The DEIS does cite some studies on domestic livestock in its "wildlife" section. The Air Force attempts to use these studies, which purport to show that livestock "habituate" to noise, to bolster a conclusion that there will be no impact to livestock. By the Air Force's own admission, however, none of these studies have observed *range* cattle -- the type of operations found in rural northern New Mexico. DEIS at 4-93. Instead, these studies focus on grazing operations situated near airports and conclude that livestock habituate to aircraft noise. These studies, which take place in areas where noise is continuous, are not indicative of the impacts to be expected in a

001131

rural setting. Numerous other studies, of the impacts of sporadic military aircraft noise on livestock, demonstrate that livestock do *not* habituate. These studies note that cattle in corrals and feedlots stampede when aircraft fly overhead at low altitude, and that turkey flocks kept inside turkey houses often pile up and experience high mortality rates due to aircraft noise. GEIS at 4-64.

The DEIS must recognize the potential impacts to range cattle and other livestock, and the consequent impacts to large and small ranchers beneath the proposed flight path.

6. The DEIS Fails To Discuss Adequately Negative Socioeconomic Impacts.

The DEIS is woefully inadequate on the topic of socioeconomic impacts. The DEIS concludes that there will be no negative economic impact on tourism or land values because flights are dispersed throughout the corridor and therefore the chances of being overflown are

BR-4 slim. DEIS at 4-109 - 4-110. This statement demonstrates that the Air Force has failed to comprehend both the local real estate market and the tourist economy. The attached statements of John Baen (attached at F) and William Weida (attached at G) thoroughly discuss these impacts.

First, as discussed above, many communities and small ranches lie beneath the proposed alternative D flight path. The property values of these homes and ranches will be significantly depreciated, potentially by as much as 35% to 41%, if the Air Force proceeds with alternative D. *See* Statement of John S. Baen at Section 5.

Second, northern New Mexico is a tourist economy, that attracts people from across the

001131

country and across the world with its wilderness, solitude, and recreational opportunities. The activities that attract tourists to Taos county are incompatible with low-level aircraft. The reality these training flights, and even just the knowledge that they occur, is enough to drive many tourist away from the area. Weida Statement (attached at G) at 7. Guest Ranches like Vermejo Park stand to lose 30%-50% of their revenue if the Air Force proceeds with Alternative D. Baen Statement at section 6. Moreover, the Taos area, whose economy is almost entirely related to tourism, is likely to sustain an economic loss of $18 to $30 million with a corresponding loss of between 450 and 720 jobs. Weida Statement (attached at G) at 2.

All this would have a substantial impact on northern New Mexico, that could not possibly be offset by the few jobs the proposed action would create. Moreover, the impacts would be felt by the people who can least afford them. By the Air Force's own admission, "the lands under the affected airspace currently support higher proportions of [minority and low-income] groups than is found, on average, nationwide." DEIS at 4-111. However, the Air Force uses its inadequate socio-economic analysis to bolster a finding that minority and low-income populations are not adversely affected. DEIS 4-109 -4-110. As discussed above, there are serious adverse socio-economic impacts associated with alternative D. Clearly, these impacts will disproportionately affect minority and low-income populations living beneath the airspace, and need to be examined further than the cursory analysis given in the DEIS.

SE-5

7. The DEIS Does Not Adequately Address Safety Issues

In an effort to veil the very real threat of bomber crashes, the Air Force baldly states in the DEIS that "Class A mishap rates are quite low." DEIS at 4-16. Hidden within the depths of

001131

the DEIS is the real story. Carrying out calculations never shown, and never discussed in the DEIS, the truth of matter revealed is that there is likely to be over 1 "Class A" crash per year on the proposed alternative D flight path.

AO-123

A "Class A mishap" is defined as "an accident that results in a loss of life, permanent total disability, total cost of more than $1 million, or destruction of the aircraft beyond repair." DEIS at 4-16. The breakdown of the types of aircraft that make up the 2,660 annual sortie-operations is as follows: 1,330 B-1s, 905 B-52s, 375 "Bombers from other bases," and 50 "Fighter Aircraft" (predominantly F-16s). DEIS at 2-52. The DEIS gives only the probability of Class A mishaps of B-1s and B-52s. DEIS at 2-60 (chance of class A mishap for B-1s and B-52s is .07 percent and .02 percent, respectively). Using these numbers alone, however, one finds that there is a chance of greater than 1 Class A mishap per year:

$$\begin{array}{rr} & 1{,}330 \times .07\% = .931 \\ + & \underline{\ 905 \times .02\% = .181} \\ & 1.112 \end{array}$$

This calculation does not even include the risk of class A mishap of the 425 other bomber and fighter aircraft[3], nor does is include the risk of non-Class A crashes. Moreover, it is not clear if the authors of the DEIS took into account that any crash in northern New Mexico carries with it a very high likelihood of forest fire. Thus, *any* "mishap" in northern New Mexico is likely to be Class A. Yet, it appears that the authors are using general crash data to determine the likelihood of a Class A crash on Alternative D. Furthermore, one class A crash per year is not

[3]The rate of Class A mishaps for F-16s has risen dramatically in 1998 and 1999. In fact, in the first four months of fiscal year 1999, there were nine F-16 Class A mishaps, or about 6.5 per 100,000 flying hours. *Star Telegraph*, February 14, 1999, "Faltering Falcon" (attached at P). Thus, adding F-16s into the calculation, along with "other bomber," could raise the number of "mishaps" per year significantly.

001131

"quite low," but rather, is unacceptable in an area at high risk for forest fires.

AF-34

D. The Air Force Must Prepare a Programmatic Environmental Impact Statement Analyzing the Impacts of All Low-Level Training Activities Nationwide.

As of 1990, the Air Force's low-level training operations covered almost one million square miles of airspace, representing about 25% of the total land and fresh water area within the United State, including Alaska. Generic Environmental Impact Statement ("GEIS") at 4-62 (attached at J). Many federal agencies have recognized that the cumulative impacts of all these training flights have been enormous.

The National Park Service ("NPS"), in its September 1994 Report to Congress on the Effects of Aircraft Overflights on the National Park System, found that the national parks across the country are negatively impacted by military low-level flying. The NPS found that such flights "cause physiological and/or behavioral responses that reduce the animals' fitness or ability to survive . . . and can cause excessive arousal and alertness, or stress." NPS Report (attached at Q). The way in which animals behave in response to overflights also interferes with the raising of young, habitat use, and physiological energy budgets.

The United States Fish and Wildlife Service ("FWS") has found that military overflights are one of the most harmful activities affecting the nation's National Wildlife Refuges. In "National Wildlife Refuge System Aircraft Overflight Issues," the FWS found that 25 wildlife refuges across the country reported significant impacts associated with low-level military flights. In Buenos Aires National Wildlife Refuge in southern Arizona, low level flights are a "constant annoyance to the thousands of visitors coming to the Refuge and have been a causative agent for

001131

several wild fires on the Refuge." FWS Report (attached at R). Among the concerns expressed by Refuge managers is the impact such flights have on the number of migratory birds and endangered species. The Sequoyah National Wildlife Refuge in eastern Oklahoma documented a drop in snow goose populations from 14,000 to less than 6,000, and a drop in wintering bald eagles from 19 to 3 in two weeks time due to low-altitude military flights. FWS Report (attached at R).

The Council on Environmental Quality ("CEQ"), the agency responsible for implementing NEPA, found a "need for coordination within the Department of Defense to adequately assess the cumulative impacts of military agencies' airspace requests, and a need for consideration of the inherent conflicts between airspace and land use below." CEQ Report (attached at S). The CEQ has "been made aware of increasing complaints from across the country by affected citizens regarding the number of and noise from low altitude military flights. . . . As these events indicate, the potential conflicts and the cumulative impacts of military overflights on the people and lands below can be severe and must be addressed fully in the environmental documentation." CEQ Report (attached at S).

The comments, which are just a few of the many made by federal agencies, highlight the need for a coordinated look at the cumulative impacts of all Air Force low-level training missions, along with the impact of low-level flights by other branches of the military as well. This analysis should be carried out in a programmatic environmental impact statement prepared by the Air Force that considers impacts on humans and wildlife nationwide.

001131

E. The Public Participation Process for Comment on the DEIS Is Inadequate.

GE-2 While proposed Alternative D affects 9 New Mexico counties, the public hearings for the DEIS were held in only three locations: Roy, Angel Fire, and Taos. Because of the great distance between numerous affected communities and these three locations, many persons who will be greatly impacted by RBTI did not have an opportunity to appear at the hearings. For instance, the route passes just south of the town of Costilla, yet the nearest public hearing was held in Taos, 40 miles away. Public hears were not held in the town of Clayton, which lies beneath the MOA, or the town of Tucumcari, just west of the MTR. Clearly, the Air Force understood that communities in these areas would be affected. Indeed, the Air Force held public hearings in both Clayton and Tucumcari during the scoping phase of the EIS. Thus, it is hard to conceive why these areas were neglected during the DEIS comment phase.

GE-28 Further, there is a substantial Spanish-speaking population in the region affected by Alternative D. Indeed, for many Spanish is their first and primary language. Yet the Air Force did not publish any Spanish language notices or newsletters, and failed to provide translators at the public hearings. The military is accustomed, however, to carrying out bilingual environmental evaluations. At the Yuma Proving Grounds in Arizona, the Army published its EIS in Spanish and provided translators at public hearings. Bilingual documents and public hearings are equally appropriate and necessary in the Northern New Mexico region, and should have been provided in order for the Air Force to gather comment from one the largest affected population groups in the region.

001131

III. THE AIR FORCE HAS NOT COMPLIED WITH THE ENDANGERED SPECIES ACT.

The Endangered Species Act was enacted "to provide a means whereby the ecosystems upon which endangered species and threatened species depend may be conserved, [and] to provide a program for the conservation of such endangered species and threatened species." 16 U.S.C. § 1531(b). Under the Act, all federal agencies are required to initiate consultation with the appropriate wildlife agency to ensure that the agency's action "is not likely to jeopardize the continued existence of any endangered species or any threatened species or result in the destruction or adverse modification of habitat of such species which is determined . . . to be critical . . ." 16 U.S.C. § 1536(a)(2). In every consultation, "each agency shall use the best scientific and commercial data available." *Id.* Formal consultation is required if there may be a potential impact on a listed or candidate species or its critical habitat.

BI-11 As the DEIS recognizes, there are numerous threatened and endangered species in northern New Mexico. Nevertheless, the Air Force has failed to initiate consultation with the Fish and Wildlife Service. Although the DEIS states that the Air Force has initiated consultation under the ESA (DEIS at 2-63), it is readily apparent from Air Force and FWS correspondence that this is not the case. *See* DEIS Appendix at H (January 27, 1998 letter from FWS to Air Force stating that RBTI would not become part of GAF consultation and "will not be addressed by the Service until the GAF consultation is complete.").

Formal consultation is required for RBTI because, according to FWS, the proposed flight path "may potentially affect threatened and endangered species in counties where overflights and ground disturbing activities occur." *Id.* Because RBTI will affect much of the same airspace as

001131

the German Air Force expansion (GAF), formal consultation on RBTI must be at least as broad in scope as the GAF consultation and biological opinion. In addition, because the flight patterns of RBTI and GAF together cover much of New Mexico, formal consultation must address the cumulative impacts on endangered species in the entire State.

Finally, the DEIS states that alternative D overlies unsurveyed but potential Spotted Owl habitat. DEIS at 4-107. As part of the Cannon AFB action, the Air Force was supposed to survey these areas. It appears from the DEIS that the Air Force has not fulfilled this obligation. As part of consultation on RBTI, the Air Force should proceed with the requisite Spotted Owl survey.

IV. CONCLUSION

As stated above, the DEIS is lacking the kind of detailed analysis required under NEPA. The Air Force must recognize the vast body of scientific study demonstrating that the proposed RBTI may indeed have significant impacts on people and wildlife. The Air Force must acknowledge, discuss, and analyze these potential impacts, including cumulative impacts in its Final EIS. In addition, the Air Force must comply with the Endangered Species Act before proceeding with any action.

Dear Sir

BR-6 This is a response for your request for public comment on the Realistic Bomber Training Initiative (RBTI). We realize fully that if our armed services are to be effective in their mission realistic training is essential.

We are requesting that the Air Force reconsider the use of the low altitude air space over Philmont Scout Ranch in northeastern New Mexico. Mr. Waite Phillips donated this area to the Boy Scouts of America in 1941 for use as a high adventure base. Since that time over 500,000 young men and women of our country have enjoyed this area. For many of these young people it may be their only experience in what was the "Wild West", and I feel that low flying bombers would degrade their adventure. In addition during the summer there are thousands of scouts throughout Filmont's 137,000 acres, please do not put them in danger by turning Philmont into a MOA.

This area teems with natural wonders and wildlife that you cannot show on population demographics in a cold report. Raymond enjoyed his first "Trek" to Philmont in 1973 at the age of fourteen. Matthew who is also a signatory to this letter is twelve and I (Raymond) look forward to sharing this experience with him in an environment where we see deer, bison, and other wildlife not B-52's overhead at 3-400 ft.

In light of the recent tragedies in our country involving youth, with your help scouting can reach young people with positive goals in a natural environment. Through the dedication of adult volunteers, scouting might be able to stem the tide of youth violence in our society. We truly believe that the Air Force could use federal lands in the near vicinity and accomplish their training goals without disturbing Philmont.

• KINGWOOD, TX •

We look forward to hearing from you and thank you for your consideration in this matter.

001132

Sincerely,

Raymond K. Johnson

ORAL COMMENTS

As I mentioned before the break, we're going to proceed with our speakers in the order that I indicated previously, and we're going to start with Mr. Bill Ehrie from the Abilene Chamber of Commerce.

008000

TY MR. EHRIE: Good evening. Can you hear me? Last name is spelled E-h-r-i-e, retired colonel, former wing commander, currently representing the Abilene Chamber of Commerce Military Affairs Committee.

On behalf of the Military Affairs Committee, we have reviewed the Environmental Impact Statement and the history behind this issue. We want it clearly known that we support the issue fully. The proven methodology that's been used to develop the EIS both currently and in the past clearly substantiates the fact that there is no impact to the area.

While we acknowledge the concerns of other citizens as they've expressed them in various forms, the methodology does not support that, neither does the facts. When you look at the history of Air Force flying throughout the United States and Canada in the low-level environment, the methodologies that have been used to develop EISes over the last 30 to 40 years clearly states that there is no impact that you can recognize and it's substantiated in this report.

We support the Air Force's efforts on selecting a route. And when that route selection is known, we will support that. On behalf of the Abilene community and the Dyess Air Force Base

community, we think it's absolutely essential for the training of the airmen and women in the 21st Century that we go forward with these routes and establish a greater presence in West Texas than we've had in the past. If we're to be prepared for war in the next century, we must be prepared to train in the proper environments. The EIS is correct and online. It states the case very well. We stand behind it, and we stand behind the Air Force on this effort. I don't think you'll hear us quibble one bit on any other issue that subjects itself to a confrontation. Thank you.

6:41P HEARING OFFICER: Thank you, sir. Now we're going to move on with the other individuals here. Bynum Miers.

TY 008001 MR. MIERS: Colonel, my name is Bynum Miers. I'm a rancher in Taylor County, Texas, and have two locations. One location is one mile north of Tye -- north of Interstate 20 north of Tye, and the other one is three and a half miles southwest of Buffalo Gap.

I'm here to speak mainly about the effects of noise and/or low-level flights. I have a cow/calf operation north of Tye, and I've been operating that place for 40 years, since 1959, and I have had no effects on cattle or horses. As you can imagine, that near Dyess, those planes come out of there when the wind is out of the north at pretty low altitude. Cattle operate on the -- and react on the theory of what hurts me. And when they find out that it doesn't hurt them, it doesn't bother them.

The noise pollution is -- is more so to humans, but it is not -- it has had no effect on reproductivity. My cattle reproduce and are easy to handle. When they find out something doesn't bother them, they don't pay any attention to it.

As far as the south part of the county, those flights there are at a little bit higher level, but I have no effects from -- from those flights for cows or horses. My son has a horse operation there. And those are the only two things that -- that I wanted to speak to you about.

6:43P HEARING OFFICER: Thank you, sir. Buster Welch.

008002 MR. WELCH: I'm Buster Welch from Fisher, Scurry, and Kent County. I ranch up there on the Double Mountain Fork of the Brazos River. And I want to say right off that I'm real proud of our Air Force, and I think we've got the best Air Force there's ever been, and I'm proud of Dyess and the personnel, and I want Abilene to do real well.

But I'm president of H.E.P.A., an organization that we formed to stop you from practicing your training over our eight-county area because we cannot stand the decrease in the value of property, the interruption of our lives, and -- so -- but I want you to know that I have a brother that's a retired colonel. I lost a brother in World War II in a bomber crash. And we're Air Force people and we want you to have a good place to train, but we don't want you to work a hardship on 55,000 good, hardworking American people.

BR-4

That's -- I'll show you men up there that -- five brothers went to the war at the same time. We're all patriotic, but our economy will not stand that. And noise is expensive, and there's all kinds of tales to prove it. Thank you.

6:45P HEARING OFFICER: Thank you, sir. Stanley Griffith.

008003

TY MR. GRIFFITH: My name is Stanley Griffith, G-r-i-f-f-i-t-h. I raise cows. The military guarantees my freedom to raise cows, so I have a vested interest in you conducting the most realistic training that you could do. I also would hate to think that my reluctance to disturb a jack rabbit might result in some crewman not coming back from a mission. That's all I have to say. Thank you.

