Military Forces: What is the Appropriate Size for the United States?

Edward F. Bruner
Specialist in National Defense
Foreign Affairs, Defense, and Trade Division

Summary

For several years, some Members of Congress and other military analysts have argued that the U.S. Armed Forces are too small to adequately meet all the requirements arising in the post-Cold War era, and particularly in the Global War on Terrorism (GWOT). In January, 2004, the Department of Defense acknowledged a problem by temporarily adding 30,000 troops to the authorized active duty end strength of the Army. The House and Senate are addressing the issue, in different ways, through the FY2005 Authorization Bill, H.R. 4200 and S. 2400. This report describes the background to this action, current Administration planning, and assesses several significant issues for Congress. The report will be updated.

Background

Throughout the Cold War, end strength of the U.S. active duty force never dropped below 2.0 million personnel and peaked at over 3.5 million during the Korean and Vietnam Wars.¹ From 1989 to 1999, end strength dropped steadily from 2.1 million to 1.4 million, where it has remained. Force structure dropped even more, with active Army divisions, for example, going from 18 to 10. Expectations that military requirements would also diminish, however, were not realized: U.S. forces deployed to new missions in such places as the Persian Gulf, Somalia, Haiti, the Balkans, and, with the recent advent of the GWOT, to Afghanistan and other far-flung places. The results of *Operation Iraqi Freedom* suggested that U.S. ground forces, in particular, are stretched thin.

¹ CRS Report RL31349, *Defense Budget for FY2003: Data Summary*, by Stephen Daggett and Amy Belasco. See p. 16 for historical personnel levels and p. 17 for force structure levels. End strength refers to the number of uniformed personnel at the end of a Fiscal Year and is a measure of the total size of the active forces. Force structure counts major combat elements, such as divisions or carrier battle groups, and does not directly reflect support elements.

Concerns about the effects of increased requirements on a diminishing force first surfaced some ten years ago, and initially focused on readiness. A Defense Science Board report in 1994 found “pockets of unreadiness” attributed to ongoing turbulence in the armed forces.² Members and staff of the House Armed Services Committee discerned problems in the field and challenged Administration assertions that readiness remained high; by 1997 they asserted that “The post-Cold War defense drawdown and the expanding demands of manpower-intensive peacekeeping and humanitarian operations ... are placing at risk the decisive military edge that this nation enjoyed at the end of the Cold War ...”³ Other studies began to highlight problems stemming from the operating tempo of units (OPTEMPO) and personnel (PERSTEMPO).⁴ Various solutions were proposed. Many suggested fewer overseas commitments, but neither Democratic nor Republican Administrations could stem demands on U.S. forces. Congress mandated DOD to compensate soldiers who were deployed too long or too often, but September 11, 2001, caused that law to be waived. Technological advances made transforming U.S. forces ever more combat effective against conventional forces, but could not yet substitute for all the manpower needed in the unconventional and asymmetric environments of “stability” operations. In contrast, some charged that the Army, in particular, was resisting such “constabulary” operations and therefore managed its personnel inefficiently.

The combat phase of the 2003 Iraq War was won quickly with fewer divisions than many analysts expected. The occupation phase, however, soon involved some 220,000 forces. As the first anniversary of combat approached, DOD was engaged in the “largest troop rotation since World War II.” All active Army divisions were involved. Indicators that forces were stretched thin included Reserve Component and Marine Corps units committed for over a year (shorter tours had been the norm); many personnel came under “stop-loss” orders that kept them from leaving their Service, were extended in their tours, or were anticipating multiple combat tours; a ceremonial company from The Old Guard⁵ in Arlington, VA was deployed to Djibouti; and, no Army division was available as a strategic reserve (air and naval forces were shifted to cover key contingencies).⁶ A House bill was introduced to increase the Armed Forces by 83,700 personnel for five years.⁷ Various Senators have proposed either adding one Army and one Marine division or

⁷ H.R. 3696. Note, an increase in one service might create demands in another, e.g., another Army division would require more Air Force tactical air control parties and training sorties.

permanently increasing the Army by 10,000 soldiers.⁸ No decreases to end strength have been proposed. Whether as a result of internal or external pressures, in January 2004, DOD addressed the end strength question.

Administration End Strength Initiative

Before the House Armed Services Committee on January 28, 2004, the Chief of Staff of the Army, General Peter Schoomaker, testified that he had been authorized by the Secretary of Defense to increase the end strength of the Army by 30,000 personnel on a temporary, emergency basis.⁹ He argued that a permanent, legislated increase would be unwise and unnecessary. He asserted that a permanent increase would create a burden on planned defense budgets in the out years, citing \$1.2 billion annually for each increase of 10,000 troops. Some ongoing programs were presented as, over time, providing a more efficient and usable force structure within current Army end strength.

