range of his weapon when used in conjunction with other image intensification devices. It also provides a limited visible laser capability and a white light capability during MOUT conditions. The ILWLP will be mounted on the M16A2, the M4 Carbine, the M16/M4 Modular Weapon System, and the M9 Semi-automatic Pistol. This project supports the Legacy-to-Objective transition path of the Transformation Campaign Plan (TCP).

#### Justification:

The FY04/05 funding procures 1692 Individual Soldier Intercoms and continues the procurement of the Integrated Laser White Light Pointer with a quantity of 8187. (1) Command and control through radios currently ends at the squad leader level. The SI extends the ability of the squad leader to disseminate voice information to members of the squad by using a small rugged, non-developmental radio. (2) The ILWLP will provide combat Soldiers with a compact, lightweight, integrated laser/white light device for use in a variety of combat scenarios and weather conditions. It will allow the combat and combat support forces to acquire and engage targets with small arms weapons on the battlefield and in close quarters combat engagements during limited visibility conditions or in total darkness.

The Combat Survivor Evader Locator (CSEL) system is a joint program for a hand-held survival radio that will provide downed aircrew members and Special Operations Forces (SOF) personnel multiple communications capabilities and precision location. The CSEL will replace the AN/PRC-90 and AN/PRC-112 radio that are currently fielded to aviation and SOF units. The radio determines the survivor's location through an embedded Global Positioning System (GPS) capability. The survivor transmits position/location and situational information via two-way voice Line-of-Sight, beacon, or Over-The-Horizon (OTH) communication paths. The Joint Search and Rescue Center (JSRC) receives the OTH information and conducts a hand-off to operational forces that carry out the Combat Search and Rescue(CSAR)mission. The two-way voice communication ensures single pass pickup by enabling the survivor to communicate with the inbound CSAR aircraft. Army requirements are for approximately 18,531 radios for Force Package (FP) 1-4 aviation and SOF units. A Milestone review was approved in January 02 for LRIP-Lot 2. A LRIP-Lot 3 is scheduled for second quarter FY03 and a Full Rate Production decision is scheduled for FY04.

This system supports the Legacy-to-Objective transition path for the Transformation Campaign Plan (TCP).

#### Justification:

FY04/FY05 funding continues FRP procurement and starts fielding to Force Package 1 SOF units.

Based on current Unit Cost projections- a total of 9,630 units are currently resourced out of a projected AAO of 18,531.

Medical Communications for Combat Casualty Care (MC4) is a capstone program which provides support to the deployable Army medical force structure through the acquisition of existing digital communications equipment and existing/emerging information management/technology capabilities for modular hospital platforms and non-hospital units throughout the wartime theater of operations as well as peace operations, humanitarian assistance and operations in aid of civil authorities. MC4 will also link the Medical Information Systems to the Army Command and Control (C2) and key Combat Service Support structures, which are evolving to support the Army transformation into the future. PM MC4 engineers, acquires, tests and deploys automation infrastructure for Army implementation of the Office of the Assistant Secretary of Defense, Health Affairs managed Joint Theater Medical Information Program (TMIP).

This system supports Legacy-to-Objective transition path of the Transformation Campaign Plan (TCP).

#### **Justification**:

FY04/05 procures hardware to continue infrastructure deployment to provide TMIP applications to the remainder of the First Digitized Corps (FDC) at Fort Hood, Texas and additional Stryker Brigade Combat Teams (SBCT). MC4 acquires, deploys and integrates automation infrastructure for Army users of the Joint Theater Medical Information Program (TMIP), to include specified warfighting Combatant Commanders.

This program provides the Army, as a member of the DoD counterintelligence community, with an advanced global automated data processing information environment and architecture, enhancing the Army's ability to counter the global threat through significant improvements in information sharing, common situational awareness, and knowledge management in a joint operational environment. Program resources time-sensitive CI force protection suport to a deployed Land Component Commander.

### **Justification:**

FY04/05 supports the development and recapitilization of the Defense Counteringelligence Information System (DCIIS). Funds will procure Department of Defense Intelligence Information System (DODIIS)-compliant Counterintelligence (CI) and Human Intelligence (HUMINT) material solutions to support implementation of DCIIS at Army Intelligence sites at the MACOM level and at major subordinate command levels. Funds will provide capabilities at 21 large sites, 52 medium sites and 253 small sites in support of Echelons Above Corps (EAC) and Echelons at Corps and Below (ECB) organizations employment of DCIIS.

Army Key Management System (AKMS) is the Army's system to automate the functions of Communications Security (COMSEC) key management control and distribution, Electronic Counter-Countermeasures (ECCM) generation and distribution and Signal Operation Instructions (SOI) management. AKMS will electronically generate and distribute Army key and key-related material, thereby limiting adversarial access to, and reducing the vulnerability of, Army C4I systems. It provides key management to communications and network planning. Direction was provided in FY98 to separate the Local COMSEC Management Software (LCMS) from the Automated Communications Engineering System (ACES). LCMS is the COMSEC accounting and generation software and ACES is the network planning software. LCMS is the Army's portion of the four-tiered Electronic Key Management System (EKMS). The EKMS is a key management, COMSEC material distribution and logistics support system consisting of interoperable service and civil agency key management systems. ACES will provide enhanced automated functions of net/cryptonet management and engineering, Signal Operating Instructions and Electronic Protection. The Data Transfer Device (DTD) moves the ACES/LCMS data to End Crypto Units (ECUs). The acquisition strategy was updated in an Acquisition Decision Memorandum (ADM) approved by the PEO C3T Milestone Decision Authority (MDA) on 10 June 2002. The DTD will now be known as the Simple Key Loader (SKL). AKMS is part of the management/support infrastructure for the Area Common User System (ACUS) program, which provides critical functions for supporting Army's transformation.

This system supports the Objective transition path of the Transformation Campaign Plan (TCP).

### Justification:

FY04/05 procures SKL/DTD, continues the fielding of the SKL and provides for the associated government and contractor engineering support and training. The SKL will be utilized to perform all Tier Three functions of EKMS.

Funds the Army's Information Systems Security (INFOSEC) Program (ISSP). Provides communication security (COMSEC), biometrics, crypto security, transmission security, emission security, computer security, information assurance and equipment and products as a means for protecting telecommunications and information systems which process classified, mission sensitive, national security, and related sensitive information. Acquires for tactical and sustaining based, password access management Information and Information based systems transformation technology, which is biometrically based in accordance with technology specifications and requirements and preferred products from the Department of Defense Biometrics Management Office. Prevents exploitation through intercept, unauthorized electronic access, or related technical intelligence threats. Ensures authenticity, integrity, protection and availability of information transmitted by information and communication systems. These systems support the Legacy-to-Objective transition path of the Transformation Campaign Plan (TCP).

#### Justification:

The FY 04/05 budget procures Network Security, In-Line Encryptors, and High Assurance Guards to secure Army's portion of the Defense Information Infrastructure. Tactical-Secure Terminal Equipment (T-STE) to provide INFOSEC transparent to the soldier and solutions for TOP SECRET/Special Intelligence subscribers to echelons above and below corps communication systems to resolve problems of secure interface of strategic, tactical, and commercial communication systems as identified by the Joint Staff (J6) in the Multiservice Communications Electronics Board (MCEB) in August 1993/March 1996. Link Encryptors secure systems used for intelligence gathering and video teleconferencing. Trunk Encryptors provide digital data encryption for large robust data connections. The Assistant Secretary of Defense for Command and Control, Communications and Intelligence (C3I) sent a memorandum, dated 3 Feb 01, and directed the Services to implement an aggressive Cryptographic Modernization Program. It is imperative that Army COMSEC inventory and associated Key Management/Public Key Infrastructure be modernized to avert catastrophic susceptibility/threat to information security due to many of these devices having hard-wired cryptographic algorithms that are obsolete or nearing the end of their useful life. In addition the legacy inventory is becoming logistically non-supportable. This presents unacceptable "vulnerability" and substantial risk to operational and national security. The Top Level Architecture (Secure) equipment provides boundary defenses for unprotected systems within the Army enclave. Ensures an acceptable level of availability by defending against denial of service attacks. Provides gateway protection/detection capability. Enables rapid detection of and response to intrusions. Defends against unauthorized modification or disclosure of data. Ensures that physical and logical enclaves are adequately protected. Provides new equipment training, first destination transportation, and consumable parts for total package field

This program is a component of the Army's seamless Enterprise Network that provides compatibility across operational systems supporting the Department of Defense approved program to modernize and integrate digital operations within the Pacific and European Theaters. The goal architecture will be able to accommodate the rapidly changing deployment and realignment of forces within the Pacific and European Theaters. The modernization program supports force projection through technology insertion and evolutionary changes. The program also utilizes emerging technological developments to capitalize on digital information systems throughout the worldwide Defense Information System Network (DISN). The theater Combatant Commanders require a robust infrastructure that will facilitate mobilization and sustainment of a deployed force.

### Justification:

FY04/05 procures on-going Project Management and engineering efforts to accomplish the Army unique requirements as defined by European Command (EUCOM) initiatives. The objective is an integrated, survivable network that provides voice, data messaging, video and transmission services to the warfighter through the application of emerging technology such as Asynchronous Transfer Mode (ATM), Synchronous Optical Network (SONET), bulk encryption and network management systems. FY04 begins the upgrade of power, timing and alarm systems for the European Transmission Systems.

FY04/05 procures the continuation of the Korean Optical Backbone Replacement program initiated by US Forces Korea. This will replace the existing 420-mile, 13-link fiber optic cable plant with technically advanced fiber optic cable. The Korean Digital Microwave Upgrade will continue with the upgrade of 10 Microwave Links. FY05 will begin the effort to replace the existing AN/FCC-98 multiplex units in Korea; 70 of the required 140 will be replaced. Continuing the Okinawa Microwave Upgrade, FY04/05 procures and installs the bulk encryption for all the radio links as well as the fiber optic links mandated by Pacific Command (PACOM) Directive.

This program supports the Department of Defense approved program to modernize and integrate digital operations within the Pacific and European Theaters. The goal architecture will be able to accommodate the rapidly changing deployment and realignment of forces within the Pacific and European Theaters. This program is a component of the Army's seamless Enterprise Network that provides compatibility across operational systems. The modernization program supports force projection through technology insertion and evolutionary changes. The program utilizes emerging technological developments to capitalize on digital information systems throughout the worldwide Defense Information Systems Network (DISN). The theater Combatant Commanders require a robust infrastructure that will facilitate mobilization and sustainment of a deployed force.

The Digital European Backbone (DEB) Programs realign the DISN in Europe to comply with mandates of the Conventional Forces, Europe agreement and the Base Realignment and Closure (BRAC) Acts. This program supports all efforts related to the modernization of the command, control, communications and computer (C4) infrastructure in the DISN-Europe. This program also supports networks that provide voice, data, messaging, video, and transmission services to the warfighter through the application of emerging technologies such as Asynchronous Transfer Mode (ATM), the Synchronous Optical Network (SONET) and bulk encryption.

### Justification:

FY04/05 procures on-going Project Management and engineering efforts to accomplish the Army unique requirements as defined by European Command (EUCOM) initiatives. The objective is an integrated, survivable network that provides voice, data messaging, video and transmission services to the warfighter through the application of technology such as ATM, SONET, bulk encryption and network management systems. FY04 begins the upgrade of power, timing and alarm systems for the European Transmission Systems.

This program is to modernize the information technology infrastructure by; strategically improving the ability to successfully defend the Pacific Theater during periods of stress; increasing survivability of command, control, communications, computers and intelligence (C4I) systems; increasing information systems capacity to meet surge requirements; and improving the ability to reconstitute C4I systems. This program supports the command and control communication networks serving the Combined Forces Command, Commander US Forces Korea, Commander US Forces Japan and the United States Army Pacific Command. The objective is an integrated survivable network that provides voice, data, messaging, video and transmission services to the warfighter through the application of emerging technologies.

### Justification:

FY04/05 procures the continuation of the Korean Optical Backbone Replacement program initiated by US Forces Korea. This will replace the existing 420-mile, 13-link fiber optic cable plant with technically advanced fiber optic cable. The Korean Digital Microwave Upgrade will continue with the upgrade of 10 Microwave Links. FY 05 will begin the effort to replace the existing AN/FCC-98 multiplex units in Korea; 70 of the required 140 will be replaced. Continuing the Okinawa Microwave Upgrade, FY04/05 procures and installs the bulk encryption for all the radio links as well as the fiber optic links mandated by PACOM Directive.

This program funds Army-wide requirements for base support radio systems and Test, Measurement and Diagnostic Equipment (TMDE) for the Network Enterprise Technology Command (NETCOM). Base support radios are used by installation military police, fire departments, medical personnel, and other emergency response activities to coordinate and support emergency response efforts and for critical communications support during mobilization, deployment, and split-based operations. Base support radio systems will permit users to share frequencies, thus conserving scarce radio spectra and also provide secure voice/data transmission and access to local telephone systems from portable hand-held radios. Army non-tactical trunked radios are Commercial Land Mobile Radio (LMR) systems that provide mobile/portable radio support to garrison safety, force protection, and facilities maintenance operations. This equipment must be compatible with state and local fire protection and law enforcement organizations. The National Telecommunications and Information Administration (NTIA) mandated the conversion of wideband LMR systems to narrowband operations by 1 January 2005 or 1 January 2008, depending on the specific band frequency. Law enforcement, security, and other base functions would be greatly constrained without adequate communications capability. This program also supports the phased replacement of obsolete, nonsupportable TMDE and interim mission support for command, control, communications and computers worldwide. The NETCOM TMDE inventory consists of general purpose and special purpose test equipment. Additionally, long lead times for acquisition of new TMDE results in this program supporting interim acquisition of special purpose TMDE to satisfy mission requirements. Densities of TMDE supported by this program are determined by Defense Information Systems Agency (DISA) standards and maintenance support plans for information systems.

### Justification:

FY04/05 procures upgrades and replacement base support radio systems that are critical to public safety and force protection missions and also procures program management for the radio systems. Army has designated a centralized management office to ensure non-negotiable NTIA deadlines are met both within Continental US (CONUS) and overseas. FY04/05 also procures replacement TMDE, which include spectrum analyzers, transmission test sets, communication analyzers, protocol analyzers, category 5/6 local area network cable test sets, fiber optic cable analyzers, fiber optic test sets, integrated services digital network testers, optical time domain reflectometers, asynchronous transfer mode broadband test systems, cable fault locators, earth ground test sets, power analyzer/monitor ups, power meters, video teleconference multimedia test systems and interim support of authorized special test equipment. These funds will replenish and rebuild expensive, unique test equipment identified as non-repairable through standard Army maintenance systems. All procurements are designed to satisfy mission requirements and equipment shortages based on critical need and the five-year TMDE Acquisition Plan. Equipment will be distributed to NETCOM units and will enable NETCOM to continue to meet the required 99.9% availability rate for all communication systems worldwide.

The Army Defense Information System Network (DISN) Router Program (ADRP) provides the hub for the site networking connections and the connection to the Top Level Architecture (TLA). These connections include Army host computers, servers, Local Area Networks (LANs), and Campus Area Networks (CANs) to the TLA. The ADRP includes the acquisition of routers and switches for direct connections, access servers and modems for dial-in connections. Program acquisition also includes testing, installation, Installation Bill of Materials (IBOM), warranty and training. The ADRP equipment is upgradable to satisfy future Army, DoD, and industry standards and is an integral part of the Installation Information Infrastructure Modernization Program (I3MP) initiative.

### **Justification:**

FY 04/05 procures routers, cache engines, port expansions, switches and access servers (and upgrades to existing switches and access servers) to meet emerging program requirements in support of I3MP.

The Electromagnetic Compatibility Program (EMCP) ensures the readiness of command and control systems by testing the electromagnetic environment and engineering the frequency requirements to be compatible with other civil and defense communication and electronics (C-E) systems operating in the area. EMCP engineers conduct on-site spectrum surveys at existing and proposed C-E installations to determine the availability of frequency resources. The use of computer models to accurately predict the effects that the proposed system will have on the environment, as well as the effects the environment will have on the proposed system. This is done primarily to prevent expensive reworking or retrofitting but is also required when emission conflicts arise. The following equipment sustains and enhances the capability of the program:

- A. MEASUREMENT INSTRUMENTATION
- B. MEASUREMENT CONTROLLERS
- C. ANCILLARY EQUIPMENT: Antennas, amplifiers, filters, cabling etc.
- D. ENGINEERING WORKSTATIONS AND PERIPHERALS Computers, specialized software and related equipment that EMC engineers use to perform data reduction, analysis and engineering functions. Stand alone systems (NOT office automation) that automate data reduction and analysis thus greatly speeding the frequency engineering process.
- E. MEASUREMENT ACCESSIBILITY EQUIPMENT: For vehicles, electric generators, power inverters, and related equipment that EMC engineers use to gain access to remote sites where they perform their measurements.

### **Justification:**

The FY04/05 funds will procure state-of-the-art hardware and software that provides the capability to characterize the digital electromagnetic environment and provides the required access to remote sites. The rapidly evolving communication equipment made possible by digital signal processing and melding of computer technology with transmitters and receivers requires that we keep pace in order to accomplish our prevention and resolution mission. Small frequency agile transmitters and receivers that transmit a high volume of information at lower power and higher speed, new digital modulation schemes, the extreme mobility of the new radios and increased spectrum congestion resulting from the advance of the "wireless world" make these acquisitions imperative. Advanced equipment and software will help reduce the susceptibility of Army communication systems to interference from outside sources and help prevent financial liability that may result from interference with civil, defense and commercial users.

The World Wide Technical Control Improvement Program (WWTCIP) is a continuing program to initiate, improve, expand and automate Army Defense Information Systems Network (DISN) Technical Control Facilities (TCFs) and Patch and Test Facilities (PTFs) to enable technical control personnel to gain full use of communications resources to support the Warfighters and gain information dominance. The program provides Alternating and Direct Current (DC) power, timing and synchronization equipment, line conditioning equipment, and automatic technical control, Voice Frequency (VF) tactical interface, Defense Communications Tri-Tac interface and appropriate test equipment with associated hardware. The program benefits all users of the DISN worldwide including tactical users who connect to the DISN for long haul communications requirements. The upgrades provide the end user faster response time, high quality voice, video and digital circuits, and greatly minimizes outages. Many of the present configurations and equipment can no longer support the warfighters requirements of voice, digital data, and Video Teleconference (VTC) requirements as well as Asynchronous Transfer Mode (ATM) technology and GigaBit Ethernet. The program is essential to correct these problems and to support everincreasing high speed digital requirements of the tactical and strategic users with minimal personnel requirements. The program currently supports Combatant Commanders programs in Europe and the Pacific as well as CONUS Power Projection Bases and Defense Satellite Communications Systems.

#### Justification:

FY04/05 procures equipment to improve, expand, automate and integrate Technical Control Facilities (TCF) and Patch and Test Facilities (PTF) in various CONUS sites. This will include continuing the automation of manual technical controls at Fort Detrick and Fort Belvoir, the upgrade of timing and synchronization systems and replacement of obsolete DC power systems for Okinawa.

This program provides for improvement/modernization of Army base level voice, data and video networks worldwide. It encompasses nontactical telecommunications services in support of Army base operations, Army Knowledge Management (AKM), Army Transformation and Information Systems for Command and Control (C2) requirements and also funds the acquisition of common user information systems in support of Military Construction, Army (MCA) projects.

### **Justification:**

FY 04/05 procures the Information Systems upgrades to the Army's installation information infrastructure. It is comprised of four separate programs to include:

The Information Systems (CONUS/Western Hem) provides for the convergence of voice, video and data on one platform and is an integral part of the Installation Information Infrastructure Modernization Program (I3MP). DSSMP supports Army Transformation, Army Knowledge Management (AKM), power projection support platforms and split based operations through the modernization or replacement of the Army's voice switch systems.

The Information Systems (EUCOM) program provides high capacity and near real time data through put for data, cable and voice solutions to sustaining base installations throughout the European Area of Operations.

The Information Systems (PACOM) program provides for the modernization of the non-tactical telecommunications requirements that support Army base operations and U.S. military Command and Control requirements at U.S. posts, camps and stations in Korea and Japan.

The Information Systems (MCA Support) program finances acquisition of information systems equipment and switch expansion equipment to be installed in conjunction with military construction projects worldwide, which are not included in the MCA funding.

This program provides state-of-the-art major information system equipment such as integrated voice/data switches, Tier II computers (i.e., common user, multiple-purpose assets supporting Army installations and/or organizations), voice/data switch expansions, common user Local Area Network (LAN) transport equipment and basic telephone instruments. This equipment is installed in conjunction with Military Construction, Army (MCA) projects.

#### Justification:

FY 04/05 procures information systems requirements associated with approved MCA projects. Funding is applied to specific projects based upon mission priority, timing of construction schedules, beneficial occupancy dates (BOD) and minimum lead time required for acquisition and installation of associated information system equipment. Funding supports regulatory requirements as outlined in AR 415-15 and other applicable US Army directives. These funds are essential to insure that information systems are installed in sync with Corps of Engineer construction schedules. FY04/05 will also procure additional remote switching units (RSU) in support of the Battle Simulation Center at Fort Lewis, the Efficient Basing East project at Grafenwoehr, Germany and the USARPAC C2 facility at Fort Shafter. The remaining FY04/05 funds will provide Information System support for an additional ninety five (95) approved MCA projects.

The Digital Switched Systems Modernization Program (DSSMP) mission is to modernize and maintain the Army's digital switch systems worldwide and is an integral part of the Installation Information Infrastructure Modernization Program (I3MP). Upgrading telecommunication equipment provides the most effective interface with existing public telecommunication networks, ensures the installation is postured for emerging voice technologies and optimizes the development of evolving Department of the Army programs.

#### Justification:

FY 04/05 procures the modernization of switch systems at multiple I3MP installations in CONUS. These modernization programs will upgrade the voice communications infrastructure in support of Army Transformation, Army Knowledge Management, power projection support platforms and split based operations. Voice communication is a key component of the installation level telecommunications network which allows deployed forces to stay digitally linked to their support base at home. The modernization efforts will provide for the convergence of voice, video and data on one platform and will allow the switches to support such applications as distance learning, video conferencing, telemedicine, voice over internet protocol, health and morale calls, computer telephony integration, wireless telecommunication, remote access, automated directory assistance and network management.

The Information Systems (EUCOM) mission encompasses two major programs. The Defense Information Systems Network-Europe (DISN-E) Telephone Switch Modernization Program is currently replacing the European Telephone Switch (ETS) network in support of USCINCEUR and USAREUR switching requirements, as documented in CINCEUR letter dated 9 Oct 97 and USAREUR letter dated 20 Oct 97. The Installation Information Infrastructure Modernization Program (I3MP) Europe is the primary initiative to provide increased data pipes and connectivity to the installation, other support activities and deployed combat forces in the EUCOM theaters. This program provides high capacity capabilities and near real time throughput for data, cable and voice solutions to sustaining base installations throughout the European Area of operations. This program supports the Defense Reform Initiative in such areas as Army Transformation, Army Knowledge Management, web enabled applications, image processing for intelligence missions, command and control, telemedicine and telemaintenance. In addition to DISN-E and I3MP, this line also provides for Videoteleconferencing (VTC) hubs which support video interconnection and conference capability between HQ, USAREUR and its major subordinate commands and deployed troops in areas such as Bosnia and Kosovo.

#### **Justification:**

FY 04/05 procures state-of-the-art telephone switches for the Defense Information Systems Network-Europe (DISN-E) telephone switch modernization program. The new telephone switches will have Integrated Services Digital Network (ISDN) and other commercial features as well as military unique requirements. The number of switches upgraded each year will depend on the type of switch (large or small multifunction, end office or remote switching unit) and the price negotiated with the contractor. Switch installation will be accomplished in accordance with the Installation Sequence List (a prioritized list of ordered installations issued by the Army, G3). FY 04/05 procures two additional classified and unclassified VTC hubs to support HQ, USAREUR mission requirements.