HEARING OFFICER: Thank you, sir. And Diana Moore, did you wish to speak?

MS. MOORE: I'd like to wait. If anyone else --

HEARING OFFICER: We just exhausted the list.

MS. MOORE: You said you're going to open it up.

HEARING OFFICER: Would anyone like to make any comments at all that hasn't made any comments? Or any of those who have made comments, would you like to make additional comments?

MR. PAGE: (Indicating.)

HEARING OFFICER: Yes, sir. I take it, sir, that you have not filled out one of our cards?

MR. PAGE: Filled out the card. I did not indicate that I would speak.

HEARING OFFICER: I see.

MR. PAGE: But listening to the program, I would like a comment.

HEARING OFFICER: Yes, sir. If you could just approach the microphone. And, if you could, provide us a little bit of information. 008004

6:46P TY MR. PAGE: I'm William L. Page, P-a-g-e. I'm a refired lieutenant colonel of the Air Force. I'm also a safety consultant by education, by training. I performed noise level surveys in connection with my job as a safety consultant and a safety engineer over the last 33 years.

In looking at the draft document, I see that the methodology that was used is very well done, and I was very impressed with the methodology that I saw in that document.

My experience in working with noise level surveys indicates that there would not be any significant impact on wildlife or livestock as a result of the overflights proposed by these training routes. I also represent the Page and Childress Ranch, which is located in the northwest corner of Stonewall County, so I'm looking at this from both sides of the table, both as a retired Air Force officer and as a rancher, and I see no significant impact on the ranching operations as a result of these training routes.

6:48P HEARING OFFICER: Thank you very much, sir. Would anyone else like to make any additional comments?

Ladies and gentlemen, that concludes this public hearing. Thank you very much for your participation and your inputs. Please remember, the public comment period will extend through June 16, 1999 and comments can be sent to the address shown on the slide. This public hearing is adjourned. Thank you again.

(Meeting adjourned at 6:48 p.m.)

appreciate you handing it in so that any names, places, references to scientific terms or other information can be recorded accurately.

Finally, I would like to remind you to limit your comments to the draft EIS. That is the purpose of this public comment period. Also, I ask that you avoid repeating what another speaker has said if there -- there is nothing inappropriate about agreeing with other speakers, but to repeat the same thing just delays others in making their comments. If you agree with a previous speaker on a particular issue, you can just state your agreement.

If you'd like to turn in your written comments there, you can do that at any time. There is a box provided for -- for you to do that.

I would like to get started now so -- as I indicated, we will start with comments from elected officials. Following their remarks, we will take oral comments from those of you who have asked to speak. Again, I wish to remind you of the three-minute time limit.

And the first speaker that I would like to call upon is Ricky Fritz, who is a county judge.

(PAUSE) 008005

MR. FRITZ: Yes, sir. Can you hear

me?

My name is Ricky Fritz. I am the Scurry County Judge. I am out here for several reasons, but the first point I want to make is that I firmly believe that we live in the greatest country in the world, and I believe it is great because of our freedoms, the freedoms we have that didn't come cheap, that people in the military and lots of people here fought and had friends that died serving our country to keep it free.

And the freedom I want to talk about specifically tonight is the freedom to own and possess property. We are one of the few countries in the world where you can actually own property as a citizen. And our earliest rights, property rights, have been set up where when you own your property, you own it from the borders to the center of the earth and to the Heavens above. It don't include BR-5 that the government can take it away from you without just compensation.

So my first question would be is, if we are actually going to be losing some space, there doesn't appear to be just compensation. I feel like there is a detrimental situation there.

My second one is, I feel like there is many,

28

many areas -- you know, big cities don't feel like we are a populated area, but we feel like we are populated. And we feel like any time there is military planes or private planes flying over, there is that risk. And God forbid that something would happen that you got citizens out here. We feel like there is areas in other parts of the country where, if something did unforeseen happen, you know, it wouldn't even kill a lizard. And so we feel like that that is our second problem.

AO-4

And our third problem -- as County Judge, we have an airport here that is very important to our economy, and we spend a lot of time trying to keep it up. We have boll weevil eradication flying out of here, we have private planes flying out of here with our industry, crop dusters fly out of here, and we are just very, very concerned that it will be detrimental to our airport and to citizens. So I just wanted to touch on those three points.

BR-2

So as County Judge of Scurry County, I received many, many calls from our citizens, and so I would have to say that I'm opposed to Scurry County being a part of -- of this project.

And thank you for letting me speak.

COLONEL BURD: Thank you.

29

I would like to call on Buddy B. Baldridge. The organization listed here is the Jayton-Girard ISD.

008006

MR. BALDRIDGE: Hello, everybody. My name is Buddy Baldridge, B-A-L-D-R-I-D-G-E, for the record. I would like to thank you for the opportunity to address this hearing.

I, too, support -- support a strong military for the protection of the United States. It is important that our men and women of our armed forces be well trained and be prepared physically and mentally to defend the United States against a variety of opponents. While not a veteran myself, I have numerous friends and family members who have faithfully served in the military in World War I and World War II and in Vietnam to defend our country and our way of life. Some have even given the supreme sacrifice of their lives for our country.

With this as a background, let me say that I clearly am opposed to the proposed use of the private lands for the Realistic Bomber Training Initiative.

PD-7

In particular, I am opposed to the Lancer MOA because of its effect it will have on my home and my community.

As I understand the proposal, the Lancer MOA

30

would be used for realistic bomber training of B-52s, B-1s and their associated support aircraft. As many in our area will attest, it not unusual to have a C-130 or T-37 or T-38 or Military Lear flying at or below 3 to 500 feet above the ground, often directly over our homes. Obviously, the military aircraft are not prohibited from flying below the published floor of the MOA. That would keep the B-1s and B-52s from flying -- what would keep them from flying lower than 3,000 feet?

AF-6

When I was growing up, my dad gave me a good way to make a decision. He said split a piece of paper in half and put the advantages on one side and disadvantages on the other. In discussing this proposal with the leaders from the counties that are involved, no one came up with even one advantage, not one.

I would like to use the rest of my time to focus on the effect that RBTI would have on land values in our area where training is conducted. You are probably wondering how it could have a direct effect. The noise and stress that it will cause will have multiple effects on people, livestock and wildlife. Animals, including domestic livestock and wildlife, will be subjected to the startling effect

AO-18

BR-3

31

of extremely loud, fast-moving aircraft even at the 3,000 feet. Weight gain, reproduction, antler growth and many other areas of production will be affected. Can you imagine what a startled herd of cattle can do to a fence?

BR-3

The stress of continual noise will also affect humans. In '69 and '70, I officed just outside of the DFW Dallas -- or Dallas Love Field area under the flight path. We never got used to the noise when air -- of aircraft flying overhead.

Currently, recreational use of our lands is the only enterprise that is profitable. Recreation has kept land prices stable. We have hunters to come to our ranch from all over the United States. They come all the way to West Texas to relax and get away from city life and the noise. They come for the experience. Will they keep coming with these aircraft flying overhead? Absolutely not. Landowners will lose income as a source of revenue, and the local community will also lose money.

BR-4

COLONEL BURD: You have met your three minutes, sir.

MR. BALDRIDGE: Thank you very much.

COLONEL BURD: Thank you.

I appreciate Mr. Baldridge terminating his

32

present -- his comments right at the three-minute point. Again, as I said earlier, if we do have time, and any of you who run out of time before you finish your comments and you want to make additional comments, we will certainly accommodate you.

The next speaker I would like to call on is Bobby McGough from Stonewall County. 008007

MR. McGOUGH: Thank you, Colonel. As you said, my name is Bobby McGough. That is spelled M-C-G-O-U-G-H. I am the County Judge of Stonewall County, and I have also served 25 years as a military pilot, over three years of that flown out of Dyess in and around this air space.

We are a God-fearing and nation-respecting community. And as we are here, there are people projected on our behalf, and we would ask to protect -- the Almighty for their safe return and the safe (inaudible) of their mission.

I have read through a portion of the EIS and would like that it be further expanded or better information concerning a statement that the Lancer would not represent a substantial increase from recent or historic air space use, and that was footnoted and based to a recent are four, a recent area of five in the Roby MOAs, and those two

AO-77

33

(inaudible) to have 106 aircraft operations over the past year. The Lancer MOA, as it is stated, will have 2,350 operations over a year, and I personally consider that a substantial increase in the air space.

In addition, the three prior MOAs based air space is either 10 or 12,000 feet AGL, and Lancer, as is expressed, will be at 3,000 feet.

The noise level is addressed at minimal change from the baseline of a 45 DNL. If the Lancer were enacted we would have a 46 DNL. I am not a scientist or have the ability to analyze DB, but it would be a -- it is hard for me to imagine that 2,350 airplanes, with 40 percent of them operating between 5,000 -- between 3,000 feet AGL and 5,000 feet AGL, would not create a change. Thank you.

AO-78

Overall, the likely effect on land use, recreation -- aircraft, to date, 260 operations -- 260 operations a day will affect our ability to effectively raise livestock, our cost of production and the cost of operation and increase the hazard of handling.

BR-4

In a socio -- on the socioeconomic statement of no measurable impact on the economic values of land since the area has generally been overflown

34

since 1940, I believe there will be a decreased margin in production value, (inaudible) a decline, and our costs go up. There will be a decreased potential for wildlife income.

BR-4

And the direct impression of that is, if you choose to seek a -- your recreational solitude and solace in the open countryside, and you had a choice between leasing, renting, hunting, boating, fishing in an area that had aircraft operating over ten a day down to the 3,000 feet and the noise that would be generated by them and operating -- or leasing an area that wouldn't, I believe you would choose the latter. Thank you.

COLONEL BURD: Thank you.

I would like to call on Mr. Giles Dalby, the County Judge for Grange County, it looks like.

MR. DALBY: My name is Giles, 008008 G-I-L-E-S, Dalby, D-A-L-B-Y. I'm County Judge for Garza County.

Your Honor, I have to concur with my fellow Judges on what has been said here today. Also, I would like to address some of the other concerns that we have. If the Air Force decides to go down below five -- to a level of 500 feet, what is the liability of the Air Force in coming over homes, some of our

35

rural homes?

Now, I live in the country. I am a rancher, too. I live in the direct path of Dyess Air Force Base where they fly the C-130s. I know what the noise level there is, and they fly fairly low. Excuse me. I was also in the flight pattern 12 years ago when you were flying B-52s on the deck, and we had an Air Force installation there in Post guiding the low-level flying of the aircraft, so I know from experience the noise level that can be created. With a B-51, I understand it is three or four times the noise level.

Now, those are some of the concerns, as well as the others, and there is no sense of me repeating what my colleagues have said.

But I do have some concerns, and I would like to know what the liability is to the Air Force and how are you going to proceed to address your grievances as far as any damages are concerned? Because I know when in our home the 52s came over, they rattled every dish in the house, and my wife has got some pretty valuable dishes. And if nothing else, I would like a phone number to give to somebody to talk to her from the Air Force, if you can do that.

AF-15

AF-36

(PAUSE)

COLONEL BURD: It has been brought to my attention that possibly my earlier remarks may have been misunderstood about repeating comments you have already heard. I, in no way, want to limit anybody's comments, and if you want to comment repetitively on essentially what someone else has said, that is fine, and you will be permitted to do that. But what I would like everyone to be conscious of is the time constraints that we have here and the number of people who would like to make comments.

And if you haven't already filled out a card and indicated that you want to comment, you still have the option of doing that. Representatives are around the room, and just give a card to one of them or bring it directly up to the sergeant that is sitting down here below me.

I would like to now call on Mayor David Holt. 008009

MR. HOLT: Thank you, Judge. My name is David Holt. I am mayor of the City of Snyder. I have a resolution prepared by each member of the city council in opposition to the RBTI, and also I would like to address some of the concerns.

On what some of the others have said on the

economic impact, I have had realtors tell me that to try to sell ranchland out in the Big Bend country, that when they are out showing ranches and the planes come over and the noise is pretty great, that people just get back in their car and say, "No. Thank you very much." So, to me, that has a great impact on the ability to resell land. BR-4

Also, another issue is the safety issue. And I know other people that have addressed that, but my other concern is the responsibility of the Air Force. More than one person has told me that the more you complain, the more flights you have over your property. And that when people call the Air Force with complaints, they don't get much satisfaction, and that is of great concern to me. AF-37

Also, as mayor, I have not had a single phone call or letter in support of this project.

In a matter of saving time, another job that I have, I represent Representative David Counts. And he could not be here today, so I have a prepared statement for him which says, "Gentlemen: My schedule in Austin would not allow me to be here this evening to express my opposition to the use of the eight counties, seven of which I represent, for low-level training. This training will diminish BR-4

property values, increase noise and discourage economic development in an already economic disadvantaged area. While I am very much for a strong and well trained military, I feel that there are already enough well situated areas to provide adequate training sites. Your consideration of the wishes of the people of the 70th district is greatly appreciated." BR-4 SE-5

Thank you.

COLONEL BURD: I would like to now call on the Greg Henley. The organization he is from is the Tahoka ISD board of trustees. 008010

MR. HENLEY: Yes, sir. Thank you, Colonel Burd.

I am the president of the board of trustees for the Tahoka ISD, and we would like to express our concerns on the proposal for the Realistic Bomber Training Initiative and the possible loss of land values which could result if this initiative passes. BR-4

The Tahoka ISD receives approximately 40 percent of our taxable values from agricultural lands. T-Bar Ranch is one of the top ten taxpayers for the Tahoka ISD, and of those top ten taxpayers, is the only privately-owned entity of that top ten. So we are greatly concerned of anything that would

adversely affect or prohibit this ranch from remaining a viable and active part of our community, which it has been for over 100 years.

Just like everyone in this room, our entire economy is based on agriculture. As everyone knows, this is a economy that is under stress. We have low cattle prices, cotton prices. And anything that would further put a hardship on these depressed economies could be catastrophic to our area.

We are extremely concerned with the conflicts created by having these jets and bombers that would be flying in the same air space with our crop dusters or aerial applicators. These are a vital part of our economy. They are necessary for the treatment of our crops for pesticides. And with the passage in the southern part of our county of the boll weevil eradication project, there will be a significant increase in the number of flights necessary to eradicate these pests. And so anything that would hinder or prevent these applications would have a dire effect on our economy, and so we would question the ability to these flights to be able to be performed with the bombers in the area. BR-2

We also have safety concerns as to the U.S. Air Force pilots, in that our area has a large number

40

of sandhill cranes. These are birds that are quite large. They have wingspans in excess of six feet. They are present in our area for five to six months, and their numbers are well into the thousands. We question the safety of having jets and stuff flying in the same air space with these large birds. **BI-2**

I will share the same concerns we have with the safety of the farms and homes that are located in this area and the effect of their quality of life and value as well.

In closing, we simply hope that the Air Force will be able to have common sense, and there has to be a better place in the way to locate this training initiative. We hope they will abandon their plans for using this area and allow us to continue to have our quality of life that we enjoy in West Texas. Contrary to what the rest of the state believes, we are a viable, productive part of the state and want to remain that way. **PD-4**

I thank you for your time.

COLONEL BURD: I would like to call on Van L. York of Borden County. 008011

MR. YORK: Thank you.

My name is Van York. I am the County Judge from Borden County. Borden County is located just

41

west of Snyder, Texas, here. Borden County is a rural, agricultural based county with a population of approximately 800 people.

We in Borden County have chosen this place and this way of life, an outdoor, a serene -- in an outdoor and serene setting. If the proposed Realistic Bomber Training Initiative becomes a reality, our way of life will come to an end. The quality of life in Borden County will be greatly reduced. This is a fear that has been presented to me by many of my citizens in the past couple of weeks. **BR-7**

From a personal standpoint, my ranch is located on the east side of Borden County, and I have experienced these bombers flying at low altitudes. This has taken place over the last three years. These planes fly from north to south about once every two or three weeks. They are flying about one-quarter to one-half mile west of my house. The noise is so loud when -- that it will drown out the conversation in the house. And on one occasion, I was caught out in the pasture as one flew directly overhead. The noise was just deafening. In fact, it almost hurt. This is what we are concerned with when we talk about our quality of life. **AO-79** **AO-20**

42

We have cowboys who are on horseback daily in these pastures. If one of these planes come over, the safety factor would be highly questionable. It -- it just can't be safe. **BR-3**

It is frightening to imagine 10, 20 or 30 flights a day and the amount of noise and disruption to our peace and quiet that we will -- we will endure.

Also, on another area that I would like to address is from an economic standpoint of our ranchers. We use a type of predator control, which is aerial hunting, to protect these livestock. One of the most effective areas was using these light planes to hunt these air -- these coyotes and bobcats to protect our livestock. These flights -- the B-1 bombers must not be allowed to fly over these private lands. **BR-2**

I am not antimilitary or antigovernment, but a citizen and a Judge of Borden County, and it is my first responsibility to protect the citizens of the county and of my family.

In closing, I will repeat that the Realistic Bombing Training Initiative will destruct our farming industry, our livestock industry and hunting industry. And more importantly, the realistic bomber **BR-4**

43

training initiative will lower our quality of life in the affect counties. Thank you.

COLONEL BURD: I now call on Mike Braddock, Lynn County Commissioner No. 2. 008012

MR. BRADDOCK: Good evening. My name is Mike Braddock. I am here representing the Lynn County Commissioners Court and the people of Lynn County.

