## **A. Mission Description and Budget Item Justification**

The Sensor Technology program element is budgeted in the Advanced Technology Development Budget Activity because it funds sensor efforts that will improve the accuracy and timeliness of our surveillance and targeting systems for improved battlefield awareness, strike capability and battle damage assessment.

The Surveillance and Countermeasures Technology project will improve the accuracy and timeliness of our surveillance and targeting systems for improved battlefield awareness, strike capability, and battle damage assessment. Timely surveillance of enemy territory under all weather conditions is critical to providing our forces with the tactical information needed to succeed in future wars. This operational surveillance capability must continue to perform during enemy efforts to deny and deceive the sensor systems, and operate, at times, in a clandestine manner. This project will exploit recent advances in multispectral target phenomenology, signal processing, low-power high-performance computing, and low-cost microelectronics to develop advanced surveillance and targeting systems. In addition, this project encompasses several advanced technologies related to the development of techniques to counter advanced battlefield threats.

The Sensors and Processing Systems project develops and demonstrates the advanced sensor and processing technologies and systems necessary for Intelligence, Surveillance, and Reconnaissance (ISR) missions. Future battlefields will continue to be populated with targets that use mobility and concealment as key survival tactics, and high-value targets will range from specific individual insurgents and vehicles to groups of individuals and large platforms such as mobile missile launchers and artillery. The Sensors and Processing Systems Project is primarily driven by four needs: (a) providing day-night ISR capabilities against the entire range of potential targets; (b) countering camouflage, concealment, and deception of mobile ground targets; (c) detecting and identifying objects of interest/targets across wide geographic areas in near-real-time; and (d) enabling reliable identification, precision fire control tracking, timely engagement, and accurate battle damage assessment of ground targets.

The Exploitation Systems project developed algorithms, software, and information processing systems to extract information from massive Intelligence, Surveillance, and Reconnaissance (ISR) datasets. In particular, it developed new technologies for detection and discrimination of targets from clutter, classification and fingerprinting

of high value targets, localization and tracking over wide areas, and threat network identification and analysis. Interest extended to open source information and issues such as trustworthiness and provenance. The resulting technology enables operators to more effectively and efficiently incorporate all sources of information, including sensor, human, and open source data, in intelligence products.

**Change Summary Explanation**

FY 2016: Decrease reflects the SBIR/STTR transfer offset by reprogrammings.

FY 2017: N/A

FY 2018: Increase reflects Blue Note program new start.

| Title: Multi-Optical Sensing (MOS)  |             |         |         |              |  |               |         |         |   | 19.772         | 15.027           | 15.960     |
| Description: The proliferation of radio frequency (RF)-based countermeasures, such as digital radio frequency memory (DRFM), has presented challenges to the effectiveness of data sensors. The Multi-Optical Sensing (MOS) program will enable an alternative approach to detecting, tracking, and performing non-cooperative target identification, as well as providing fire control for fighter class and long-range strike aircraft. This program leverages emerging high-sensitivity focal plane array (FPA) and compact, multiband laser systems technology in the near/mid/long-wave infrared bands to enable the development of a multi-optical sensing system. Technical challenges include the demonstration of inexpensive, multiband, large-format, photon-counting, high-bandwidth receivers and their integration into a multi-optical sensor suite compatible with airborne assets. The MOS program seeks to advance the state of the art of components and technology to support an all-optical airborne system that can detect, geolocate, and identify targets at standoff ranges. Technologies from this program will transition to the Services. |             |         |         |              |  |               |         |         |   |                |                  |            |