FY 04/05 procures I3MP OCONUS EUROPE engineering support to furnish and install backbone Wide Area Networks (WAN) and Campus Area Networks (CAN) at 45 sites in accordance with the EUCOM Installation Sequence List (ISL). WAN connectivity and CAN installations are critical to support the ever increasing data transport requirements attributable to actions supporting key Army wartime doctrine. High speed backbone CANs will be installed to modernize installation transport capability, standardize transport networks, and increase the sustaining base capacity for key Army systems such as Army Knowledge Management (AKM), Distance Learning, DoD Standard Procurement System (SPS), Global Combat Support System Army (GCSSA), Combined Health Care System (CHCS), Installation Support Module (ISM), Defense Message System (DMS), Joint Computer-Aided Acquisition and Logistics System (JCALS) and other web enabled applications.

The Information Systems (PACOM) Program is an integral part of the OCONUS Installation Information Infrastructure Modernization Program (I3MP) and is the primary initiative to digitize and provide connectivity to the installation, other support activities and deployed combat forces in the PACOM theater. Its objective is to create an infrastructure sufficiently flexible to meet ever increasing telecommunication requirements. This program digitizes the sustaining base installations to support the Defense Reform Initiative in such areas as web enabled applications, multimedia applications, image processing for intelligence missions, maneuver control, telemedicine and telemaintenance.

Information Systems (PACOM) program is also responsible for the upgrade of the fixed plant telephone systems in Korea. The upgrades to the Korean Telephone Network (KTN) will modernize the Army telephone system and provide the capability to meet requirements that are not presently satisfied.

#### **Justification:**

FY 04/05 procures I3MP OCONUS PACOM engineering support to furnish and install backbone Campus Area Networks (CAN) in accordance with the PACOM Installation Sequence List (ISL). The ISL is a prioritized list of ordered installations issued by the Army, G3. CAN installations are critical to support the ever increasing data transport requirements attributable to actions supporting key Army wartime doctrine. The Army is currently using outdated and eroding cable systems, overstressed communication resources and expensive, non-standard measures to satisfy the ever increasing telecommunications requirements. High speed backbone CANs will be installed to modernize installation transport capability, standardize transport networks, digitize the sustaining base, and increase capacity for key Army systems such as Army Knowledge Management (AKM), Distance Learning, DoD Standard Procurement System (SPS), Global Combat Support System Army (GCSSA), Combat Service Support Control System (CSSCS), Combined Health Care System (CHCS), Installation Support Module (ISM), Defense Message System (DMS), Joint Computer-Aided Acquisition and Logistics System (JCALS) and other web enabled applications.

FY 04/05 procures essential hardware to expand the line capacity for Camp Market, Yongsan South 3 and the Far East District Engineer (FEDE), Korea Switch Upgrades. FY 04/05 funds will continue efforts in support of Camp Page, Chinhae, Camp Colbern, Camp Market, Yongsan South 3 and the FEDE Compound.

The Defense Message System (DMS) is replacing today's Telecommunication Centers and Automatic Digital Network (AUTODIN) Switching Centers. DMS will serve as a single, seamless global messaging system supporting administrative, command and control, and intelligence traffic from the sustaining base to the battlefield. DMS is being implemented in two Phases. The focal points of Phase I, which is complete, included the AUTODIN Mail Server (AMS) Desktop Interface to AUTODIN Host (DINAH), Automated Special Security Information System Terminal (ASSIST) and other AUTODIN terminals. Phase II focuses on the full-scale implementation of Consultative Committee on International Telegraphy and Telephony (CCITT) standardized X.400/X.500 messaging products and the phase out of the AUTODIN system. Implementation of DMS within the Army (DMS-Army) will modernize message services by providing special features including a free-flow message format, Joint and Coalition interoperability, multifunction workstations for most users, guaranteed timely delivery, sender and receiver authentication through the use of electronic signature, and end-to-end security. It will provide regional, installation level and user interfaces to DoD record communications services Army wide. DMS-Army will be the Army's Command and Control messaging system of record. Special features of this new message system include: (1) a user operated service concept, (2) a single form of message service using a simplified message format, (3) multilevel secure processing, and (4) automated local distribution via information transfer networks. The program's implementation emphasis transitioned from the Sustaining Base to the Tactical environment in December 1999. This system supports the Legacy-to-Objective transition path of the Transformation Campaign Plan (TCP).

#### Justification:

FY04/05 procures Tactical Message System (TMS) sets, which provide Sensitive But Unclassified (AN/TYC-24V2), Secret (AN/TYC-24V3), and Top Secret (AN/TYC-24V4) capabilities. It also procures Fielding, Field Service Representatives and Government Furnished Equipment necessary to support the fielding of the Army's TMS and continues the extension of DMS to the battlefield in support of the Warfighter in accordance with the Operational Requirements Document (ORD). TMS' will be fielded IAW Basis of Issue Plan (BOIP) as established by the US Army Signal Center at Ft. Gordon.

The Local Area Network (LAN) Program is comprised of two different efforts; the Common User Installation Transport Network (CUITN) and the Outside Cable Rehabilitation (OSCAR) program. CUITN provides the common user backbone Campus Area Network (CAN) consisting of the data networking electronics and fiber optic cable to interconnect the communications nodes supporting users in office buildings. CUITN provides an intelligent and secure data networking information infrastructure which supports the Army Installation Information Infrastructure Modernization Program (I3MP) at posts, camps and stations. It provides the necessary bandwidth and data-networking capabilities for digital communications as the Army undergoes transformation. It is sufficiently robust and scalable to easily meet the installation's data requirements in support of the legacy force, the interim force and the objective force. CUITN also provides the capability to transport high-volume and near real time data throughout the installation and to the Defense Information Systems Network (DISN) in support of sustainment, contingencies and split-based operations. OSCAR provides for the manhole, ductwork and cabling for the infrastructure upgrade. It also augments and supports replacement and expansion of information transport medium to meet the requirements of voice, data and the single line concept. Transport mediums include single mode fiber optic cable, copper wire and wireless systems.

#### **Justification:**

FY 04/05 procures CUITN and OSCAR program engineering and implementation support to furnish and install backbone local area networks at the Minimum Essential Requirements (MER) level on the Installation Sequence List (ISL). (The ISL is a prioritized list of ordered installations issued by the Army, G3). In FY 04/05 the CUITN Program will engineer, furnish and install Campus Area Networks that provide the infrastructure to manage the ever increasing data transfer requirements supporting key Army wartime doctrine and information technology transformation initiatives. The Army is currently using outdated systems, obsolete, overstressed communication resources, and expensive, non-standard measures to satisfy the increasing data communications requirements. High speed backbone networks will be installed to modernize site data transport capability, improve connectivity, standardize transport networks and increase capacity for key Army systems such as Army Knowledge Management (AKM), Defense Message System (DMS), Installation Support Module (ISM), Combined Health Care System (CHCS), Global Combat Support System, Army (GCSS,A), Distance Learning, Joint Computer-Aided Acquisition and Logistics System (JCALS) and other web enabled applications. In FY 04/05 the OSCAR program will engineer, furnish and install manhole, duct and cable systems to Minimum Essential Requirements (MER) level under the Army Installation Information Infrastructure Modernization Program (I3MP). Sites will be implemented in accordance with the Army Installation Sequence List (ISL).

The Pentagon Renovation Project is an on-going construction project directed by the Office of the Secretary of Defense and implemented by a Program Manger (OSD/WHS) and an Army Project Manger, Information Management & Telecommunications-PR (PM, IM&T-PR). PM, IM&T-PR is responsible for the relocation of existing IT facilities while sustaining operations and implementing a new modernized Pentagon telecommunications infrastructure in concert with Pentagon Renovation Construction. Relocation activities include moving the National Military Command Center (NMCC) Services Operations Center, merging seven Technical Control Facilities, consolidating 11 Automated Data Processing (ADP) facilities to two facilities, and consolidating 15 Command and Control tactical and administrative telephone switches to eight (8). The IT infrastructure includes the installation of an unclassified/classified backbone and a Network and System Management Center. The implementation of IT requirements is integral to each phase of the Pentagon Renovation construction program due to the synchronization of both programs. The Pentagon Renovation IM&T Project will provide modern integrated information and telecommunication capabilities to all levels of command in the Pentagon including OSD, the Joint Staff, Army, Navy, Marine Corps, Air force and Defense Agencies.

### **Justification:**

FY04/05 procures the backbone network infrastructure equipment and services for Wedge 2, including data switches, routers, media and cable. In addition, FY04/05 funds also procure servers, workstations, and management software required to integrate the Wedge 2 network into the Network and Systems Management Center, which manages the Unclassified and Classified Backbones for the Pentagon. FY05 funds will also initiate efforts for Wedge 3.

The All Source Analysis System (ASAS) provides US Army commanders at echelons above corps through battalion a standard all source intelligence processing and reporting system that provides the means for gaining a timely and comprehensive understanding of Opposing Force (OPFOR) deployments, capabilities, and potential courses of action. The system interfaces with selected national, joint, and theater Intelligence assets, adjacent/higher/lower military intelligence preprocessors, Distributed Common Ground Station-Army (DCGS-A), Army Battle Command System (ABCS), and organic deployed Intelligence/Electronic Warfare (IEW) teams and assets. The ASAS product set currently includes: ASAS Remote Workstation (RWS), ASAS-Light, Analysis and Control Team Enclave(ACT-E), Analysis and Control Element (ACE), Trusted Workstation (TWS), and the Communications Control Set (CCS). The ASAS system uses standard joint and Army protocols and message formats to interface with forward deployed sensor/teams, intelligence preprocessors and joint/national/Army C3I systems. This system supports the Legacy to Objective transition path of the Transformation Campaign Plan (TCP).

Digital Reconnaissance, Surveillance and Target Acquisition (DRSTA), SSN K28808, is a combined sensor and computer system that provides support for rapid and accurate gathering and digital transfer of Long Range Surveillance (LRS) unit intelligence messages and images from surveillance sites into the All Source Analysis System (ASAS). Digital RSTA supports the Legacy to Objective transition path of the Transformation Campaign Plan (TCP)

#### Justification:

FY 04-05 procures and completes the fielding of RWS, ACT-E, and ASAS Light. FY 05 begins hardware replacement of RWS, to include the ACT-E workstations, with ASAS Light. ACE fielding begins in FY 05.

FY 04-05 procures DRSTA systems to support 82nd AB Division, 10th MTN Division, XVIII AB Corps, and V Corps.

Digital Reconnaissance, Surveillance, and Target Acquisition (DRSTA), SSN K28808, is a common sensor control station that can work with a variety of sensors to provide support for rapid and accurate gathering and digital transfer of intelligence messages and images from surveillance sites into the All Source Analysis System (ASAS). DRSTA leverages existing hardware and software efforts for sensors, computers, and software. DRSTA interfaces with current and future Frequency Modulation (FM), High Frequency (HF), and Satellite Communication (SATCOM) radios to provide an end-to-end digitization solution. The DRSTA system is comprised of an out station, a ruggedized PDA-based Hide Site Computer, and a base station. Digital RSTA supports the Legacy-to-Objective transition path of the Transformation Campaign Plan (TCP).

#### Justification:

The FY04/05 funding will procure DRSTA systems to support 82nd ABN Division, 10th MTN Division, XVIII ABN Corps, and V Corps.

The Integrated Broadcast Service (IBS) is the worldwide DoD standard network for transmitting tactical and strategic intelligence and targeting data within a common format and migrating to a single family of Joint Tactical Terminals (JTT) and CIBS modules for improved operational jointness with Army, Navy, Air Force and Marine platforms. The Common Integrated Broadcast Service - Modules (CIBS-M) is a totally integrated Joint Program (all services and Special Operations Command (SOCOM)) which was created to consolidate and replace existing IBS receiver functionality/capability, with a "common family" of IBS modules (both hardware and software). This is required to implement the IBS Plan and consolidate/eliminate duplicative efforts. The Joint Tactical Terminal (JTT) program leverages, to the maximum extent possible, early tech-based efforts initiated by organizations such as the National Reconnaissance Office (NRO). The CIBS-M family of modules will be the "sole" provider, ensuring continued IBS interoperability to a variety of tactical receivers across DoD and the services. CIBS-M will be provided to Joint Tactical Radio System (JTRS) JPO for inclusion into the the JTRS Library to meet intelligence broadcast requirements. The JTT terminals deliver critical, time sensitive battlefield intelligence and targeting information at collateral and system high security levels in near real time (NRT) to worldwide tactical commanders and intelligence nodes at all echelons. The terminals provide direct, secure and dedicated connectivity/interoperability for rapid targeting, threat avoidance, battlefield management, mission planning and sensor cueing. The equipment can be mounted in fixed and rotary wing aircraft as well as fixed or mobile ground platforms. The JTTs are a subcomponent in major Air Force, Navy and Marine Corp systems. The reduced size JTT Briefcases (B) were fielded to the US Army Special Operations Command to satisfy real world events. This system supports the Legacy transition path of the Transformation Ca

#### **Justification:**

There is no funding request for FY04/05.

Prophet's primary mission is providing 24-hour Situation Development and Information Superiority to the supported maneuver brigade to enable the most effective engagement of enemy forces. Prophet is an integral part of the Army Transformation, providing near real time (NRT) information to the Brigade Commander within his combat decision cycle. It is the tactical commander's sole organic ground based Multi-Sensor system for the Division, Stryker Brigade Combat Team (SBCT) and Armored Calvary Regiments (ACR), Prophet provides the tactical commander with the next generation Signals Intelligence/Electronic Warfare (SIGINT/EW) - radio detection/direction finding and electronic attack capabilities. Prophet operates in direct support (DS) as an embedded and integral part of the Future Combat System (FCS) Unit of Action (UA) maneuver element and FCS Unit of Employment (UE)1. Prophet replaces the division level Trailblazer and Teammate legacy SIGINT systems in Block I, and TrafficJam in Block II. Prophet stationary and on-the-move direction finding information develops battlespace visualization, intelligence preparation of the battlefield (IPB) and target development for enemy and gray emitters within radio line-of-sight across the brigade area of responsibility. Block II/III will add Electronic Attack (EA) and an improved signal type detection capability. This increased capability will provide the Brigade Commander with the ability to detect and suppress all types of communications anticipated in the future battlespace. Additionally, Prophet provides the ability to intercept voice communications data when on board linguists are available. This NRT information when processed provides a key component of the fused intelligence common operating picture (COP). Initially Prophet will interface with the maneuver brigade Analysis Control Team's (ACT) All Source Analysis System (ASAS)-Remote Work Stations (ASAS-RWS) via Prophet Control. Prophet Control is a surrogate for the Distributed Common Ground System-Army (DCGS-A) in Blocks I to III. Prophet Control's functionality will be integrated on the Objective Force DCGS-A platform. The ACT will forward the gathered information to the division and armored cavalry Analysis Control Element's (ACE) ASAS. Block I fielding started in 1QFY03 to 101 AAD. Block II/III upgrade will start fielding in 4QFY05. Prophet enables the Brigade Commander to detect signals while the vehicle is moving, a first for a Tactical SIGINT system. Prophet is being developed in a user prioritized five block approach: Block I - Electronic Support (ES) (COMINT), Block II - Electronic Attack (EA), Block III - Modern Signals (TAS), Block IV - SIGINT/MASINT Fusion and Block V - Micro-Sensors and Robotics sensor extension capabilities. Blocks IV/V Capabilities are being acquired as requirements in the Future Combat System (FCS) vehicles. Prophet Block II/III is being developed to support integration into the Unit of Action (UA) reconnaissance and surveillance vehicles to provide SIGINT and EA sensors to support the Intelligence, Surveillance, and Reconnaissance (ISR) requirements. Future block upgrades capability will be modular and scalable to support UA vehicle integration. The Prophet System supports the Legacy to Objective transition path of the Army Transformation Campaign Plan (TCP).

The Tactical Unmanned Aerial Vehicle (TUAV) Shadow 200 provides the Army maneuver commander with dedicated Reconnaissance, Surveillance and Target Acquisition (RSTA) and Battle Damage Assessment (BDA). The TUAV Shadow 200 air vehicle will meet a minimum range of 50 kilometers and remain on station for up to four hours. The baseline payload is electro-optic infrared (EO/IR). Procurement of systems including attrition air vehicles commenced in FY 2001. The TUAV Shadow 200 system consists of four air vehicles, each configured with an EO/IR sensor payload, ground control equipment, including communications equipment, launch and recovery equipment, remote video terminals, and High Mobility Multipurpose Wheeled Vehicles with trailer(s). The Shadow 200 is a brigade asset. Each system is supported at the brigade level by a Maintenance Section-Multifunctional and at the division level by a Mobile Maintenance facility. Flyaway and Weapon System procurement costs do not include attrition air vehicles. The TUAV Shadow 200 is an Objective Force System and is to be fielded to the Counter Offensive Force/Counter Attack Corps.

This system supports the Legacy to Objective transition path of the Transformation Campaign Plan (TCP).

#### Justification:

Funding in FY 2004 procures 8 Full Rate Production TUAV Shadow 200 systems in accordance with the Army Transformation Strategy. These systems will be fielded to 25 ID, 10 MNT, 2nd ACR, 2nd ACR, 11th ACR, 1st CAV, 82nd ABN and 4th ID. Funding in FY 2005 procures 6 Full Rate Production TUAV Shadow 200 systems in accordance with the Army Transformation Strategy. These systems will be fielded to 10 MNT, 1st AD, 1st AD, 56th BDE, 1st ID and 101st AA. System contributes to the commander's dominant situational awareness and allows him to shape the battlefield to ensure mission success.

The Tactical Unmanned Aerial Vehicle (TUAV) Shadow 200 provides the Army maneuver commander with dedicated Reconnaissance, Surveillance and Target Acquisition (RSTA) and Battle Damage Assessment (BDA). The TUAV Shadow 200 air vehicle will meet a minimum requirement range of 50 kilometers and remain on station for up to four hours. The baseline payload is electro-optic infrared (EO/IR). Procurement of systems including attrition air vehicles commenced in FY 2001. The TUAV Shadow 200 system consists of four air vehicles, each configured with an EO/IR sensor payload, ground control equipment, including communications equipment, launch and recovery equipment, remote video terminals, and High Mobility Multipurpose Wheeled Vehicles with trailer(s). The Shadow 200 is a brigade asset. Each system is supported at the brigade level by a Maintenance Section - Multifunctional and at the division level by a Mobile Maintenance facility. Flyaway and Weapon System procurement costs do not include attrition air vehicles. The TUAV Shadow 200 is an Objective Force System and is to be fielded to the Counter Offensive Force/Counter Attack Corps.

TUAV was provided a supplemental fund called Defense Emergency Response Fund (DERF), as a non-add, for \$5.0M in FY02 for Shadow.

This system supports the Legacy to Objective transition path of the Transformation Campaign Plan (TCP).

#### Justification:

Funding in FY 2004 procures 8 full rate production TUAV Shadow 200 systems in accordance with the Army Transformation Strategy. These systems will be fielded to 1st 25 ID, 10 MNT, 2nd ACR, 2nd ACR, 11th ACR, 1st CAV, 82nd ABN and 4th ID. Funding in FY 2005 procures 6 Full Rate Production TUAV Shadow 200 systems in accordance with the Army Transformation Strategy. These systems will be fielded to 10 MNT, 1st AD, 1st AD, 56th BDE, 1st ID and 101st AA. System contributes to the commander's dominant situational awareness and allows him to shape the battlefield to ensure mission success.

The Common Ground Station (CGS) is a rapidly deployable and mobile tactical sensor data processing and dissemination center mounted on 2 High Mobility Multi-Wheeled Vehicles (HMMWVs). As part of the Stryker Brigade Combat Team (SBCT), and the Counter Offensive Force/Counter Attack Corps, CGS provides a key interface between intelligence and command and control systems by concurrently providing timely intelligence data and receiving the Common Tactical Picture (CTP) via the Tactical Operations Center (TOC) Local Area Network (LAN). CGS integrates imagery and signals Intelligence Surveillance and Reconnaissance (ISR) data products into a single visual presentation of the battlefield, providing commanders at Echelons Above Corps, Divisions and Brigades with Near Real Time (NRT) situational awareness, enhanced battle management and targeting capabilities. CGS initially served as the ground station for the Joint Surveillance Target Attack Radar System (Joint STARS), but has evolved into a multi-sensor ground station that receives, processes and displays sensor data from Predator, Tactical Unmanned Aerial Vehicle (TUAV), Airborne Reconnaissance Low (ARL), U2, Guardrail/Common Sensor (GRCS) and Integrated Broadcast Service (IBS) while preserving a small tactical footprint. CGS is the Army's premier radar Moving Target Indicator (MTI) ground station, receiving MTI data from Joint STARS, ARL and U2 sensors. Additionally, CGS receives and processes data and cross cues airborne sensors that include SAR, EO/IR, video and Signals Intelligence (SIGINT) sensor data. CGS disseminates timely targeting and battlefield surveillance data to Army Battlefield Command System (ABCS) nodes. CGS contains a robust modeling and simulation capability that supports linkage to sensor simulations, system-of-systems training and participation in a wide range of exercises on a worldwide basis. CGS with its Joint STARS and other sensor feeds, fulfills an urgent air-land battlefield requirement by providing an Army/Air Force sensor and attack con

#### Justification:

FY04 completes field upgrades of CGS systems replacing the Commanders Tactical Terminal (CTT) with the Joint Tactical Terminal (JTT) and incorporating enhanced Modeling and Simulation (M&S) capabilities to improve unit training and operator competancy.

The Digital Topographic Support System (DTSS) will provide digital maps and updates to commanders and weapons platforms in support of mission planning (e.g., imagery exploitation, Cover and Concealment, other Intelligence Preparation Battlefield (IPB)), rehearsal (e.g., 3D fly throughs, simulations) and execution (e.g., Common Tactical Picture, route planning). The DTSS automates terrain analysis and visualization, data base development/update/management/distribution, and graphics reproduction. The Combat Terrain Information Systems (CTIS) Modernization Plan emphasizes the development of a combined, integrated, tactically deployable, fully autonomous terrain analysis and graphics reproduction capability. CTIS consists of the Digital Topographic Support System-Light (DTSS-L)(HMMWV), DTSS-Heavy (DTSS-H)(5-ton), DTSS-Deployable (DTSS-D), DTSS-Base (DTSS-B) and the High Volume Map Production (HVMP) equipment. Fielding of the DTSS-H has been completed. The DTSS-H systems will be replaced by DTSS-Ls. The DTSS-L is a highly mobile systems which is capable of supporting a full range of military operations, as well as peacetime stability and support operations. The DTSS-D provides a Commercial Off the Shelf (COTS) configuration that is capable of operating all of the terrain analysis software. The DTSS-D consists of transportable workstations and peripherals that can be set up to augment the tactical configurations. The DTSS-D does not include tactically deployable shelters and vehicles or tactical communications. The DTSS-B was procured in response to an initiative to develop the capability to generate terrain information over sparsely mapped areas to support training, mission rehearsal and contingency operations. The DTSS-B is designed to augment National Imagery and Mapping Agency (NIMA) capabilities at the Echelons above Corps (EAC) level by providing quick response, special purpose mapping, terrain analysis and data base generation. The DTSS-B includes a component that is capable of handling national technical means information in a secure environment. The HVMP will provide a tactical capability to rapidly reproduce large volumes of topographic materiel. HVMP will be capable of reproducing information from a variety of digital and hardcopy sources via direct digital interfaces. A Milestone C decision will be completed during 2QFY03. Additionally, an institutional training classroom environment has been delivered to the National Geospatial/Intelligence School (NGS)(formerly the Defense Mapping School). NGS provides critical MOS specific training on the operation of CTIS developed systems. CTIS systems operate within the Army Battle Command System (ABCS) architecture and are deployed from Brigade through EAC. CTIS systems support the Legacy to Objective transition path of the Transformation Campaign Plan (TCP).

#### **Justification:**

FY04/05 procures the DTSS-L and HVMP. Procurement of the DTSS-L and HVMP support HQDA approved Army Order of Precedence fielding requirements. CTIS systems will be fielded to Army Engineer Terrain Teams at Brigade through Echelons Above Corps.