I guess what I'm -- it is just a repeat of what has been going on, but I feel like repetition is a thing that really soaks in.

I guess what the main problems are is going to be the private planes that spray our lands and to take care of them. Are they going to have to get permission from you all, or what is going to be the deal on that? Or will they have their own? **BR-2**

And can you actually tell me this will not damage property, and that it will not drop over the 3,000-foot mark? Is this going to damage the foundations on houses, barns or farmhouses that are getting more and more obsolete? **AO-12**

And, also, the training in our area, that is something that a lot of people enjoy, and it is something that we are proud to have in our community. A lot of people come down and hunt, and

44

it -- and I feel like it could be detrimental to the Air Force if they fly in this area. They could either drive the birds out or create even a larger problem, a crash and kill innocent people.

BI-2

AO-16

And that's -- that's mainly all I have to say, except for there are about approximately 6,700 people in my county, and I feel like there are other areas that are a whole lot less populated. Thank you.

COLONEL BURD: Now, I would like to call Vic Burke, the president of the Rotan ISD board of trustees.

008013

MR. BURKE: Thank you for allowing me the opportunity to speak. My name is Vic Burke. I am the president of the board of trustees of the Rotan ISD.

I would like to address some things that I feel the draft EIS did not address. It states in the December '97 meetings, prior to the notice of intent to prepare the EIS, there were meetings held to gain input on the alternatives. None of these meetings were held within a hundred miles of the area of the Lancer MOA, so there was no input for this area considered at that time. Also, only one scoping meeting was scheduled initially within the boundaries

GE-2

45

of the Lancer MOA.

Moving on to some of the socioeconomic issues, I agree with what my colleague from Tahoka said. But, also, there are studies out there that show increased noise causes decreased land values, and they were disregarded or not considered in the EIS.

BR-4

The impact of the Realistic Bomber Training Initiative on land use for tourism and hunting is not addressed. That considers -- they don't consider recent changes in our land use. 20 years ago, 30 years ago, hunting leases weren't important to the income of this area, and now they are vital.

BR-4

Our school district has experienced the loss of approximately 40 percent of the taxpayer value in the past several years. Further decreases could be devastating to our ability to raise funds and continue programs, and that could also apply to our cities and counties.

The EIS doesn't attempt to adequately assess the total economic impact on the area. Cultural resources such as parks and historical buildings seem to be given more consideration than schools, towns, hospitals and homes. An example of that is the proposal to eliminate the overflights of Big Bend in

46

favor of flying over populated, private land. If the impact is truly minimal, as stated by the Air Force in the EIS, why not fly over the Big Bend or the Mall of Abilene.

(PAUSE)

MR. BURKE: The concerns of people actually living under the proposed Lancer MOA are consistently trivialized or disregarded entirely in the EIS. If the impact is not minimal, there is no protocol in place to go back and change it once it is here. I think that we -- I want to submit that it is because the impact is known to be substantial, and that is why some of these areas weren't included. Thank you.

COLONEL BURD: I would like to call on W. Calloway Huffaker. Mr. Huffaker is from the City of Tahoka.

008014

MR. HUFFAKER: Colonel Burd, ladies and gentlemen, Congressman Stenholm, I'm W. Calloway Huffaker, the city attorney for the City of Tahoka here representing the city council of the City of Tahoka to present a resolution against this initiative.

We in the City of Tahoka, population of approximately 2,500, and of the county, approximately

47

7,000, strongly oppose this initiative for the reasons that have previously been stated here this evening and others that we would additionally point out to this group here this evening.

We in the rural areas live in these rural areas for the quality of life. The quality of life is very important to us. We appreciate the quiet, the peacefulness that is afforded in these areas.

Because of this initiative, I would point out that -- to you as an individual and to the people here at this gathering tonight that this is a perfect example of a governmental entity taking advantage of a population that is not comparative to the urban centers such as Dallas, Houston and San Antonio. You are taking advantage of the low population and trying to utilize this initiative to get a -- a flying zone which would benefit the Air Force and impact as few a people as possible.

We in the country do not feel that that is fair. We do not feel that you are taking our rights into account. We would strongly urge you to look at other places which are less populated and strongly urge you to look at federal lands that are not populated to use this initiative.

PD-4

(PAUSE)

48

BR-5

MR. HUFFAKER: Lastly, this is another example of you using our land and not compensating us for it.

(PAUSE)

BR-4

MR. HUFFAKER: If I want to go hunting or fishing on my neighbor's land, I compensate him for it. If someone wants to come hunt and fish on my land, I am compensated for it. You are going to adversely affect my ability to make a living by utilizing the air space above my land, mainly in the hunting of the sandhill crane, which is becoming very prominent in our area. I would ask this panel to strongly look at that.

We in the rural portions of this country strongly support strong defense, and we are not in this to stop a strong defense. We are here to ask you to go somewhere else. Thank you.

COLONEL BURD: I'd like to now call on Mayor Jerry Marshal from the City of Rotan. 008015

MR. MARSHAL: I think I'm a little shorter.

Colonel Burd, thank you, sir.

Like it has been said, I am Jerry Marshal, mayor of the City of Rotan. Also, for the record, I would like to say that I'm immediate past president

49

of West Texas Texas Council of Governments and the Texas Midwest Community Network. And I say that not to toot my horn, but to say that because I fully believe in regional cooperation.

Had this project not being here created a negative impact on Abilene and the City of Abilene and Dyess Air Force Base, then I might not be here. But since it could certainly create a negative impact on our area and the City of Rotan, then I am here.

Much has been said of the quality of life, and you all heard that. We say that over and over to our city folks, because that is all we have out here is quality of life. It is quiet. And in the City of Rotan. We have no trains. We have no -- very few planes. We have no traffic. So, therefore, that is all we have. And hunting is primarily our largest industry.

I also have a letter from the District and County Chamber of Commerce, and they express the same thing that, I think, Dr. Burke and several others mentioned, that there is no -- in the EIS, there has

BR-4

been no significant mention of the hunting industry. That is one of the things that our Chamber of Commerce is beginning to stress, because of the declining cattle prices and the other things, and of

50

course, the oil industry.

It is one of those things -- I guess the bottom line is that the citizens of my city just don't want any extra noise. They like it quiet, and that is the way they want to keep it. Thank you very much.

COLONEL BURD: And our last official is Tommy Stanaland, Kent County Judge. 008016

MR. STANALAND: I am Tommy Stanaland, S-T-A-N-A-L-A-N-D. I am the County Judge of Kent County.

To the honorable Congressman Charles Stenholm and to the distinguished Unites States Air Force, thank you. Number one, thank you for defending our country. Number two, thank you for defending our allies who are in need.

As recent as now, this very moment, the need for training is evident and understandable. What isn't understandable is in this great vastness of the United States, in the huge land mass from border to

PD-4

border, why did you pick Kent County and the surrounding counties and --

(PAUSE)

MR. STANALAND: Sirs, please realize that the people will be subjected to noise

51

BR-4

pollution. They will be subjected to a loss of property value, to a loss of revenue on their hunting leases.

Sirs, our ranchers, our farmers frankly do not want their livestock buggered.

(PAUSE)

AO-50

MR. STANALAND: We don't want our land damaged due to a possible fuel dumpage. We don't

AO-16

want our citizens, our homes, our communities or our lands put in any danger due to a possible airplane crash.

In closing, we the people in Kent County prefer you seek other alternatives for your training program. Thank you.

COLONEL BURD: We are now going to move to the second group of individuals commenting on behalf of themselves.

What I am going to do is I am going to -- to help speed this up a little bit, I will read the name of the individual who is up now and then also read the next person so you can be ready to come on up and make your presentation. And then when I call that person, I will read the person who is on deck.

Now, the first person I would like to call upon now is Brian Kelly. Then after Mr. Kelly makes

52

his comments, then Dick Crill will be the next speaker after that. 008017

MR. KELLY: I would like to express my thanks for coming back over here about a year ago when we had the scoping process.

My name is Brian Kelly. I'm the president of the TransPecos Protection Group. We have been at this nearly three years. What we have found over this period of time is like the draft of the EIS, if you have looked at -- I hope you have all read it. If you haven't, please do. It is very educational. The only trouble is, most of it is smoke and mirrors. We have got about 27 pages that really address what the issues are. I won't talk legalese to you. I would like for you to get into this. Most of all, please, if you would, write, call, contact.

The National Environmental Policy Act is, if nothing else, a participation piece of federal law, statute. Please participate. It is very important. Mail, certified mail, return receipt, to all your elected officials, county, state, federal, senators, representatives, but most of all, of course, to the Air Force.

I'm sorry, I'm not addressing you, but you have heard me for two and a half years now, and I am

53

sure you understand how I feel. I am totally against this, of course.

I am tired of the Air Force and the bombers and the F-16s and so forth trying to fly into my carport space. I have been knocked down a couple of times back in April and May of 1996. It got me interested about, you know, who are these guys? Where do they come from? And we have answered all the questions that I think we need to answer.

We would like to make an executive solution to this, if possible. We have tried, and we have failed. We would like to make a legislative solution to this. Our representative, Mr. Henry Bonilla, has worked very hard on this to no avail. Our Senator Kay Bailey -- I'm speaking of the Air Force -- Kay Bailey Hutchison has done the same thing (inaudible).

The whole point of this, the very -- there is a easy solution to it, really. The solution is the Air Force needs to go fly over some of the 6 million acres of federally-owned land that now exists. It needs to be like training for tanks, training for artillery, training for Army, et cetera, et cetera. It needs to be isolated from the human environment. All you people sitting here live within

PD-7

54

the human environment. There is no difference between military training for the United States Air Force or air combat command or the Department of Defense air forces as there is for Army tank divisions or -- they have just got to be isolated. That is the only solution there is.

So, please, if you would, write your elected officials. We can -- I hope all of you got one of these handouts that we brought with us. We have a book of about 98 pages that we have conditioned into this one part.

But, again, this EIS is exactly like we have seen in 26 others, a joke.

COLONEL BURD: Mr. Kelly.

MR. KELLY: Yes?

COLONEL BURD: Your time has expired.

MR. KELLY: Thank you very much.

COLONEL BURD: Mr. Crill. And then after Mr. Crill will be John Oudt, O-U-D-T. I'm sorry if mispronounced that. 008018

MR. CRILL: Thank you, Colonel Burd.

My name is Dick Crill. I have a comment that is a question about the environment that is the air space above my property where I live at Camp Springs here in Scurry County.

55

For my information, what is your plan to compensate the affected citizens for the proposed military occupation of our environmental air space, whether it is above my property or in any other part of the country? Thank you.

BR-5

COLONEL BURD: Mr. Oudt. And then after Mr. Oudt, Kay Kelley. 008019

MR. OUDT: My name is John Oudt, spelled O-U-D-T. My family and I ranch in Kent County, Texas. We pay school taxes to both Kent County and to the Snyder ISD.

I am extremely upset that -- by what I have read in this draft EIS, and more importantly, for what I don't read in this draft EIS. The draft EIS is extremely complicated, and laypeople must rely on oral statements made by the Air Force, many of which were made here tonight.

For example, the Air Force has repeatedly told the public that they will not fly below 3,000 feet in the proposed Lancer MOA. But if you read this EIS very carefully, you will find out, in fact, that there continue to be four MTRs underneath the Lancer MOA. I am talking about IR-180, with a floor of 200 feet above ground level; IR-128, with a floor of 600 feet above ground level; VR-1116, with of

56

floor of 200 feet above ground level; and IR-154, with a floor of surface level.

Using the usual justification, that this special use air space already exists, the question is, what is to keep the Air Force from using these MTRs for B-1s? The answer that I have repeatedly come up with by conversations with the FAA and the Air Force is very little.

Even more misleading to me is the representation that the new IR-178 MTR leading in the Lancer MOA will have a floor of 2,000 feet above ground level. While that may be true, the Air Force barely mentions that IR-178 directly overlays VR-1116, which has a floor of 200 feet above ground level in those very same segments. What's to stop the Air Force from deciding tomorrow that they need to fly B-1s over VR-116 at 200 feet? Again, the answer is not much.

My most serious complaints about the EIS, however, is what it does not contain. It does not contain any research on noise levels that we will hear in the countryside if the RBTI is adopted.

I was naive enough to think in that the environmental impact study the Air Force would actually study our noise problem. Instead, they just

AO-80 AO-80 AO-25

57

copied some 20-year-old data on urban noise, and then constantly state that the noise will have no significant impact on my life. That is not very comforting to me.

In the scoping meeting, my neighbor and -- my neighbors and I voiced repeated concern over the low-level training, how it would affect our livestock, wildlife and our hunting industry. Once again, we thought the Air Force would actually study our problems. Instead, they just went to the library, pulled out some old existing studies that don't apply to our specific area and shrugged off our concerns as unfounded.

On Page 4-93 of the EIS, the Air -- the Air Force admits that range cattle have not been studied. Our cattle are, in fact, range cattle. That is it?

COLONEL BURD: Your time has expired.

MR. OUDT: Time has expired. Thank you very much.

008020

COLONEL BURD: Now, let's call on Kay Kelley. And then after Kay Kelley, we will call on William J. Weida.

MS. KELLEY: Thank you very much. My name is Kay Kelley. The last name is spelled

BR-4 BR-3

58

K-E-L-L-E-Y.

We are representing the TransPecos Protection Group. It is a group of people that are opposed to the expansion of the military in the West Texas area only these overflights. And we are an informational organization and very concerned for having the best training for our Air Forces, but having these low-level realistic combat training flights over populated private property just doesn't make any sense. There is no way that we can mix these flights with people or anything living, really, under them and come to any kind of compromise that will work.

All of the fears that you have been hearing, we agree with all of them that the public has been telling you. They are very, very, very real. I have been under some B-1s. Also, all the stories that I get told to me -- people have described it as being annoyed. They have described it as they were terrified. We will hope you will listen to us.

This area is very precious to many more people than just the landowners and the residents. This is sort of a sanctuary for many, many tourists and people that just need to know that the quiet and peace and remoteness of Big Bend country is out there

59

for them when they vacation here. They come for the peace and quiet, and I have never seen anyone that wanted to go vacation in a war zone.

Is there a couple of questions I could ask you all at this time?

COLONEL BURD: Well, as I previously indicated, you are certainly permitted to state any questions you have, but this is not a forum for questions and answers.

MS. KELLEY: Well, my questions were that I was wondering -- I recently read that there were 93 B-1 bombers, and we knew about the ones that have gone down in Montana in the mountainside and most recently Kentucky, and I just wondered what happened to the seventh B-1 that had gone down? Is that a -- is that a crash? Is there 93 or is there 94? And that was my concern. I just wanted to find out about that.

Also, I was concerned on the recent -- the previous literature with no-action alternative shows you all flying into other areas, and the one that is in this last newsletter shows you still in 178 and in those areas, and I was wondering about the significance of the no-action alternative as it has been represented in the newsletter. Thank you.

AO-16

60

COLONEL BURD: I call on William Weida. Then after that, Rich Anderson.

MR. WEIDA: My name is Bill Weida. That is spelled W-E-I-D-A. 008021

This entire environmental impact statement is based on projected noise levels, and these projections all come from an Air Force model. This Air Force model is based on data that were gathered in such locations as Amsterdam, Berlin, Los Angeles, Copenhagen, Chicago. There is not a single bit of rural data in this model. As a result, this model has been thoroughly discredited in most places in the world. It is not -- as a matter of fact, the work of Schultz is not even referenced anymore in Europe.

In the United States, there are only two agencies that use this model in an urban setting, and that is the FAA and the Air Force. And there is only one outfit -- and that's the Air Force -- that claims this model is applicable to rural settings.

Now, in 1986, Air Force contract F33615-86-C-0530, issued to Fidel and others, informed the Air Force that this model vastly underestimated the amount of noise that was generated by aircraft and the amount of annoyance to that noise. That was the second part of a study which has

AO-60

61

never been referenced in any EIS. In 1993, the Air Force's head researcher, Lawrence Fiengold, confirmed this finding.

In 1996, Armstrong Labs published a request for proposal which stated that they had no model in -- that could forecast noise annoyance in rural areas, and what's more, what they were doing was not legally defensible, something you are well aware of, because the last two EISs, the ones you copied Appendix G out of, are already tied up in the Courts.

A number of us for the last four or five years have been providing you not only with citations that you could reference to clean up the EIS, but also with specific models that you could use as alternative forecasting models. None of this has been adopted. Instead what we have in this particular case is a model which has been designed by the Air Force specifically to depress noise levels in rural areas and then has been used to try and tell people that they will not be annoyed with the activity that is planned to take place.

Why aren't the approved noise models being used? Very simple. Because if the Air Force was to use them, they could not do what is being proposed in

62

this EIS. Thank you.

COLONEL BURD: I would like to call on Rich Anderson. And then after that, we will call Corky King. 008022

MR. ANDERSON: Thank you, Colonel Burd, for the time limits.

I just -- I am going to associate myself with the remarks that have been made, particularly those by County Judge Ricky Fritz about private property.

However, I would like to say that The West has been under attack by the government for several years now. They have attacked private property through various acts that have been passed in the Congress, the Endangered Species Act, the Clean Water Act, the Clean Air Act and others. And for working people, like Congressman Charles Stenholm, the government would like to see an end to private property. The environmentalists have said as soon as we get all the cattle off of federal lands, they were going to start on private property.