| <p><b>Title:</b> Aerial Dragnet</p> <p><b>Description:</b> Aerial Dragnet seeks to detect multiple small unmanned aerial systems (UAS) in complex and/or urban terrain before they are within line-of-sight (LOS) of friendly assets. Unlike traditional air targets, small UASs pose a special threat in urban terrain for several reasons: they can fly at low altitudes between buildings, they are small making them difficult to sense, and they move at slow speeds making them difficult to differentiate from other movers. Moreover, the development of small UASs is driven by commercial technologies, which make them rapidly adaptable and very easy to use. Building upon technologies developed in the System of Systems Integration Technology and Experimentation (SoSite) program (budgeted in PE 0603766E, Project NET-01), Aerial Dragnet will perform surveillance using an architecture consisting of networked sensors mounted on distributed aerial platforms. The ability to see over and into urban terrain allows an Aerial Dragnet to rapidly detect, track, and classify UAS incursions, thus enabling multiple defeat options. This program focuses on the development of payloads, to be hosted on unmanned aerial platforms, comprising of signal processing software, sensor hardware, and networking for distributed, autonomous operation. The system will be scalable to provide cost-effective surveillance coverage from neighborhood to city-wide sized areas. Aerial Dragnet technologies are expected to transition to the Army and Marines with particular relevance to missions in the EUCOM and CENTCOM Area of Responsibilities (AORs).</p> <p><b>FY 2017 Plans:</b></p> <p>- Commence development of surveillance subsystems for UAS detection, classification, and localization from an aerial platform.</p> <p>- Conduct engineering subsystem tests to assess small UAS detection performance in an instrumented urban test area.</p> <p><b>FY 2018 Plans:</b></p> <p>- Complete development of initial hardware sensor payloads.</p> <p>- Evaluate software for non-line-of-sight UAS tracking and classification.</p> <p>- Demonstrate and test the performance of the system over a neighborhood-sized urban area.</p> |  | -   | 4.000   | 14.383  |

A. Mission Description and Budget Item Justification

The Sensors and Processing Systems project develops and demonstrates the advanced sensor and processing technologies and systems necessary for Intelligence, Surveillance, and Reconnaissance (ISR) missions. Future battlefields will continue to be populated with targets that use mobility and concealment as key survival tactics, and high-value targets will range from specific individual insurgents and vehicles to groups of individuals and large platforms such as mobile missile launchers and artillery. The Sensors and Processing Systems Project is primarily driven by four needs: (a) providing day-night ISR capabilities against the entire range of potential targets; (b) countering camouflage, concealment, and deception of mobile ground targets; (c) detecting and identifying objects of interest/targets across wide geographic areas in near-real-time; and (d) enabling reliable identification, precision fire control tracking, timely engagement, and accurate battle damage assessment of ground targets. The Sensors and Processing Systems Project develops and demonstrates technologies and system concepts that combine novel approaches to sensing with emerging sensor technologies and advanced sensor and image processing algorithms, software, and hardware to enable comprehensive knowledge of the battlespace and detection, identification, tracking, engagement, and battle damage assessment for high-value targets in all weather conditions and combat environments.

| <b>Title:</b> Spatial, Temporal and Orientation Information for Contested Environments (STOIC)  | 26.900  | 21.365  | 15.632  |
| <b>Description:</b> The Spatial, Temporal and Orientation Information for Contested Environments (STOIC) program will enable precision cooperative effects by developing global time transfer and synchronization systems independent of GPS. As a corollary to time synchronization, this program will also enable GPS-independent positioning to maintain precise time synchronization between collaborating mobile users. Key attributes of this program are global availability; minimal and low cost infrastructure; anti-jamming capability; and performance equal to or better than GPS through recent advances in optical clocks and time transfer. Demonstrations on relevant platforms in relevant environments will be used to validate the technology. This program will transition to the Services, emphasizing platforms that operate in GPS-denied environments. |         |         |         |
| <b>FY 2016 Accomplishments:</b> <ul style="list-style-type: none"><li>- Completed prototype components of optical clocks.</li><li>- Completed detailed design and began development of compact optical clocks.</li><li>- Developed prototype components and systems for enabling precision time transfer independent of GPS.</li><li>- Completed detailed design and began development of GPS-independent precision time transfer systems.</li><li>- Developed prototype jam-proof Positioning, Navigation, and Timing (PNT) system components (signal transmit and receive) for achieving GPS-level positioning performance in contested environments.</li></ul>   |         |         |         |

| <p><b>Title:</b> Automatic Target Recognition (ATR) Technology</p> <p><b>Description:</b> Automatic Target Recognition (ATR) systems provide the capability to detect, identify, and track high value targets from collected sensor data. Current ATRs are typically designed for specific sensors and static due to pre-programmed target lists and operating mode, limiting mission execution capabilities. Extending ATR Technology to accommodate sensor upgrades or include new emerging targets can be costly and time consuming. The objective of the ATR Technology program is to develop technologies that reduce operation limitations while also providing significant performance improvements, dramatically reduced development times, and reduced life cycle maintenance costs. Recent breakthroughs in deep learning, sparse representations, manifold learning, and embedded systems offer promise for dramatic improvements in ATR Technology. The program will focus on three core areas: (1) development of on-line adaptive algorithms that enable performance-driven sensing and ATR technology; (2) recognition technology that enables rapid incorporation of new targets; and (3) technologies that dramatically reduce required data rates, processing times, and the overall hardware and software footprint of ATR systems. ATR technology developed under the program is planned for transition to the Services.</p> <p><b>FY 2016 Accomplishments:</b></p> <ul style="list-style-type: none"> <li>- Initiated design of an embedded real-time, low-cost radar ATR processor that incorporates advanced ATR algorithms and uses commercial mobile embedded computing platforms.</li> <li>- Designed and executed additional data collection experiments for continued algorithm development and testing.</li> <li>- Continued to improve ATR algorithm performance, including decoy rejection and false target rejection.</li> <li>- Initiated design of an Open Mission System (OMS) architecture study for ATR algorithms to enable rapid and flexible integration onto multiple operational platforms.</li> </ul> |  | 16.259   | 24.759         |