General Schoomaker began making organizational changes shortly after he became Army Chief of Staff on August 1, 2003. He ordered divisions to create more combat “modules” by forming four new brigades from their existing three brigades and divisional support forces. Once implemented, this would provide 10 additional brigade-equivalent maneuver elements for the rotation base. Also, including planned Stryker brigades, could eventually raise the number of brigades available from 33 to 48.¹⁰ He is pursuing a “unit manning” policy, rather than rotating individuals to deployed units. He would also shift from the “Cold-war” mix of combat capabilities to one geared to the less technologically-advanced enemies, joint operations, and stability-type operations recently experienced. Examples include reducing air defense, artillery, and ordnance unit strength and increasing military police, civil affairs, and transportation capabilities.

The Army and DOD have also been seeking other ways to glean manpower efficiencies. General Schoomaker noted that some 5,000 soldier positions were converted to civilians last year — presumably making many of those soldiers more available for deployments — and he anticipated finding another such 5,000 positions in the coming year. This raises issues about the numbers of civilians and contractors needed by the Services. Another organizational initiative has been “re-balancing” the mix of Active Duty and Reserve Component forces to increase fairness and flexibility in deploying the total force and to allow initial deployments with fewer reserve forces. Other measures have potential to reduce military manpower requirements over time, such as reposturing U.S. forces overseas and base closings and realignments at home scheduled for 2005.

⁹ Federal News Service, “Operation Iraqi Freedom Force Rotation Plan,” HASC Hearing, January 28, 2004, p.9. “Emergency” refers to increased military requirements resulting from the terrorist attacks of September 11, 2001. “Temporary” was defined as the duration of the current emergency situation in Iraq or four years to accomplish Gen. Schoomaker’s planned changes for the Army.

¹⁰ This includes several non-divisional, independent brigades and armored cavalry regiments. Costs may be \$9.9 billion from FY2004-FY2007. *Inside the Army*, February 9, 2004, p. 6.

Considerations for Congress

Congress is debating the Administration's end strength initiative in the FY2005 defense authorization bill. The Senate version, S. 2400, endorses the Administration's proposal to increase the Army by 30,000 temporarily. The House version, H.R. 4200 (passed on May 20, 391-34), boosts the Army by 30,000, adds 9,000 Marines, and designates \$1.2 billion of Iraq War funding towards associated costs. Various considerations could influence the debate. The "right" size for the military addresses military requirements now and in the future. The Administration acknowledges current stresses on the force, but interprets the situation as a "spike" in requirements that will return to a lower, more manageable "plateau." Critics counter that the war on terrorism and occupation of Iraq could endure for many years and that the continuing potential for sudden, major crises, such as in Korea, requires a robust U.S. military force.¹¹ There are many views on the future and how much risk should be accepted in preparing for it.

Other considerations may also influence the debate. Predicted federal deficits may create pressures to restrain the overall budget, and competition between sectors may call forth "guns versus butter" tensions. Within DOD, competition for funding will continue; many will argue that personnel costs must be constrained so that research and procurement for the transformational weapons of the future will be adequate.¹² Some may be influenced by implications of the end strength debate for particular military installations and defense industry employers.

Should End Strength Be Increased, and by How Much? Many voices in Congress and in the military community have publicly supported an increase, and few have argued against it unconditionally.¹³ Proposals now range in magnitude from 10,000 permanent Army positions to the Administration's 30,000 temporary positions to 83,700 for five years (introduced and supported by Democratic Members).¹⁴ Some proposals are couched in force structure terms rather than manpower figures. Adding two combat divisions, for example, could easily exceed 30,000 spaces when large numbers of necessary combat, basing, and institutional support troops are provided.¹⁵

¹² See CRS Report RL32238, *Defense Transformation: Background and Oversight Issues for Congress*, by Ronald O'Rourke, 40 pp.

¹³ On November 5, 2003, Representatives Heather Wilson and Jim Cooper wrote a letter to President Bush urging that the FY2005 budget request include funding for two additional active duty Army divisions in order to relieve stress on reserve component personnel. It was signed by 128 House Members, to include 54 of 61 HASC members.

¹⁴ Starting at FY2004, H.R. 3696 would increase the Army from 482,400 to 522,400; the Air Force from 359,300 to 388,000; the Marine Corps from 175,000 to 190,000; and, leave the Navy at 373,800. Figures were derived from various internal studies conducted within the Services.

¹⁵ Anselmo, op. cit., "Duncan Hunter, R-Calif., chairman of the HASC, is pushing for the permanent addition of two Army divisions made up of a combination of heavy forces and special (continued...)