I look at this as Texas. If they drill an oil well on my ranch, and they drilled it 50 or 60,000 feet, whatever they find down there is mine. Conversely, if I want to build a building twice as

BR-5

63

tall as the Empire State Building on our ranch -- my banker wouldn't allow it, you understand. But, theoretically, if I did, I could do it, and nobody could stop me because I own that air space.

In a lot of cities, if you own a -- people have buildings on different sides of the street, and they want to build a skywalk across there, they have to make a deal with the city to either lease that space or buy it. And so here, none of this -- none of this is happening.

Now, there is a Mr. Penley that has written a book. He works for the Mountain States Legal Foundation. It is called War On The West. And, quite frankly, I am sick and tired of it.

I noticed on your map up there a while ago that we didn't go east of Mississippi River. Everything was back west. And I -- and I want to go along with the people that said you should work it on government-owned properties.

Your Commander-in-Chief found well enough to go to Utah, mark off about a million acres there that nobody could do anything in, and the Congress has marked off millions of acres for wilderness areas, and I suspect that the reason for that is because of the environmentalists.

BR-5

64

So I am going to cut to the point here. I am willing to go to the Supreme Court to tell you that I own the air over my ranch, and if you violate it, we are going to find out just how much air I do own.

(PAUSE)

COLONEL BURD: I'd call on Corky King. And then after that, Roy Davis. 008023

MR. KING: Colonel, Charlie Stenholm.

AO-2 I am wondering if this environmental impact study studies anything about the vertices off of wings of low-flying jets. I used to fly a private helicopter on my ranching operations, and it just got too dangerous. At one point, I quit because some low-flying aircraft, oh, about 50 miles south of here over Silver, Texas, a big ranch over there -- these were coming out of Bergstrom. I visited with the people at Bergstrom, and it didn't help. They informed me that, no, they couldn't see me. Yes, they didn't have to hit me or shoot me to make me go down; they just had to be close. And that concerned me greatly.

AO-2 Back on the vertices or the wind off of air tips. I have got pictures of -- I have given one to Congressman Stenholm of a windmill that was taken

65

down by low-flying aircraft. This happens -- has happened through the years many times in Crockett County. And Buddy Baldridge that has already talked earlier knows of three accounts on his father-in-law's country.

The noise level -- my little helicopter, two-seat helicopter that I flew on the ranch one time at 8,000 feet. My guys couldn't see me coming, but they could hear me, my -- my ranch crew. And at -- at 3,000 feet, a B-1, a B-2, even if they don't lower their level, has got to make extreme noise.

I consider myself much into wildlife management. On my ranch out here, there's mule deer, white tail deer, blue quail, bobwhite quail. Yesterday, I saw two turkeys. It's the first turkey I have seen in 16 years I have had the ranch, and one toad frog. I hadn't seen one of those in years.

AO-11 BI-19 What are these hydrocarbons coming off -- out of these planes and fuel burning going to do to these animals? I wonder if it's really been approached in your study. Thank you.

COLONEL BURD: I would call on Roy Baze. And then after Mr. Baze, I will be calling on John Boswell. 008024

MR. BAZE: Colonel, my name is Roy

66

Baze. I appreciate the opportunity to speak here and enter this one page of comments.

I am a long time resident of Snyder. For the record, I love this country and respect the flag. I served in the field artillery in World War II, discharged as captain and spent years in the reserves. Usually, I am a strong supporter of military operations. Today, I would have to speak in opposition to the bomber training initiative for this Lancer area.

I don't see this as a political matter and I don't see it as an opportunity that can only take place in this Lancer area. I have had considerable experience in economic development both as an officer of an international corporation and in projects here in Scurry County. I am very much aware of the economic needs in this area.

Colonel, I am an experienced petroleum engineer and manager. Starting about 50 years ago, some of these Lancer counties were favored, blessed with the discovery of major oil fields. Local economies then shifted from the agricultural base over to the oil base. But, Colonel, oil fields are like people, they get old, they get tired and they wear out, and that's exactly what is happening to oil

67

fields in this area.

In Scurry County, the tax base declined 80 percent in about the last 15 years due to the depletion of oil reserves. It has come from $2.7 billion down to $500 million. The depletion of the oil base is going to continue. It will not get better. Dependence on agricultural is increasing.

I heard the argument the Lancer area is a less costly area in which to operate. However, in my view, national and economic savings come out second best when I size up the adverse economic effects on

BR-4 the area and adverse economic effects on people living here and trying to make a living here when I weigh that up against the fact that, reasonably, these operations can take place in other areas. The federal government controls vast acreages better suited than Lancer private property.

In conclusion, sir, I respectfully enter this opposition. The Air Force considers the Lancer proposal as a win proposition, but I have to tell you that most of us here think it is losing for us. Apparently, the Air Force thinks the bomber incentive is a good label for the program, but I have to tell you many of us here think a better name for the scenario we see is bomber disincentive.

68

It is already challenging enough here to make a living with Nature's forces of wind and declining oil. This area doesn't need or want the addition of a man-made disincentive.

I wish you success in operation, but I wish you would move them somewhere else. Thank you.

COLONEL BURD: John Boswell. And then after Mr. Boswell, Doug Riley, I think, we will call.

008025

MR. BOSWELL: My name is John Boswell. My mother and I run a commercial cow/calf operation in Dawson and Borden Counties on a ranch which has been in our family for over 125 years, and we are members of HEPA. And we also have other members -- ranch families, people that live on a ranch here in attendance here today.

I was sitting here thinking before I got up here what I was going to say, because everybody else has said what I want to say. I want, for the record, to be known that I am in opposition to this. And I also, for the record, want to point out to you that in the almost two hours I have been sitting here I have not heard one argument in favor of the Lancer MOA and its related MTRs and --

(PAUSE)

69

MR. BOSWELL: I want to start off by saying that I do support a strong military, and my comments aren't supposed to be taken any other way.

Since I was prepared to make a longer speech and I only have three minutes, I will try to cut it down. I believe that this country is the greatest country in the world to live in. I have had the good fortune to travel, and I know that this is the greatest country.

It is times like this that it makes me wonder why that such a great country would take it upon itself to seize, or for a better term, confiscate a property right of its citizens. In this case, I believe that y'all are proposing to confiscate the air space over our ranch.

BR-5

And what it really boils down to is it is not a matter of national security; it is a matter of convenience to the Air Force pilots who want to play war games in our backyard, and to heck with the 55,000 God-fearing, tax-paying citizens of this area.

(PAUSE)

MR. BOSWELL: Some months ago, I requested an environmental impact study conducted by the Air Force. I want to tell you that as of

70

yesterday when I left my home, I have yet to receive one. If that is the way you do business, then I just don't know what to think.

I would like to know if anybody has done any studies on the effects on livestock. I have a feeling that they haven't. Have you all done any studies on how this will affect the crop dusters? Not only do they help the farmers, but they also spray for mesquite and other invading plant life on a ranchland.

BR-3

BR-2

And I just really think it's a shame that the military and the Air Force think that some of these hearings are going to pacify our fears when what you are proposing will have a negative impact on a way of life that is sacred to me and many of these eight counties, and it will affect us for years to come. Thank you very much.

BR-7

COLONEL BURD: I would like to call on Doug Riley. And then after that, I will be calling on David Freeman.

008026

MR. RILEY: I am Doug Riley, and thank you for being here today. I want to express my appreciation to be allowed to come up and air one or two of my views.

I thoroughly enjoyed the presentations that

71

have been made here this afternoon. They make a lot of sense to me. The thing that is running through my mind is a couple of items that -- these low-lying, low-flying aircraft and things, there is a lot of activities that go on around here in the ranching and recreation means, and a lot of kids are involved in this. And what happens if one of these planes come over where we got a bunch of kids at a rodeo arena practicing on a play day or what have you and somebody gets hurt? Who is going to be liable for that?

AF-15

You know, we are trying to raise these kids to be good citizens of the United States, but if we are forced into these situations where, you know, we are afraid to do these things on account of these airplanes coming up. There has been one or two come over my house down there, and as it has been stated here earlier, it rattled every dish in my house, you know. And if it comes over after you've gone to bed, you think the barn has blowed up or something.

And the other thing that I want to know is that in the event that you get some horses run over a fence and cut up when one of them planes come over, who is going to be liable for that? Is the United States going to allow us as an individual the same

BR-3

72

amount of money as they allow the Air Force to fight this to see who it is, or are we going to have to do it ourselves? We are bucking a deal there that there is no winning to it.

Another thing that I want to point out that a lot of people here hadn't thought about, in 1970 when the Cuban crisis was going on, the B-1s were flying out of Abilene. They are still flying out of there. What is the motive for putting these in and what effect is it going to have on the Stealth Bomber? Will we be having them next? **GE-32**

COLONEL BURD: Call on David Freeman. And after David Freeman, we will be calling on Ms. Sherry Gicklhorn.

008027

MR. FREEMAN: My name is David Freeman. I live in Wilson, Texas. I work in Lubbock, Texas, and I drive over a half an hour to get to and from work.

The reason I moved out of Lubbock south of Wilson is because I like the peace and quiet, so I am not just real pleased about the proposal.

Secondly, it is a farming community out there. This is in the Lancer MOA. Crop dusters are needed to timely do the application of chemicals for the farmers, and we are a little bit concerned about **BR-2**

73

y'all knocking a few of them maybe out of the sky. **BR-2**

The third problem, we live right next to the Tahoka plate. A gentlemen mentioned earlier that we have got a lot of sandhill crane out there. These flocks are over 1,000 thick. They come in over winter in that area, and that is from March until October. And they fly out every morning, and they catch thermals and they follow these things up just as high as they can go, and then they glide to Muleshoe and then come back in the evening. And it's going to put them way up there. They are going to be in the area where they can do some damage to y'all's equipment and possibly your people, and that is a concern that bothers me. **BI-2**

The other thing is, if everybody here will just for a second think about it, when you are working on your pickup and you got your hood up, and I don't know about y'all, but I'm a little short, and I can't hardly reach everything. You got the bar up. You got a foot or two hanging out, you know, trying not to get your ole shirt dirty and all and trying to do a little work there, or maybe on the stripper or on the combine. And you're about a foot and a half into it, and you got your knuckles about halfway bleeding anyway from doing the work and

74

stuff, and then all of a sudden, wham. That is what these gentlemen are getting ready to do to us, and that is -- you are talking about people getting hurt. This isn't just for grins and looks and stuff. When you are working on cotton sprinklers, combines and equipment like that, you are talking about people getting hurt bad.

They said that the noise level is 42 to 62. They know better than that. That's an average noise level. That's not a single event noise level. The knock out is better than 20 dBA with the possibility that you live in your house with the doors and windows shut. That is making you a trapped animal, but I am considering that.

A power lawnmower is up to 90 dBA. 10 dBA difference doubles the noise. They said 40 to 62. A power lawnmower can do 90. Now, somebody is not telling the truth. I have heard these things before.

A B-1 bomber that's got a four-inch, 13,000-pound thrust engine pushing up to 477,000 pounds of aircraft, and there is no way in the world that those things can fly over you at a couple thousand feet and produce 45 to 62 dBA. That is less than a blender in your kitchen. Somebody is not **AO-81**

75

telling the truth. **AO-81**

(PAUSE)

MR. FREEMAN: The information that they are providing us, they have got better information than that. They know that, for instance -- they have done studies on it. They know that this can interrupt -- interrupt people's sleeping. Anything over 72 dBA will wake up your baby, and it's hard to explain to a kid what is going on. It can cause increase in suicides, increase in cardiovascular disease and interrupt your school activities.

That's about it. I appreciate it.

COLONEL BURD: Thank you.

Ms. Gicklhorn. And then I will be calling on Preston Brouchard after that.

008028

MS. GICKLHORN: My name is Sherry Gicklhorn, G-I-C-K-L-H-O-R-N, from Lynn County. I'm a farm wife, and I also represent FARM, which is a group of concerned farmers, active business people, ranchers and merchants.

I would like to express thanks for being able to attend tonight and also to be able to voice our concerns regarding the recent critical information that we have obtained regarding the proposed military exercises being conducted over

76

eight of our area counties, including our own county of Lynn County.

While we clearly understand and want our military to be well-trained and combat ready, we do not want these military training exercises to take place over these populated counties.

PD-7 Our federal government owns millions of uninhabited areas and acres in other states that these training exercises could be conducted in. There is absolutely no reason why 50,000 plus citizens of our eight-county area should have to be put through this major disruption and also loss of certain property rights and piece of mind.

We are also extremely concerned about the fact that much of these areas in these counties is farm and ranchland. Besides all of us citizens, livestock, wildlife, farm and ranchland that will be adversely affected by these training exercises, our farmers and ranchers are already in extreme crisis. Please do not put them in further crisis. Our small towns also need to be protected, not hurt.

Please understand we are very supportive of our military, and we understand they must stay trained for our country's future and protection. We would greatly appreciate understanding our position

77

and our concerns regarding this serious matter. Please hold these trainings elsewhere. And I do oppose this Realistic Bomber Training Initiative.

COLONEL BURD: I would call on Preston Brouchard. And then after that, I will be calling on Buster Welch. 008029

MR. BROUCHARD: I am one of a family that owns the Coleman Ranch in Scurry and Mitchell County, and I came here from California where I live to protest because I think it's an extremely bad precedent that -- it preempts a person's right to complain about flights.

Now, if there is a U-2 spy plane or something at a great altitude, that doesn't make much difference. If they are down at 300 feet, we ought BR-5 to have the -- our property rights extend at least that far. As you go up, maybe our property rights get smaller. But as it stands now, we have a right to protest and to make complaints and to -- but the Air Force is going to get a preemptive right on this ability to protest, it seems to me.

I can see why they would want to do something like this, because now they have to make settlements with individuals and go to Court occasionally and pay damages. I know some of that

78

will continue, but it -- it preempts our ability, and I think this is a first -- I don't think this kind of thing has been stated before where they take away your ability to -- to protest anywhere from 300 feet to 5,000 feet against citizens.

I also differentiate this from the way things were done in World War II bomber training. There was a target on our ranch which the -- the Air Force -- in Big Spring, at least they went around leasing certain lands from everybody. There was compensation. So I think that that's lacking, and it certainly should -- should be there. Thank you.

COLONEL BURD: I now call on Buster Welch. And then after Mr. Welch, then I will be calling on -- I am having trouble reading this -- Jerry and Nancy Swafford, I believe. From Lamesa, Texas, if that helps. 008030

MR. WELCH: Thank you.

I am Buster Welch. I am president of HEPA, and I'm here to object to the RBTI, and I want to go on the record as that. But I want to say that I am real proud of our Air Force. I appreciate your coming and listening to us, and I want to thank the honorable congressman there for being here. And I think -- I want to thank all of you all for being

79

here, and I am proud they got to see real people.

These are real people here. I want you to look at them. They bought a one-way ticket to come here and make a living and raise their families and educate them, and it is not an easy life. It can be hard, but it is a good life, and we love it. And we PD-4 want you to think about going somewhere where there is not inhabitants. If you don't have it, buy it. And the -- that is the way we got our land, we bought it.

(PAUSE)

MR. WELCH: And I want you to know that I am patriotic. I want you to know that I am for fair. Now, if you want to get fair, well, I'll tell you what I will do. I will give up my ranch to train bombers on if all the Air Force colonels and generals will give up their retirements and all the politicians that want to bring this into Texas will give up their retirement plans. We can save the government a whole lot of money.

(PAUSE)

MR. WELCH: You know, if we are going to talk about somebody sacrificing, let's all get in it together.

You know, I have three -- I have one

80

minute. I have three legs that supports my business. They are hunting, they are riding cattle and they are horses, and a lot of our horses that is in our town. And cattle is my biggest income. And I -- I run 14 or 1,500 mother cows. And I sell to Coleman Natural Meats and Supreme Beef, and I probably get an average of $15.00 over the sale barn market.

But I have to ranch those cattle. I have to be out there. I have to seek them. I have to have people out there. And I don't let anybody slam a pickup door at the wrong time when I am working cattle, and much less fly one of them big airplanes there. **BR-3**

And the thing that I depend upon most is my hunting. Since I have been out here 12 years, my hunting has tripled as how much money it brings in. **BR-4**

I want to thank you tonight.

COLONEL BURD: Jerry Swafford. And after that, I will be calling on Jim and Carol Wilson.

008031

MR. SWAFFORD: Thank you, Colonel.

I am Jerry Swafford, S-W-A-F-F-O-R-D. And I thought I'd sign in with my wife tonight, but she is not going to speak.

81

My family and I have owned land in Dawson, Terry and Tom Green County for 75 years and operated businesses. My concern today is safety. I have over 8,000 hours as a pilot in command. The majority of it is ag time in what you would call spray flying or crop dusting.

Let me tell you the realistic truth. About eight years ago in 1992, or somewhere about that time, I was about 15 miles north of Lamesa in northern Dawson County crop dusting, and I was headed to the east one afternoon about 4:00 o'clock. And as I come up in my turn, you normally -- the lane I was flying, the way it was loaded, it gets to about 150, 170 feet at the peak of my turn. As I was in the peak of my turn, I looked to the left where a shadow flipped across me. I looked up to my right, and there was a B-1 bomber that went over me at probably 300 feet. We were within 120 or 30 feet of one another. So that will bring realistically to you the hazards and -- of this program. **BR-2**

I had two more instances I would like to -- to relay right quick. I have a ranch in San Angelo, Texas, and in January of this year at about 12:20 at night I was laying in bed asleep, and it sounded like -- just immediately like a bulldozer pulled up

82

in your front yard with the motor wide open. I jumped out of bed and went out, and there was two black -- those big, heavy helicopters beating. They were probably 100 feet in the air or 100 feet east of the ranchhouse, and they had no lights on. The FAA requirements are to have certain types of beacons and lights running at night. The military, I assume, can get around those requirements.