| <p><b>Title:</b> Seeker Cost Transformation (SECTR)</p> <p><b>Description:</b> The Seeker Cost Transformation (SECTR) program will develop novel weapon terminal sensing and guidance technologies and systems, for air-launched and air-delivered weapons, that can: (1) find and acquire fixed and moving targets with only minimal external support; (2) achieve high navigation accuracy in a GPS-denied environment; and (3) have very small size and weight, and potentially low cost. The development objectives are technologies and systems with small size, weight and power (SWaP), low recurring cost, applicability to a wide range of weapons and missions such as small unit operations, suppression of enemy air defenses, precision strike, and time-sensitive targets. The technical approach for the sensing/ processing hardware is to use both passive electro-optical infrared (EO/IR) sensors, which have evolved into very small and inexpensive devices in the commercial market, and a reconfigurable processing architecture, such as the architecture developed in DARPA's Adaptable, Low Cost Sensors (ADAPT) program. The program will also develop a Government-owned open architecture for the seeker with standardized interfaces between components (both hardware and software). The technical approach to target recognition will start from "deep learning" and 2D/3D machine vision algorithms pioneered for facial recognition and the identification of critical image features. Technologies developed under this program will transition to the Services.</p> <p><b>FY 2016 Accomplishments:</b></p> <ul style="list-style-type: none"> <li>- Initiated development of core seeker system engineering design.</li> </ul> |  | 13.315   | 20.002         |

| <p><b>Title:</b> Small Satellite Sensors</p> <p><b>Description:</b> The Small Satellite Sensors program will develop and space-qualify electro-optical and infrared (EO/IR) sensor and inter-satellite communications technologies, and establish feasibility that new DoD tactical capabilities can be implemented on small (&lt; 100 kg) satellites. Experimental payloads will be flown on small satellites, and data will be collected to validate new operational concepts. Small satellites provide a low-cost and quick-turnaround capability for testing new technologies and experimental payloads. Operationally, small and low-cost satellites enable the deployment of larger constellations which can provide greater coverage, persistence, and survivability compared to a small number of more expensive satellites, as well as the possibility for launch-on-demand. This program seeks to leverage rapid progress being made by the commercial sector on small satellite bus technology, as well as investments being made by DoD and industry on low-cost launch and launch-on-demand capabilities for small satellites. The program will focus on developing, demonstrating, and validating key payload technologies needed by DoD that are not currently being developed for commercial space applications. Technologies developed under this program will transition to the Air Force.</p>  |  |  | 8.000                 | 24.478   | 29.651         |

| <b><i>Title:</i></b> Adaptive Radar Countermeasures (ARC)<br><br><b><i>Description:</i></b> The Adaptive Radar Countermeasures (ARC) program will pursue new algorithms for rapidly protecting DoD systems against new or unknown radar-based threats. Protecting these systems currently relies on uniquely identifying an enemy radar and applying an appropriate, pre-programmed electronic countermeasure (ECM), which can take years to develop. The emergence of digitally-programmed radars that exhibit novel behaviors and agile waveform characteristics, however, has made this approach to countering radar-based threats increasingly challenging. Developing new ECM over several years is no longer sufficient. ARC will therefore pursue new processing techniques and algorithms that adapt in real-time to generate suitable countermeasures. Using techniques such as machine learning and artificial intelligence, ARC will learn the behavior of the threat   |  |  | 20.512                | 19.487   | 4.200          |