Critics of the Administration proposal deem it inadequate and largely based on accounting for current troop numbers rather than on an injection of fresh troops. The increase of Army end strength to 510,000 is already less than the 30,000 advertised, given that Congress authorized 482,400 in FY2004 (P.L. 108-136). Further, the Army has recently and regularly exceeded its authorized end strength as it concentrated on meeting wartime requirements — 493,000 was even reported.¹⁶

A formal mechanism for determining the size of the U.S. military is the Quadrennial Defense Review (QDR), last published by the Bush Administration in September, 2001, per P.L. 103-62. As the next one will not likely appear until 2005, the QDR process provides little guidance for current force level debates. The 2001 QDR was considered ambitious, premised on fielding military capabilities to prevail in any two theaters of operation in overlapping timeframes. It also planned to maintain and prepare forces for smaller-scale operations in peacetime, occupations, and a rotational base for forward-deployed forces. Besides these operational requirements, the QDR emphasized the goal of rapid transformation into the future force. The QDR looked at force structure rather than end strength. In retrospect, it did not predict the stress of trying to meet all developing wartime, peacetime presence, and transformation requirements at the same time. Many observers believe that U.S. troops, active and reserve, have been bearing the load of that stress for some time and that an increase in end strength — failing an unexpected, sudden victory in the War on Terror — is justified to help relieve that stress.

Should Any End Strength Increase Be “Permanent” or “Temporary”?

The Administration proposal to increase the Army’s size would only be in effect for four years. This is based on the premises that, in the interim, manpower requirements might decrease, initiatives to find greater efficiencies within the current force might bear fruit, or both. If so, the Army will have avoided some near term and longer term cost differentials between permanent and temporary solutions. A permanent increase would require additional resources for recruiting, retention, and training activities. Also, any change upwards in permanent force structure could possibly negate some anticipated savings from base closures in the upcoming BRAC process.

Critics assert that DOD premises may be faulty; a sudden reduction in military requirements bucks the tide of recent history, and, finding more manpower through internal efficiencies has probably been a goal not well-realized by this and preceding Administrations. Whether or not one accepts DOD premises, the method by which it plans to implement a temporary increase is subject to criticism. Rather than recruiting all new personnel, current personnel are being retained, many through the imposition of “stop loss” orders to extend tours of duty. Some question the fairness of making those currently serving sacrifice further to avoid recruiting additional personnel for the future.¹⁷ Some

operations troops,” p. 271. CBO estimates up front costs of \$18 million to stand up two divisions and \$6 million annual costs. HASC testimony, November 5, 2003.

¹⁶ See Anselmo, op. cit., p. 272. On December 31, 2003, DOD reported the size of the Active Duty Army to be 490,174. See [<http://web1.whs.osd.mil/mmid/military/miltop.htm>] for current Service statistics.

¹⁷ Military Officers Association of America. “Stop-Loss: The New Draft,” *MOAA Legislative* (continued...)

argue that paying the costs for a permanent increase now would avoid the risk of discovering, a few years from now, that the forces are inadequate. Congress could revisit and correct end strength in each annual authorization bill.¹⁸ Others, however, believing the situation will ease, would argue taking such a step is premature.

What Kind of Forces Do We Need? Specific types of forces needed will be defined by perceptions of future requirements, recent experiences, and response to current stresses. Congress influences the type of forces to be acquired by allocating end strength among the four Services. Further refinements occur as specific weapons systems and materiel are developed and procured, and through the oversight process. Whether or not to create dedicated “constabulary” forces remains an issue.

Substantial ground combat forces will likely be needed, as “stabilization” efforts in Afghanistan and Iraq have no defined end point¹⁹ and other nations of concern, such as Iran, Syria, and North Korea retain a potential for future armed confrontation. Combat campaigns in both Afghanistan and Iraq demonstrated the value of U.S. Special Operations Forces. SOF strength is being increased, and is particularly important to the War on Terrorism, but that strength is accounted for within the Services that contribute their personnel to SOF units. In Iraq, the ability of U.S. mechanized infantry and armored forces to survive and prevail against both regular and nonconventional enemy forces, even in urban areas, was striking. To reinforce success, some advocate maintaining and increasing units armed with Abrams tanks and Bradley fighting vehicles.²⁰

For some time, the Services have denoted various specialized units as being Low Density/High Demand. Examples from the Army are civil affairs, military police, and transportation units. Examples from the Air Force are SOF air crews, air controllers, and crews for airborne warning and control system (AWACS) and electronic warfare (EW) aircraft. LD/HD assets are, as are infantrymen, needed both in combat and stability operations.²¹ Some analysts have recommended that DOD organize one or more division-level headquarters to specialize in stability operations.²² This supposes that such a capability will continue to be needed and that specialized units could improve the planning, effectiveness, and efficiency of U.S. participation in stability operations. This new unit, although it might include some existing combat elements, likely would not reduce current pressures for an increase in end strength.

¹⁷ (...continued)

Update, February 13, 2004.

¹⁸ Congress has, in the past, usually avoided annual end strength fluctuations as a stable end strength provides management efficiencies for the Services.