This last Saturday morning, a turkey hunter came in and said, "What was happening last night, Jerry?"

And I says, "What do you mean?"

He said, "There was a helicopter out over the ranch with a spotlight flying when I came in last night." And I assumed it was a military helicopter out of Goodfellow. Thank you.

COLONEL BURD: Call on either Jim or Tim --

MR. WILSON: Tim.

008032

COLONEL BURD: Tim and Carol Wilson. And after that, I will be calling on R. J. Grossman.

MR. WILSON: I am Tim Wilson from Borden County. We are ranchers, and we are clearly in opposition to the Proposal B. I agree with everything I have heard here, and my comments will

83

reflect very much what I have already heard. But -- but I wanted to present our comments representing our family more from an emotional viewpoint, and I think I represent most of the people here.

80 years ago -- really, a little longer than that -- my wife's grandfather purchased the ranch that we currently live on with our two young children. We are the third generation, and I can assure you that the cattle business was much better back in those days than it is now. And I think you could probably say that about all of agriculture. And when you look on the horizon, there are very few bright spots out there.

So the question would naturally be, well, why do people stay here like that? We are young, and we have young children. Why would you want to live out here? And the answer is very simple, and you have heard it from Mr. Welch and a number of other people. It's because we can live out here with our neighbors in which is essentially a pollution-free environment with a significant lack of noise pollution. It is probably our only great luxury that we have out in this region of the United States is that we truly have peace and quiet. It's a phenomenal thing to have that. A large percentage of

our citizens in this country have never experienced it. It has been that way for three generations for the family in the ranch that we live on.

BR-7

If this Proposal B is passed, that is all gone. I mean, it is gone overnight. Poof, it is gone. And, to me -- and it is not gone just for us; it is gone for all of these other good folks here and the people that aren't here. And with all the difficulties that this region is facing that you have heard about today, it would seem to me that approval of this proposal is just knocking people or kicking people that are already down.

Personally, as a taxpayer, I think that our state and federal lands should be used for this training. I think it is completely unfair to adversely impact private property when there is so much public property available. The urban patrons of these lands, if it is the Big Bend or the Yellowstone or whatever, those people would not want their homes impacted in such a way as this. I think it is simply unfair.

PD-34

COLONEL BURD: Call on R. J. Grossman.

(PAUSE)

COLONEL BURD: And R. J. indicated maybe, so I will take that as a no.

And I would like to call on Greg Pruitt now. After Mr. Pruitt, I will be calling on Terry Gillam.

008033

MR. PRUITT: Sir, my name is Greg Pruitt, and I am here as a representative for the Rotan Development Corporation. I would like to read a statement from this board.

The Rotan Development Corporation wishes to express our opposition to the military project known as the Realistic Bomber Training Initiative. Our opp -- our opposition is based mainly on that this project could greatly damage our fragile local economies.

Our board administers the 1/2 cent sales tax for economic development in Rotan. Our local economy is based primarily on agricultural, cotton farming and ranching and that type of agricultural. However, there is a growing interest in this area in many types of bird and wild game hunting, and a military project such as this could greatly damage this part of our economy.

BR-4

Another very important part of our economy, cotton farming, is at a critical stage in boll weevil eradication. We cannot afford interference with our planes that are flying insecticide during this

BR-2

period. There is no guarantee from the military that there won't be conflicts over air space in the area that is involved with this boll weevil eradication. Boll weevil eradication is also supported by some federal funding, as well as this project would be, so there is a conflict there, and we see that as a problem.

Private property rights are very important in this part of Texas, and there are studies also based on similar type projects that have shown significant decreases in property values. There is no potential for any kind of property value increases. And like it has been said before, there is federal lands available that this project could be used for, and we feel strongly about that.

BR-4

As a board, we are always looking for projects that help our local economy and the people that choose the rural life-styles that we enjoy. People in this area of Texas aren't antimilitary or antigovernment. However, we do not want projects forced upon us that will alter our quality of living.

BR-7

Thank you for your consideration.

COLONEL BURD: I now call on Terry Gillam. And then after that, I will be calling Joel

Dennis.

008034

MR. GILLAM: Gentlemen, Mr. Stenholm, my name is Terry Gillam. I'm a small stock farmer, and so I may not know as much as some of the rest of you do, but I do appreciate the information you have put out.

The people who produce the livelihood for the armed services are being abused by that same armed service. Not many people who come into power use it wisely. There will be many people that I know that are allergic to gas fumes, some of them being my friends and one of them my wife, that it will be extremely painful and harmful to her.

AO-62

I have a lot of other things in here, so if you'll be patient with me, well, I will skip over a bunch of it, because much of it has already been said.

We waste much money in government at home and overseas helping nations who are our enemies, so it would not be a waste of money to fly over desert areas, build towns, fake ones, to practice over. It would be a saving when you look at the complete picture.

One more example that I know personally about, in World War II in Houston they were flying

88

light aircraft, the cadets were, and they would come in and tell of the fun they had. One of them, he flew in and over a farmer on a tractor, and the farmer on the -- was so afraid, he jumped off of his tractor. His tractor went through several fences and ended up in a ditch, because it didn't have anybody to take care of it. There will be much of this, and the excuse will be low-level flying. There will be cows to be brought back home, fences to be repaired, and no kind of compensation will be able to pay for the trouble that we will have.

AF-15

Is the additive, ethyl diprobine (phonetic), being added to JP8 jet fuel? This additive was removed from gasoline in 1960 due to its toxicity to the people. Several sources say it has been added.

AO-31

I thank you.

COLONEL BURD: I'll call now on Joel Dennis. And then after that, I will be calling on Mark -- and I can't make it out -- G-L-Z-E-S, maybe, of Snyder, Texas.

008035

Mr. Dennis.

MR. DENNIS: Colonel, Congressman, I appreciate the opportunity to come.

My name is Joel Dennis, and I am a rancher in Borden County. I am also the president of the

89

Texas Wildlife Damage Management Association, which is a cooperative between the United States Department of Agriculture, the Texas A & M University system and ourselves to protect the livestock and wildlife in parts of the State of Texas.

My main concern here is safety. We have helicopter pilots and gunners which are -- many times are local trapping personnel, and they are in the air at random. We hunt when the weather is good, which we try to take advantage of as often as we can. They also fly supercubs. We range to low-level.

BR-2

But when I was speaking to my helicopter pilot that I flew with Monday, I asked him a scenario. I said, "If we were surveying the countryside and looking for predators at 150 feet, and we got passed over the top by a B-1 at 300, where would we be?" and he said, "Dead," and that kind of struck home.

The tornadic winds coming off the wing tips would obviously be devastating to a lot of our private aircraft that are flying, looking at the ground, and they are supposedly in our air space here close to the ground that we thought belonged to us.

AO-2

BR-5

I want to close by reading a small statement from the EIS which says, "Aircraft emission and the

90

potential for aircraft mishaps would be inconsequential." Thank you.

COLONEL BURD: Mark, are you -- are you here?

UNIDENTIFIED PERSON: It is Mark Glass.

COLONEL BURD: If you are here and would like to speak, please come on up.

(PAUSE)

COLONEL BURD: I would like to then move to the next speaker, and that is Ray Alderman. So if Ray Alderman is present and would like to speak, please come forward.

After Mr. Alderman, I will be calling on Wendell Strahan.

008036

MR. ALDERMAN: Thank you, Colonel. I am happy to be here, and I appreciate being able to talk to you.

My name is Ray Alderman, and I live at Winters, Texas. We ranch in Coke, Nolan and Kent County, and, of course, my reason for being here today is because of our Kent County operations. My son, George, operates the ranch, which is eight miles north of Clairmont. It is known locally as the White Camp Ranch. George lives there with his wife and

91

four children. They pretty well work the ranch by themselves. All the kids have horses.

The ranch has two sources and only two sources of income. One is the sale of cattle and the other one is hunting leases. We have been real fortunate on hunting leases. We have people coming from Virginia, Tennessee. They come there and hunt quail. It is some of the best quail country in the state. The proposal that you have to fly low level over this land would be detrimental to our operation.

BR-4

We are not new to this business. My grandfather came to Texas in 1869. This fall, we will have been in Texas 130 years.

I will shift gears on you now and tell you that I do honor the Air Force. I am an ex Air Force pilot, a fighter pilot, and I graduated from Williams Air Force Base, fighter training in the FAD, which was the first jet that got down to the squadron level. I transitioned to the F-84 at Luke Air Force Base. We flew low-level missions over southwestern Arizona. It is a tremendous amount of country there. It was live ammunition, flying at altitudes, so you know there had to be plenty of room underneath. That gunnery range is still there. It

PD-4

92

PD-4

is not being used. Luke was closed down as far as tactical aircraft were concerned.

BR-4

Do I think that low-level flying will be detrimental to our ranching operation? I certainly do. And what -- but I have no desire at all to interfere with the best training that air crews can get.

But, you know, we own something like 145 million acres that belongs to the government. You have got places you can fly over Snyder at 50,000 feet and see Fort Bliss out at El Paso. They have got a couple of million acres there. You are not dropping ordnance with these airplanes. You are simply shooting electronic messages.

PD-4

Why something couldn't be worked out where the Air Force could use some of these millions of acres that the government already owns in place of imposing themselves on private property owners beats the hell out of me.

COLONEL BURD: I would like to now call on Wendell Strahan. And after that, I will be calling on Mark Kirkpatrick.

008037

MR. STRAHAN: Thank you, Colonel.

Most of the comments that I have have been covered. I -- I have one comment, and this is an

93

observation, since we don't have answers to the questions. And that is, your military operating areas, MOAs, now existing between Abilene, Big Spring, Lubbock and Wichita Falls were utilized by air bases that are now closed. Webb Air Force Base in Big Spring was closed, and Reese was closed, but they never seem to abandon military operating areas. With that premise, I would presume your proposed new area would be just as permanent, and we are not talking about something temporary.

The other comment is that our Air Force and our neighboring forces are now training -- and I don't know where -- but they sure look competent on TV, and so they must be training somewhere. And I would think to go back to that place where you are training now. And if the premise is that you don't have the fuel to get there, I think our economy, if it is supported and continues to grow and pays taxes, will pay for that fuel.

PD-41

In answer to -- I believe Mr. Boswell mentioned the environmental study. It didn't mention the noise cost or what cost it might have on livestock. Well, on Page G-13 of that study, I noticed that it affects livestock as follows: The sporadic jumping, galloping, vocalization and random

BR-4

94

movement. I invite your environmental people to stand in a corral that has been suggested here with either livestock, cattle or horses, or mount one, and let's send a bird over and see what happens.

And I thank you.

COLONEL BURD: Call on Mark Kirkpatrick. And after that, I will call on George Newman.

008038

MR. KIRKPATRICK: Colonel, my name is Mark Kirkpatrick, K-I-R-K-P-A-T-R-I-C-K, from Post, Texas. I am also a member of the school board in Post.

I would like to concur with what everybody has said here this evening. I would like to reiterate a couple of points. Number one, that the economic impact it will have on our school districts and our -- our governments as far as the land values falling. I think mostly ranchers will be the first people in the appraisal offices, if you start flying jets over their land, to try and get the appraisal district to lower their land values, because it is not worth as much.

BR-4

Secondly, I would like to say that this -- this part of the country is very unique, in that we have got several people here that represent fourth

95

and fifth generation ranchers. Their families were some of the first people in these counties. And if -- if you are going to consider the endangered species of animals, why don't you consider the endangers species that this may become as these kind of acts continue. Thank you.

COLONEL BURD: I'll call on George Newman. And then after that, I will be calling on Glenn McClarity.

008039

MR. NEWMAN: Thank you, Colonel, and thank you, Congressman Stenholm, for being here.

I am George Newman. I am a rancher, and I am a professional biologist. I have my Doctorate Degree from Texas A & M in wildlife biology. I have been involved in writing and researching several environmental impact statements over my professional life. But unlike the rest of the people that have spoken here, I already ranch under one of these low-level flight corridors.

If you will look at your map that was provided to us by the Air Force, you will see a dark line, and you will see the northernmost point of that line where aircraft come from the southeast and turn at that northernmost point and go to the southwest. My house is right at that point, my ranchhouse in

West Andrews, Texas, and Eastern Lea County, New Mexico, and I get low-level flights all the time. It has been particularly bad with the B-1s over the past several years.

I was in this position that the gentleman spoke of just a few minutes ago. Four or five cowboys, myself included, had just rounded up a six-section pasture. We had just penned cattle, cows and calves, about 200 of them, in a gathering pen when two B-1 bombers came over at treetop level one right after the other. Of course, we had cattle that broke out. We had several crippled, though not permanently. We had horses pitching. The cowboys were good enough to stay on them. One of the B-1s circled and came back over. Why? I don't know. I don't know if they were enjoying the rodeo or what.

AF-8

I have been in a pasture when I felt the muscles of that horse tense up before I could sense anything. I saw the wild-eyed look in his eyes, and then I felt the rumble as the B-1 came right over my head.

BR-3

I suggest to you that some of you be in that position. I will provide the horses. If I don't have enough, I am sure Buster Welch will provide some horses for you. But come on out, and let these

people that have written these environmental impact statements be a part of that so that they know exactly what it is that is happening to them.

I, too, support the armed forces. I appreciate them very much. Only in this country could we come and speak like this and not be fearful of what might happen to us.

So thank you very much.

COLONEL BURD: I now call on Glenn McClarity. And after that, I will be calling on Doug Thompson.

008040

MR. McCLARITY: Hello, Colonel Burd.

For the record, my name is Glenn McClarity. I have been a resident of Scurry County for 19 years and have employed during those 19 years as the chief pilot for Patterson Energy, Incorporated, which a publicly-held oil well drilling company.

As the corporate pilot for Patterson Energy, my job entails flying our company personnel to and from Winston Field in our turbo crop aircraft to varying destinations. I fly approximately 300 hours or 75,000 miles a year.

My purpose in speaking to you this afternoon is to register not only my personal opposition, but also the opposition of the management of Patterson

Energy, Incorporated, to the proposed RBTI.

In the limited time I am allowed to speak, I would like to address the concept of military operating areas, or MOAs, as they are commonly referred. We have a saying in aviation, MOAs are like flies. They are everywhere, and they breed constantly. They are large blocks of public air space designated by the Federal Aviation Agency that are allocated to the military for their inflight training purposes.

Whenever MOAs are in use by the military, the use of that air space is denied to civilian air traffic that is operating under instrument flight rules. When that air space is denied to civilian use, we have to go under, over or around that MOA, regardless of the weather conditions. I recognize the Air Force's need for MOAs, but I question the necessity of even more air space being gobbled up by the military.

BR-2

Here is an interim chart. From the far left side of the chart is El Paso, Texas, to -- the southeast quadrant is San Antonio. Lubbock is at the very top. Snyder is just about in the middle. The red areas that you see entail military operating areas. They got a bunch of them. There is millions

of square miles of air space there, and yet the Air Force wants more. They are proposing the additional large and very inclusive Lancer MOA that will literally sit on top of Scurry County, Snyder and Winston Field and the surrounding countryside.

Once the Lancer MOA is in place, general aviation aircraft arriving or departing from Winston Field will be subject to numerous restrictions that will result in both takeoff and arrival delays.

BR-2

In terms of national security? Perhaps it is more accurate to say in terms of U. S. Air Force convenience.

I only wonder why the Air Force couldn't waive this convenient intrusion into our backyard and utilize the air space that has already been designated for them. Go west to Mt. Dora. Go south next to Texon. Go fly the low-altitude training groups above Alternative C or D, but please don't come to Scurry County. Leave our air space as it is, and let us get on with the job of raising cotton, cattle and kids in some semblance of peace and quiet. Thank you.

COLONEL BURD: I'll now call on Doug Thompson. And then after that, I will be calling on Gary Lawrence.

100

008041

MR. THOMPSON: Thank you.

My name is Doug Thompson, and I serve as volunteer and executive director of HEPA. And as most of you know, probably from being out in the lobby, we oppose this Alternative B. And I am here tonight as the executive director and here to speak on some of the administrative things we are concerned about.

The first has to do with where this hearing was originally scheduled. I don't know how many are aware that down the hall there is a room, the lunch room. If you go look in that, there is a lot of pillars, and it maybe will hold about 100 people or so. There is 438 people here tonight. The Air Force thought that room was going to be just fine. As a matter of fact, the high school told the Air Force about the inadequacies of that room, and the Air Force said, "Don't worry about that. That is all we need."

The second issue -- and Mr. Boswell made the point early on -- he hadn't got his environmental impact statement. Well, the Air Force knows this, and I will tell you that, from what we have heard, the Air Force has sent out about 1,200 copies of the environmental impact statement. We gave them about

GE-26

101

500 of those names on our own, so that shows you where the other -- how much research was done to get those out.

They had one library for this whole eight-county area where they were going to send the environment impact statement here in Snyder. We got them -- we gave them five of our libraries when we saw what was happening, and asked them to send it to Post, Rotan and some of the other ones.