The Tactical Exploitation System (TES) is an interim DCGS-A that provides tactical commanders with Intelligence products at the level of engagement. Division TES (DTES) at the division level offers a standalone system, with multiple communication interfaces and capabilities. DTES is packaged in High Mobility Multi-Wheeled Vehicles (HMMWV) type vehicles and power source for operations. DTES is C-130 transportable and has On-the-Move (OTM) and Under-the-Hood (UTH) power capability. DTES is a self-contained and integrated system with multiple, remoteable, and reconfigureable Multi-Functional Workstations (MFWS) to handle Imagery (IMINT) and Signal (SIGINT) Intelligence data. DTES will be in limited production relegated to replacing predecessor legacy systems and bridging capability at the division-level until DCGS-A architectures and production objectives are solidified.

DTES supports the Legacy-to-Objective transition path of the Transformation Campaign Plan (TCP).

#### Justification:

FY04/09 has no procurement.

Advanced Intelligence, Surveillance and Reconnasaince (ISR) capabilities — integrated vertically and horizontally from strategic to tactical level — will form the knowledge backbone of the Future Combat System of Systems (FCS) and the Objective Force and enable all other capabilities. Distributed Common Ground System — Army (DCGS-A) will draw information from a wide variety of automated and manual sources; on-board sensors, space platforms, unattended air and ground vehicles, traditional and new ISR capabilities, and an assortment of correlated databases — all interactive and updated in near-real time. DCGS-A is focused on improving and accelerating the decision-action cycle and providing the means for commanders at all levels to achieve situational understanding and unified action through a common operational picture (COP) tailored to the force, mission, and situation. Combined with other battlefield functional area capabilities, this will allow Army commanders and joint warfighters to be aware of friendly forces, enemy forces, and the environment and to understand the consequences as each interact — the essence of the Army's vision and requirements for network centric warfare. Key objective of DCGS-A is to reduce forward deployed footprint, executing the preponderance of ISR processing and exploitation at rear Unit of Employment and CONUS based facilities. A key early DCGS initiative is the creation of CONUS based Home Station Nodes within the various Unit of Employment echelons, that directly support tactical Commanders through reach and split based operations. This line also procures key DCGS-A components. The Common Imagery Ground/Surface System (CIG/SS) is a subcomponent of DCGS-A and a Department of Defense (DoD) project aggregating all imagery ground/surface systems into a single project. The CIG/SS objective is to enable all systems to receive, process, exploit, and report any imagery source regardless of platform or sensor type to meet the intelligence and targeting needs of tactical commanders. The C

This system supports the Objective transition path of the Transformation Campaign Plan (TCP).

#### **Justification:**

FY 04/05 procures Home Station Nodes for fixed Echelon Above Corps DCGS-A capability. Will support ISR split-based and reach operations with forward deployed units. FY 04/05 procures DTES equipment and Spiral 1 & 2 DTES Product buys.

The JTAGS M3P Pre-Planned Product Improvement (P3I) Phase II program will procure an Institutional Trainer; initiate the JTAGS M3P Technology Insertion program; and begin integration of M3P with current and future communications architectures.

#### Justification:

FY05 funding procures the Institutional Trainer which will provide trained and ready users (soldier and sailor) fully capable to utilize the JTAGS M3P system. Training provided will include both strategic and theater mission requirements per Army and Air Force agreements.

This system supports the Legacy to Objective transition path of the Transformation Campaign Plan.

TROJAN, as an Army Intelligence system, has been providing a direct support and an operational readiness capability to warfighters since 1985. TROJAN exists to provide value added to the tactical commander with remote access to signal environments, in order to maintain a high state of operational readiness and enhance the training and sustainment of highly perishable intelligence skills. Additionally, the TROJAN architecture provides the infrastructure enabling split-based and force protection operations in direct support of the warfighter.

Trojan Classic XXI (TCXXI) advances the tactical commanders' readiness in the areas of training (technical and operational signals intelligence (SIGINT)), operational intelligence production and dissemination, and operational support to split-based intelligence operations supporting force projection operations. TCXXI's principle use is to provide remote access to target environments, enabling split-based operations from a sanctuary by being the gateway interface to environments of immediate relevance to every supported commander's priority intelligence requirements. In addition, TCXII will continue its role as an operational readiness system, while also supporting commanders' intelligence requirements across the spectrum of conflict.

TCXXI is an intelligence and electronic warfare (IEW) system that supports the increased readiness of key mobilization personnel in preparation for actions in the mission areas of The Army Plan (TAP). TCXXI is capable of maintaining operational readiness status of unit personnel supporting the full spectrum of military operations as outlined in the Army Strategic Planning Guidance and Army Planning Guidance sections of the TAP.

TCXXI provides operational readiness capability to an Army commander employing a rapid global response capability to any level of military conflict throughout the seven mission areas. By employing reach technology relay capabilities between the forward deployed sensors and the sanctuary-based Remote Operational Facilities (ROFs), TCXXI can meet the operational deployment timelines through the use of readiness training venues to meet the requirements of units from Brigade Combat Teams through Corps and Echelon Above Corps (EAC). This operational concept provides the unique capability to remotely control the sensors and direction finding capabilities of the Deployable Collection Assets (DCAs) and process and analyze the collected information for timely reporting of time-sensitive information to the forward deployed Army, Joint Service and Multi-National warfighters.

Troian supports Legacy to Objective Transition path of the Transformation Campaign Plan (TCP).

#### **Justification:**

TCXXI is a major hardware and software upgrade to components of the TROJAN Classic, AN/FSQ-144, Special Purpose Receiving System.

BZ9750 contains two baby ssns, BZ9751 and BZ9752.

BZ9751: Classified Program and information will be provided upon request.

BZ9752: The Remotely-Monitored Battlefield Sensor System II (REMBASS-II) is a family of unattended sensors that provide all weather, 24-hour area surveillance, force protection, and target detection and classification capability to support the battlefield commander. REMBASS-II was fielded to MI Battalions in Army Airborne, Air Assault and Light Divisions. The system was also fielded to Special Operation Forces and the 2nd Infantry Division in Korea where it is used to monitor the Demilitarized Zone (DMZ). REMBASS-II is fielded to the Stryker Brigade Combat Team (SBCTs).

The AN/PPS-5D is an all weather, man-portable, Ground Surveillance Radar (GSR). The GSR detects moving wheel and track vehicles out to 20 kms and detects personnel out to 10 kms. The operator can monitor target movements, determine the distance to target, and can estimate the direction and speed of the target. The system provides a Built-in-Test capability with a fault isolation rate of 85%.

These systems support the Legacy to Objective transition path of the Transformation Campaign Plan (TCP).

#### Justification:

FY04/05 procures Ground Intelligence Hardware, (REMBASS-II & PPS-5D) in support of the Stryker Brigade Combat Teams (SBCT).

The Counterintelligence/Human Intelligence (CI/HUMINT) Management System (CHIMS) is the tactical CI/HUMINT system. It meets the requirements for Army tactical and strategic CI/HUMINT information collection, investigation, interrogation, operations, document exploitation, and force protection. The total CHIMS automation architecture extends from the Corps and Division Analysis and Control Element (ACE) to the individual agent/collector. The AN/PYQ-7 Counterintelligence Operations/Interrogation Operations (CI & I OPS) workstation provides automation and analysis capabilities to Military Intelligence units, and CI Staff Officers (CISO) at Division and Corps. It provides a common interface to the Defense Counterintelligence Information System (DCIIS).

CI/HUMINT teams require two types of automation support. The first, a Team Leader device, is the AN/PYQ-3 CI/HUMINT Automated Tool Set (CHATS). It interfaces with the ASAS Remote Workstation (RWS), CI &I OPS workstation and individual CI/HUMINT agents/collectors device. The second, the AN/PYQ-8 Individual Tactical Reporting Tool (ITRT) provides a hand held automated collection and processing device for agent operations. It provides automation capabilities to collect, manage, receive, store and export text, electronic data, and digital imagery information. It is also capable of preparing, processing and disseminating standard messages. CHIMS is the HUMINT component of the Army Distributed Common Ground System (DCGS-Army) planning. CHIMS will play a vital role in the Army's Objective Force through the DCGS-A to be fielded at the 18th Airborne Corps in FY03 and fielded to III Corps in FY04.

This system supports the Legacy to Objective transition path of the Transformation Campaign Plan (TCP).

### **Justification:**

FY04 funding procures CHIMS systems to be fielded to USAREUR, 513th MI BDE, and SBCT #4. Additionally, FY 04 begins procurement and fielding to RC Training Base. FY05 funding continues full scale production and fielding to include SBCT #5 and completes Reserve Component Training Base.

This budget line supports automation requirements for the Army Intelligence and Electronic Warfare Master Plan (AIMP)and procurement of TROJAN Special Purpose Integrated Remote Intelligence Terminals (TROJAN SPIRIT) for the Transformation Brigades.

This system supports the Legacy-to-Objective path of the Transformation Campaign Plan (TCP).

AIMP uses capabilities from the Force Integration Masterplanner (FIM) to develop decision support aids that facilitate development and display of intelligence force structure, architectures and systems. The FIM is a computer-based system of systems using commercial-off-the-shelf (COTS) software to support PPBES decision making in the Intelligence and Electronic Warfare (IEW) community. The AIMP is a publication mechanism that presents the IEW future vision to Army consumers over Intellink and Intelink-S.

TROJAN SPIRIT provides both the Legacy Force and the Transformation Brigades with dedicated, secure, high capacity, SCI-high intelligence data processing and communications. It provides a rapidly deployable, multi-level security, processor-to-processor, high capacity communications capability, and supports tactical to strategic reach-back, essential to split-based operations. TROJAN SPIRIT LITE supports Legacy to Objective transition path of the Transformation Campaign Plan (TCP).

#### Justification:

JUSTIFICATION:

AIMP - funding will be used to continue replacing proprietary and obsolete hardware with standard COTS UNIX platforms and software. This provides the potential for interoperability with other UNIX applications, reduces hardware maintenance costs, and provides significantly better processing capability. These funds will also be used to acquire high speed product servers for Intelink & Intelink-S networks making the FIM products available to any Army consumer, world-wide. Hardware and Software procured will support Headquarters, Department of the Army, and FIM field support sites at Fort Belvoir, Fort Huachuca, and Fort Monmouth.

TROJAN SPIRIT LITE - funds the procurement integration and fielding of TROJAN SPIRIT Lightweight Integrated Telecommunications Equipment (TS LITE),(AN/TSQ-226 V) systems for the Transformation Brigades and National Guard. Each Brigade requires three TS LITE systems, one of which will be fielded with a HMMWV-mounted shelter, Modular Command Post System (MCPS), HMT trailer and SCI-capable workstation. Funding will be used to procure TS LITE systems for Transformation Brigades 3-8.

The SHORTSTOP Electronic Protection System (SEPS) is a fully integrated Radio Frequency Countermeasure system which is designed to provide protection for personnel and high value assets against proximity fuzes. There are three configurations of SEPS: a manpack system, a stand alone system, and a vehicle mounted system. SEPS will maximize tactical utility and provide protection against indirect fire. SEPS will be used by Infantry, Engineering, Armor, Field Artillery and Intelligence units to enhance survivability.

SEPS has received Congressional adds from FY97 thru FY03 which procured hardware and associated documentation to support urgent Combatant Commanders requirements.

This system supports the current force of the Transformation Campaign Plan (TCP).

## **Justification:**

There is no funding request for FY04/05.

Sentinel AN/MPQ-64 consists of a radar-based sensor with its prime mover/power, identification friend or foe (IFF), and Forward Area Air Defense (FAAD) Command, Control and Intelligence (C2I) interfaces. The sensor is an advanced three-dimensional battlefield X-Band air defense phased-array radar with an instrumented range of 40 km. The Sentinel is capable of operating day or night, in adverse weather conditions, in the battlefield environments of dust, smoke, aerosols and enemy countermeasures. It provides 360-degree azimuth coverage for acquisition tracking. The Sentinel contributes to the digital battlefield by automatically detecting; classifying, identifying and reporting targets (cruise missiles, unmanned aerial vehicle, rotary wing and fixed wing aircraft). Targets can be hovering to fast moving, as well as from nap of the earth to the maximum engagement altitude of Short Range Air Defense (SHORAD) weapons. Very accurate and quick reacting, Sentinel acquires targets sufficiently forward of the Forward Line of Troops to improve SHORAD weapons reaction time and allow engagement at optimum ranges. The Sentinel integrated IFF reduces the potential for fratricide of US aircraft. Highly mobile and reliable, the Sentinel Anti-Radiation Missile and Electronic Countermeasures resistant performance supports Army Corps and Divisional Air Defense operations across the full spectrum of conflict.

# This system supports the Legacy transition path of the Transformation Campaign Plan (TCP).

#### **Justification:**

REMARKS: FY01 Deliveries-Reflects exercise of reopen option for Full Scale Production Option 5(FSP5) buy (FY00). One consideration for new FY00 delivery schedule was the addition of an option that allows additional systems to be purchased at the FSP5 price. The option was exercised on 30 November 00. Award of this option eliminated the need to negotiate and award a new production contract (FSP6) to procure the 6 Sentinels in FY01. As a consideration for this option, Raytheon would procure systems for marketing and direct sales and deliver US systems at the end of the contract.

Sentinel consists of a radar-based sensor system with its prime mover/power, identification friend or foe (IFF), and Forward Air Defense (FAAD) Command, Control and Intelligence (C2I) Interfaces. Sentinel Modernization is a material enhancement of the Sentinel system. Sentinel Modernization upgrades provide Sentinel with the capability to classify and detect cruise missiles and UAVs. The system provides forward area Short Range Air Defense (SHORAD) systems information dominance via a digital air picture for support of maneuver forces and critical assets. The data acquired and processed by the system provides the commander an integrated battlefield picture and cueing/target identification information for SHORAD assets. The Modernization program will provide the capability for Sentinel to detect and classify small radar cross-section targets, such as cruise missiles and unmanned aerial vehicles. In order to engage at ranges beyond visual range, the SHORAD system must detect and track the target at sufficient range to alert, then cue the gunner to the target. The Sentinel Modernization efforts extend the range of Sentinel, so gunners will receive cues with sufficient time to engage targets at ranges beyond visual range. Cueing alone is not sufficient to support an engagement. The target must be identified as a friend or recognized as an engageable target based on the rules of engagement (ROE) and requirement of the defended assets. The Modernization program allows Sentinel to determine aircraft type or to support manned vs. unmanned determinations to fully support precision engagements beyond visual range. Sentinel Modernization supports growth to multi-mission radar capability. Based on the multi-mission radar desired performance matrix, Sentinels with Enhanced Target Range and Classification (ETRAC) modifications supports the Active Defense Fire Control baseline requirements and supports Air Defense surveillance and Air Traffic Control requirements. This system supports the Legacy to Objective transition path of

Note: Funding supports modernization of counter attack force.

#### Justification:

FY04 funds procure ETRAC retrofit kits. FY05 funds procure transmitter kits. The transmitter kits will replace the current Sentinel transmitter with Power Amplifier Modules (PAM). The ETRAC retrofit kits include waveform upgrades for the Receiver/Exciter, Variable Rotation Rate and Target Classification upgrades. Installation of these kits will provide Sentinel with the capability to classify cruise missiles, UAVs, rotary and fixed wing aircraft to support precision engagements beyond visual range. Sentinel is the only sensor available that detects cruise missiles, UAVs, rotary and fixed wing aircraft in the forward battle area at low altitude.

MODIFICATION TITLE: Transmitter Improvements [MOD 1] 111-11

MODELS OF SYSTEM AFFECTED:

#### DESCRIPTION/JUSTIFICATION:

Funds provide for the replacement of the current Sentinel transmitter with Power Amplifier Modules (PAM). Initially, the upgraded transmitter will replicate the existing transmitter function. With the implementation of the "waveforms" portion of the modernization program, both increased average power and classification waveforms capabilities will be activated. PAMs were selected because they offer excellent power conversion efficiency, are sufficiently stable to support subclutter visibility and classification waveform requirements and allow incremental growth and graceful degradation in the event of failure. Without these improvements, maneuver forces and critical assets are at risk against advancing threat capabilities, because Sentinel would not be able to detect and classify UAVs and cruise missiles. Sentinel Modernization supports growth to a multi-mission radar capability. Sentinels with ETRAC modifications support the Active Defense Fire Control baseline requirements and support Air Defense Surveillance and Air Traffic Control requirements.

Note: Funding supports modernization of counter attack force. The installation schedule is dictated by the Unit Set Fielding Schedule set by DA and the procurements are at econicomic quantities.

#### DEVELOPMENT STATUS/MAJOR DEVELOPMENT MILESTONES:

Note: Transmitter/ETRAC kits will be applied during the same retrofit to minimize trips to contractor's facility and cost.

MODIFICATION TITLE: ETRAC Modifications [MOD 2] 111-12

MODELS OF SYSTEM AFFECTED:

#### DESCRIPTION/JUSTIFICATION:

ETRAC Modifications include waveform upgrades for the Receiver/Exciter; Variable Rotation Rate and Target Classification upgrades. Exciter upgrades will provide low level RF signal sufficient to support the acquisition and track of small cruise missile targets and to accomplish generation of target classification waveforms. Receiver upgrades accomplish receipt and signal conditioning of low level Radio Frequency (RF) signal prior to Analog/Digital (A/D) conversion sufficient to support the acquisition and track of small cruise missile targets and to accomplish target classification. Variable rotation rate provides capability to slow the antenna rotation, increasing time on target to acquire and track small cruise missile targets and to provide flexible antenna positioning capability for target classification waveforms. Target classification efforts include software implementation of target classification capability to support beyond visual range engagements. Implementation of the ETRAC modification will enable SHORAD weapons to engage cruise missiles, UAVs, and fixed and rotary wing aircraft at the maximum effective range protecting critical assets from aggressors.

Note: Funding supports modernization of counter attack force. The installation schedule is dictated by the Unit Set Fielding Schedule set by DA and the procurements are at econicomic quantities.

#### DEVELOPMENT STATUS/MAJOR DEVELOPMENT MILESTONES:

Note: Transmitter/ETRAC kits will be applied during the same retrofit to minimize trips to contractor's facility and cost.

Night Vision Devices (KA3500) is a summary budget line including the following programs: (1). (K36400) AN/PVS-7 is a lightweight, head or helmet mounted night vision goggle consisting of a single objective lens assembly, state-of-the-art image intensifier technology, and two eyepiece lens assemblies. The AN/PVS-14 Monocular Night Vision Device (MNVD) is similar to the AN/PVS-7, except that it presents an image to only one eye (the soldier views the AN/PVS-7 with both eyes). Beginning in FY06 the production will begin transition to the Enhanced Night Vision Goggle (ENVG). The ENVG will be a lightweight device providing soldiers a passive sensor, fused electro-optical night vision device with the ability to engage and execute Close Combat (including MOUT), Combat Support, and Combat Service Support operations in all light levels, adverse weather, and battlefield obscurant conditions over existing night vision goggles.

(2). (K35000) AN/PAQ-4 Infrared Aiming Light (IAL) is a lightweight, weapon mounted and boresighted aiming light. The line also includes the AN/PEQ-2 Infrared Target Pointer/Infrared Aiming Light (ITPIAL). The aiming light output is visiable only when used with a night vision goggle, such as the AN/PVS-7. (3). (K31300) AN/VAS-5 DVE is an uncooled thermal imaging system developed for use on combat and tactical wheeled vehicles. (4). (B53800) AN/PVS-6 Mini Eyesafe Laser Infrared Observation Set (MELIOS) is an integrated, eyesafe laser rangefinder with Compass/Vertical Angle Measurement and digital data display. This line currently funds an upgrade for digital connectivity and interface with an Image Intensification device for 24 hour mission capability.

(5). (K41500) AN/PVS-10 Sniper Night Sight (SNS) is an integrated day/night third generation image intensifier system that mounts on the existing rail of the M24 sniper rifle. The SNS provides the sniper with the capability to accurately fire the M24 at night to a range of 600 meters and during the day to a range of 800 meters. These programs support the Legacy to Objective transition path of the Transformation Campaign Plan (TCP).

### **Justification:**

FY 2004/2005 funds will continue procurement of AN/PVS-14, AN/PEQ-2A, AN/PVS-10 SNS and AN/VAS-5 DVE systems. Fielding continues to Special Operations Forces, 75th Ranger Regiment, 10th Mountain, and Brigade Combat Team (BCT) units.

The Driver's Vision Enhancer (DVE) is an uncooled thermal imaging system developed for use on combat and tactical wheeled vehicles. The DVE allows for safer movement of combat and tactical wheeled vehicles in support of their operational missions in all environmental conditions. DVE facilitates fast paced force projection operations by providing enhanced mobility during darkness and in degraded battlefield conditions (smoke, dust, fog) enabling rapid combat operations and rapid movement / turn-around-time of supplies to forward deployed units. Addressing these mobility requirements increases the combat effectiveness of military forces.

This system supports the legacy-to-objective transition path of the Transformation Campaign Plan (TCP).

#### **Justification:**

FY04/05 procures DVE systems for the TOW HMMWV vehicles in the 82nd Airborne Division, 2nd Infantry Division, 10th Mountain Division, SETAF(1/508 Infantry), the 101st Airborne Assault Division, and portions of the tactical wheeled vehicles for two Stryker Brigade Combat Teams (SBCTs).

The AN/PEQ-2A, Target Pointer/ Illuminator/ Aiming Light (TPIAL) is a dual laser device which can be hand-held or weapon mounted (threshold: M16A1/A2, M4, M249, Modular Weapons; objective: M136, M203, M60, M240B, M2 and MK19), using the same Mounting Brackets available for the AN/PAQ-4C. The laser beams can only be detected with Night Vision Goggles. The AN/PEQ-2A emits a highly collimated invisible infrared light for precise aiming of the weapon as well as a separate infrared illumination beam with adjustable focus. Both beams can be zeroed to the weapon and each other. The beams can be operated individually or in combination. The AN/PAQ-4C is a lightweight, eye-safe aiming light which is attached to several weapons. The AN/PAQ-4C sends out an invisible light beam along the Line-Of-Sight. Visible only with Night Vision Goggles, the projected spot of light appears at the exact point where the weapon is aimed. This aiming light can be used only in the weapon-mounted mode using the various mounting brackets or the Rail Grabber Bracket Assembly for the Modular Weapons.

### **Justification:**

FY04/05 funds procures critically needed AN/PEQ-2A Infrared Target Pointer and AN/PAQ-4C Infrared Aiming Lights for fieldings to Stryker Brigade Combat Team (SBCT), Aviation units, and the National Guard Separate Infantry Brigade (SIB) units.

The AN/PVS-7/14 systems support the Army Transformation objectives by increasing situational awareness, mobility, and lethality during times of low light and night. The AN/PVS-7 is a lightweight, head or helmet mounted night vision goggle consisting of a single objective lens assembly, state-of-the-art image intensifier technology, and two eyepiece lens assemblies. The AN/PVS-14 Monocular Night Vision Device (MNVD) is similar to the AN/PVS-7, except that it presents an image to only one eye. These systems support the tactical level of war: enabling the individual soldier to see, understand, and act first, permitting superior tactical mobility during night and low light conditions. Individual soldiers use the AN/PVS-7 or AN/PVS-14 to perform Combat, Combat Support, and Combat Service Support functions during night operations. The AN/PVS-14 enhance survivability, lethality, and tactical mobility for individual soldiers of the Legacy and Interim Force precluding a capability gap during limited visibility operations.

### Justification:

FY 04/05 procures AN/PVS-14 systems for fielding to fulfill night vision equipment shortages in Stryker Brigade Combat Team 4 (SBCT 4), SBCT 5, SBCT6, III Corps, I Corps, 1st Infantry Division (1ID), and 1st Armor Division (1AD). These systems will provide the Legacy and Interim Force the capability to continue to dominate night operations while development of the next generation night vision goggle is performed.

The AN/PVS-14 will enable the Legacy and Interim forces to maintain dominance and win the close-in fight with individual combatant overmatch during night operations across the full spectrum of conflict and battlefield environment.

The AN/PVS-10 Sniper Night Sight (SNS) supports the Army Transformation objectives by increasing the sniper's ability to detect, identify and engage targets in darkness and extremely low light conditions, it enhances the sniper's situational awareness, survivability and lethality. The AN/PVS-10 SNS is an integrated day/night system that mounts on the M24 sniper rifle and can be adapted to mount on other sniper weapons. The SNS supports the tactical level of war enabling the individual sniper to see, understand, and act first. The SNS provides the sniper with the capability to acquire and engage targets at extended ranges during day and night. The SNS utilizes passive third generation image intensification technology for night operations.