| <b>Title:</b> Dynamically Composed RF Systems<br><br><b>Description:</b> Dominance of the RF spectrum is critical to successful U.S. military operations. Radar systems, electronic warfare (EW) systems, and communication systems require custom software and hardware that is costly and time consuming to build and integrate onto platforms. Expanding on ideas developed under the Multifunction RF program, also budgeted in this PE/ Project, the Dynamically Composed RF Systems program addresses these challenges by developing adaptive, converged RF array systems. This enables enhanced operational capability by dynamically adapting the system for tasks to support radar, communications, and EW in a converged manner. This program will design and develop: (1) a modular architecture for collaborative, agile RF systems; (2) advanced techniques for RF apertures and airframe integration and the associated wide-band agile electronics to support converged missions over those apertures; (3) a heterogeneous signal processing complex implementing hardware-agnostic RF operating modes (the RF Virtual Machine); (4) software tools for the control, coordination, and scheduling of RF functions and payloads at the element level to maximize overall task performance (a system and sensor resource manager (SSRM)). This capability can be adapted to address diverse missions. Technology developed under this program will transition to the Services.                                   |  | -  | 14.000  | 23.689  |

| <b><i>Title:</i></b> Advanced Scanning Technology for Imaging Radars (ASTIR)<br><br><b><i>Description:</i></b> The Advanced Scanning Technology for Imaging Radars (ASTIR) program will provide immediate benefit to applications that are constrained by power, weight, and the complexity limits of production. The goal of this program, building on technologies developed under the Multifunction RF (MFRF) program which is budgeted in this PE/Project, is to demonstrate a new imaging radar architecture using an electronically scanned sub-reflector to produce a more readily available, cost-effective sensor solution that does not require platform or target motion. Key system attributes will: (1) provide high-resolution 3D imaging for enhanced identification and targeting, independent of platform or target motion; (2) produce video frame rates to provide well-focused images even when there is platform or target motion; (3) beam steer with a single transmit/receive chain to reduce system complexity resulting in lower cost, power, and weight; and (4) integrate millimeter-wave (mmW)/terahertz (THz) electronic component advancements from other DARPA programs for transmit and receive functions. The completion of this program will result in a more readily available, cost-effective imaging radar technology that will work in concert with a wide area surveillance system to provide target identification at video frame rates in all conditions where existing sensors will not work. Candidate military applications include efficient terminal seekers, imaging systems for defense of shipping in ports and littoral environments,   |  | 12.988   | 10.985         |

| <b>Title:</b> Multifunction RF (MFRF)<br><br><b>Description:</b> The Multifunction RF (MFRF) program goal is to enable U.S. rotary wing aircraft forces to fight effectively in all forms of severely Degraded Visual Environments (DVE) when our adversaries cannot. The program goes beyond landing aids in DVE to address all elements of combat to include landing, takeoff, hover/taxi, in route navigation, lethality, and survivability. Building on previous RF sensors advancements, the program seeks to eliminate many redundant RF elements of current independently developed situational and combat support systems to provide multifunction capability with flexibility of adding new mission functions. This will reduce the overall size, weight, power, and cost (SWaP-C) of subsystems and protrusive exterior antennas on military aircraft, enabling greater mission capability with reduced vehicle system integration burden. The program approach includes: (1) development of synthetic vision for pilots that fuses sensor data with high-resolution terrain databases; (2) development of Advanced Rotary Multifunction Sensor (ARMS), utilizing silicon-based tile arrays, for agile electronically scanning technology at low SWaP-C; and (3) implementation of software development kit to re-define modes as required by mission or platform needs, and ease of adding new modes via software without hardware modifications. The program is planned for transition to the Army.<br><br><b>FY 2016 Accomplishments:</b><br><ul style="list-style-type: none"> <li>- Conducted laboratory and field demonstrations with integrated ARMS, synthetic vision backbone, other potential collision avoidance sensors and multifunction software development kit.</li> </ul> |  |  | 7.273                 | 3.500  | -              |