GE-26

So a lot of people -- we have been calling people. We called about 600 people on our mailing list last night or over the last week to get them to this meeting. A lot of people go to church on Wednesday night in the part of the country, so this is a very inappropriate night for this meeting. We have got 438 people, but there is still a lot of people in church praying for us. But we have got these people here, and I encourage you to send those letters back in.

GE-2

But if it wasn't for the work that HEPA has done -- and we are not trying to pat ourselves on the back. But what the Air Force was doing was they placed one ad for this meeting. In all of the eight counties, they placed one ad last week in the Snyder newspaper advertising this public hearing, and that

GE-22

102

was filled with a lot of other things about how their EI -- the environmental impact studies in New Mexico. We didn't need to know that.

HEPA has run a series of three ads in eight newspapers for the last month or so. We also paid for 50 radio spots in Snyder to get people here.

Somewhere, someone made a decision in the Air Force of how much money was going to be allocated to telling the people in this eight-county area about what was going to be ongoing, and we think they made a serious error in judgment in terms of what was going to be going on, because people here are very concerned about what is going on.

And we just would like to encourage all of you to continue to share with the Air Force your concerns of the opposition. Thank you.

COLONEL BURD: I would like to now call on Gary Lawrence. And then after that, I will be calling on Powell Box.

008042

MR. LAWRENCE: Colonel Burd and Congressman Stenholm, thank you for the opportunity to speak at this hearing.

My name is Gary Lawrence, and I am president, chairman and CEO of Norwest Bank in Lubbock. I am also the past immediate chairman for

103

the last three years of Market Lubbock, Inc., which is the city economic development corporation. So I have spent some time not only in Lubbock looking at our economy, but also this entire region because we are kind of linked together. Our bank serves customers from as north to Dalhart, Texas, east of Paducah, Texas, west of Seminole, Texas, and south to Abilene.

Environmentalists talk about endangered species. And Mark Kirkpatrick, he kind of stole my line here, but I think it is worth repeating. I am here to tell you that ranchers in West Texas are becoming an endangered species due to the price of cattle and the amount of capital to operate a ranch today. I am real worried about our future in West Texas in some of these critical areas.

Ranchers have turned to hunting and hunting leases to create income. Not supplement income in many cases, but to create income to survive in these days. I have a small customer in Kent County that, without hunting income, would have gone out of business the last two years. If wildlife is harmed, then the resource of -- the source of income will deteriorate and more ranchers will go out of business, in my opinion.

BR-4

104

Recent sales of ranches have been to -- mainly to rich people from Dallas and Houston and other big cities in Texas, because our people don't have the -- the wherewithal when you can't make any money raising cattle to make debt service payments. These people from the outside towns, they want wildlife and not noise. They want to get away from noise, not come to it.

This proposal, in my opinion, will lower the future land prices in this area and will reduce the borrowing bases for borrowing customers, which will -- which will contract an already depressed economy in this region.

With great respect, I hope this proposal is not implemented. Thank you very much.

COLONEL BURD: I would call on Powell Box now. And then after that, I'll be calling on Tory and Brenda Remy.

008043

MR. BOX: Yes, my name is Powell Box. The last name is B-O-X.

I tell you what, I was raised in West Texas all my life, Sweetwater, Roscoe. I always had a dream of owning my own ranch. Me and my wife worked our tails off, earned the money and bought the ranch. We are out here 18 miles northeast out toward

105

Buster.

And just Tuesday morning, our kids were taking a nap, and eight helicopters flew right over the house. I wouldn't have spoke if that hadn't have happened. It woke both of our kids up. It woke me up. I was home sick.

And now, that is not livelihood, people. That is not -- we moved out there to have peace and quiet. We have a big wheat field around the house. The mule deer, 60 and 70 of them, come in there every evening. I have seen it with my own eyes, these helicopters and planes come over. Those deer, they don't stay in the fields. We don't even hunt them. We enjoy them. We can't even enjoy them now.

Our livelihood -- I want my kids to have peace and quiet. I want to know when I send my 4-year-old out on his little pony, he ain't going to get bucked off out in the pasture or run off with. Those are my concerns as a father, and those are my concerns as a citizen of Scurry County.

BR-3

I have been here all my life, and I am doing what I do. I've worked in the oil field, too. My day starts at 5:00 every morning, and it ends at 10:00 after the news every evening. What about the quality of sleep? You all talk about all these tests

AO-26

106

that you all have looked at, all these examples. What about me? What about my family? What about the other ranchers and farmers and just people that enjoy the countryside just to go out and have a nice restful night?

If I wanted planes, I would have moved to Irving, Texas. I want peace and quiet. I want a good surrounding for my family and my kids, and that is all I have to say.

COLONEL BURD: Call on Tory and Brenda Remy. And then after that, I will be calling on Mark Graham.

008044

MR. REMY: My name is Tory Remy.

I have been involved in litigation with the Air Force in another low-altitude route for about a year and a half now. There are tremendous similarities between the two suits. This will not stand up in Court. Unfortunately, this is where it is headed. I think you know it won't stand up in Court. You have heard plenty of people talk about the inconsistencies and the disinformation that has been perpetrated on us.

I think that it is really wrong to spend so much time and effort and taxpayer money trying to perfect a mistake. I think it would be very

107

important to consider that substantial investment, which we will all have to make if we finally get to litigation on this, is not the right thing to do.

I am not only promilitary, I am something of a hawk. I believe if you don't want to fight, you'd better be ready to fight. I believe that very much. Our founding fathers were that way.

There is some issues here that they had to really struggle with. One of them had to do with how to have the military be big and strong and good and serve a country and not run it. One of the things they came up with was the Third Amendment.

I have had the personal experience of being in my house and happened to get buzzed by a fighter and have conversations disrupted, felt the vibration inside and run outside to see it disappear above the barn before I could even get to the front door. And I was so thankful no one was shoeing a horse in there at the time.

AF-8

This is an intrusion into the home. This is a Third Amendment issue. This is not just a debating issue. These guys say right there in EIS that they are going to obey the Federal Aviation Regulations and miss your house by 500 feet. That airplane was more than that away from me, and it wasn't at the

108

ungodly speeds that these airplanes are going to be flying, and it wasn't a B-1; it was a fighter plane. That is a Third Amendment issue. That is not open for taking. Our founding fathers saw to that.

BR-5

The military does not have the right to take a portion of the value of your home and cause you to have to support the military. This country is not set up this way.

I believe the patriot is one who loves and defends his country. I believe that we can defend our country, and we can try to see that the military is not able to wrongly confiscate property, and that it should service this country. Thank you.

TY

COLONEL BURD: I would like to call on Mark Graham now. And then after that, I will be calling on Carla and Dan Ducet.

008045

MR. GRAHAM: Congressman Stenholm, I'm glad to see you. Officers.

I am Mark Graham, G-R-A-H-A-M. I have been a pilot since I was 15. I have lived in Scurry County as a resident for over 20 years sometimes as a rancher, and like in the audience, always a taxpayer.

Now, Glenn McClarity really kind of stole my thunder on the MOAs. Earlier today, I counted them

109

in Texas. 41 Texas MOAs. The Reeves one, two and three are 75 by 100 miles. In New Mexico, I counted 16 with the size of 200 by 100 miles with a roaming of 5107 bravo. And like the other gentlemen, I agree that the MOAs tend to expand and never retract.

And that is all I have.

COLONEL BURD: I now call on Carla and Dan Ducet. And then after that, I will be calling on Mike and Molly Tatum.

(PAUSE)

COLONEL BURD: We will move on with Mike and Molly Tatum then. After that, I will be calling on Robie Robinson.

008046

MS. TATUM: Thank you.

My husband wasn't able to come tonight, so I'm -- I came just so I could become more aware about the bomber training and become more -- get more involved in what was going on in my community, I guess.

I have heard a lot of people talking about this, but this was the first meeting I had really been to. And I came here tonight hoping that some of my fears would go away after this meeting, and that I wouldn't be so fearful of what is happening to my home life.

110

We also recently had a plane to come over our place that spooked our horses and was very disruptive to our household, and it was very frightening to me.

AO-42

And unlike most of the people here, we are not ranchers. We have a small piece of property here in Scurry County, and we have been able to raise a little bit of livestock and two kids on that. Our children are very involved in showing horses and rodeoing, and we spend a lot of time in our roping pen with other friends and their kids roping.

And just for the record, my dad was Doug Riley that spoke a while ago about the kids in this community that do spend a lot of time going to rodeos, horse shows and just riding with their parents. There is a lot of babies out there, folks. There is a lot of these ranchers out here, they just don't wake up one morning and become a cowboy. They have got those kids on horseback, and they are 3 and 4 years old, so their parents know where they are when they are working cattle. Something like this comes through and you are out there getting them, it could be devastating.

And I -- I guess I came here tonight because I really felt like I was going to hear that the

111

planes wasn't going to fly that low and these things wasn't going to happen. But after my dad sat down, a man from the Air Force come and give him a piece of paper saying who we could contact if our horses get cut up or if our kids get killed. This doesn't make me feel any better. I'm sorry.

COLONEL BURD: I would like to now call on Robie Robinson. And then I would call on Marshal Bennett.

008047

MR. ROBINSON: My name is Robie Robinson, R-O-B-I-E, R-O-B-I-N-S-O-N. Not only do I live here in this area as a landowner, but I am also an elected official. I'm the elected county attorney of Fisher County, Texas.

I think there is some common ground here that hadn't been considered yet. I want to join Congressman Stenholm and everyone else in thanking you all personally and the rest of the Air Force for providing us the most efficient and best-trained military in the world. There is no question about that. I watch CNN. I read the newspaper every day. We have some very efficient fighting men and women working for us. It is also affordable training that they get; otherwise, they wouldn't have gotten it already. They are already getting it without any

PD-1

112

undue burden on the private sector, those of us out here who are not in the military.

PD-1 Alternative A, no action, will allow this to continue, so we can keep seeing the same positive results in the newspaper, and we can be proud of what we have.

BR-7 Quality of life is a very important issue that was not really addressed adequately in this draft EIS. Quality of life, according to that, boils down to what makes people happy. Quality is not -- of life is not simply a decibel noise level. There is a little bit more to it than that.

BR-4 As Dr. Burke and several other people pointed out, in agricultural income hunting leases are becoming ever more important. Hunting and tourism, whether it is fishing, hiking, camping, those things are what are going to make the difference for people to stay around and keep raising cattle and for people to keep living in this environment.

What we have to offer is not Time Square. It is not Disney World. We can't offer people lights and sounds. What we have is exactly the opposite; we have peace and tranquility that we can offer to people.

113

This draft EIS evaluates animal behavior and results to noise, but it ignores human behavior in terms of whether these people are actually going to come here and provide us the income that lets us feed and educate our children.

You say that the Lancer MOA saves money. Well, maybe it does. If it does so, every penny it saves it puts on our backs. You choose a small area like this without enough people to oppose it and ask them to shoulder that entire burden, and we can't do it. We cannot do that and stay around. It will put people out of business. We rely on that too greatly.

I am asking you now to go back and look at the social and economic impact of the -- of the Lancer MOA on this area.

Alternative A, no action, we have the most effective, the strongest and the best-trained military fighting for us in the world, and we can continue living here and raising our families the way we know how to do and we are proud to do. Thank you.

COLONEL BURD: Now, I'll call on Marshal Bennett. And after that, I will be calling on Drew Bullard.

114

008048

MR. BENNETT: I am Marshal Bennett, the Fisher County Judge, and I had to follow my attorney, thank you very much.

I was contacted by Buster Welch about a year ago, and at the time we were talking about a

AO-47 5,000-foot ceiling and all. Now, it got down to 3,000, and now I came in today and it's down to 200.

I don't have a horse that can be spooked or anything, but I do have a lot of farmers. The farmers right now are in the real process of trying

BR-2 to have a boll weevil eradication. And I think with this 200-foot or 300-foot ceiling you are talking about, low-level, not only are we going to have restricted air space, we're probably going to have closed air space.

These men are sitting there, and they've spent time and money on trying to fight the boll weevil, and they don't need to be sitting around fighting the Air Force on this same thing. Thank you very much.

COLONEL BURD: I would like to apologize to those officials who should have been included in the first group.

I would like to call now on Drew Bullard. And after that, I will be calling on Crawford

115

008049

Edwards.

MR. BULLARD: I am Drew Bullard, and I am an official trustee at Western Texas College, and I want to take a little bit different perspective than we have had.

At the Western Texas College, we have just started a work force education center, which has been very successful. It has state-of-the-art equipment. It is designed to attract business, to allow distance learning and video conferencing, and we have had tremendous response from businesses.

One of the businesses that uses this is Harver Industries, which has attracted statewide attention. Mr. Harver has met with Governor Bush, and we have had a number of politicians tour the facilities. And it's -- it has a tremendous ability to attract other businesses that would relate to Harver, which is a cotton-spinning mill.

And I think that this will -- something like the -- the Realistic Bomber Training Initiative will kill economic development here, because it is a very competitive business. And if somebody says, "I am going to put a business in Snyder," they say -- another town or region says, "If you want to have these" -- "do you know they have bombers flying over

116

there all the time over their airport? You may not even be able to get into their airport."

We have an airport here that is big enough to accommodate some corporate jets. They come in quite often. If they can't come in or they're even worried about their safety, it is going to hurt us. It is going to hurt our economic development. **BR-2**

Another thing that I want to mention is the character of the West Texas people that we have seen here. Most people -- in fact, everyone has been very polite. People support the military, and they are behind the military, and they are patriotic, but I hope that the military doesn't take this to mean there is not a lot of passion behind what they are saying.

And I think this passion will be reflected in several ways. One is we are here making a reasoned argument, hoping that the military will see our point. If that doesn't happen, I have no doubt that the money will be generated to go to Court and fight it all the way, whatever it takes. And the third thing is political. If that doesn't work, people are going to have long memories when this comes over. And people are getting upset, losing jobs and having their life-style destroyed, and we

117

may have to try to get people that support us. Thank you for the opportunity to speak.

COLONEL BURD: I would like to call on Crawford Edwards. And there will be following a Steve Godwin. **008050**

MR. EDWARDS: My name is Crawford Edwards.

Ostensibly, the Lancer MOA and the other two Alternatives B and C are to conduct low-level missions. To my knowledge, Desert Storm, trying to effect Sadam Hussein, nor the recent deboggle in Belgrade were there any low-level bombing missions flown by B-1Bs or B-2s. I stand to be corrected on that. **AF-38**

The second point I would like to make is, these fine people have asked some excellent questions, very germane questions, yet difficult questions. They have given you an answer, and the answer is to conduct these missions on government-owned land. So although they have asked these difficult questions, they have given you an answer on it. **PD-7**

Now, the third thing that has been brought to my attention recently is that, as far as economic or anybody else knows, not one person in any of these **GE-29**

118

lands came to conduct the draft EIS. We would ask you to at least come to this land, walk on this land, instead of drafting a draft EIS from Washington or Abilene or wherever. Thank you. **GE-29**

COLONEL BURD: Is Steve Godwin here? Please come forward. And after that, I will be calling on Randall Murphree. **008051**

MR. GODWIN: I am Steve Godwin, president of Stonewall Kent County Farm Bureau. We represent 515 farm families in a two-county area.

I appreciate Congressman Stenholm here and certainly our state representative, David Counts', comments, and Colonel Burd, you giving us the opportunity to voice our opposition.

The message from our county farm bureau is very simple: We oppose any low-level bombing training over our area.

I would like for the gentleman that is passing out the card from the air base where you turn in complaints -- I lost a windmill this last year. I would really like to know who to contact over that. **AF-15**

Hunting in -- has been a Godsend for us in 1998. It's been a really tough year, drought, low prices. We take our hunters in on horseback. We have got a lot of deep canyons. The scenario that we

119

have talked about with horses would be catastrophic, not to mention I have one grandchild, a 7-year-old granddaughter, that rides all the time. It would be really rough on us. **BR-3**

And I say this very candidly, I don't want to be compensated. I don't want you flying over my country. Thank you.

COLONEL BURD: Call Randall Murphree. And then after that, I will be calling on that B. J. Baldridge. **008052**

MR. MURPHREE: Colonel, Congressman Stenholm, thank you for the opportunity to speak.

My name is Randy Murphree. I have spent 48 years over here next door in Fisher County. I own and operate a crop dusting business, Murphree Flying Service, and my company serves six of these eight counties in the proposed Lancer MOA.

I've accumulated about 20,000 hours over these skies around here, and I have got a pretty good idea how it all works. In my commercial flying business, I have been in the charter business, and I've made my living most of the time in the crop dusting plane. I got to tell you that when we are down here working if -- we have got tunnel vision. We don't have time to be watching over our shoulder **BR-2**

120

BR-2

for one of these shadows coming over and seeing how -- how close these guys are going to be to us.

I am a patriotic American. I was at Dyess Air Force Base the first day the first B-1 came in from Edwards Air Force Base, and I got to tell you, I was amazed. That is a tremendous airplane. But the one thing that sticks in my mind about that occasion was noise. We were expecting that airplane to come in from the west, from Edwards Air Force Base. Those of us -- Charlie, you were there. He slipped around the backside of Abilene and approached from the east, and when he came over at about 2 or 300 feet, it was awesome. It was absolutely awesome. I love airplanes, but I have got to tell you, the noise was also awesome.

And I can tell you that when these airplanes get out here over Lancer right on that 600 knots, it is going to be awesome. It is something we cannot tolerate, our fragile economy won't tolerate it, and we hope you will go somewhere else with it. Thank you very much.

COLONEL BURD: I would like to call on B. J. Baldridge.