## Justification:

FY04/05 procures requirements for a night sight to mount on the .50 cal Long Range Sniper Rifle (LRSR) being fielded to United States Army Special Operations Command (USASOC). Without the night sight, the sniper will not have the capability to engage and eliminate threat snipers, materiel, and thin skinned armored vehicle targets under low light conditions. The AN/PVS-10 allows the special operator to engage enemy vehicles, command and control centers and snipers at an increased stand-off distance even during low light and night conditions, thus increasing the special operator's survivability and lethality.

The Long Range Advanced Scout Surveillance System (LRAS3) is a long range reconnaissance and surveillance system operable in both a stationary vehicle mounted configuration and in an autonomous dismounted configuration. The LRAS3 is a multi-function, line-of-sight target acquisition common sensor suite, which provides real-time target detection, recognition, and identification capability 24 hours a day in all weather conditions. LRAS3 also automatically determines Far Target Location (FTL) coordinates for any target ranged to by the operator. LRAS3 will enable information superiority by interfacing with Force XXI Battle Command Brigade and Below (FBCB2) to provide target acquisition and FTL information, which supports early and accurate intelligence preparation of the battlespace. LRAS3 utilizes the Horizontal Technology Integration (HTI) Second Generation FLIR (SGF) thermal sensor, enabling 24 hours a day operations in adverse weather and penetrate battlefield obscurants. LRAS3 significantly increases the survivability of forces through its standoff capability, allowing them to continue their mission as the eyes of the maneuver commander on the battlefield. The LRAS3 program is one of the top priority systems of the US Army Armor Center and other Training and Doctorine Command (TRADOC) components that supports the Transformation Force (Stryker Brigade Combat Team (SBCT)). Without LRAS3, US Army reconnaisance, surveillance and target acquisition elements do not have the necessary equipment to perform target acquisition and FTL functions around-the-clock and with sufficient performance capability to enable them to remain outside enemy engagement ranges. The LRAS3 is a key enabling technology for the SBCTs. This system supports the Legacy to Objective transition path of the Transformation Campaign Plan (TCP).

## Justification:

FY 04/05 procures LRAS3 systems which will be fielded to the 1st Infantry Division, 76th Armored Cavalry Regiment, 3rd Infantry Division, 5th and 6th Stryker Brigade Combat Teams (SBCT), and the First Armored Division, directly supporting the Army Order of Prescedence (AOP) and the Unit Set Fielding Modernization schedule.

The AN/PVH 1&2, Lightweight Video Reconnaissance System (LVRS) supports the Army Transformation by enhancing situational awareness during all light conditions especially low light and low visibility operations. The LVRS captures and transmits still frame video images through military radios and provides near real-time intelligence to gain and retain the initiative, expedite the decision-action cycle, and facilitate the establishment of a common operating picture of the battlefield at the tactical level of war. The images are captured with a portable Out Station LVRS (AN/PVH-1) that also enables the user to attach operational intelligence messages and then transmit the captured images and intelligence to the Base Station LVRS (AN/PVH-2) for intelligence analysis and further dissemination. The LVRS provides the first day/night image transmission capability between ground scouts, long range surveillance units (LRS), and special operation forces (SOF), and their higher headquarters, facilitating rapid target identification and analysis of key structures/terrain and other data critical to mission planning/execution. LVRS supports the Army Transformation while upholding the Army Objective Force tenets of lethality, mobility, and survivability. LVRS enhances situational awareness by providing relevant real-time information for evaluation. LVRS permits infantry-based forces to gain and maintain information superiority, and enhances the ability to dominate and win the close fight with individual combatant overmatch across the full spectrum of conflict. LVRS will enable the Legacy, Interim, and Objective Forces to dominate Battlefield Functional Areas (BFA) of Maneuver and Intelligence, Surveillance, and Reconnaissance. LVRS enhances Legacy Force situational awareness during daylight and limited visibility operations and will facilitate Interim and Objective Force survivability and lethality while capitalizing on advances in technology. This system supports the Legacy-to-Objective transition path of the Transformation Ca

### Justification:

There is no funding request for FY04/05

The AN/PAS-13 Thermal Weapon Sight (TWS) program supports the Army Transformation objectives by increasing the individual soldier's situational awareness, lethality, mobility and survivability during periods of significantly reduced visibility. The AN/PAS-13, TWS, is used with a variety of Infantry individual and crew served weapons. The TWS supports the tactical level of war enabling the individual soldier to see, understand, and act first. The TWS program is able to insert advanced imaging technologies as the Army transforms. TWS consists of a Second Generation thermal imaging device that significantly improves mounted and dismounted Infantry operational capability and supported weapon system performance by increasing target acquisition range and enabling both day and night vision through smoke, fog, battlefield obscurants and in extremely low light levels. TWS is produced in three configurations (light, medium and heavy) to support the target acquisition range of the weapon systems. TWS is the thermal imaging target acquisition component of the Land Warrior program. TWS is also a Horizontal Technology Integration (HTI) program, and is procured with the Driver's Vision Enhancer (DVE) as part of the Thermal Onmibus contract approach. TWS upholds the Army Objective Force tenets of lethality, mobility, and survivability while emphasizing the "Soldier as a System." TWS enables Legacy, Interim, and Objective Forces to dominate and win the close fight with individual combatant overmatch during day, night, and low visibility operations across the full spectrum of conflict. TWS will be fielded for use with Stryker Brigade Combat Team (SBCT) dismounted soldiers. TWS satisfies an immediate capability gap providing thermal imagery for the Legacy and Interim Force individual soldier and is poised to capitalize on advances in technology providing revolutionary enhancements for the Objective Force in all operating environments. The TWS program supports the Legacy-to-Objective transition path of the Transformation Campaign

## **Justification:**

FY04/05 procures TWS systems for fielding to Special Operations Forces, 25th Infantry, 10th Mountain Division, 82nd Airborne, 101st Airborne, SBCT, and TRADOC. TWS is an integral component of night time operations and upholds the Army Objective Force tenets of lethality, mobility, and survivability while emphasizing the "Soldier as a System."

The Individual Combat Identification System (ICIDS) was terminated by the Army. The decision to cancel the Individual-Combat Identification System (I-CIDS) program in FY 02 was precipitated by the need to fund other high priority programs supporting Army Transformation. The Army recognizes the need to protect soldiers on the battlefield and has already transferred the funding and technology from the ICIDS program to the Land Warrior program in order to integrate this capability into the Land Warrior System. The ICIDS Milestone Decision Authority and Program Executive Office Soldier approved a transition plan detailing the transfer of technology and PM Land Warrior is using these funds to integrate this capability and the technologies into the Land Warrior System.

The existing program was restructured to produce ICIDS/Land Warrior compatible equipment, with technology to support the Objective Force. The system will fulfill requirements in the Operational Requirements Document (ORD) for use by Army, Marine and Special Operations Forces. Survivability is one of the seven tenets of the Army Transformation Strategy and LW/ICIDS represents an integral part of that strategy as it works to reduce incidents of fratricide and increase combat effectiveness.

The Advanced Aviation Institutional Training Simulator (AAITS) program was a Congressional Add in FY02 and FY03. This funding was placed in the Combat Identification/Aiming Light procurement line. The FY02 Congressional Add procured a motion cued virtual collective task training device in a UH-60L Blackhawk configuration that emulates a live UH-60 aircraft system. The simulator will contain UH-60L Blackhawk flight stations and controls for a pilot and a co-pilot. The UH-60L simulation device will be located in the Aviation Warfighting Simulation Center at Fort Rucker, Alabama. The FY03 Congressional Add will procure a virtual training simulator in an OH-58D KIOWA Warrior configuration that will emulate this aircraft in all anticipated flight envelopes. The simulator will also contain OH-58D flight stations and controls for a pilot and co-pilot. The OH-58D simulator's physical location is to be determined.

#### Justification:

There is no funding request for FY04/05.

1. ICIDS Remodulation										
FY 2001	General Dynamics Scottsdale, AZ	SS/FP	CECOM, Ft. Monmouth, NJ	Sep 01	Mar 03	80	40	No	NA	Mar (
FY 2002	General Dynamics Scottsdale, AZ	SS/Option	CECOM, Ft. Monmouth, NJ	Jun 02						
8. Training Devices								1		
FY 2002	TBD TBD	C/FP	CECOM, Ft. Monmouth, NJ	Feb 03	Feb 04	1	2500	No	NA	Oct 0
FY 2003	TBD TBD	C/FP	CECOM, Ft. Monmouth, NJ	Jun 03	Jun 04	1	6811	No	NA	Mar (

REMARKS: Sole source contract is required because General Dynamics is the only responsible source. No other supplies or services will satisfy this agency's requirements. A competitive action would result in significant duplication of non-recurring costs and delay fielding.

In FY03, two competitive contracts will be awarded to procure the AAITS simulator devices. The contract award in February 2003 will procure one Blackhawk aviation simulator. The contract award in June 2003 will procure one KIOWA Warrior aviation simulator.

Artillery Accuracy Equipment involves the procurement of meteorological, survey and velocity measuring equipment designed to improve accuracy of Army artillery weapons and increase the probability of first round target hits. This category of equipment included procurement of the Meteorological Measuring System(K27800), Artillery Muzzle Velocity System (AD3250) and Improved Position and Azimuth Determining System (M75700).

These system supports the Legacy-to-Objective transition path of the Transformation Campaign Plan (TPC).

### Justification:

FY04/05 procures the Muzzle Velocity System (MVS) and the Improved Position and Azimuth Determining system (IPADS) in support of fielded units and readiness requirements.

The conventional Muzzle Velocity System (MVS) is a Doppler Radar System which measures the muzzle velocity of artillery projectiles. It consists of weapon-mounted antenna connected to a display unit. The display will provide the muzzle velocity of the last round fired. The MVS will also compute weapon calibration data and store that data. A separate Paladin version of MVS is being fielded for use with the M109A6 Paladin Howitzer. It does not require a display and will be integrated into the M109A6 Paladin Automatic Fire Control System. The MVS will enhance artillery accuracy and first round hit probability. This will decrease projectile and propellant usage and reduce the requirements to adjust fire on target. The MVS will also provide an automated method for calculating and storing weapon calibration data. The MVS is being procured as a non-developmental item (NDI) which includes acquisition of provisioning data, manuals, and related hardware for the conventional system; i.e., Muzzle Velocity Communications Adapters (MCA). Procurement quantity reflects the total combined M94 and M93 MVS procurements.

This system supports the Current transition path of the Transformation Campaign Plan (TCP).

#### **Justification:**

FY04 procures the final quantities of Muzzle Velocity Systems and related hardware to fully support both the conventional and Paladin fleet.

The quantity of Muzzle Velocity Systems (MVS) to be procured in FY03 is a combination of M93 (Paladin) MVS to use as floats during upcoming retrofit, and M94 (Conventional) MVS. The overall requirements for M93 (Paladin) MVS has been decreased due to pending contract award of the Paladin Digital Fire Control System (PDFCS). The M93 will not be fielded one per gun, but what we currently have will be retrofitted.

The Meteorological Measuring System (MMS) provides field artillery weather data to the active Army. It is an upper air meteorological data collection, processing and dissemination system that provides necessary data to field artillery, target acquisition, and air weather service to improve their mission capability. It is mobile, provides high altitude Met Data to USAF Weather Service, radiological fallout data to the chemical sections, meet roll on/roll off HMMWV requirements data to 30KM.

This system supports the Legacy-to-Objective transition path of the Transformation Campaign Plan (TCP)

### **Justification:**

There is no funding request for FY04/05

The Improved Position and Azimuth Determining System (IPADS) supports modernization of the Army's Field Artillery and Air Defense Artillery survey capabilities. The current PADS was fielded in the 1980s with 1970s technology. Poor reliability and obsolete technology has resulted in a system that is no longer economically supportable. The IPADS will leverage technology advances, substantially improve reliability, and provide a digital communications capability to meet the needs of the Army of the Future This system supports the Legacy to Objective path of the Transformation Campaign Plan (TCP).

### **Justification:**

FY03 procures low technical risk NDI test articles (8 each) and refurbishes them for initial fielding into Army inventory.

FY04/05 procures 144 IPADS to begin the replacement of the obsolete PADS with a significantly more reliable and technologically advanced product.

The Meteorological Measuring System (MMS) provides field artillery weather data to the active Army to achieve required capability. It is an upper air meteorological data collection, processing and dissemination system that provides necessary data to field artillery, target acquisition, and air weather service to improve their mission capability. It is mobile, and provides high altitude Met Data to USAF Weather Service, radiological fallout data to the chemical sections, meet roll on/roll off High Mobility Multipurpose Wheeled Vehicle (HMMWV) requirements data to 30KM. This system support the Legacy-to-Objective transition path of the Transformation Campaign Plan (TCP).

### **Justification:**

FY04/05 procures supports additional National Guard MMS requirements. The MMS provides meteorological data to field artillery units to improve their firing accuracy. Current systems do not have the digital format capabilities that will be required for all artillery systems. It is critical to replace current systems with the MMS to improve the combat capability.

The Muzzle Velocity System/Muzzle Velocity Communications Adapters (MVS/MCA) Mod-In-Service line will allow for software upgrades to 1,059 M94 MVS and 1,322 MCA, to maintain interface compatibility with various other pieces of DOD hardware, end items and support equipment currently fielded; i.e. Battery Computer System (BCS) and Field Artillery Tactical Data System (FATDS). This system supports the Legacy transition path of the Transformation Campaign Plan (TCP).

### **Justification:**

FY04/05 procures software upgrades to 1,059 M94 MVS, and 1,322 MCA, to maintain interface compatibility with other pieces of DOD hardware, end items, and support equipment. It also ensures that resources are available for future DOD systems such as Light Weight 155MM, and other new requirements that are unknown at this time.

Profiler will employ remote and local sensing of the atmosphere, mesoscale modeling and enhanced computing capabilities to provide target area and more timely meteorological data. Profiler will be fielded during FY05-FY10, replacing the Legacy Force Meteorological Measuring Set (MMS) systems in support of the Objective Force. Profiler replaces the current AN/TMQ-41 MMS. By providing more accurate meteorological data messages, Profiler will enable the artillery to have a greater probability of a first round hit with indirect fire systems than is achievable with the current MMS. The new capabilities will increase the lethality of field artillery systems such as Multiple Launch Rocket Systems, towed and self-propelled cannons. This effort will increase the accuracy of a wide range of deep fire weapons and munitions, and ultimately reduce total cost of ownership to the Army. This capability is to be fielded to the Stryker Brigade Combat Teams plus Objective Force units. This system supports the Legacy-to-Objective transition path of the Transformation Campaign Plan (TCP).

#### **Justification:**

FY04/05 procures systems to be fielded to the Stryker Brigade Combat Teams and initiate the production line for orderly ramp up.

MOD IN-SERVICE EQUIPMENT (TAC SURV) funds the modifications to the Firefinder radars, the AN/TPQ-36 Mortar Locating Radar and the AN/TPQ-37 Artillery Locating Radar. The Firefinder equipment is designed to meet the Army's critical need to quickly and accurately locate the large number and variety of hostile indirect fire weapons it may face. The Firefinder radars use a combination of radar techniques and computer controlled signal processing to detect and locate enemy mortars, field artillery, and rockets with sufficient accuracy to permit rapid engagement with counterfire. The Firefinder radars are capable of locating multiple weapons simultaneously and transmitting the target data to appropriate counterfire elements in near real time. The AN/TPQ-36 is a phased-array X-Band radar which automatically locates mortar and short range rocket launchers. The system is configured on three (3) High Mobility Multi-Wheeled Vehicles (HMMWVs) making it highly mobile and transportable. The AN/TPQ-37 is a larger system requiring a 5-ton truck to pull the Antenna Transceiver Group (ATG). The AN/TPQ-37 is a phased-array S-Band radar with a longer target acquisition range than the AN/TPQ-36 allowing it to locate artillery and rockets.

These systems support the Legacy-to-Objective transition path of the Transformation Campaign Plan (TCP).

#### Justification:

FY04/05 Procures the following:

- a. Procurement and fielding of AN/TPQ-36(V)8 modification kits to correct deficiencies in range, false target rate, target throughput, target classification and displacement to resolve obsolescene issues.
- b. Fielding of Fire Support Digitization hardware/software required to upgrade AN/TPQ-37s to sustain Advanced Field Artillery Tactical Data System (AFATDS) connectivity and provide Joint Technical Architecture-Army (JTA-A) compliance.
- c. Procurement and fielding of Modular Azimuth Positioning System (MAPS) Hybrid to the Firefinder systems in order to provide self-survey capability.
- d. Procurement of support hardware and costs associated with fielding the AN/TPQ-37 to Stryker Brigade Combat Teams (SBCTs).
- e. Consolidaton of multiple individual operational software builds into a single Multi-mode operational software package for the AN/TPQ-37 to allow operators to alter their mission focus "on the fly".

## INDIVIDUAL MODIFICATION

Date:

February 2003

MODIFICATION TITLE: AN/TPQ-36(V)8 Electronics Upgrade [MOD 1]

MODELS OF SYSTEM AFFECTED: AN/TPQ-36(V)5 and AN/TPQ-36(V)7 HMMWV Radar

### DESCRIPTION/JUSTIFICATION:

The AN/TPQ-36 is the primary target acquisition and counterfire system for Field Artillery in support of Divisions, separate Brigades, and rapid deployment task forces. The AN/TPQ-36(V)8 incorporates an electronics upgrade to correct identified deficiencies in range, false target rate, target throughput, target classification and displacement time. It replaces electronic components rapidly approaching obsolescence with Common Hardware/Software (CHS) and/or Commercial Off-The-Shelf (COTS) equipment.

To date, the Army has procured eighty (80) AN/TPQ-36(V)8 modification kits. FY04-05 funds will be used to procure an additional eight (8) modification kits and continue fielding/installation of mod kits. The AN/TPQ-36(V)8 is fielded three (3) systems per Division and one (1) system per Stryker Brigade Combat Team.

MODIFICATION TITLE: AN/TPQ-37 Fire Support Digitization [MOD 3]

MODELS OF SYSTEM AFFECTED: AN/TPQ-37(V)5/6

### DESCRIPTION/JUSTIFICATION:

This upgrade will modify the Firefinder AN/TPQ-37 Operations Control Group (OCG) and will incorporate hardware and software to sustain AFATDS connectivity and provide Joint Technical Architecture-Army (JTA-A) compliance. The new hardware will include a Versatile Computer Unit (VCU) and TACFIRE Control Interface Module (TCIM).

FY04/FY05 funds the procurement of hardware/software and installation of the kits and fielding to Active Army and National Guard units. The AN/TPQ-37 system is fielded two (2) per Division and one (1) per Brigade Combat Team. Quantity of 57 fulfills total Army AAO.

#### DEVELOPMENT STATUS/MAJOR DEVELOPMENT MILESTONES:

IOC was accomplished with the First Digitized Division (FDD) fielding in 4QFY00. FY02/FY03 funded procurement of fifty-five (55) modification kits to fulfill the total Army requirement. Fielding will begin in 1QFY04.

MODIFICATION TITLE: AN/TPQ-37 Software Consolidation [MOD 5]

MODELS OF SYSTEM AFFECTED: AN/TPQ-37

### DESCRIPTION/JUSTIFICATION:

The Firefinder AN/TPQ-37 is a phased array Artillery Locating Radar. Multiple unique missions have resulted in the development of mission specific operational software programs for the AN/TPQ-37. Each of these unique enhancements requires the radar system operator to initialize the radar system from scratch. This action takes the radar system off-line for up to twenty (20) minutes. Combining these capabilities into a single Multi-mode operational software package will allow the Commander to direct switching of the radar system to one of these mission specific modes "on the fly" in less than 30 seconds.

FY04/05 funds the integration, live-fire testing, and fielding of the Multi-mode operational software package. The AN/TPQ-37 system is fielded two (2) per Division and one (1) per Brigade Combat Team. The Multi-mode software package would be fielded to all AN/TPQ-37s in the Army.

#### DEVELOPMENT STATUS/MAJOR DEVELOPMENT MILESTONES:

Non-Recurring Engineering (NRE) efforts to integrate multiple individual operational software builds into one program are scheduled for FY04. Live Fire Testing and fielding of the software is scheduled for FY05.

FBCB2 is a digital, battle command information system that provides integrated, on-the-move, timely, relevant battle command information to tactical combat, combat support and combat support leaders and soldiers. FBCB2 incorporates state-of-the-art information technology to allow commanders to concentrate combat system effects rather than combat forces, enabling units to be both more survivable and more lethal. FBCB2 provides the capability to pass orders and graphics allowing the warfighter to visualize the commander's intent and scheme of maneuver. FBCB2 affords combat forces the capability to retain the tactical/operational intiatives under all mission, enemy, terrain, troops, and time available conditions to enable faster decisions, real/near-real time communications and response. The system includes a Pentium based processor, display unit, keyboard and removable hard disk drive cartridge. FBCB2 supports situational awareness (blue and red force positions) and command and control down to the soldier/platform level across Battlefield Operating Systems (BOS) and echelons. FBCB2 as a key component of the Army Battle Command System (ABCS), completes the information flow process from brigade to platform and across platforms within the brigade task force. A Full Rate Production (FRP) decision review is planned following IOT&E, FY04. This system supports the Legacy-to-Objective transition path of the Transformation Campaign Plan (TCP).

### **Justification:**

FY 04/05 procures FBCB2s to continue fielding to units of 4th and 5th SBCTs, 3rd BCT of 4th ID, III CORPS, 1/72 LIB, 1 CAV, 2LCR and 3rd ACR in accordance with Army Order of Precedence(AOP) and the transformation campaign plan.

NOTE: The total Army Acquisition Objective (AAO) number is 59,522.

This includes 56,465 FBCB2 systems and 3057 Abrams/Bradley appliques funded in accordance with the Horizantal Technology Integration (HTI) policy.

The Army has postponed the IOT&E from FY 03 to FY 04.

The Lightweight Laser Designator Rangefinder (LLDR)(AN/PED-1) is a modular system designed for manportable day/night all weather target acquisition, precise location, and designation for engagement by a variety of munitions, e.g. Hellfire, Copperhead, PAVEWAY Series guided bomb units. The target location module contains an advanced thermal sensor, day camera, laser rangefinder, digital compass/vertical angle measurement device, Global Positioning System, and system controller with digital data and video outputs. The laser designation module contains the laser and associated optics required for precision engagement by laser-guided artillery and aircraft-launched munitions. Weighing 35 pounds with tripod and battery, the man-portable LLDR gives the light forces new fire support capability with 24-hour target identification, digital data export of precise target location for engagement by indirect fires, or laser designation for destruction by laser-guided munitions. LLDR is a prime targeting sensor for Advanced Field Artillery Tactical Data System (AFATDS), and the digital interface facilitates cross-sensor cueing. This system supports the Legacy-to-Objective transition path of the Transformation Campaign Plan (TCP).

### Justification:

FY04/05 procures this critical capability for fielding to the light forces - 82nd Airborne, 10th Light Infantry Division (LID), 101st Airborne Assault (AA), 25th LID, and the 2nd Armored Calvary Regiment (ACR). The LLDR meets a critical requirement for precision target location and engagement for the artillery fire support teams.

The Mortar Fire Control System (MFCS) accurately determines weapon position and orientation, navigates, calculates ballistics, and communicates digitally on the fire support net.

### The MFCS consists of four main components:

- The Commander's Interface (CI) links all MFCS components together, communicates, and performs the ballistic computations necessary to locate and aim the mortar. The CI can function as a mortar ballistic computer in a stand alone configuration. This is being fielded seperately in response to an urgent need in both heavy and light forces.
- The Pointing Device & Position System (PDPS) enables the mortar to "know" its own location and thus eliminates the need for aiming posts, aiming circles, and survey.
- The Gunner's Display (GD) shows the gunner where to point the tube given the tube's location and pointing and the ballistic solution.
- The Driver's Display (DD) enables the vehicle driver to rough aim (50 mils) the vehicle in the firing direction when a call for fire alert is received.