| <p>- Demonstrated DVE landing, takeoff, Ground Moving Target Indicator (GMTI), and Synthetic Aperture Radar (SAR) modes of operation.</p> <p><b>FY 2017 Plans:</b></p> <p>- Prepare technologies developed under MFRF for planned transition to the Army.</p>   |  |  |                |                |
| <p><b>Title:</b> Video-rate Synthetic Aperture Radar (ViSAR)</p> <p><b>Description:</b> Recent conflicts have demonstrated the need for close air support by precision attack platforms such as the AC-130J aircraft in support of ground forces. Under clear conditions, targets are easily identified and engaged quite effectively, but in degraded environments, the atmosphere can inhibit traditional optical sensors. The AC-130J must fly above cloud decks in order to avoid anti-aircraft fire, negating optical targeting sensors. Similarly, rotary/wing blades in urban operations generate copious amounts of dust that prevent circling assets from supplying cover fire for ground forces. The Video-rate Synthetic Aperture Radar (ViSAR) program seeks to develop a real-time spotlight synthetic aperture radar (SAR) imaging sensor that provides imagery of a region to allow high-resolution fire direction in conditions where optical sensors do not function. Technology from this program is planned to transition to Air Force Special Operations Command (AFSOC).</p> <p><b>FY 2016 Accomplishments:</b></p> <p>- Completed development and unit-level testing of flightworthy high power amplifier.</p> <p>- Integrated hardware into a sensor control system (gimbal) and demonstrated performance in a laboratory scenario, and in over-the-air testing against calibration targets.</p> <p>- Integrated hardware and gimbal on a surrogate aircraft.</p> <p>- Conducted flight tests to demonstrate ViSAR performance in comparison to Electro-Optic sensors.</p> <p><b>FY 2017 Plans:</b></p> <p>- Conduct flight demonstrations in cooperation with the Air Force Research Laboratory (AFRL) and AFSOC.</p> |  | 12.250   | 4.500          | -              |
| <p><b>Title:</b> Military Imaging and Surveillance Technology (MIST)</p> <p><b>Description:</b> The Military Imaging and Surveillance Technology (MIST) program is developing a fundamentally new optical Intelligence, Surveillance, and Reconnaissance (ISR) capability that provides high-resolution 3-D images to locate and identify a target at much longer ranges than is possible with existing optical systems. Short, moderate, and long-range prototype optical surveillance and observation systems are being developed that: (1) demonstrate probabilities of recognition and identification at distances sufficient to allow stand-off engagement; (2) overcome atmospheric turbulence, which now limits the ability of high-resolution optics; and (3) increase target identification confidence to reduce fratricide and/or collateral damage. The program will develop and integrate the necessary component technologies including high-energy pulsed lasers, receiver telescopes that have a field of view and depth of field that obviates the need for steering or focusing the optical system, computational imaging algorithms</p>   |  | 12.361   | 2.656          | -              |

**A. Mission Description and Budget Item Justification**

The Exploitation Systems project developed algorithms, software, and information processing systems to extract information from massive Intelligence, Surveillance, and Reconnaissance (ISR) datasets. In particular, it developed new technologies for detection and discrimination of targets from clutter, classification and fingerprinting of high value targets, localization and tracking over wide areas, and threat network identification and analysis. Interest extended to open source information and issues such as trustworthiness and provenance. The resulting technology enables operators to more effectively and efficiently incorporate all sources of information, including sensor, human, and open source data, in intelligence products.

| <b>Title:</b> Insight  | 9.456          | -              | -              |
| <p><b>Description:</b> Insight developed the next generation multi-intelligence exploitation and analysis system. Insight provided new exploitation capabilities through an integrated, standards-based system that is designed for mission flexibility and cross-theater applicability. Insight enabled threat detection through combination and analysis of information from imaging and non-imaging sensors and other sources. The technical approach emphasized graph-based correlation, adversary behavior modeling, threat network analysis tools, a unified data management and processing environment, novel exploitation algorithms and analysis methodologies, and tools to integrate human and machine processing, including visualization, hypothesis manipulation, and on-line learning. Insight development activities leveraged both virtual and physical test bed environments. The virtual test bed enabled evaluation of alternative sensor mixes and algorithms under extended operating conditions. The physical test bed enabled live testing under realistic operational conditions using current and next generation sensing and processing systems. Insight technology development was coordinated with the following transition sponsors: Army Program Executive Office - Intelligence, Electronic Warfare &amp; Sensors (PEO IE&amp;WS), United States Army Intelligence Center of Excellence (USAICoE), Project Manager Distributed Common Ground System - Army (PM DCGS-A), Air Staff, National Air and Space Intelligence Center (NASIC), Air Force Research Laboratory, and an operational command partner. There are MOAs or MOUs in place with each of these transition stakeholders. Insight provided a unified architecture for plug-and-play ISR with extensibility to all Services and Combatant Commands.</p> <p><b>FY 2016 Accomplishments:</b></p> <ul style="list-style-type: none"> <li>- Tested advanced fusion and analytic technologies, and demonstrated improvements and maturity of multi-intelligence exploitation capabilities.</li> <li>- Addressed capability objectives and key performance parameters identified by the Army, and delivered Insight software to PM DCGS-A.</li> </ul> |                |                |                |