008053

MR. BALDRIDGE: My name is B. J. Baldridge. I'm from Jayton and Kent County, and I am

121

a fifth generation rancher. And I have lived on that ranch all my life, and it has been in the family a long time.

And growing up there was the greatest place to grow up in the world, because of the peace and quiet and the secludedness and the ability to do as you pleased. And with the -- the airplanes flying over and stuff, it won't be the same place it will be as it was as I grew up. And seriously thinking ahead, being 18 years old, I might want to bring my family to grow up on the same ranch, and I don't want my kids growing up any other way than how I was.

And it is important to every person in this building that we have our land to ourselves as property. Property is one of the most valued things to every person in this room, and we all treasure it. It is very important to us, because our Constitution gives us the right of property and gives -- the government has no right, nor anyone else, to take it away, including the air above our land. It does not say anywhere where the -- where the air is not ours if we own the land below it.

BR-5

Thank you. That's all I have to say.

COLONEL BURD: Ladies and gentlemen, that exhausts the list of cards and names of

122

individuals who have indicated a desire to speak.

I would like to now give anyone else who would like to speak that opportunity.

MS. MERLESON: Sir?

COLONEL BURD: Yes.

MS. MERLESON: May I speak?

COLONEL BURD: I believe we have one gentleman that is now coming down and then --

MR. FERGESON: Thank you, sir.

008054

Congressman Stenholm and Colonel Burd and Lt. Colonel Mason, my name is Richard Fergeson, and I have a small place in Scurry County. I turned in the card to speak here. I don't know what happened to it.

I have been a crop duster since 1966, and I still am. But for 24 years in there, I was an Air Force pilot, and I am retired from the Air Force, fast movers, gun ships, helicopters, transports and a few others.

In 1974, I had to tell a military judge about this. I guess I can do it now. In Oswego, Kansas, I was leaving at about 350 knots, a three shift south of Oswego, and I topped a rise and I saw firsthand the effect on cattle. I saw a 16-year-old go through a barb wire fence, a couple of cowboys hung on, a few cattle had splayed legs. I pulled up,

123

but there was nothing I could do. There was nothing I could do.

If you don't think it will change your quality of life, talk to the people at Ajo, Arizona, or talk to the ranchers at Dade County, Florida. They will tell you what happened to their quality of life. If you don't think that it will affect your life-style, if you don't think when an airplane comes behind you and you are on your tractor that there is a tremendous shock effect to human beings, you are wrong, because there is.

Strong national defense, yes, we need it. Training, I am not so sure that any of the U.S. bombers ever dropped a bomb 40 miles from a (inaudible) home station, but maybe we need to do that sometime.

A strong national defense, I don't know. Personally, I was a volunteer for Vietnam and the Falklands. I tried to get back on active duty to go to the Gulf War. I'd go to Kosovo tomorrow. Every man in this room would. That is strong national defense and always has been.

Lt. Colonel Mason assures me that, as a crop duster, low-level conflict and safety is negligible. Well, that is probably true. If you seen this B-1

BR-2

124

BR-2

and my little (inaudible) plane hit head on, that is true, he probably doesn't have much of a problem.

I asked the Air Force in the forum outside if they brought a current United States chart of MOA restricted flight areas, low-level routes and MOA routes, and no, they don't. They don't have one here. There is a good reason for that. If you saw it, it looks like an explosion of spaghetti. Low-level routes are everywhere. The only reason they want the air space is because it is there. That is the only way it has ever been since I have been associated with them, and it is going to continue.

The reason we don't have the -- the environmental impact people in New York or wherever, Washington, say that we don't have any problems is because we don't have 5,000 people from the library, or whatever the number is.

These ranches have been in gener -- in the family for generations. Thank you.

TY 008055

MS. MERLESON: Thank you, sir.

My name is LuAnn Merleson, and I thank you for the opportunity to speak tonight. I am a mother, I am a landowner, I am a taxpayer and I am a member of the Snyder Independent School board of trustees, an elder in the Presbyterian Church and a pilot, and

125

in any one of those capacities I can see no good for the low-level bombing practice.

And I agree with this fellow that was just up here, if you see an MOA of the United States, you have plenty of land, and it seems like government greed.

And I ask you, when you go back to Washington to make your decision and you are in your bed, ask yourself, "Would I want these airplanes over my house?" Thank you.

TY 008056

MR. CHISHOLM: My name is Roy Chisholm. I am a family rancher in Kent County. And I didn't come here intending to speak tonight, but something has become evident in watching the comments made tonight.

There is some -- we do value our peace and tranquility, but there is something else we value here, and that is honesty and integrity. And the best I can see tonight, the Air Force has not been honest with us. They have misled us, tried to pull the wool over us and presented an invalid study. And my comment for the record is, I am ashamed. Thank you.

008057

MS. BULLARD: I am Carol Bullard, and thank you for the opportunity for letting me speak.

126

I live on a ranch. I also work in town. I have a Master's Degree in art education. I teach 1,500 children art. I just want to mention about our clusters of also individuals who live in the city of Snyder, plus the surrounding cities, that they will also be emotionally affected.

I noticed during art, children's emotions come out, things that they can't verbally tell us about. And I noticed just today some drawings of children just from the things on television about Kosovo. The children were drawing bombers -- airplanes and bombers flying in and houses being blown up and people getting killed.

I knew that -- as I grew up in Los Angeles, every Friday we had air raid exercises where we would get under our desk in case they dropped the A-bomb. It would do you a lot of good.

BR-1

But, anyway, I know the emotional impact on children for things like that. So they -- in their reality, they have a difficulty separating fiction from fact or practice from real bombers.

So I was just saying, aside from the rural community, we also have -- I just need to speak for the several thousand children that we have here that are not used to -- as I was used to Los Angeles, a

127

certain level of noise, I gained certain levels of paranoia. When I moved here, I had to learn to relax, and I finally came down off of it.

But I just know the children here are not used to the same kind of level that even the city children that -- like, say, children in Los Angeles are used to.

Also, I wouldn't want to be a surgeon operating or a dentist doing a root canal on me at those particular moments.

But I am just saying, our kids have a different outlook than, say, Dallas, just their psyche. So I didn't know if there was any studies done on impact of children's performance in school on the TAAS test or literacy and their emotional well-being.

Excuse me. Thank you very much. I appreciate it.

COLONEL BURD: We still have a little bit of time, so please address us.

008058

TY

MR. BILLUP: Thank you, sirs.

My name is Jason Billup, and I am from Borden County. I am not -- I have been out here about eight years, and I figured I was one of the luckiest ones that got to come out here and to live

128

in this country. Moving from East Texas to West Texas is just like going from no bombers flying over to having bombers fly over.

I was told on the ranch that I live on there that there was planes there that have gone down, and I looked for them and talked to some folks, and I found them. And it -- it had come to Borden County about a mile west of the Borden County High School there. The school there is where a plane went down. There is an ejection seat there and part of the fuselage is still there.

I know there hasn't been any impact studies done on this -- on the environment, because me just being a cowboy, I have been out there, and I haven't seen anybody else out there. We are the only ones out there.

I know, you know, it's you all's job to defend us, but it sounds like you are going to kill us trying to take care of us. Thank you.

COLONEL BURD: Would anyone else who has not had an opportunity to make comments like to make comments? Please come forward.

008059

(PAUSE)

TY MR. EILAND: My name is Bill Eiland, E-I-L-A-N-D. I started out with Buster and them on

129

HEPA to try to put it together. They have done a good job. I thought we was fighting a losing battle, but after tonight I think we can whoop the hell out of the whole damn bunch.

008060

TY MR. HERRING: My name is Ray Herring. I was stationed in Camp Roberts, California, and that's the only guy that didn't see me while I was there.

I appreciate what has been said here tonight, and I would reiterate it. There is not any use in trying to go back over it, even if I could. But I was just going to tell you guys that -- in the military, we respect you. We are not a bunch of flag burners up here, and we love the military. We love the service that we served. There is Vietnam veterans here; there is Cold War veterans; there is second World War veterans; there is Desert Storm. And we all put our britches on one leg at a time just like you do.

And we know -- we know that you have superiors and we know that you are disciplined, and we just want you to -- our message to you is, would you just go back and tell them that we are just real people and we have got real concerns, and we honestly believe that we -- what we are standing for is

130

correct, and we just want to thank you.

COLONEL BURD: Now, is there anyone else who has not had an opportunity to speak that is interested in making comments?

Is there anyone who has already made comments that wasn't able to finish the comments and would now like to make some additional comments.

MR. KELLY: Here.

COLONEL BURD: Please come forward.

MR. KELLY: Thank you.

008061

I would just like to finish up what I started earlier. In our opinion, in investigating over 52 documents issued by the Department of Defense, the United States Air Force and air and combat command, as well as the Federal Aviation Administration, Environmental Protection Agency and Council on Environmental Equality, what we have here is a mistake that started as far back as World War II. The Air Force has been nothing but attempting for all these years to perfect a mistake, which is the worst thing, as you know, you can try to do is perfect a mistake.

We would like to help them every way we can. We would like to have them fly -- you know, they can do dives three stories high, fence to fence,

131

PD-7 bomb (inaudible). Just go fly over federal -- existing federal land where there is no human environment. Thank you.

008062

TY MR. EILAND: I apologize to you, sir, for what I just got through saying. Not for what I said, but for the way I said it. I am a veteran of World War II. I have respect for you and myself, but I am sorry for the way I said that.

COLONEL BURD: Thank you, sir, but to me personally that was not needed. Thank you.

Yes?

008063

MR. WELCH: I appreciate the extra time. There wasn't time earlier to address something I think is very significant, and it really comes under the area of cultural and heritage factors. You will find they are addressed in the EIS. It is admitted that they exist. The only reference that is made of doing any kind of study for any consideration of the factors is the sentence in there that describes Indian tribes that this disturbs. I think these cultural and heritage factors are extremely important.

I agree that the Air Force -- the military is extremely important for national defense, for the strength of the nation, for national defense. It's

132

also important for a nation to be able to produce its own food. Something that really needs to be fitted into this cultural thing is the motivations for why you are in this sort of industry and producing food.

I have worked for years with the cultural services grazing lands and ranch management and other entities that are very concerned with the health agricultural sector that's so important to the nation. If you look at any other types of business, you will find no one vesting in the -- remaining in a business that has such a very poor return on assets.

What is very important to realize is that people participate in agriculture for the challenge itself. It is the most complex production environment that I know of, and I have some experience in production. It is a very complex production environment. And the fulfillment that is gained from it, that is very important.

We don't want to end up like the Russians where nobody cares to dig the potatoes up. Nobody owns the land, and you have got to send your Army out there to do it. When you look at these motivations, you find that stewardship is a very important part of

133

it.

BR-4 All of us in various ways assess what our long-term grazing or long-term farming implications are. It is a very difficult science. It deserves to be plugged in on this EIS. It's hardly considered at all. It is vital to the nation as national defense. These motivations far exceed what you would get from monetary satisfactions, but you are giving up a lot in order to remain in this sector.

The way you can hurt agricultural groups the most, then, is to do something that actually directly devalues the property that they own. You have no hope for recovery after that. And it has already been pointed out this initiative is going to do that.

I think if the Air Force itself were more acquainted with these motivations and with these issues, they would recognize what truly is going on. The education that was needed here is not just for us to realize. We need to allow this to happen. It is for the government and the military to be educated as well, to understand how important these things are and how disruptive their actions are here. Thank you.

008064

TY UNIDENTIFIED PERSON: I would like to

134

take this opportunity to thank HEPA and all the people that have worked so hard. And I am proud to say that these people have got a backbone from the top of their head to their heel, and I think you have done your country a great service to -- and I think we need to show the people we elect and the people that we hire to run our military that we are important, too.

And the production of food and fiber is equally important, and so I want to thank all of you for coming tonight, and I want to remind the Air Force and our elected officials, for everyone that came here, there is 10,000 more out there that feel the same way. Thank you.

COLONEL BURD: Ladies and gentlemen, we are going to need to cut off the comments here. I would like to allow this gentleman to speak, and then if there is one other person who has a burning desire to say something, please come forward, and then that will be that, because we need to get packed up and vacate the building.

008065

MR. MURPHREE: Please, Colonel, I was just passed this letter. It is from the administrator of the Fisher County Hospital District, Ella Raye Helms. "To whom it may concern: Fisher

135

County Hospital District provides health care services to residents of Fisher and Kent Counties and surrounding communities. Both Fisher and Kent Counties are designated medically underserved and health provider shortage areas. Fisher County is also designated as a medical frontier county.

"Reliable emergency medicine and trauma care are crucial in rural counties such as ours. We are fortunate to have a well qualified staff available for primary response to emergency situations. However, we rely on transport to tertiary medical facilities for patients who have traumatic injuries or in life-threatening situations such as acute myocardial infarction.

"Time is of the essence in life-threatening situations. We prefer to transport critical patients by air ambulance, since even a few minutes can make the difference between life and death, or the prognosis of a full recovery.

BR-2 "If Fisher County is designated as a low-fly training zone for military exercises, there will be occasions when air ambulance flights will be delayed, and people -- impeding patient care. This is not a theoretical possibility, but it is a real scenario encountered by hospitals in close proximity to

136

military training sites in New Mexico.

"Please reconsider the use for our lands for low-flight military training."

Thank you.

COLONEL BURD: Sir, if you could call out your name.

MR. MURPHREE: Randy Murphree.

COLONEL BURD: Thank you.

008066

TY

MR. MOSELEY: Yes, sir, my name is Dennis Moseley, M-O-S-E-L-E-Y.

I don't even own a handful of dirt I could pick up, but I read a book, Bury My Heart at Wounded Knee, where they took the Indians and took them off their land. And we invaded slowly and we come in, and I guess to make a long story short, we watched Sitting Bull make his last stand out of Canada. And it ripped the hearts out of those people, and it took their land and it took their life. They were never the same, but they hung onto their heritage, and they were put on reservations. They were taken to Florida where disease killed half of them. And like I said, these people owned thousands of acres. They loved that land and put their heart and soul into it.

And I think when you come in and you take a group of people and you -- you are not taking their

137

land from them, but you are taking their life from them. What they have right now is their life, and you are just ripping their hearts right out of them, and it takes something out of them that you can never put back.

And I have the greatest respect in the world for the military. I am proud to say that when our military goes to another country, we are successful.

And I would just ask that you would take it in your heart and your mind to just take a step back and take a look and say, we have American people that support us. Let's not do this to them. Let's find another alternative. Thank you.

COLONEL BURD: Ladies and gentlemen, there was one concept that kept running through my mind as each of you were speaking this evening, and that concept is civility. I want to personally thank you for the civility that you have shown here tonight and the way you have treated us. I personally appreciate that.

And, ladies and gentlemen, this concludes this public hearing, and thank you for your participation and input. Please remember the public comment period will extend through June 16, 1999.

138

This public hearing is adjourned. Thank you again.

(PUBLIC HEARING ADJOURNED AT 8:57 P.M.)

23

up.

008067

MR. MERONEY: Yes, sir. I'm Don Meroney from Big Lake, Texas. And my first comment has to do with the Realistic Bomber Training, and underlining the word "realistic." To me, the low altitude segments close to home bases are in themselves not realistic. A 35-hour flight from Louisiana to Iraq and then return mostly at high altitudes, that's realistic. 16-hours missions from England to Yugoslavia are realistic. I feel that your present sites of South Dakota and Utah are much more realistic than any of the other alternatives, so I would favor Alternative A.

PD-44

The next thing I'd like to comment on is negligible to minimal, which is common terms in your Draft statements. I've been flying in this area for 40 years, 20 of which as a crop duster. All this low-level flying, I can guarantee you that the effects on the people, livestock, and wildlife is not negligible or minimal.

AO-28

I've seen a girl thrown from a startled horse. I've seen stock scattered during roundups. I've seen deer running wildly, separated. And when Bambi gets separated from her mother, that's the end of her. I've had a pumper drop a $100 gauge line in

24

an oil tank due to when I -- getting startled when I pulled up over him in a sprayer. So these effects are not negligible nor minimal.

Third point I'd like to make, military aircraft fly over Big Lake at illegal altitudes on almost daily routine, some of them as low as 200 to 600 feet above our airport out here, circle over the auditorium, and head back to the east. I don't -- and when you think about Italy and some of these other things, I don't think we need any more activity in this area. **AF-2**

The last comment I'd like to make, West Texas looks sparse to people that don't really know about it, but I can assure you there are many multitudes of civilian flights out here every day. We have pipeline pilots, highline patrol pilots, ag operations, pleasure flights, corporate operations, charter flights, cloud seeders. We've got people out here all the time. And this see and avoid nonsense, I don't think we can handle it. **BR-2**

And I appreciate the opportunity to speak.

COLONEL BURD: I would like to call on Lad Lithicum. **008068**

MR. LITHICUM: Thank you, Colonel. I guess I'm not totally antagonist. I was in the Air

25

Force myself and air training command. And I have good feelings about the Air Force.

However, I'm a little bit concerned about this extremely low-level flying. My son and I fly two small airplanes around in the area, and mainly in the sea zone and at the low levels. One of my planes flies about 60 miles an hour. And I don't believe I could avoid a B-1 bomber at 550 knots. There just would be no way I could even respond quick enough. **BR-2**

You said to direct your comments about the environment. I'm kind of environment -- I've been here a long time and I don't anticipate having to be dodging these low-flying aircraft. We've got some low fliers now that do fly, like others have said, at a low altitude, lower than they should be. But we've been dealing with that. But a B-1 at that level just scares me to death.