### The Mortar Fire Control System (MFCS) provides a revolutionary improvement in mortar capability:

- MFCS communicates digitally on the fire support network and is interoperable with the Advanced Field Artillery Tactical Data System (AFATDS) and legacy systems, which seamlessly integrates mortars into the digital battlefield.
- MFCS increases Operating Tempo (OPTEMPO) by reducing setup times from more than 8 minutes to less than 55 seconds. This makes mortars more responsive to the maneuver commander than Field Artillery (FA), thereby freeing FA units from close-in direct support missions and reducing FA ammunition, fuel, and lift requirements.

Exhibit P-40C, Budget Item Justification Sheet				Date: February 2003
Appropriation/Budget Activity/Serial No: Other Procurement, Army /2/Communications and Electronics Equipment			P-1 Item Nomenclature	MORTAR FIRE CONTROL SYSTEM (K99300)
Program Elements for Code B Items: 64802/D613	Code: B	Other Related	Program Elements:	

- MFCS dramatically increases survivability by eliminating the need for soldiers to dismount, enabling dispersed (beyond line of sight) emplacement, and providing Paladin-like semi-autonomous operations and shoot and scoot capability.
- MFCS significantly reduces the probability of fratricide by providing situational awareness.
- MFCS maximizes the lethality of the battalion commander's organic 120mm mortars by reducing the circular error probable (CEP) from 230 meters for the current aiming circle to 60 meters. This results in a first round fire-for-effect capability, which increases OPTEMPO and substantially reduces ammunition, transportation, lift, fuel, and other logistics footprint requirements.
- MFCS-equipped 120mm mortar systems can be deployed by HMWWV or UH60, providing instant fires in hilly terrain (e.g., Afghanistan), which cannot be targeted by FA.

The MFCS modernizes the legacy force's M113 family of vehicles based mounted mortars. The MFCS will also be fielded with the Brigade Combat Team's IAV mounted 120mm Mortar System.

This system supports both the legacy and interim transition paths of the Army Transformation Campaign Plan.

#### Justification:

FY04 funds continued procurement of MFCS units with 146 MFCS Heavy Gun systems and 12 MFCS FDC systems. FY05 procures 38 MFCS Heavy Gun Systems and 3 MFCS FDC systems.

Type Classification Date:

- Commander's Interface as a mortar ballistic computer 28 Feb 2002
- Full MFCS (Heavy) system 2Q FY 03

ACQUISITION MANAGER: PM Combat Ammunition Systems

Integrated Meterlogical Systems Sensor (IMETS) is a tactical automated weather data system that receives, processes and disseminates timely weather and environmental effects, forecasts, observations, and automated Tactical Decision Aids (TDAs) in support of the Army Warfighting commanders. This system consists of Army Tactical Command and Control System (ATCCS) common hardware/software (CHS), and communications that will be operated by Air Force weather personnel. IMETS is deployed at Echelons Above Corps (EAC), Corps, Division (DIV), Separate Brigade, Armored Cavalry Regiment (ACR) and Special Operations Forces (SOF). The IMETS requirements have been upgraded to align with the Joint Technical Architecture (JTA), Defense Information Infrastructure Common Operating Environment (DII COE), and the Army Battle Command System (ABCS). Three different configurations are tailored to the needs of the echelon supported; Vehicle Mounted Configuration (VMC), Command Post Configuration (CPC), and Light Configuration (LC) based on a laptop. Each IMETS configuration supports a core set of requirements and is capable of performing the following functions: (1) receive weather data from all available sources: weather satellites; local and remote weather sensors at higher, lower and adjacent echelon IMETS; artillery meteorology sections (ARTYMET); theater forecast units (TFUs) and the Air Force Weather Agency (AFWA); (2) process and display weather information, display weather satellite data and imagery, and generate Tactical Decision Aids; (3) disseminate weather data, forecasts, and Tactical Decision Aids via area communications system, to all users and to other IMETS at higher, lower and adjacent echelons; (4) operate independently using satellites, or communications networks as appropriate; and (5) relocate with the unit to which it is assigned. IMETS received \$8M DERF in FY02 of which \$4.927M was spent procuring and fielding the requested Systems for SOF and the remainder spent in RDTE of accellerated technology insertions.

#### **Justification:**

FY04 procures and fields Vehicular Mounted Configuration (VMC) and Light Configuration (LC) and FY05 procures and fields Intel based CPCs and Intel based LC. IMETS hardware is NDI/COTS and is purchased from either PM CHS or other Army activities. Integration is handled by contractor, Northrup Grumman Information Technology (NGIT).

The Tactical Operation Centers (TOCs) Program supports the overall mission area of "Exercising Command and Control". The TOCs program provides commanders (at all echelons of command from battalion to corps) with integrated digitized command and control facilities from which they execute battle command and make decisions based on objective data and intuitive feel for the battle. To perform these functions, the commander and his staff require command, control and communications systems integrated on mobile platforms capable of keeping pace with maneuver forces. The TOCs program provides the physical infrastructure (platforms, power, environmental control, data networks, inter-communications and video displays) capable of operating under all conditions on the modern battlefield, and provides the real-time situational understanding (Common Operational Picture) inherent in the Army Battle Command system (ABCS). Digitized TOCs are key to ensuring that information superiority and force synchronization are gained on the tactical and operation battlefield. TOCs are required for all combat, combat support and combat service support units. In addition, this program includes the Single Integrated Command Posts' "customer funded" procurement of five command post variants, each designed to accommodate the various Battlefield Functional areas. These variants include: Tent Command Posts, Rigid Wall Shelters, Conversion Kits for M577 Track Vehicles, Installation Kits for 5-ton Expansible Vans and Installation Kits for Soft-Top HMMWVs. The SICPS (BZ9962) program and funding has been transferred to the TOCs program beginning in FY04. Prior year - FY03 depicts TOCs only. SICPs prior year funding can be found in separate submission BZ9962.

### Justification:

FY 04 procures shelters and integrates TOCs for the Third Stryker Brigade Combat Team (SBCT-3), the 3rd Brigade, 4th Infantry Division, the 3rd Armored Cavalry Regiment, and GFE for the initial elements of III Corps and Field Support to all fielded units of 1 CD and SBCT1/2.

FY05 procures shelters and integrates TOCs for III Corps and SBCT-6/4, GFE SBCT-5, and support for 1CD, 3 ACR, 3Bde 4 ID, and SBCT-3.

These TOCs are critical to integrated command and control and information superiority on the battlefield. They provide the infrastructure for executing battle command and maintaining situational awareness.

AFATDS provides the multi-service (Army and Marine Corps) automated Fire Support Command, Control and Communications capability, enabling the manuever commander to plan and execute attacks utilizing the optimal weapon-target pairing combinations. It provides the maximum utilization of fire support assets available on the expanding battlefield. AFATDS provides integrated automated support for planning, coordinating and controlling all fire support assets (field artillery, missiles, mortars, close air support, naval gunfire, attack helicopter and offensive electronic warfare) and for executing counterfire, interdiction and suppression of enemy targets for all fire support operations. AFATDS uses nondevelopmental, ruggedized Common Hardware/Software, including the Compact Computer Unit (CCU), Notebook Computer Unit (NCU) as well as vehicle installation kits. AFATDS will interoperate with the Navy's and Air Force's current and evolving weapon and control systems, as well as international British, German, Italian and French systems. The legacy system support comes from the successful fielding of AFATDS Version A96 through A99 and Version 7. The objective system support emanates from transitional support of AFATDS to the Effects Control System (ECS). This system supports the Legacy to Objective transition path of the Transformation Campaign Plan (TCP).

### Justification:

FY 04/05 procures AFATDS, which will greatly enhance the fire support capability of the battlefield through responsiveness, survivability and continuity of operations. It will provide a complete fire support command and control capability to the manuever commander. The FY 04/05 funds will completely procure two Stryker Brigade Combat Teams (SBCTs), 4 and 5.

The Mod Of In Service funding is a supporting line to the AFATDS program. AFATDS is the Fire Support Command, Control and Communications capability, enabling the manuever commander to plan and execute attacks utilizing the optimal weapon-target pairing combinations. AFATDS utilizes Common Hardware and Software (CHS) computers and peripheral hardware. DA Hardware Re-Procurement policy indicated that computer workstations have only an approximate five year operational life before they are obsolete, or their system effectiveness is significantly diminished in comparison to the capability growth of the "current" market. A "rebuy" or upgrade is required to maintain operational effectiveness of the aging hardware. Therefore, this funding has been programmed to allow for upgrade or replacement of the oldest AFATDS computer workstations or components as required to maintain unit capability in the field. The legacy system support comes from the successful fielding of AFATDS Version A96 through A99 and Version 7. The objective system support emanates from transitional support of AFATDS to the Effects Control System (ECS). This system supports the Legacy transition path of the Transformation Campaign Plan (TCP).

### Justification:

FY 04 procures upgrades to the processor equipment to support the current technical requirements for the AFATDS program.

### DESCRIPTION/JUSTIFICATION:

The Mod Of In Service Equipment funding is a supporting line to the AFATDS program. AFATDS is the Fire Support Command, Control and Communication capability, enabling the manuever commander to plan and execute attacks utilizing the optimal weapon-target pairing combination. AFATDS utilizes Common Hardware and Software (CHS) computers and peripheral hardware. DA Hardware Re-Procurement policy indicates that computer workstations have only an approximate five year operational life before they are obsolete, or their system effectiveness is significantly diminished in comparison to the capability growth of the "current" market. A "rebuy" or upgrade is required to maintain operational effectiveness of the aging hardware. Therefore, this funding has been programmed to allow for upgrade or replacement of the oldest AFATDS computer workstations or components as required to maintain unit capability in the field.

#### DEVELOPMENT STATUS/MAJOR DEVELOPMENT MILESTONES:

The AFATDS Mod Of In Service Equipment program will utilize various nondevelopmental, commercial off the shelf (COTS) components and peripherals. These will vary according to individual system requirements and therefore will not be procured or installed as standard kits. These items will be procured through the Army's Common Hardware and Software (CHS) contract.

The Lightweight Technical Fire Direction System (LWTFDS) provides critically needed technical fire control for the Light/Heavy Fire Direction Centers and the Cannon Firing Platoon Leaders. It provides immediate and early entry automated fire support capabilities for the light divisions. The LWTFDS actually consists of three subset efforts all dealing with the replacement and upgraded technology for various Fire Support systems. First, this program will upgrade the aging Lightweight Computer Units (LCUs) for computing the fire support technical solutions for both Battery Computer System (BCS) and Fire Direction System/Multiple Launch Rocket System (FDS/MLRS). Second, it also provides a replacement for the Back-Up Computer Unit, the BUCS-R, which will be hosted on a Personal Digital Assistant (PDA). It will provide early entry forces an automated means to compute cannon firing solutions and once full automation is available via AFATDS, it then serves as the mandatory backup device to minimize fratricide. Third, the antiquated Gun Display Unit (GDU) will now be replaced with a PDA device that will provide the "Gunners" with an automated lightweight wireless transfer and data display of elevation, deflection, fuze and powder mixes to allow accurate cannon firing.

Objectively LWTFDS will consist of porting the NATO Artillery Ballistic Kernel (NABK) computational software algorithm onto a PDA.

In February 2001, the Fire Support Ada Conversion (FSAC) program name was officially changed to the LWTFDS. The FSAC program consisted of the BCS and FDS which provide Technical Fire Direction capability for Cannon and Multiple Launch Rocket System (MLRS) units. Both systems are hosted on a Lightweight Computer Unit (LCU).

This system supports the Legacy transition path of the Transformation Campaign Plan (TCP).

#### Justification:

FY 04/05 procures a total of 72 Personal Digital Assistants (PDA) to support the Gun Display Unit (GDU) replacement, engineering and program management support.

The Combat Service Support Control System (CSSCS) is the Combat Service Support C2 component of the Army Battle Command System (ABCS). CSSCS is a networked system of workstations that provides comprehensive combat service support capabilities and exchanges messages in near real time. It provides the critical combat power assessment capability across the range of combat forces. CSSCS is the fulcrum between Army Transformation logistics enablers and combat power. It automates current manual processes for force level planning and supports decision-making for the warfighting commanders, the combat service support commanders and their staffs. The total procurement requirement for CSSCS based on approved 1998 Operational Requirements Document (ORD) is 3,120 systems. This system supports the Legacy to Objective transition path of the Transformation Campaign Plan (TCP).

### Justification:

FY04/05 funds will support the Full Scale Production procurement and fielding of CSSCS and associated items including Standard Integrated Command Post Systems (SICPS). Fielding locations include third and fourth Stryker Brigade Combat Teams (SBCTs), 75th Ranger Regiment, III Corps slice to include 3rd Armored Cavalry Regiment and 4th Infantry Division (3rd Bde). In addition FY04/05 reprocures retrofit hardware for SBCTs 1 and 2, as well as III Corps units to include 4th Infantry Division and 1st Cavalry Division. The automated CSSCS node is required to support the fielding and operation of ABCS by providing a responsive automated Combat Service Support (CSS) operation that is capable of supporting the Commander's requirement to perform timely predictive and situational analyses.

The Forward Area Air Defense Command, Control, and Intelligence (FAAD C2) System is the first Command, Control and Intelligence (C2I) System to digitize. FAAD C2I provides continuously tailored situational awareness and situational understanding of the battlespace [including data on threat aircraft, cruise missiles and unmanned aerial vehicles (UAVs)] to support the planning and decision process at various levels of command. The mission is to collect, digitally process and disseminate real time target cueing and tracking information, common tactical air picture, and C2I information to all Short Range Air Defense (SHORAD) weapons [Avenger, Bradley Linebacker, Manportable Air Defense System (MANPADS), joint and combined arms].

Unique FAAD C2 software will provide this mission capability by integrating FAAD C2 engagement operations software with the Joint Digital Radio (JDR), Single Channel Ground and Airborne Radio System (SINCGARS), Enhanced Position Location Reporting Sy stem (EPLRS), Global Positioning System (GPS), Airborne Warning and Control System (AWACS), Sentinel, and the Army Battle Command System (ABCS) architecture. Provides joint C2 interoperability and horizontal integration with PATRIOT, THAAD, MEADS, JLENS and SHORAD weapon systems by fusing sensor data to create a scalable and filterable single integrated air picture (SIAP) and common operating picture (COP) at Army divisions and below. System software will provide target data and engagement commands/status to the Surface Launched Advanced Medium Range Air-to-Air Missile (SLAMRAAM) air defense system. FAAD C2I is the first system to digitize for Army Transformation in the First Digitized Division (FDD), III (Digitized) Corps, the Joint Contingency Force (JCF) and the Stryker Brigade Combat Teams (SBCTs). The FAAD C2 netted and distributed system architecture has been briefed as the basis for a potential BM/C4I Future Combat System (FCS). FAAD C2 enables maneuver commanders to receive air and missile attack warnings, provides situational awarenes

This system supports the Legacy to Objective transition path of the Transformation Campaign Plan (TCP).

### **Justification:**

FY2004 funds will be used to procure CHS computers, display and tactical software for one Army National Guard (ARNG) Battalion and one Stryker Brigade Combat Team (SBCT). FY2004 also funds the integration and fielding of a III Corps ARNG Battalion and two active component Air Defense Batteries. FY2005 funds will procure one SBCT and complete the fielding of the ARNG Battalion procured in FY04.

The Air and Missile Defense Planning and Control System (AMDPCS) is the backbone of Army Air Defense through the Battle Management/ Command, Control, Communications, Computers, and Intelligence (BM/C4I) capability it provides to Air Defense Artillery (ADA) Brigades at corps and echelons above corps (EAC), the Army Air and Missile Defense Command (AAMDC) headquarters, and joint force command and control elements, such as the Battlefield Coordination Detachment (BCD). The AMDPCS provides ADA Brigades with a fire control system via the Air Defense System Integrator (ADSI) for monitoring and controlling air battle engagement operations by subordinate battalions. The AMDPCS provides a common air and missile defense staff planning and battlespace situational awareness tool via the Air and Missile Defense Workstation (AMDWS) to achieve the common tactical and operational air picture. The AMDWS, like ADSI, will be fielded to air and missile defense units at all echelons of command, battery through theater. The AM DPCS provides the Army Battle Command System (ABCS) architecture and the Army AMD Task Forces (AMDTF) with Joint BM/C4I capability and the Army component of interoperable Joint Theater Air and Missile Defense (JTAMD) BM/C4I. The AMDPCS enables Active, Passive and Attack Operations coordination and a correlated single integrated air picture (SIAP) to Army AMD and Joint Forces.

This system supports the Legacy to Objective transition path of the Transformation Campaign Plan (TCP).

### Justification:

FY04/05 program completes procurement and fielding of the objective system configuration for 31st ADA BDE for participation in the III (Digitized) Corps Capstone Exercises and maintains previously fielded prototypes, 263rd AAMDC, and AAMDC for USAADASCH.

In order to support the DoD mandated interoperability requirements, the Forward Entry Device (FED) was augmented by the Lightweight Forward Entry Device (LFED) in FY 99. In FY01,TRADOC's direction to downsize the device for the Forward Observer (FO) resulted in the Pocket-Sized Forward Entry Device (PFED). The LFED/FED/PFED is a re-capitalization effort. The LFED and PFED hardware platforms replace the obsolete Simplified Handheld Terminal Unit (SHTU) 286-based system originally fielded under the FED program. As technology progressed, this system became obsolete and was unable to run current Fire Support (FS) software packages. The SHTU was fielded during the period FY92 – FY95.

The LFED/FED is an integral part of the digitized system architecture. It is a programmable input/output device used for composing, editing, transmitting, receiving and displaying alphanumeric and graphic messages for transmission over standard military radios. The LFED/FED hosts the Forward Observer System (FOS) software, which enables users to plan, control and execute fire support operations at maneuver platoon, company, battalion and brigade levels. The PFED hosts a modified version of FOS. It provides the dismounted FO with a hands-free pocket-sized "call for fire" capability with existing/future laser ranging binoculars, GPS devices, and tactical communications equipment. PFED integrates these systems improving their function as a whole and increasing their performance as a system of systems. The LFED/FED/PFED provides the vital sensor to shooter link required for effective fires.

The LFED/FED/PFED utilizes Common Hardware Software (CHS) components including the Handheld Terminal Unit (HTU), Ruggedized Handheld Computer (RHC), and the Lightweight Computer Unit (LCU). Commencing in FY03, all Combat Observation Lasing Teams (COLT) in Brigade Operational Facilities (OPFACS) will be fielded with the CHS Stand-Alone Computer Unit (SCU), which replaces the LCU. All dismounted Forward Observers will be fielded a CHS Ruggedized-Personal Digital Assistant (R-PDA) known as the PFED.

This system supports the Legacy transition path of the Transformation Campaign Plan (TCP).

### **Justification:**

FY04/05 procures hardware, engineering, fielding and program management support. The FY04/05 hardware purchase is comprised of a total one hundred and seven (107) systems which are Ruggedized Handheld Computer (RHC), Ruggedized-Personal Digital Assistant (R-PDA) and Stand-Alone Computer Units (SCU).

The Knight (formerly Striker) program integrates the Bradley Fire Support Vehicle (BFIST) mission equipment package (MEP) into a High Mobility Multi-Purpose Wheeled Vehicle (HMMWV) chassis supporting heavy and light force fire support operations. The Knight program is a continuation of the BFIST program designed specifically for the Combat Observation Lasing Team (COLT) in heavy divisions and light divisions. The Knight was approved as a Warfighting Rapid Acquisition Program (WRAP) designed to get the Knight operational enhancement to the soldier quickly at the best cost. The Knight Mod-In-Service line provides funding for life cycle software support including evolutionary hardware changes for the Knight program. The system supports the Legacy transition path of the Transformation Campaign Plan (TCP).

### Justification:

FY04/05 funds procures fielding, logistics support and contract close-out cost for previously procured Knights. FY04/05 procures Mod-In-Service hardware changes as well as logistic changes to support the new digital communications platform and accommodates the integration of the Stand-alone Computer Unit (SCU) onto the Knight.

The Knight (formerly Striker) program integrates the Bradley Fire Support Vehicle (BFIST) mission equipment package (MEP) into a High Mobility Multi-Purpose Wheeled Vehicle (HMMWV) chassis supporting heavy and light force fire support operations. The Knight program is a continuation of the BFIST program designed specifically for the Combat Observation Lasing Team (COLT) in heavy divisions and light divisions. The Knight was approved as a Warfighting Rapid Acquisition Program (WRAP) designed to get the Knight operational enhancement to the soldier quickly at the best cost. The Knight program provides a vehicle compatible with the maneuver scouts for Brigade reconnaissance teams in heavy and light divisions. It provides fire support planning, direction, controlling, target designation and night observation to the warfighter in a highly maneuverable platform. FY03 includes procurement of 20 Long Range Advanced Scout Surveillance Systems (LRAS3), which meets the ord real time requirement for target detection, recognition, identification and pin-pointing far-target locations.

This system supports the Legacy transition path of the Transformation Campaign Plan (TCP).

### Justification:

FY04/05 procures fielding, logistics support and contract close-out cost for previously procured Knights.

The Knight (formerly Striker) Mod-In-Service line provides funding for life cycle software support including evolutionary hardware changes for the Knight program. These hardware changes include those due to the replacement of the Lightweight Computer Unit (LCU) due to obsolescence. The Mod-In-Service line also provides funding for evolutionary hardware changes for the Knight program to include upgrade of the software of the Mission Equipment (MEP) components. The system supports the Legacy transition path of the Transformation Campaign Plan (TCP).

### **Justification:**

FY04/05 funds procure hardware changes as well as logistic changes to support the new digital communications platform and accommodates the integration of the Stand-alone Computer Unit (SCU) onto the Knight. The Mod-In-Service provides Program flexibility to incorporate minor hardware and software changes to the Knight without changing production quantities. A change in the digital communications system from the LCU to the SCU is anticipated in 3Q FY03.

Life Cycle Software Engineering (LCSE) support, by the Software Engineering Center (SEC), provides the essential services needed to maintain Communications and Electronics Command (CECOM) managed fielded Battlefield Automated Systems (BAS) in a state of operational readiness. Over 200 BASs directly depend on LCSE support to maintain a posture of mission critical readiness. Adequate funding for LCSE support is essential for the acquisition, operation, maintenance and sustainment of multi-host computer systems, peripherals, interfaces, support equipment, test beds, components, and software used to provide the necessary services and support to maintain BASs in the state of operational readiness. Policy for Post Production Software Support (PPSS) requires that system managers provide initial host capabilities for new systems and that the Life Cycle Software Engineering Centers (LCSEC) provide upgrades and replacement of obsolete equipment. Significant portions of host and network equipment are no longer economically repairable or are reaching obsolescence. There is a requirement to respond to emergency requests from the field for Software Engineering support in order to maintain operational readiness of deployed Battlefield Automated Systems (BASs). With host computers and peripherals having a life span of approximately five years and SEC performing its mission over a continuous period of time beyond five years, equipment must be replaced and/or upgraded regularly to deal with obsolescence and take advantage of the continual improvements in technology that are indigenous to high-technology based weapon systems and their software support environments. SEC must complete these upgrades in order to meet the ever-increasing mission requirements imposed by the field. Funding for this task is essential to provide and maintain software support environments and LCSE support required to maintain fielded BASs in a state of operational readiness, worldwide, to support the Warfighter in the field.

This system supports the Lega

#### **Justification:**

FY04-FY05 procures the following items: 1) Purchase a Testbed/COMSEC Facility Upgrade – This facility will provide the SEC with a secure communications capability for the Joint Users Interoperability Communications Exercise (JUICE). 2) Support the Tactical Switching Testbed Upgrade for Communications Systems. This effort will enable the SEC to stay current with Commercial Off The Shelf (COTS) communications equipment. Our lab will stay current with the technology that is in the field. 3) Provide an airborne simulator for GUARDRAIL. This simulator will provide the SEC testbed facility the capability to simulate Signal Intelligence (SIGINT) support data which is critical for all intelligence collection systems. This SIGINT capability will be one that is incorporated in the Aerial Common Sensor. 4) Upgrade the Single Shelter Switch (SSS) Testbed Facility to enable it to develop and test the software for the emerging Objective Defense Satellite Communications System (DSCS) Operational Control System (ODOCS).

This program provides state-of-the-art technologies used with automated logistics systems to facilitate and expedite property receiving, distribution, storage, inventory management and accountability. This facilitates rapid and accurate data capture, retrieval and transmission. The technology includes various radio frequency identification and barcode scanning devices, barcode label and page printers, and various data carrier devices with associated readers and writers. The data carrier devices include optical laser cards, integrated circuit chip cards (smart cards), PC memory cards, optical memory buttons, and wireless Local Area Network (LAN) technology. Automated Identification Technology (AIT) is used throughout the Army at the wholesale and retail supply levels and in automated maintenance, personnel and transportation systems, where rapid and accurate source data collection is required. The AIT contract establishes a baseline of AIT devices for use throughout DoD and ensures standardization and interoperability of this equipment among the Services, while providing extensive warranty and maintenance. This systems supports the Objective transition path of the Transformation Campaign Plan (TCP).

### Justification:

FY04/05 procures fielding support to Army STAMIS and Non STAMIS systems with AIT, Radio Frequency Data Collection Devices (RFDC), networks and printers.

Transportation Coordinators'-Automated Information for Movement System II (TC-AIMS II) is a joint program which will reduce redundancy by consolidating management of the unit/installation-level transportation functions of Unit Movement, Load Planning and Installation Transportation Office/Traffic Management Office (ITO/TMO) operations into a single automated capability for use throughout DoD. TC-AIMS II will provide a common hardware suite running software applications designed for easy data retrieval, data exchange and connectivity to relevant external sources. Open systems architecture is emphasized throughout for standardization and interoperability and for ease of system growth and maintenance. This system supports the Objective transition path of the Transformation Campaign Plan (TCP).

#### **Justification:**

FY04/FY05 procures the necessary replacement hardware and automated information technology (AIT) for existing Transportation Coordinator-Automated Command and Control Information System (TC-ACCIS) and Department of the Army Movement Management System-Redesigned (DAMMS-R) legacy systems. It also supports the procurement of initial and replacement TC-AIMS II hardware including 173 mini-servers, 3,010 work stations, and AIT equipment (590 combination hand-held interrogators/bar code printers and 26 optical memory card readers) for Army early deploying Power Project Platforms and Power Support Platforms. Additionally, FY04/05 supports 294 classes composed of 4,918 students. During the FY04-09 POM, TC-AIMS II project received broad support from the transportation community that resulted in increased funding in FY06-09 to support the system's deployment, replacement TC-AIMS II hardware and AIT for Army, and user training for all Services. The Project received Milestone III approval for the deployment of TC-AIMS II Block 1 to the Army and Navy as well as permission to proceed with the development of Block 2.

The Gun Laying and Positioning System (GLPS) decreases the time required to survey and lay a howitzer battery from 2 hours to 14 minutes. The GLPS is a modular, lightweight, cost effective Non-Developmental Item (NDI) that gives each towed and self-propelled non-digitized firing battery autonomous positioning and directional capability. The GLPS rapidly self-locates and determines azimuth/deflection and position (Universal Transverse Mercator (UTM) coordinates and altitude) of each howitzer from one centrally located orienting station. The GLPS consists of a tripod mounted gyroscope integrated with an electronic digital optical instrument, eye-safe laser rangefinder, and transport case(s). Use of the GLPS also requires the AN/PSN-11 Precision Lightweight Global Positioning System (GPS) Receiver (PLGR).

This system supports the Legacy transition path of the Transformation Campaign Plan (TCP).

### **Justification:**

There is no funding request for FY04/05

Integrated System Control (ISYSCON (V)1 & (V)2) provides a centralized capability for planning and managing tactical communication networks on the battlefield; automated tools for signal staff to plan, install, operate, and maintain communications networks consistent with the flow of the battle. The ISYSCON (V)1 & (V)2 software resides on CHS II Hardware Platforms in a client/server architecture. The server terminals are located in SICPS Shelters, and client terminals are located in the SICPS tent. The major functions of ISYSCON (V)1 & (V)2 are network planning and engineering, signal command and control, battlefield spectrum management, wide area network management and COMSEC management. The ISYSCON V4/Tactical Internet Management System (TIMS) is a requirement based on a change to the ISYSCON ROC, calling for Network Management for the Lower Tactical Internet and TOC LAN. TIMS will perform network planning, initialization, management and monitoring of the Tactical Internet at Brigade and Below (FBCB2) as well as TOC LAN's. TIMS Milestone C, Limited Deployment, was approved 21 June 2001.

ISYSCON (V)1 & (V)2 and TIMS systems support the Legacy transition path of the Transformation Campaign Plan (TCP).

#### Justification:

The ISYSCON (V)1 & (V)2 program provides the network management of Area Common User System (ACUS) and solves significant shortcomings in today's network management systems. FY04/05 procures hardware, facilities, initial software licenses, PDSS, recurring license maintainance, software enhancements, New Equipment Training, Recapitalization, and field support to continue the fielding of the ISYSCON (V)1/(V)2. ISYSCON (V)4 transitioned to Tactical Internet Manager (TIMS) FY03.

The Joint Network Management System (JNMS) is a Combatant Commander and Commander, Joint Task Force (CJTF) joint communications planning and network management tool providing network management support at the Joint Task Force (JTF) and Joint Communications Control Center (JCCC) level. JNMS is an automated network management software system. It will provide communications planners with a common set of tools to conduct high level planning (war planning); detailed planning and engineering for voice, data, and message systems; network/system monitoring and control; network performance assessment and modeling, bandwidth management; and security of transmission and satellite systems. JNMS consists of commercial and government off-the-shelf software modules integrated on a flexible software architecture and hosted on a Defense Information Infrastructure, Corps of Engineers (DII COE) compliant hardware platform. This system supports the Legacy to Objective transistion path of the Transformation Campaign Plan (TCP) and the Warfighter Information Network-Tactical (WIN-T).

#### Justification:

FY04/05 initiates the procurement of JNMS, which will provide a needed capability to the Combatant Commander and Commander, Joint Task Forces and their supporting Components. It will procure hardware, software licenses and maintenance and initial spares to continue the JNMS fielding. It also will procure the fielding and training required to provide the system to the user.

The ISYSCON (V) 4/Tactical Internet Management System (TIMS) is based on an Operational Requirements Document (ORD) for the Integrated Systems Control (ISYSCON) dated May 02, calling for Network Management for the Lower Tactical Internet and TOC LAN. TIMS will perform network planning, initialization, management and monitoring of the Tactical Internet at Force XX1 Brigade and Below (FBCB2) as well as TOC LANs.

Prior to FY03, TIMS funding was part of ISYSCON, BX0007.

The TIMS Program supports the Legacy transition path of the Transformation Campaign Plan (TCP).

#### Justification:

FY 04/05 procures hardware, Commercial-Off-the-Shelf (COTS) software, initial spares, New Equipment Training and fielding in accordance with the Unit Set Fielding Modernization Schedule V 9.0, and roundout previously fielded units to the ORD quantity requirements. It also procures Contractor Field Support and Post Deployment Software Support (PDSS) for these units.

The Maneuver Control System (MCS) is an automated tactical Command, Control and Communications (C3) system which provides a network of computer terminals to process combat information for battle staffs. It provides automated assistance in the collection, storage, review and display of information to support the commander's decision process. Both text and map graphics are provided to the user. It enables operation staffs (G3/S3) to process and distribute situational awareness, estimates, plans, orders and reports. The system is designed to operate with existing and planned communications networks. The MCS program is an evolutionary development including planned system improvements to insure increasing Command and Control (C2) capabilities and infusion of current technology while, in the interim, providing an essential core capability.

MCS is an essential component of the Army Battle Command System (ABCS) and provides critical coordination among Battlefield Functional Areas (BFAs) within each echelon. MCS provides the Common Operational Picture (COP) software supporting battlefield situation display for all ABCS BFAs. The COP depicts information provided by all the BFAs and includes a Situation Map, control measures, Intelligence and Electionic Warfare graphics, Fire Support graphics, combat service support location information, air corridors and air defense weapons control information.

The MCS system will equip the total force with an automated C2 capability. This program is an integral part of the ABCS and is critical to the successful operation of that overall system. This generation of computers will incorporate advances in technology and achieve Life Cycle Cost savings due to commonality of support.

This system supports the Legacy-to-Objective transition path of the Transformation Campaign Plan (TCP).

#### Justification:

FY04/05 procures MCS systems for Stryker Brigade Combat Teams (SBCTs) and a III Corps slice to include 3rd Armored Cavalry Regiment and 4th Infantry Division (3rd Bde). In addition, FY05 reprocures retrofit hardware for SBCT's 1 and 2 and the 4th Infantry Division.

REMARKS: The MCS Milestone III decision has been delayed into 1QFY05. However, in order to meet the critical fielding objectives required to support Army Modernization, the Army is currently staffing a request for Milestone Decision Authority to procure 201 systems in FY04. Full rate production will commence in January 2005 following the Milestone III approval.

STAMIS Tactical Computers (STACOMP) are a group of Commercial Off-the-Shelf (COTS) computer systems supporting STAMIS tactical computer requirements for the US Army. These systems, used by soldiers on the battlefield to support Combat Service Support (CSS) missions at all levels, are transportable and user friendly. STACOMP COTS supports life cycle replacement of the existing logistics STAMIS: Standard Army Retail Supply System (SARSS), Standard Army Ammunition System (SAAS), Standard Army Maintenance System (SAMS), and Unit Level Logistics System (ULLS), as well as Global Combat Support System-Army/Tactical (GCSS-Army/AT), and the Electronic-Military Personnel Office (e-MILPO)(formerly SIDPERS-3).

The Global Combat Support System-Army/Tactical (GCSS-A/T) is a Major Defense Acquisition Program (MDAP) and the primary enabler of the Army's Combat Support/Combat Service Support (CSS) transformation. GCSS-A/T will replace SAAS, SAMS, SARSS, ULLS, SPBS-R and ILAP. GCSS-A/T will provide the warfighter with a seamless flow of timely, accurate, accessible and secure information that gives combat forces a decisive edge. The GCSS-A/T system will provide the best business processes and streamline procedures and accountability for all users in support of the Interim Force and support of the Army's Transformation to the Objective Force. GCSS-Army/T supports the Objective transition path of the Transformation Campaign Plan (TCP).

e-MILPO will integrate the myriad Human Resources (HR) developments to produce a system of systems to support Army Personnel Transformation. e-MILPO comprises a standardized database consisting of institutional applications and systems, and tactical-operational systems to support the Active and Reserve Components in home base, exercise-training, contingency operations, and battle-war environments. e-MILPO supports the Objective transition path of the Transformation Campaign Plan (TCP).

#### **Justification:**

FY04/FY05 procures and fields COTS computers to continue legacy replacements hardware and STAMIS support systems. It also procures e-MILPO data servers, web servers, communications equipment, data entry devices, storage upgrades and other network components to facilitate accelerated fielding of Defense Integrated Military Human Resource Systems (DIMHRS) Army equipment to the Active and Reserve Components.

This program includes the procurement of five command post variants, each designed to accommodate the various Battlefield Functional Areas and Tactical Operations Centers (TOCs) of the Army Battle Command System (ABCS) and other customers. The ABCS customers include the Army Tactical Command and Control System (ATCCS) (to include Maneuver Control System (MCS), the Advanced Field Artillery Tactical Data System (AFATDS), the Combat Services Support Control System (CSSCS), the Forward Area Air Defense Command and Control System (FAADC2), the Air and Missile Defense Planning and Control System (AMDPCS), the All Source Analysis System (ASAS), and the Integrated Meteorological System (IMETS)). This also supports FDC, FDD, SDD and Transformation efforts. The five command post variants are:

- (1) A Tent Command Post (CP) that consists of a lightweight aluminum frame, interchangeable fabric wall sections, fabric roof, floors and liners, work tables, mapboards, and light set. The Tent CP can be complexed to other tents and to other SICPS variants via an interface wall.
- (2) A Rigid Wall Shelter (RWS) CP mounted on the High Mobility Multipurpose Wheeled Vehicle (HMMWV) Shelter Carrier consisting of an on-board generator, power conversion/distribution system, environmental control unit, collective chemical protection, signal and power pass-through panels, antenna mounts, equipment mounts, equipment racks to accommodate two ABCS workstations, operator seats, a vehicle intercom system and a 10 meter Quick Erect Antenna Mast (QEAM).
- (3) Conversion Kits for the M577 Track Vehicle consisting of equipment racks for two ABCS workstations, power and signal panels, tent interface panel, operator seats, antenna mounts, stowage provisions, an updated Auxiliary Power Unit (APU), a vehicular intercom system, a power distribution system, a 10 meter QEAM, and a signal/data wiring module. The converted M577 has been designated the M1068 Track CP.
- (4) Installation Kits for the 5-Ton Expansible Van (E-Van) consisting of racks for up to six ABCS workstations, centralized communications rack, communications patch panel, signal entry panel, antenna mounts, mapboards, a vehicular intercom system, a 10 meter QEAM, updated power distribution wiring and signal/data wiring.

(5) Installation Kits for the Soft-Top HMMWV consisting of equipment patching module, white canvas liners, blackout curtains and a 10 meter Q	racks for up t EAM.	o two ABCS	workstations, communica	ations patch panel module, antenna mounts, operator work surface, data
This system supports the Legacy-to-Objective transition path of the Trans	formation Ca	ımpaign Plar	ı (TCP).	
<b>Justification:</b> FY04 funds will procure 52 tents as shelters for the AFATDS systen. The mobile and environmentally protected platform for the Army Battlefield Procurement of each of the above variants is required to support the fielding	Command Sy	stem (ABCS	S) which is a major part of	the Army Chief of Staff's effort to digitized the battlefield.

Army Training Modernization includes three related efforts to acquire Digital Training Facilities (DTF). DTFs will allow rapid delivery of high quality instruction to Army personnel. Infrastructure acquired will be based on industry standards and will comply with the Joint Technical Architecture (JTA) and Defense Information Infrastructure Common Operating Environment (DII COE), where applicable. This will help assure compatibility with other military services and that commercial, state, and other resources can be leveraged to achieve cost effective solutions to support all Army components. Specific initiatives include Distributed Training Technology Program (DTTP) (BE4171), Other Training Modernization (BE4172), and The Army Distance Learning Program (TADLP) (BE4173). Other Training Modernization modernizes/enhances classrooms at existing TRADOC resident schools. This improves training provided through the schools and allows their use to broadcast training to Army wide digital training facilities deployed through DTTP and TADLP. DTTP and TADLP will provide approximately 860 modern distance learning enabled Digital Training Facilities (DTF) and associated supporting infrastructure to augment training at existing resident Army schools. This will allow Army to both increase the number of Army personnel receiving required training and the amount of training that can be provided to each individual.

Army Training Modernization provides a cost effective solution for training Army personnel. It will help maintain acceptable out year readiness levels despite massive resource reductions. Supported training enhancements will help reduce the current backlog of Military Operational Speciality (MOS) training. Army can significantly increase levels of MOS qualification, hence readiness, with standardized Army courseware delivered through distance learning (DL) technology. Implementation of these technology enablers will reduce resident training requirements and soldiers will spend less time in the training base and more time in units, thereby increasing readiness. Without this investment, the problem of training backlog will be exacerbated; Army schools will be unable to export the expertise and standardization provided by master instructors and subject matter experts; the full benefits of Army courseware already updated or currently being updated will not be realized; and soldiers will not be able to receive training any where and any time required. Army Training Modernization will deliver standardized training to Active Component (AC) and Reserve Component (RC) soldiers and Department of the Army civilians (DAC). DTTP/TADLP provide infrastructure for soldiers to train at or near their assigned station, in lieu of resident training at Army schools. The TRADOC Classroom (CR) XXI component of Other Training Modernization provides infrastructure of modernized classrooms at existing TRADOC schools.

Distributive Training Technology Program (DTTP) will provide approximately 519 digital training facilities (DTF) not included within The Army Distance Learning Program (TADLP). The primary mission of DTTP is to provide access to military readiness training to members of the Army National Guard (ARNG) who, for geographic or logistical reasons, do not have ready access to other Army distance learning facilities provided within TADLP and Classroom (CR) XXI. DTTP facilities are also available to soldiers and civilian support personnel of other Army components for military training and education. DTTP objectives are threefold: Improve readiness by providing greater access to military training and education; lower cost and improve performance through consolidation of common telecommunication requirements and facilitate command, control, communications, and computing within the ARNG; and foster economic development, improve educational levels, and provide information access through shared use with the communities in which the ARNG is based. DTTP also addresses training needs in the areas of: Weapons of Mass Destruction, support to Federal Emergency Management Agency (FEMA), Partnership for Peace, Youth Programs, and counterdrug activities.

#### Justification:

FY 04/05 procures continued fielding of DTTP digital training facilities (DTF) in order to provide Distance Learning capabilities to additional locations, consistent and coordinated with the Army plan. Each DTF provides a positive return on investment, and supports both improved force readiness and meets Congressional direction.

Classroom XXI provides an advanced instructional technology environment in which the soldier of the 21st century will train. This Training and Doctrine Command (TRADOC) initiative modernizes institutional training classrooms with information age technology to gain training efficiencies, while maximizing soldier training effectiveness. Achievement of this environment requires investments in hardware, software, facilities and communications. The TRADOC Classroom (CR) XXI program is building fully networked, high technology, and student-centered digitized classrooms to support Army Training Modernization initiatives. Infrastructure acquired will support multiple capabilities. These include interactive multimedia delivery to student desktops, Internet access, full-motion/full-screen digital video, video teletraining and collaborative computing.

## **Justification:**

FY04/05 procures continued modernization of TRADOC schoolhouse delivered training classrooms and implementation of Digital Training Access Centers (DTACs) at TRADOC schools to support use of redesigned courseware in CR XXI facilities and transmission of resident and redesigned courseware to Army wide digital training facilities. DTACs store approved courseware components in digital (automated) format for access and distribution to any Army digital training facility (CR XXI, Distributed Training Technology Program(DTTP), and The Army Distance Learning Program (TADLP)) as needed.

The Distributed Learning System (DLS), formerly The Army Distance Learning Program (TADLP), is an ACAT 1AC program. DLS will complete 307 of 380 objective Digital Training Facilities (DTFs) with standard automation and supporting infrastructure to improve Army's ability to train service members and supporting civilian workers. As of 2d Qtr, FY 2003 246 DTFs will be completed. The objective quantity of 380 DTFs consists of 214 Active Component DTFs and 166 United States Army Reserve (USAR) DTFs. DLS will aid the Army to properly train all components to a single Army standard. DLS supports readiness by enhancing institutional and individual training in all Army components (Active, Army National Guard, and Army Reserve). This system supports the Objective transition path of the Transformation Campaign Plan (TCP).

DLS provides both near and long-term infrastructure to enhance training of all Army components, particularly in the areas of Military Occupational Skill Qualification (MOSQ) and reclassification. It also provides a highly effective means to deliver training and education to deployed forces. The overall goal for DLS is to leverage technology and learning theory by providing just-in-time training to each service member regardless of location. DLS goals also include reducing training delivery and training support costs; improving service member morale by allowing members to obtain increased amounts of required training without leaving their home station; improving efficiency and effectiveness of Army instructors by allowing each instructor to train more students in a shorter period of time; and improving unit readiness due to the reduction in personnel turbulence resulting from long term absence for resident training.

### Justification:

FY04/05 procures 27 additional Digital Training facilities (DTFs); technology refreshment(desktop computers and VTT hardware suites) within previously fielded DTFs; and, supports the ongoing fielding and system implementation of previously procured DTFs to support Army training at remote sites for a major subset of existing Army courses. This supports implementation of synchronous and asynchronous training tools to augment and enhance existing Army training instruments. Also planned is the initial fielding of Block 3, Learning Management System (LMS), software that supports automated student administration and management. These efforts will maximize the utility of training to each student while reducing the time required by the student to complete assigned units of training. Efforts will continue to deploy modern, user friendly, learning environments to support all service members.

This budget line supports the Army's sustaining base automation systems. The Army's primary sustaining base information management (IM) goal is to provide information services for the sustainment and readiness of the forces at minimum cost.

### Justification:

The current sustaining base automation infrastructure is largely overstressed and reaching technological obsolescence. A stable modernization program is essential to maintain efficiency, increase productivity, and reduce operation and maintenance costs through technological advancement. As the Army modernizes its warfighting forces for the twenty-first century, it must leverage the use of automation technology to streamline and modernize its management information systems to support Command, Control, Communications, Computers, and Intelligence (C4I) for the Warrior and power projection strategies, split base operations, and downsized force structures. The effectiveness of the Continental United States (CONUS) split base operations strategy to perform as the rear area for deployed forces as well as the mobilization, force projection, and redeployment platform is increasingly dependent upon use of state-of-the-art automation technology to provide responsive combat service support to the warfighter in the areas of command and control, logistics, personnel, finance, transportation, medical and other sustaining base functions.

This program supports high payoff initiatives to replace obsolete, inefficient records management systems with state-of-the-art optical digital equipment and other electronic recordkeeping systems. This technology will reduce operations and maintenance costs and improve the mission effectiveness and productivity of records managers throughout the Army.

PERSONNEL ELECTRONIC RECORDS MANAGEMENT SYSTEM (PERMS): PERMS provides an electronic system for the maintenance, storing, and retrieval of military personnel files at Army Personnel Records Management Centers for active Army, Army National Guard, and Army Reserve. PERMS is the system of record for the Official Military Personnel File (OMPF). It receives and converts paper personnel files to digital images. PERMS provides the platform for selective retrieval of Army military personnel documents by DOD customers, federal agencies (Veterans Administration (VA), Department of Labor (DOL)), and individual soldiers. PERMS documents are critical to the Army Selection and Promotion Board process for both enlisted and officer ranks.

ARMY RECORDS INFORMATION MANAGEMENT SYSTEM (ARIMS): This initiative provides consistent access to important record information implied by the Joint Vision 2010's information superiority concept, and a capability to make the superior decisions anticipated by the Joint Vision 2010. ARIMS provides secure long-term storage and retrieval of electronic records and indexes to hard copy records maintained in Army-owned Records Holding Areas and Federal Record Centers. ARIMS provides for the secure research and sharing of information that documents the conduct of the Army's business and operations in accordance with Code of Federal Regulation 36 ensuring economy and efficiency in documenting Army business. Consolidation and centralization in a secure and redundant system provide the opportunity for developing new knowledge from institutional and historical records in either electronic or hard copy form.

#### Justification:

PERSONNEL ELECTRONIC RECORDS MANAGEMENT SYSTEM (PERMS): FY04/05 procures hardware and software to complete the Army Selection Board System, to continue the deployment of PERMS Web Services (OMPF Online, Field-to-File, Defense Personnel Records Imaging Retrieval System Interface, ARIMS Interface). The PERMS core restructuring will create a commercial-off-the-shelf, open-architecture environment that links all Army components together under common business practices and will allow us to replace obsolete optical jukeboxes and eliminate expensive computer output microfiche units.

ARMY RECORDS INFORMATION MANAGEMENT SYSTEM (ARIMS): FY04/05 procures hardware and software required for integration of secure high density storage and retrieval of the Army's long term electronic records.

Budget line supports the Total Distribution Program (TDP), which was developed to correct deficiencies in the distribution of materiel, equipment, personnel replacements, and mail that occurred during Operation Desert Shield/Storm. TDP is directly tied to and has been identified as a key enabler for Combat Support/Combat Service Support (CS/CSS) Transformation and Logistics Readiness. The transformation of Army logistics into a distribution-based system relies on distribution velocity rather than redundant mass to provide support to the warfighter. The program is envisioned to integrate all logistics plans, programs, and issues that support the Force Sustainment Domain of the CS/CSS Transformation. This effort will combine those still relevant lessons learned during Operation Desert Shield/Storm with emerging issues and projects necessary to achieve the envisioned end state of a distribution platform. Critical corrective actions include development and fielding of communications capabilities for logistics, the use of emerging technologies to enhance visibility and material accountability, upgrade of critical distribution management systems, fielding and maintenance of the required distribution infrastructure, as well as doctrinal changes in distribution management. The TDP supports "Improving Logistics" Support in Combat Zones," the Army Strategic Logistics Plan, and the DOD Logistics Plan. Digital Logistics Communications will apply commercially available, reliable and secure wireless communications in a tactical environment for Army tactical, operational and national logistics levels. This will provide effective application of digital communications using Internet/Intranet for US Army logistics -related wireless capabilities for the global wireless architecture. The Army logistics of the 21st century must be able to transmit and process logistics data within and from the tactical automated systems, through the multi-echelon support activities, to the national materiel and maintenance management level in a real-time wireless, digital environment. This will entail application of current and emerging wireless, digital communications capabilities, focusing primarily on the tactical level supply, ammunition and maintenance business processes and the associated communications architectures within the multiple Army logistics processes. This effort will address other Service and Department of Defense Agencies requirements as they apply to Joint logistics automated and communications systems, policies, and/or tactics, techniques and procedures. The Combat Service Support Automation Information System Interface (CAISI) is an interface device providing a means for Combat Service Support (CSS) users to transmit data in a secure mode in the tactical environment. CAISI can interface with the mobile subscriber equipment (MSE), tactical radio, commercial satellite and garrison local area network. It adds connectivity to the battlefield and is the backbone of the sensitive but unclassified (SBU) network supporting the CCS automation community on the battlefield. CAISI is a key component of the Army's Objective Force and without it Army CSS automation systems, such as GCSS-Army Tactical, AHRS or TC-AIMS II will not have tactical communication connectivity of any kind.

US ARMY RESERVE PERSONNEL COMMAND (AR-PERSCOM) AUTOMATION. This program provides automation support for U.S. Army Reserve Personnel Command (AR-PERSCOM) mission by providing the highest quality life-cycle personnel management (cradle to grave) and services resulting in a trained and ready force in support of the National Military Strategy and the US Army Reserve Strategic Plan. AR-PERSCOM commands and controls the Active Guard Reserve (AGR), Individual Mobilization Augmentee (IMA) and Individual Ready Reserve (IRR) soldiers; manages U.S. Army Reserve (USAR) Selected Reserve end strength; and manages Reservists retirement transition, retirement pay processing, and veterans' affairs. AR-PERSCOM also develops and sustains USAR personnel through officer and enlisted professional development education, Military Occupational Specialty (MOS) qualification, evaluations, and promotions; and supports Commander-in-Chief (CINC)/Major Command (MACOM) requirements for exercises, site/mission support, intelligence and counterdrug demand reduction. AR-PERSCOM is also partnering with the National Guard Bureau (NGB) and US Total Army Personnel Command (PERSCOM) to transform the Army Personnel Community into a network-centric, knowledge-based force with the intent to improve the decision dominance of our war fighters and business stewards. This effort is an integral part of Army Transformation.

## **Justification:**

FY04/05 procures the base infrastructure hardware, software, and communications to to allow AR-PERSCOM to achieve the Army Personnel Transformation and Army Knowledge Management goals of integrating knowledge concepts and best business practices to improve performance, while supporting self-service, Well-Being and logical migration to the Defense Integrated Military Human Resources System (DIMHRS).

This program satisfies critical needs for advanced computational technology for Army scientists, engineers and analysts, and represents the leading edge of high speed processing. This capability is not available through other technology and is designed to solve problems that cannot be resolved in other ways. The program provides for access to supercomputing resources consisting of networked supercomputers at various Continental United States (CONUS) locations. Supercomputer systems are required to satisfy critical research and development missions in combat and materiel development programs. Significant advances in supercomputer technology have provided increases in both speed and memory. This is essential for performing fully time-dependent, three-dimensional computations and simulations directed at major new weapon designs or battlefield management. The resultant use of this advanced high-performance computing technology is the generation of very large data sets. In order to effectively and efficiently process this data, robotic mass storage systems are required. Examples of the major Army applications best suited to supercomputer technology include battlefield management, modeling/simulation, weapons systems design, terrain analysis, mechanical design (structural and dynamic vehicles), nuclear survivability, and materiel dynamics and composition. Supercomputers are contributing to efforts for high leverage, high payoff programs which exploit technological advances, reduce logistics burdens, lower acquisition and operation and maintenance costs, and provide required lethality at reduced weight and volume. Funding is provided in RDT&E appropriation beginning in FY02.

Provides funds for information systems that support Army headquarters worldwide. These requirements conform to the Army Enterprise Architecture.

The Strategic C-2 Facilities (the Command Center Infostructure and the Command and Control (C2) Infostructure) systems support the Legacy-to-Objective transition path of the Transformation Campaign Plan (TCP).

## **Justification:**

HEADQUARTERS, DEPARTMENT OF THE ARMY AUTOMATED DATA PROCESSING EQUIPMENT (HQDA ADPE): This program funding provides for information management support to Headquarters, Department of the Army (HQDA), across the entire Information Management (IM) spectrum. HQDA ADPE supports the joint Office of the Secretary of the Army/Army Staff (OSA/ARSTAF) Senior Planning Group and other DOD Information Technology (IT) initiatives. FY 04/05 procures hardware and software to expand and upgrade applications that support efficient operation of HQDA to include the HQDA Tracking System. This provides a flexible, integrated, automated system to support the control and management of Executive correspondence, internal actions, and file documentation. Further, it will streamline the flow process of actions within HQDA, reduce the amount of data re-entry and duplication of information, promote data sharing, and provide immediate access to information. FY 04/05 funding will also procure application support and data protection upgrades to include a Storage Area Network (SAN), or technically similar information technology mass data storage solution, which is capable of replicating required automation files, electronic records and electronic mail at the primary HQDA classified relocation facility. Secondary goals include improvement of functionality, security, survivability, and availability.

ARMY MODEL IMPROVEMENT PROGRAM (AMIP): AMIP is designed to improve the Army's analytic capability by providing a consistent basis to support decision making affecting force structure, doctrine, and procurement. AMIP directly supports Principle 10, Exploit Modeling and Simulations, of the Army Enterprise Strategy. By using state-of-the-art hardware and new software technology, AMIP will develop an integrated family of computerized combined arms combat models with supporting databases. These models will support studies, research, training and materiel acquisition. Component models will be interfaced and tested for validity and consistency of representations and results. The FY04/05 funds procure state-of-the-art computer simulation software, computer automation and graphics equipment. The equipment will be used by numerous analysis agencies, Major Commands (MACOMs), and national laboratories to develop more efficient, cost effective, realistic scenarios and real-time simulations of complex combat and associated processes for analysis of data.

Exhibit P-40C, Budget Item Justification Sheet				Date: February 2003
Appropriation/Budget Activity/Serial No: Other Procurement, Army /2/Communications and Electronics Equipment			P-1 Item Nomenclature	HQ MANAGEMENT INFORMATION SYSTEMS (BE4161)
Program Elements for Code B Items:	Code:	Other Related	Program Elements:	

The achievement of these goals will provide readily understood, valid, and more responsive input into the decision making process affecting weapons procurement, force development, force deployment, tactics, and sustainment and will enhance the overall warfighting capability of the Army. The funds will also provide for the upgrading of existing simulations/support equipment and software.

HOUSING OPERATIONS MANAGEMENT SYSTEM (HOMES): HOMES is a Standard Army Management Information System (STAMIS) designed to provide efficient processing of soldiers' housing needs. It consists of a system with integrated functions that provides service members housing in on-post government quarters, off-post community quarters, and Unaccompanied Personnel Housing (UPH) in barracks and permanent party quarters. It also provides an inventory management function to manage Army-owned household furniture and appliances. HOMES increases availability of housing services; helps monitor and manage housing utilization, control and manage housing inventory, and monitor issuing of Basic Allowance for Housing (BAH); and permits upward reporting. It is identified as a critical element of the Army Family Action Plan to improve the level of housing services to soldiers and families. Software is being developed to enhance capabilities and convenience to service members in acquiring housing. HOMES is centrally developed and managed. It is installed at 103 installations worldwide including Continental United States (CONUS), Alaska, Puerto Rico, United Kingdom, Europe, Korea, Japan. FY 04/05 procures computer and peripheral equipment including (1) servers for technical maintenance, replacement of low end servers, (2) smart card readers for technical support and installations, (3) laser printers for large scale faster printing at housing installation offices, (4) workstations for increased users and replacements in the field, (5) scanners for field users to scan interior/exterior views of housing and surrounding areas into their computers, (6) communications equipment components for the systems technical support team, and (7) related and required software. Since initial fielding of HOMES, Army Installation Housing Offices have become dependent on the system to fulfill their mission. The management of Army housing inventory and its military occupants is too large an activity to be managed without an automated information system. Equip

PENTAGON INFORMATION TECHNOLOGY (IT) INFRASTRUCTURE: This program supports two separate Army-Pentagon infrastructure requirements. Common Information Technology (IT) infrastructure supports the Pentagon Renovation through life cycle replacement of Army systems/networks to ensure interoperability, supportability, and enable rapid response to network outages. Other IT infrastructure supports the U.S. Army Information Technology Agency (formerly Network Infrastructure Services Agency (NISA)) Data Center and the Pentagon Telecommunications Services Center (PTSC) through replacement of equipment that has been extended beyond, or is at the end of, its life cycle. The Data Center provides mission critical Automated Data Processing (ADP) platform and software application support for the Logistics Force Planning, Training, Budget Formulation, and Medical Operations Management missions of Headquarters, Department of the Army (HQDA), Air Force Secretariat, and the Office of the Secretary of Defense (OSD). The PTSC is a congressionally mandated function, for which Army is the Executive Agent. The PTSC, as mandated by the U.S. Congress, provides Defense Messaging System (DMS) Services and Information Technology Infrastructure that supports Command and Control (C2) and individual messaging (E-Mail) for the Pentagon, National Capitol Region, and a global customer base from Unclassified to Top Secret. PTSC has been assigned additional mission responsibility to support AUTODIN legacy interface for non-DOD and allied communities. Common IT: FY04/05 procures life-cycle replacement of infrastructure IT acquired and installed by the Pentagon Renovation program, to include network routers, C2 voice switches, matrix switches (red/black), firewalls and hubs, modems and multiplexers, security software, intrusion detection systems, access control technology, and electrical power systems. Other IT: FY04/05 procures hardware/software for DMS capability and on-going support for AUTODIN. Insertion of DMS equipment is critical for compliance

COMMAND CENTER INFOSTRUCTURE. Command Centers must conduct the full spectrum of military operations in concert with coalition forces.

Exhibit P-40C, Budget Item Justification Sheet				Date: February 2003
Appropriation/Budget Activity/Serial No: Other Procurement, Army /2/Communications and Electronics Equipment			P-1 Item Nomenclature	HQ MANAGEMENT INFORMATION SYSTEMS (BE4161)
Program Elements for Code B Items:	Code:	Other Related	Program Elements:	

This program procures Command, Control, Communications, Computers, and Intelligence Technology (C4IT) and functionality at designated Army and Army -supported Command Centers. It provides for the modernization and interoperability efforts to ensure a seamless transition to the command centers during a crisis such as prosecution of war. It supports the command and control functions in Combatant Commander roles to maintain ready forces to conduct the full spectrum of military operations unilaterally or in concert with coalition partners, to enhance security and stability, and to advance U.S. interests throughout the area of responsibility. Modernization includes upgrades to outmoded facilities, combatant commander unique systems such as emergency action reporting systems, crisis action cells, battle staff display and other like configuration management requirements, software, hardware and communications components. Specific Army command centers include the Army Operations Center (AOC), the European Command (EUCOM) Command Center, the US Forces Korea Command Center, Southern command (SOUTHCOM), and the Alternate Joint Command Center - Site R. FY04/05 procures hardware, software, fielding and program management. The program supports the National Security Strategy and the National Military Strategy; Army Transformation initiative; and Joint Vision 2010 initiatives. It upgrades outmoded and deficient visual display, audiovisual connectivity and information technology infrastructure. All are critical to efficiently and effectively support command and control center operations that are currently deficient. Funding includes program management costs. FY04 funds will also support the DoD Continuity of Operations Plan (COOP) Integrated Network (DCIN) in the event of a catastrophic occurance. DoD users will include OSD, Joint Staff, and other military services. Remote sites are located throughout CONUS. FY04 funds procure hardware and software to support the IT infrastructure.

COMMAND AND CONTROL (C2) INFOSTRUCTURE. This program procures the Command, Control, Communications, Computers, and Intelligence Technology (C4IT) infostructure at Army and Army supported Combatant Commander sites. It provides for command and control (C2) infostructure capabilities that support C2 functionality to the Combatant Commander, Army commanders and staffs throughout a Combatant Commander's area of responsibility. The program provides classified computer and communications infrastructure to allow for planning, mobilizing, and execution of Combatant Commander and Army plans and orders. The program allows for the incorporation of information technology to ensure a more mobile, lethal, survivable and responsive force and enables secure interconnectivity with Combatant Commander's command centers. Specific Combatant Commanders supported include the European Command (EUCOM), the US Forces Korea (USFK), the Southern Command (SOUTHCOM), the Joint Special Operations Command, and the US Army Special Operations Command. FY 04/05 procures critical infostructure components for the Global Command and Control System (GCCS), the Global Combat Support System (GCSS), Warfighting Infostructure, Information Assurance (IA), and classified LANs. These components will improve reliability; broaden and enhance systems management capabilities; bolster security; and maintain compatibility and integration with command and control, other application systems, and other infrastructure. Procurements will focus on LAN expansion, bridges, hubs, routers, and as technology permits, implementation of Secret and Below Interoperability (SABI); increased critical component redundancy; and enhanced systems security and security monitoring. Funding includes program management costs.

LEGAL AUTOMATION ARMY-WIDE SYSTEM (LAAWS). LAAWS, the Army JAGC's automated legal information sharing system, is an approved Standard Army Management Information System (STAMIS) for all Army law offices and legal personnel. It provides critical legal resources and mission support for all garrison and deployed legal operations, all active and reserve legal personnel, and for all phases of mission planning and execution. LAAWS consists of a host of web-enabled legal databases, information, and legal applications (military justice, claims, administrative law, litigation, etc) on JAGCNet (the Army JAGC Internet legal portal), and provides legal research capabilities in support of the full range of functional legal areas. LAAWS also provides legal research and library resources, such as CD/DVD resources to support offline and stand-alone legal support requirements using the Rucksack Deployable Law Office and Library (RDL) or the Judge Advocate Warfighting system (JAWS) when Internet-connected to JAGCNet. LAAWS is deployed and accessible world-wide through JAGCNet. JAWS is the RDL when Internet-connected to JAGCNet. The JAWS is the Rucksack Deployable Law Office and Library (RDL), which includes equipment such as a laptop, CD/DVD, printer/scanner/fax, digital camera, associated connectivity, CD ROM library references, and Internet connection to JAGCNet. LAAWS-JAWS is the single Army JAGC legal system that provides critical resources deployed legal personnel use to advise commanders/activities on statutory and regulatory requirements.

# **Description:**

Funds support automation system requirements of Major Army Commands (MACOMs) and activities not included in other centrally managed programs. These requirements conform to the Army Knowledge Enterprise Architecture (AKEA). Funding has been programmed to accomplish high priority, high payoff initiatives that offer efficiencies and improvements in mission support and reduce operations and maintenance costs. Acquisitions will be accomplished primarily through standard requirements contracts.

Army Knowledge Enterprise Architecture Program systems support the Legacy-to-Objective transition path of the Transformation Campaign Plan (TCP).

Army Transformation Experimentation Campaign Plan systems support the Legacy-to-Objective transition path of the Transformation Campaign Plan (TCP).

### **Justification:**

MAJOR ARMY COMMAND (MACOM) INFOSTRUCTURE/AUTOMATION SYSTEMS. This program supports installation and modernization of classified and unclassified local area networks, other MACOM infostructure, and mission requirements. This includes the critical last 100 yards that connects users at all levels to the high speed worldwide networks needed to sustain a reliable, interoperable enterprise infostructure for access to Army Knowledge Portals and to support power projection and Army Transformation. The enterprise infostructure provided by this program must be in place before a lighter, more sustainable force can be effectively deployed. These capabilities are essential to support a strategically responsive and dominant force and are needed to make critical information available to the warfighter in both garrison and deployed locations. The program focuses resources to sustain and modernize bases that support power projection and split-based operation as specified in Army doctrine and the National Military Strategy. The networks are being implemented in accordance with approved standards in the Joint Technical Architecture - Army (JTA-A) and the Installation Information Infrastructure Architecture (I3A) to ensure interoperability with all services in accordance with the Army Enterprise Strategy. FY04/05 funds will be used to engineer, furnish, install, and test and consolidate MACOM, installation, and regional servers (e-mail, web, print, file, etc.) and to engineer, furnish, install, and test Gigabit Ethernet switches, local area network cable, and associated components to ensure a consolidated infostructure in accordance with the Army Knowledge Management (AKM) Strategic Plan and support mission requirements. Funding also procures program management.

INSTALLATION SUPPORT MODULES (ISM). ISMs are software applications that have been developed and standardized to perform the business functions at the installation or garrison level. These modules are based upon the functional processes accomplished by the installation Staffs. Presently the ISMs are operational throughout the Continental U.S.

Exhibit P-40C, Budget Item Justification Sheet				Date: February 2003

(CONUS) and Outside the Continental U.S. (OCONUS), however, they require modernization to run on the updated infostructure. The current environment features user workstations connected by Local Area Networks (LANs) to the installation's backbone communications network. Portable Operating Systems Interface for Computer Environments (POSIX)-compliant ISM servers perform application processing, database processing, and storage. The installations use Non-classified Internet Protocol Router Network (NIPRNET) backbones for long haul communications. Installation gateways connect installations to the long-haul network. Remote user access is accomplished through Terminal Server Access Controller System (TSACS) dial-in modems when required. The ISM is migrating to a regional server architecture that will support a graphical user interface, WEB based user access, and a consolidated infostructure in accordance with the Army Knowledge Management (AKO) Strategic Plan. Theater Network Operations and Security Center (TNOSC), located at Ft. Huachuca, Arizona, manages the ISM network. It performs the Network and Systems Management (NSM) functions, provides general system configuration control, operates a 24/7 Helpdesk, provides user account management, and performs automated backups for ISM devices located at Army installations. FY04/05 procures data and web servers and program management.

ARMY KNOWLEDGE ENTERPRISE ARCHITECTURE (AKEA): The AKEA is a blueprint/framework/decision tool used to guide information technology investments, acquisitions, and fielding of integrated systems-of-systems capabilities. It supports Joint and Army information (technology) visions, architectures and plans designed to win the battlefield information war and is based on operational needs and Joint/DOD/Coalition IT requirements. The AKEA also supports business process improvements and leverages information resources. AKEA affects the development of all Army systems, including weapon systems, that use, produce, and exchange information electronically, and mandates the standards and protocols all systems must use to operate together as a digitized force with split-based operations and reachback capabilities. AKEA also provides a full range of Army-wide services in a common operating environment, to include technical integration of software architectures and data management, domain engineering, Internet services, software reuse and data management, and synchronization and standardization of software packages within Unit Set Fielding. Objective products include standard data elements, activity models, data architectures/models, and systems architecture components for the Army Forces, First Cavalry, Stryker Brigade Combat Teams, First Digitized Corp, First Digitized Armored Cavalry Regiment, Unit of Action and Unit of Employment. Objective products also include functional and sustaining base architectures of areas such as intelligence, space, logistics, and personnel in support of Modernization and Transformation; Joint Operational and Technical architecture standards for interoperability; and other architectures required to support DOD Global Information Grid development. Use of the AKEA concepts are expected to increase the quality of software development projects by increasing productivity and system reliability, by reducing software maintenance costs and by promoting greater standardization and reuse of software products. FY 04/05 procures hardware, software, and modeling tools necessary to provide both the combat and the materiel development communities with integrated systems critical for the expansion of a shared data environment. These tools are needed to continue the migration of materiel developer programs (Command and Control, Intelligence, and sustainment systems) to the DOD Common Operating Environment/Network-centric Enterprise Services and weapons systems to the Weapons Systems Common Operating Environment. AKEA will provide significant contributions to the Army/DOD Data Standardization Program with an increased ability to share, reuse, and manage all data products within the Joint Community. Funds will also expand the AKEA infrastructure to substantially improve the Army's ability to produce and share dynamic models based on doctrinally developed static representations of information exchange requirements that will be key to supporting Army compliance with Joint Instructions.

ARMY TRANSFORMATION EXPERIMENTATION CAMPAIGN PLAN (ATECP): The Army Transformation Concept Development and Experimentation Campaign Plan (AT-CDEP) outlines the Army's aggressive, innovative experimentation program in a coherent Service/Joint context. AT-CDEP ensures the Army provides Combatant Commanders with sustained land combat capabilities that are indispensable combat multipliers for the Joint Force. The AT-CDEP defines four principal axes for experimentation: Exploratory, Developmental, Service/Joint Engagement, and Integrating Experiments. FY04/05 experimentation includes Unit of Employment development, conducted in coordination with the US Joint Forces Command (JFCOM) Standing Joint Force Headquarters, as well as the FY04 integrating experiment (Army Transformation Experiment 2004) to ensure systems of systems integration, and that Service/Joint integration objectives are met.

EV01/05 funds progues notwork sognitive software and againment, notwork	lr managama	nt coftware o	nd hardware and other no	arinharal aguinment to support apparimentation avarages requirements

FY04/05 funds procure network security software and equipment, network management software, and hardware and other peripheral equipment to support experimentation exercise requirements.

SMART CARD/COMMON ACCESS CARD (CAC): In 1999, the Deputy Secretary of Defense mandated that the Common Access Card would become the new Department of Defense identification card for all military personnel (including Reserve Component personnel), all civilian personnel, and for eligible contractors. The Common Access Card incorporates smart card technology features and, in conjunction with the Army's Public Key Infrastructure program, will provide Army personnel with the capability to digitally sign and encrypt email messages. The Army supports the Department of Defense Access Card Office, which procures cardstock on behalf of all Department of Defense components, by funding the cost of the cardstock needed to provide Common Access Cards to all Army Personnel. This is the only funding source for the CAC cardstock. This cardstock is the only source for the new identification cards for all army personnel. FY04/05 funds procure cardstock for producing Common Access Cards for Army personnel and others authorized.

NETWORK ENTERPRISE TECHNOLOGY COMMAND (NETCOM) WORLD-WIDE SUPPORT MISSION: NETCOM mission is to operate, manage and defend the Army's infostructure at the enterprise level by leveraging network operations capabilities that offer efficiencies, improvements, and responsive support of warfighter Command, Control, Communications, Computers and Intelligence (C4I) communications requirements. FY 04/05 procures Network Operations (NETOPS) tool suites for NETCOM global Theater Network Operations and Security Centers (TNOSCs) and strategic battalions. These tool suites enable the TNOSCs to accomplish critical functions in support of information assurance and network and systems management. This will provide NETCOM the capability to ensure the operational integration, timely provisioning and effective delivery of strategic, tactical and installation information technology (IT) services critical to support split-based operations and power projection.

TRANSFORMATION TRAINING SUPPORT: The TRADOC Institutional Army Battle Command System (ABCS) Training Base educates future commanders, battle staffs, and soldiers to exploit the new digital capabilities on the battlefield. The ABCS is the principle digital command and control system of systems for battlefield commanders from battalion to corps. ABCS builds the Common Tactical Picture (CTP) depicting the complete tactical battle space picture control measures and friendly and enemy platforms near real time. ABCS consists of Global Command and Control System - Army (GCCS-A), Advanced Field Artillery Tactical Data System (AFATDS), All Source Analysis System (ASAS), Combat Service Support Control System (CSSCS), Army Missile Defense Warning System (AMDWS), Maneuver Control System (MCS), Force XXI Battle Command Battalion/Brigade and Below (FBCB2), and Tactical Airspace Information System (TAIS). The institutional training base capability enables the schools and training centers to create a networked ABCS learning environment to transition soldiers from analog to digital thinking and warfighting. It also produces soldiers with the skills, knowledge, and attributes needed to operate and maintain the different pieces of digital equipment. Active Component units have already fielded many ABCS systems with fielding completion expected in the next few years. FY04/05 funding procures ABCS Digital Systems (tactical computers, connectivity, and sim/stim driver capability for operator and integrator training) for the schools to conduct ABCS training that will prepare soldiers for assignment to units which have already fielded the systems. If training on these systems lags behind the fielding effort, untrained soldiers will fall in on digital units, hindering unit readiness. This will result in increased cost to the Active Component in order to bring soldiers to the necessary level of digital warfighting proficiency.

# **Description:**

This budget line provides for procurement of automated data processing equipment (ADPE) for management information systems in the personnel community. These systems conform to Army Knowledge Enterprise Architecture (AKEA) requirements.

### Justification:

PERSONNEL ENTERPRISE SYSTEM -AUTOMATION (PES-A): PES-A is an ADPE acquisition and redesign/implementation program which ensures that state-of-the-art automation infrastructure (automation training, computer platforms, services, telecommunications and productivity/automation tools) is available to the warfighter. It supports all five personnel functions, including recruiting, and is key to execution of day-to-day operations within the Army (e.g., strength accounting, personnel movement, assignment actions, career management, training, recruiting, reenlistment and mobilization). PES-A is the vehicle by which personnel are managed and information is provided to the Department of Defense (DOD), and ultimately, to Congress. It provides interoperability among key activities of the Army's personnel community, namely the Total Army Personnel Command (PERSCOM), Army Reserve Personnel Command (AR-PERSCOM), Army Recruiting Command (USAREC), National Guard Personnel Center (NGPERCEN), Army Accessions Command, and the US Military Entrance Processing Command (USMEPCOM), a joint command for which the Army is the executive agent. PES-A has been the cornerstone of the Army's personnel automation capability required to support emerging systems and the modernization of Power Projection Platforms. FY04/05 procures automation infrastructure (which includes hardware, software, and Enterprise licensing), communications capability, and system modeling to support the personnel community consolidation initiative and distributed capabilities. Continued implementation of PES-A is a major step toward providing personnel information as a force multiplier and integration of the Army's personnel community, with emphasis on system interoperability and integration of the Total Army Personnel Data Base with Active, Reserve, Civilian, and Army National Guard systems.

US MILITARY ENTRANCE PROCESSING COMMAND JOINT COMPUTER CENTER (USMEPCOM JCC): The JCC consists of automatic data processing resources in support of USMEPCOM and it's users, including the Selective Service System (SSS). The JCC mission includes the management of resources, in full support of USMEPCOM and SSS peacetime and mobilization mission requirements. FY04/05 procures continued upgrades and replacements with current technology. Specifically, enterprise server central memory and processor engine in FY04 and direct access storage devices (DASD) in FY04/05. Acquisitions support mission requirements and comply with the principles of life cycle management.

US MILITARY ENTRANCE PROCESSING COMMAND INTEGRATED RESOURCE SYSTEM (USMEPCOM MIRS): MIRS provides the automation and communications capability for USMEPCOM to meet its peacetime, mobilization and wartime military manpower accession mission for the Armed Services.

Exhibit P-40C, Budget Item Justification Sheet				Date: February 2003
Appropriation/Budget Activity/Serial No: Other Procurement, Army /2/Communications and Electronics Equipment			P-1 Item Nomenclature	PERSONNEL AUTOMATION SYSTEMS (BE4164)
Program Elements for Code B Items:	Code:	Other Related	Program Elements:	

MIRS will interface with recruiting capabilities for services, incorporating the concept of electronic data sharing using standard Department of Defense (DOD) data elements between USMEPCOM and all the Armed Services recruiting commands, greatly reducing redundant data entry. MIRS continues to improve Military Entrance Processing Stations (MEPS) operations by automating functions previously done manually. This project also includes Computerized Adaptive Testing-Armed Services Vocational Aptitude Battery (CAT-ASVAB), the automated version of the Armed Services Vocational Aptitude Battery test given to determine applicants' mental abilities. FY04/05 procures servers, printers, scanners, bar code readers, personal computers, and network equipment for continuing life cycle replacement and upgrade of MIRS infrastructure at all 65 MEPS throughout the United States and CAT-ASVAB replacement.

US MILITARY ACADEMY (USMA) INFORMATION TECHNOLOGY: The USMA is an accredited institution of higher learning. Many non-DOD affiliations affect mission requirements, specifically, the Accreditation Board of Engineering and Technology, Middle States Accreditation Board, and Computer Science Accreditation Board. These accreditation efforts look at future plans for information technology. To maintain its accreditation standards and to instruct and prepare future Army leaders to operate in the sophisticated high-tech warfare depicted in Joint and Army Visions for 2010 and beyond, USMA must employ in its classrooms and laboratories the latest technology and instructional tools. FY04/05 procures hardware and software to support technology infrastructure systems essential to every aspect of education, training, and command and control of the USMA and West Point. These include computer labs, upgraded classroom information technology, and shared automation facilities and resources that are critical to the mission of USMA.

DEFENSE CIVILIAN PERSONNEL DATA SYSTEM (DCPDS): Army DCPDS effort supports the standardization of business processes in the civilian personnel functional area and regionalization of civilian personnel offices. DCPDS procures automation infrastructure to support fielding of this DOD-wide system to Army activities receiving the DCPDS capability. Automation infrastructure fielded to Army activities consists of Open System Environment (OSE) compliant data and process servers, user workstations, system peripherals, communications infrastructure, and Commercial-Off-The-Shelf (COTS) software (operating system, DBMS, office automation, etc.), fielded to ten Army Regional Service Centers (RSCs) and more than 100 subordinate installation level Customer Support Units (CSUs). Army automation infrastructure is compatible with the DOD DCPDS application software and integrates with the OSE architecture at Army sustaining base sites. Procurement strategy makes maximum use of existing contracts. This effort is projected to improve DOD-wide productivity over 30% in the civilian personnel management functional area in order to accommodate reductions already applied to out-year Army budget. The initial DCPDS infrastructure acquisition concluded in FY99. Infrastructure will be replaced based on a five-year life cycle. FY04/05 funds will be used to replace NT servers, personal computers, printers, and hubs. Funds also procure UNIX servers, upgrades to existing UNIX servers, and additional Network Attached Storage to consolidate data processing for selected civilian personnel business processes. FY04 funds finish the replacement cycle.

ARMY RECRUITING INFORMATION SUPPORT SYSTEM (ARISS): ARISS is the core of the United States Army Recruiting Command's Information Technology infrastructure. The system provides critical automation support, external system interfaces to other personnel systems, and incremental mission support enhancements needed to accomplish Army's recruiting mission. ARISS is currently engaged and providing increasingly enhanced automation capabilities to field recruiters and guidance counselors at Military Entrance Processing Stations (MEPS) for the Regular Army, Reserves, and Army National Guard. The ARISS architecture facilitates response to required changes in recruiting business processes, permits reduction of administrative tasks, and eliminates most manual reports to leadership. Operationally it is used to feed leads to the recruiters, capture information about applicants, make sales presentations, electronically project applicant data to the MEPS, backup data on the recruiter's laptop, support an electronic Daily Production Review (DPR) and produce numerous management reports. ARISS continues deployment of automation enhancements to aid the Army recruiters in meeting new accession goals in an era of dwindling resources and a shrinking pool of potential applicants. Additional capabilities are added as required to fully implement its effort multiplying capabilities moving from heavy client software to Web-based software interfaces as the technology infrastructure of the nation matures. FY04/05 funds procure equipment and software to support movement of the Guidance Counselor capabilities down to our experienced cadre recruiters.

# **Description:**

This budget line funds automation initiatives that support transportation, cargo movement, and re-supply under the Army Strategic Mobility Program (ASMP), begun in part as a result of lessons learned from Operation Desert Shield/Storm and the Congressionally mandated Mobility Requirements Study (MRS). The Army is changing its warfighting strategy from a forward deployed force to a Continental United States (CONUS) based force capable of rapid deployment worldwide. At the center of this strategy of rapid force movement are a number of transportation automated systems that facilitate/expedite force movement and re-supply.

### **Justification:**

WORLDWIDE PORT SYSTEM (WPS): WPS is a Military Traffic Management Command (MTMC) Automated Information System (AIS) initiative essential to effective force projection, intransit visibility, and the Army's strategy for rapid power projection to meet unspecified threats. In support of the Army Strategic Mobility Program (ASMP), WPS provides movement control for unit equipment and sustainment cargo while in the transportation pipeline. The ASMP was initiated as a result of lessons learned from Operation Desert Shield/Storm and the Congressionally mandated MRS. When fully fielded, WPS will support MTMC ocean terminals, US Navy port activities worldwide, Forces Command (FORSCOM) Reserve Component Transportation Terminal Units, and Active Component Automated Cargo Documentation Detachments with worldwide warfighting support missions. Compact and transportable, WPS substantially increases the ability of the Defense Transportation System to provide in-transit visibility information to the warfighting Commanders-in-Chief (CINCs) and United States Transportation Command (USTRANSCOM), while reducing the personnel required to operate the system and the transportation required to deploy the system to remote places. WPS will replace four aging Automated Information Systems (AIS) that supported ocean terminal management and cargo documentation missions during peace and war. FY04/05 procures engineering, furnishing, installing, and testing of hardware and software to continue fielding WPS to selected sites.

AUTOMATED AIR LOAD PLANNING SYSTEM (AALPS): AALPS is a knowledge-based "expert system" that assists users with aircraft planning. AALPS uses an artificial intelligence methodology to load plan for aircraft in near real time. The system takes data input of equipment and personnel, establishes gross load planning information, and quickly produces fully executable load plans for either a single mission, brigade-sized deployment or multiple division-sized airlifts. AALPS is an approved migration system. Although AALPS is a joint system, the Army is designated as the system proponent, responsible for developing, implementing, and fielding it to the Army, Marine Corps, Navy, and Air Force. Army provides funding for Army sites only; any unique functionality, hardware, training, etcetera is funded by the respective service proponent.

Exhibit P-40C, Budget Item Justification Sheet				Date: February 2003
Appropriation/Budget Activity/Serial No: Other Procurement, Army /2/Communications and Electronics Equipment			P-1 Item Nomenclature	LOGISTICS AUTOMATION SYSTEMS (BE4166)
Program Elements for Code B Items:	Code:	Other Related	Program Elements:	

Funding procures hardware and software for Army users, supplying them with a deployable automated platform for developing load plans and manifests, which will be used in air deployments and in determining airlift requirements during contingency planning operations. Fielding locations include Ft Bragg, Ft Campbell, Ft Stewart, Ft Benning, Ft Drum, Ft Hood, Ft Lewis, United States Army Europe (USAREUR), Schofield Barracks, Ft Eustis, Ft Bliss, Ft Riley, Ft Sill, Ft Carson, Ft Richardson, Ft Polk, Ft Irwin, Ft Huachuca, Ft Lee, Ft McCoy, Ft McPherson, and Ft Dix. FY04/05 funds procure replacement hardware, associated peripherals and configuration management services to supports AALPS development and training efforts.

INTEGRATED COMPUTERIZED DEPLOYMENT SYSTEM (ICODES): ICODES is a Military Traffic Management Command (MTMC) initiative, applying the principles of artificial intelligence to the function of planning loads and stowage of cargo and equipment aboard ocean vessels. ICODES is being developed as the standard common user stow planning system to meet DOD worldwide requirements. ICODES will dramatically reduce stow planning time (from 12 hours to under 30 minutes) and improve the accuracy of the ship stow planning process, enabling the user to concentrate on complex problems associated with port management and vessel loading. ICODES will support rapid deployment missions, planning cargo deployments from multiple seaports of embarkation and debarkation, as well as multiple ships. ICODES will also detail a three-dimensional representation of the ship compartments, resolving the height limitations of the current system. Benefits from this system include: replacement of the current autonomous and redundant systems; improved responsiveness to changes and contingencies; ability to electronically transfer stow plans to the user community; streamlined and standardized terminal cargo training support; more effective allocation of marine cargo resources; comprehensive report capability; more precise cargo stow plans; and increased productivity. FY04/05 procures hardware and software necessary to continue fielding to authorized users.

INTRANSIT VISIBILTY/AUTOMATIC IDENTIFICATION TECHNOLOGY (ITV/AIT): ITV/AIT is a suite of technologies that enables the automatic capture of source data rapidly and accurately and transfer of the data to Automated Information Systems (AISs) with little or no human intervention. This enhances the ability to identify, track, document, and control deployment and redeployment of forces, equipment, personnel and sustainment cargo. ITV/AIT will streamline the Military Traffic Management Command and Army logistics business process and enhance its warfighting capability. The ITV/AIT devices purchased, configured, and installed, will be integrated with other components of the DOD AIT infrastructure to improve interoperability. FY04/05 procures hand-held readers and interrogators, business process servers for receiving, storing and forwarding ITV/AIT transactions, and radio frequency identification tags.

HAZARDOUS SUBSTANCE MANAGEMENT SYSTEM (HSMS): HSMS is a DoD software package designed to aid in the implementation of improved business practices for the management of hazardous material and hazardous waste at the installation level. The implementation of the improved management system results in an increase in operational readiness and cost savings in hazardous waste disposal. The readiness of the warfighting units is enhanced in several areas. First, the centralized management of hazardous materials decreases the soldier's requirements for many environmental related duties such as ordering, inventory control, issue and disposal and allows more time for maintenance of equipment, weapons and training. Second, these improved management practices reduces the inventory and thus the cost of hazardous materials to the TOE unit allowing more funds for training and other missions. Third, centralized management also allows for the rapid preparation of deployment loads and packages. The system also monitors the shelf life of required hazardous materials needed for training and/or deployment thus reducing the time for the preparation of these deployment loads and the possibility of having to use expired items during training or deployment. And, finally, the centralized management practices allow for the use of hazardous materials only by authorized personnel who are trained and equipped for these operations. Health and safety risks to the unit are reduced as well as the environmental liability of the commander. All of these benefits enhance the capability of units to train and deploy to meet the mission needs of the Total Army. The Army has fielded the improved management system and software to 66 installations to date and plans to field to an approximate total of 170 installations. To date the improved system has resulted in improved operational unit readiness and cost savings or cost avoidances in the following areas: hazardous material purchased and hazardous waste disposal cost.

The Joint Computer-Aided Acquisition and Logistics Support (JCALS) will provide all military services with automated tools to support improved business processes associated with managing, acquiring, improving, publishing, stocking, and distributing technical manuals (TMs). In addition, JCALS provides a distributed communications/automation infrastructure capable of integrating digitized business and technical data that supports a weapon system's acquisition and logistics life cycle. JCALS is data-driven and based on a robust information system architecture that can support additional capabilities beyond TMs. JCALS provides interfaces with over 20 legacy systems and will replace seven legacy systems throughout the Joint Services.

At the JCALS sites, hardware and software configurations are dependent on each site's organization and functions, processing needs, and role in the overall system. The system provides local and wide area communications processing; distributes, manages, updates, and replicates data throughout the system; and delivers the applications and functions to the users' workstations. The system architecture includes a central site for user support, system monitoring, life cycle software support, maintenance, and troubleshooting.

### Justifi cation:

Beginning in FY04 all JCALS funds are in sustainment.

The mission of the RCAS is to develop, field and sustain an Automated Information System (AIS) that will provide the Army the capability to manage and mobilize Army National Guard and Army Reserve forces more effectively. The RCAS supports the full spectrum of Army Reserve Component operations and achieves information economies of scale and seamless interoperability through centralized data management; common interfaces and applications; shared, tailorable databases; and a standard, open systems architecture. The RCAS links over 57,000 PC-based workstations at 10,500 Guard and Reserve units at over 4,000 sites located in 54 states, territories and the District of Columbia. The RCAS is an Acquisition Category 1AM project managed by the Chief, National Guard Bureau. The RCAS project was restructured in FY95 to constrain cost growth, establish a realistic requirements baseline and leverage new information management technology. The RCAS Mission Need Statement was re-validated on 5 March 1996. The RCAS program goals and functional requirements were documented in the RCAS Operational Concept Description, April 1996. The restructured project approach was approved by the RCAS General Officer Steering Committee, the Office of the Secretary of Defense, Major Automated Information Systems Review Council (OSD MAISRC) and Congress in September 1996. A joint DOD/DA Overarching Integrated Process Team chaired by OSD (C3I) approved Increment One fielding on 23 September 1996.

#### Justification:

The RCAS Acquisition Strategy focuses on a combination of evolutionary and incremental development approaches delivering hardware and software functionality in eight increments. These increments, defined in a "rolling wave," evolutionary process, satisfy user-validated requirements in the order of priority established by the Army National Guard and Army Reserve. Increment One, completed in FY01, 18 months ahead of schedule, delivered the RCAS infrastructure through wide area network (WAN) inter-connectivity and COTS hardware/software products, providing the user with immediate capability to meet unit administration, mobilization and communication needs. Increments Two through Six delivered through FY02, added data servers, logistics functionality associated with GOTS software (e.g., Standard Property Book System-Redesign), force authorization, training, human resources functionality, initial and phase 2 software encryption, and introduced mobilization planning, safety and occupational health and management functionality. Increment Seven is complete and is scheduled for a Milestone Fielding Decision early in FY03 which will provide additional occupational health management, mobilization planning, force management, and civilian personnel functionality. Increment Eight, currently scheduled for testing and deployment in FY03 will deliver the remaining mobilization, force modernization, safety and occupational health management and military/civilian personnel functionality. FY03 will also focus on transitioning the RCAS to the sustaining phase of its lifecycle and FY04-09 will focus on maintaining the RCAS developed software and replacing an aging hardware infrastructure to maintain functional operational capabilities.

REMARKS: The RCAS is an integrated automated information system consisting of myriad Commercial-Off-The-Shelf (COTS) hardware components, e.g. telecommunications equipment, routers, PCs, printers, servicers, etc., all configured to support one RCAS. FY02-03 Unit costs only reflect hardware and software acquisition costs. Other essential contract costs associated with the development and fielding of the system are not included in the unit cost.

FY03-FY05 ADP equipment (replacement category on P5) provides for replacement of hardware infrastructure. The dollar amounts identified will enable replacement of aging hardware infrastructure fielded earlier in the system's life cycle. Hardware replacement is programmed on a 5 year cycle.

Contract award dates for annual renewals of the base contract awarded in 1991. On 21 November 2002, the Project Management Office released a Task Order Request for Proposal (TRP) to acquire a single system integrator to provide support during the sustainment phase of the system's lifecycle.

The Armed Forces Radio and Television Service (AFRTS) provides American language broadcast services to Department of Defense (DOD) personnel and family members stationed overseas. AFRTS is the only mass communications support to overseas warfighting Combatant Commanders for dissemination of emergency, safety, and command information during peacetime, wartime, and Operations Other Than War (OOTW). AFRTS facilities operate 24 hours per day to broadcast radio and television programming to nearly 500,000 soldiers, sailors, airmen, marines, DOD civilians, and family members in accordance with DOD Directive 5122.10. Overseas wartime operational Combatant Commanders consider AFRTS a "combat multiplier" and an essential "quality of life" issue for maintaining and enhancing the morale, readiness, and well-being of overseas troops, DOD personnel, and their families. AFRTS service has become increasingly important for dissemination of timely information as the Army shifts resources in support of contingency, peacekeeping, and wartime operations. Congress mandates that AFRTS provide the same type of radio and television services to personnel deployed overseas that are available to American citizens in the United States.

### **Justification:**

FY 04/05 procures the life cycle replacement of radio and television broadcast and automation systems, procurement of a Tactical Mobile Radio and Television System and a Satellite Production Vehicle for use in support of AFRTS contingency operations worldwide. The mass communications broadcast mission of AFRTS is not duplicated by the strategic communication mission of the Army or other services and is the only means of direct communication from the President of the United States through Combatant Commanders to US deployed forces. Broadcast plant equipment and mobile systems enable Commanders at every level to communicate with deployed forces and serve as a force multiplier during natural disasters, civil disturbances and declared and undeclared conflicts throughout the world.

VISUAL INFORMATION SYSTEMS PROGRAM (VISP): The Visual Information Systems Program (VISP) is a centrally managed program that supports Visual Information (VI) processes for all Major Commands (MACOMs) and Headquarters, Department of the Army (HQDA) Field Operating Agencies (FOAs) through Department of Defense (DOD)/Army authorized VI activities that provides audio-visual based products and services to support Army-wide training and readiness, force development, mobilization, health, safety, and documentation of diagnostics for medical, historical, and professional information. VI support includes imagery for installation power projection platforms, video productions (especially for Military Occupational Specialty (MOS) training and readiness, safety and intelligence), electronic imaging, and photography (including DA official photos). VI equipment provides commanders with video, photography, electronic imaging, audio, and other computer-generated media that can be integrated to convey real time, two-way information throughout the chain of command. The equipment in the VISP has been reviewed and prioritized, both by MACOMs, Regional Centers, and HQDA (Chief Information Officer(CIO/G6)) through the requirements process. Funds will purchase equipment to support the transition to electronic imaging (eliminating hazardous chemical processes) and replace equipment past its life cycle for field commanders, plus HQDA, Office of the Joint Chiefs of Staff, Office of the Secretary of Defense, and other government agencies in the National Capital Region, as well as the U.S. Military Academy, Training and Doctrine Command (TRADOC) schools, and the National Guard and Army Reserve training programs.

COMBAT CAMERA: Combat camera equipment is used to support Army Combat Camera unit requirements to produce video documentation of combat and combat support operations. These support Army headquarters and other major Army field units.

#### **Justification:**

VISUAL INFORMATION SYSTEMS PROGRAM (VISP): FY04/05 funds will be used to replace old, outdated, unrepairable analog VI equipment with current digital technology. Funds will acquire replacement VI investment equipment/systems to produce training materials and other VI products to support the warfighter. Existing equipment is obsolete, requiring excessive maintenance dollars and long inefficient "throughput" times.

COMBAT CAMERA: FY04/05 funds procure hardware, software, fielding, shelter modifications, and program management costs. Funds will be used to acquire motion video hardware and software that will be fielded with Army combat camera units, and also upgrade the still photography capabilities of combat camera units through the acquisition of current generation digital cameras and night vision accessories. The combat camera mobile units, both regular Army and Reserve Components, are required to support theater headquarters and field units to accomplish digital motion video photo and still photo editing in support of documentation of combat and combat support operations.

This budget line supports the procurement and upgrade of the Automated Integrated Survey Instrument (AISI) (both Long and Short versions), Digital Levels, Topographic Supplemental Survey Set, General Purpose Survey Set, Hydrographic Survey Set and the Sketch Set. This equipment supports the survey mission of both the Topographic and Construction Engineer. Capabilities provided by this equipment enable engineers to establish the geodetic control necessary to support Artillery (e.g., placement of weapons platforms), Aviation (e.g., aircraft registration, safety surveys) and Topographic support. Additionally, this equipment supports Construction Engineering surveys (e.g., roads, buildings, logistics sites, staging areas, airfield construction). Software functionality, included as part of this procurement, allows the user to accomplish the design work necessary for site design and construction (e.g., materiel calculations, labor, resources). This system supports the Legacy-to-Objective transition path of the Transformation Campaign Plan (TCP).

#### Justification:

FY04/05 procures the AISI for National Guard and Army Reserve units not accomplished in FY03. Additionally, funding initiates procurement of the Digital Levels (the modernization of existing automated levels) for Active Duty, Reserve and National Guard units.

This program provides funding to the Army Test and Evaluation Command (ATEC), Developmental Test Command (DTC) to establish, modernize, expand or replace Army-owned industrial facilities used in production testing of Communications and Electronic materiel. It sustains Army production test capabilities through upgrade and replacement of instrumentation and equipment that is technologically and/or economically obsolete. Modernization of test instrumentation and equipment generally provides increased automation and efficiencies, improved data quality and quantity and cost avoidances to Army Program Managers. Programmed funding will be used to upgrade or replace production test instrumentation and equipment at The White Sands Missile Range Electronic Proving Ground (EPG), Fort Huachuca, AZ. This project supports all transition paths of the Army Transformation Campaign Plan (TCP).

#### Justification:

FY04/05 procures: Upgrades to the AN/FPS-16 radar system electronics used to determine system position during missions on the Instrumented Test Range; Global Positioning System location transponders used to track various ground targets and communication emitter systems which are state-of-the-art actual threat emitter systems with the capability of transmitting and receiving different radio signal modulation types (replacing current surrogate systems and providing true, validated threat environments, and permitting valid, complete, and accurate test and evaluation of Command, Control and Communications systems and Intelligence and Electronic Warfare systems) - the new systems will cover a much broader range of today's military communication frequencies and modulations. The majority of the instrumentation being upgraded or replaced is obsolete and has met or exceeded it's economic life. This instrumentation is required to ensure complete and accurate test data is collected and safety and environmental hazards are minimized. Benefits of this project include increased test efficiencies and decreased costs and risks to Army Program Managers.