I appreciate the opportunity to comment.

The other thing I might say is we're conducting weather modifications operations in this area. It's mostly in the summer, but it's an ongoing item and I don't want -- I'd hate to see anything mess that up. It's kind of in the experimental stage. And we feel like we're doing a **BR-2**

26

lot of good. And we sure don't want to have that cut back because of military operations.

I guess that's all I've got to say.

COLONEL BURD: I would now like to call on Dorothy and Jim Murray. It looks like Dorothy has indicated a desire to speak. **008069**

MS. MURRAY: My name is Dorothy Murray -- Dorothy McKinsey Murray. My family has ranched in southwest Texas for over 100 years. My grandfather brought the first shipment of cattle into Midland in the 1800s. I speak for my family who ranch over a generous portion of Pecos County. I speak for our land.

In a good year, it takes approximately seven acres of land to raise one sheep. It takes 31 acres for each head of cattle. That's in a good year. We haven't seen many of those lately. If land is broken for a pipeline or an oil location or some other need, one can go back there 15 years later and the scar is still unhealed.

Low-level flights disrupts livestock and wildlife, as we've talked. It will endanger any rancher or worker on horseback or oil rig or pumping unit, as my husband does, on a daily basis. The ranchers and farmers in southwest Texas are strong **BR-3**

27

and enduring. They are devoted caretakers of the land. They're good stewards.

There are other places where the military can train. I suggest Nevada. It already glows in the dark from the military. We have enough obstacles. Please don't break the rights of those people here. **PD-4**

I do thank you.

COLONEL BURD: I would like to call on Jack Harris. **008070**

MR. HARRIS: My name is Jack Harris. I'm -- most of the comments I had have already been stated. But as a private pilot, I'm very concerned about the safety of low-level flights in and around this -- our airport. And like one gentleman stated, we see quite a bit of that right now. And it's a very real safety concern of mine. **BR-2**

And that's about all I have. Thank you.

COLONEL BURD: I would like to call Aldis Strautins. **008071**

MR. STRAUTINS: My name is Aldis Strautins. That's A-L-D-I-S, S-T-R-A-U-T-I-N-S. Thank you for letting me talk at this hearing. I represent the West Texas Weather Modification Association as the project manager and meteorologist

28

of that association. And we do have some concerns with flying and low flight in the Texon, Alternative C area, especially the expansion of it which would encompass a lot of our target area for rain enhancement.

West Texas Weather Modification Association started -- had a program in the mid '80s and then it began again in 1996 with seven underground water districts, which include some of the counties -- and about five of those are in the Texon or the proposed Texon area expansion. Each of these districts pay into the Weather Modification Program and pay for it along with the city of San Angelo, and the state of Texas also finances some of this program.

BR-2

The proposed expansion, like I said, would actually split our target area in two, especially when you have flights operating in that area. And it would make it difficult for us to operate going from one section to another section, and it would leave a whole large area of our target area that we could not cover and see properly.

The West Texas Weather Modification Association uses numerous aircraft. We've used a Cheyenne II aircraft. We've -- Cessna 340s, Aztecs, those were the top seeding aircraft. And we also --

29

BR-2

and also base seeding aircraft. We also have some Comanches for base seeding aircraft. We operate between 1,000 feet AGL up to 10,000 feet MSL for base seeding. And we operate in an IFR condition, which was not stated in the Draft that you presented, which runs from 16,000 feet to around 22,000 feet mean sea level.

So this proposed Texon MOA expansion really adversely -- I believe adversely would affect your operation or could adversely affect our operation and the local counties, West Texas Underground Water Districts and city of San Angelo, and also the state of Texas with the underground water that we are trying to help enhance and recharge the aquifers that way.

Thank you.

COLONEL BURD: I would now like to call on Scott Holland. 008072

MR. HOLLAND: Thank you, Colonel Burd. My name is Scott Holland. I'm kind of wearing two hats today. I'm the secretary/treasurer for the West Texas Weather Modification Association, and I'm also the general manager of the Irion County Water Conservation District at Mertzon, or Irion County.

I attended the public scoping meeting held

30

on February 6th. A lot of the concerns that Aldis just raised were presented at that meeting. I did receive your Draft Environmental deal here. I can find cloud seeding mentioned in it one time. And we did talk extensively that night, and I question this because this is supposed to be an environmental study. And I realize most environmentalists are concerned with animals and things like that.

Agriculture is also a dying environment. Unfortunately, a lot of these farmers and ranchers need rain. And we're trying to do something about it. That's why we think it is important.

In the socioeconomics part of the Draft here, it talked about the decommissioning of the electronic sites and building new ones. It did not mention the fact that we had brought to light that Texas Tech University in 1996 conducted a study in the High Plains that with a 21 percent increase in rainfall, a 15 county area would realize an economic gain of about $350 million. Granted, we're not in the High Plains, but we should receive somewhere around $250 to $300 million economic gain for the entire region over this.

BR-2

If we are limited in our cloud seeding weather modification activities in this MOA, you've

31

BR-2

cut the heart out of it. And it's kind of hard to go back as a manager of a groundwater district to my voters and people at my board who hire me and say, "I'm sorry. We couldn't do anything today to help you because we were not allowed to fly in that zone." And that is our concern.

Thank you, sir.

COLONEL BURD: I'd like to call on David Wurtz.

MR. WURTZ: Sir, my comments have already been made.

COLONEL BURD: The next commenter will be Kay Kelley. 008073

MS. KELLEY: Thank you. My name is Kay Kelley. The last name is K-E-L-L-E-Y. And I'm with the Trans Pecos Protection Group, which is a nonprofit information organization. We are opposed to the military's airspace expansion over private -- populated private property. And we network with a large number of diverse people.

We feel that this Draft Environmental Impact Statement cannot fully look into the devastating effects these low-level realistic combat training flights will have on West Texas. There is a definite lack of concern for the physical,

economic, and psychological well-being of the people on the ground. The damage done to the people, structures, animals, and plants under these low-level realistic combat training flights is not compensable.

BR-5

The only solution is to isolate them from the human environment. We can see no compromise. The military is in the business of death and destruction and cannot be successfully mixed with the people they are mandated to protect. We fully support our military and want the best training possible. There is a more reasonable location for this training than over our homes, businesses, schools, communities, and recreational areas.

And we'll be giving more comments through written statements later.

Thank you.

COLONEL BURD: And our last speaker will be Bryan Kelley.

008074

TY

MR. KELLEY: My name is Bryan Kelley. That's B-R-Y-A-N, K-E-L-L-E-Y, for the record. I would like to ask if possible that we have a showing of hands of how many in the audience have received a copy of the RBTI Environmental Impact Statement, if you would, please.

What we have is an analysis of this particular Environmental Impact Statement and we find it to be identical to some 27 others that we have done plus a total of Air Force regulations and deregulations and EPA regulations, et cetera. We find it to be insufficient along with the rest of them.

What we'd like to do is point out that, again, to be reiterate last night, this is an unreasonable training program for where it is. The U.S. Air Force and the Department of Defense Air Forces have failed to address the proper alternatives. They've left out the most important one. They have left out by omission around 51 particular violations of the National Environmental Policy Act and its council and environmental and procedural regulations.

For the record, I would like to know if the Air Force would have a meeting with us in order to discuss it. This is our 17th attempt to sit down with them and talk.

Thank you.

COLONEL BURD: And I'd just like to note, as a rough estimate, when Mr. Kelley asked for a show of hands, somewhere between a third and a

half of the attendees here raised their hand.

That exhausts the list of individuals who indicated a desire to speak. I would like to know now if anyone who has not spoken that would like to now speak, I'll give you that opportunity at this time. Is there anyone who has not spoken that would like to speak?

Sir, please come forward.

MR. LINDLEY: Thank you.

008075

COLONEL BURD: Sir, you'll be next.

MS. STOKES: My name is Joyce Stokes. My father came to Glasscock County in 1903. We have owned land in Glasscock and Reagan County since that time. These Alternate A and B fly directly over our land, directly over our house. And as I have stated to this young man here, what would happen if my husband was out riding a horse and one of these airplanes came over and he was bucked off and I wouldn't know where he was? I feel like that the Air Force has not given enough recognition to people that live in these areas. I mean, I'm -- the water and everything else, but people live there, too.

BR-3

Thank you.

008076

MR. LINDLEY: Thank you. Colonel Burd, I am Clark Lindley out of Reeves County. As I

Reviewed the draft, I could not find any substantial discussion of the effect on water resources and soils beyond the discussion of the areas where the emitter station and the other type of station are located.

We have some concern about the emissions from the airplanes in that we have no information in the Draft as to the nature of the additives, as to whether those are pollutants that may be particularly toxic both to human beings and to people.

AO-62

But in Reeves County, we also have fruit crops underlying the areas where the airplanes will be flying. We don't see any studies in the Draft indicating long-term effects on food crops, on the soil, or on our underlying water resources. That area, Loving County and Reeves County, where the 400 foot altitude flights will take place, that is part of one of the nine major aquifers in Texas. And it's unclear from anything in the Draft as to whether there are pollutants in the fuels that would ultimately in the long-run affect our underground water resources.

AO-125

We ask that -- the Draft doesn't have enough information for us to make a judgment. We

don't see any long-term studies reviewed. And we think that those studies need to be done before you put at risk our soils for our farming, the breathing of people that lie -- underlie those areas, and any long-term risks to the water that we are dependent upon.

Thank you very much.

COLONEL BURD: Now, is there anyone else who has not had an opportunity to speak that would like to speak? 008077

TY MR. TURNER: My name is Tim Turner. I live in Big Lake, Texas. My family ranches north of Stiles currently near the Texon area that's already being used and -- as an area for practices.

Over the course of my lifetime, I've noticed many, many times aircraft flying across our ranch at low altitudes. I was somewhat surprised when I came and visited with some of the Air Force people before the meeting tonight that there is a stationary practice line that crosses our ranch, and apparently there are hundreds of flights a year at 500 feet or less that cross our ranch every year.

I believe that the Air Force needs a suitable place for practice. I'm supportive of that. However, I think that we currently have done

more than our share in providing space for you to practice; therefore, I'd ask that you find another place to practice in addition to what you're already doing. I think we're already doing our share, and I wish you'd look at somewhere else.

Thank you.

COLONEL BURD: Please. 008078

MS. COPEKESSLER: My name is Cathryn Copekessler, C-A-T-H-R-Y-N, C-O-P-E-K-E-S-S-L-E-R. My father was raised in Sterling County. He moved to the ranch we have now when he was 46 years old. I have been on that ranch since I was six days old. I'm 52 years old right now. I have been thrown from a horse because of a low-flying plane and injured along about three miles from the house.

AO-2 We've had windmills destroyed by jet planes. We've had concrete tanks just torn apart by them. Part of your routes are going to go straight over my house. This will impact me extremely, and I am very against any changes. I do not want them coming any more over my house than what they do now.

Thank you. 008079

MS. SUDDOCK: My name is Robin Suddock and we're from Irion County. I'm the fourth generation to work at my ranch, and I am a ranch

manager.

If it was so minimal and the danger inconsequential, do it over Dallas. Do it over Houston. The reason you don't is because that's not true. It is dangerous. I have not been thrown from a horse, but it's only by the grace of God, because I ride every day.

BR-3 Your routes are going to go over our home where I ranch. And it's going to be my responsibility to find out what day you're going to be flying over so I can arrange when I'm going to feed my cattle? I mean, this doesn't work.

I attended TCU. I'm well aware of the noise that B-52s make. I heard them every day. I lived in Fort Worth for an entire year. And it's not inconsequential. We are only that way because there's a small number of us. We're not Dallas or San Antonio or Houston where the outcry would be unbelievable. You're acting as though we don't count because, well, you know, it's just a few people. It is dangerous.

And you're going to be doing 10 to 12 missions a day in the MOA. That's not just occasional fly-overs. That's hourly. That's daily, except on the weekends and on holidays, which is

really going to limit how I'm going to work my cattle as well. I really think it needs to be reconsidered.

I firmly believe that our military is well-trained. I firmly believe they need to be as well-trained and as safe as possible. Why can't you do it over the national parks? Because people wouldn't go to them because it wouldn't be a pleasant experience because of the noise. So don't think that we don't realize why you're doing it over us and not doing it over the other places.

Thank you.

COLONEL BURD: Would anyone else who has not spoken like to come forward and speak?

Would anyone who has already spoken like to make additional comments since we have the time for that?

MS. MURRAY: I have one brief comment I'd like to make from my seat. And that is that the --

COLONEL BURD: Could you state your name, please? 008080

TY MS. MURRAY: My name is Dorothy McKinsey Murray. The United States government already owns almost 40 percent of the United States.

That seems adequate for training areas.

COLONEL BURD: Would anyone else like to come forward and make additional comment?

Well, ladies and gentlemen, this concludes this public hearing. Thank you for your participation and input. Please remember the public comment period will extend through June 16, 1999.

This public hearing is adjourned. Thank you, again.

(HEARING ADJOURNED)

If you would like to turn in your written comments at any time this evening, please place them in the box provided in the comment area.

I would like to get started now, so we have one official who has indicated a desire to speak, and I would like to call on him now. And that's Herman Tarin, Reeves County Commissioner. 008081

MR. TARIN: Thank you for your time. And I would like to really thank everyone else for being here this afternoon. On behalf of Reeves County, I would like to thank you for your input this afternoon. I really appreciate you being here this afternoon.

This afternoon, my concern that I have as county commissioner, is to inform the public of what's fixing to take place. I didn't state my name; Herman Tarin. And on your graph, there is as a great concern there. That really ignores the presence of the Hispanic people in Saragosa, Brogado, and Balmorhea. I have discussed this with Lynn B. Quilles, which has promised that he would do something about this. As part of the record, I would like to let you know that this community is mainly Hispanic, a very low-income community. SE-5

I disagree with the statement that there is

no violation of the Presidential Executive Order 1-28-98 on Environmental Justice. I believe that for those that are here tonight, we probably remember back in 1987, when this small community of Balmorhea (sic) was leveled off by a killer tornado. And visiting with these people in Saragosa has really caused shock, bad memories. Because as you know, according to your Draft, IR-178 runs right through Saragosa, a populated area with about 500 people. SE-5

Also, Brogado is another community there going through the same thing. Bringing these bad memories to Saragosa is a terrible thing for them. We are getting ready to celebrate the 12th anniversary of that tornado. And back in their hearts, they don't want anything like that to be brought back up. These flights have caused a lot of anguish, a lot of pain.

And my concern is that if we -- I have never opposed the Air Force from training, but why do it over populated areas? We do exist. And I would like for those routes to be considered as a big change. And like I said, Lynn B. Quilles has also told us he will help us on this. And I really appreciate anything that he can do for us. PD-17

I would also like to ask you to see, after

the meeting is adjourned, if the public can keep their seats and there may be questions and answers. Thank you.

COLONEL BURD: What I am going to do now is I'll indicate the person I am calling on. And then I will also, after that, indicate the next person, so you can be ready to come on up. And I will call your name after that person finishes.

So I would like to now call on Joe and Helen Vernon. And after that, I will be calling on Steve Huseland. 008082

MR. VERNON: Joe Vernon, V-e-r-n-o-n. The issue I want to address is one of the things about your study; contacting people, talking to them. I knew absolutely nothing about this until a week ago Monday, and no one from the Air Force has yet contacted me about it. GE-22

The effects of this, I have some firsthand knowledge of what it will do. I work in the oil field. I have been on locations where B-1s, F-111s, all kinds of stuff much lower than 500 feet, much faster than 250 knots. The numbers you show in the increase of decibels is ridiculous; far exceed that, far exceed it.

The presentation that you have here as far

25

as where your routes are to be in these emitter sites, one emitter site in particular affects me, No. 60, because I live right there. That comes back to never being contacted about that.

BR-1 Knowing what these -- the noise these planes make, I have got a small ranch there; cattle, chickens, horses. They won't stand for it. It's going to run them crazy. It's going to run me crazy. This is going to greatly affect my lifestyle, my ranch where I live, what I have worked for all these years.

I am also a pilot. I use a Cessna 150 to do my work with. Collision avoidance, that's going to BR-2 be a biggy. Trying to avoid vortices created by all AO-2 of this, that's another thing. That's something you can't see. So I have got -- you know, you are taking away some freedoms I have got as a pilot. You are taking away some freedoms I have got as a citizen -- I mean, a resident. I dare say, you wouldn't live under conditions like that.

BR-4 The future value of my property, I doubt seriously if anyone would be interested in property like that, not that I want to sell it anyway. That's the whole point. I don't want to move. I have worked all my life to live there.

26

So four things I want to put across to you. I have been deceived of the information about this whole ordeal. I feel I am being robbed of my freedoms as a private pilot and as a citizen. I am being robbed of my property. You are going to make my property worthless. You are going to tear it up. Shock waves are going to tear up the house. That won't work. And I am being robbed of my rights.

I see my time is up; but seriously consider these things. Thank you.

COLONEL BURD: Helen Vernon?

MR. VERNON: She isn't here. She is my wife.

COLONEL BURD: I would like to now call on Steve Huseland. And then after that, I will be calling on Sue Toone.

008083

MR. HUSELAND: Good evening, Colonel. My name is Steve Huseland. I am the vice president for the Southwest Region for the United States Pilots Association. I am the immediate past president of the New Mexico Pilots Association, an FAA safety counselor in Hobbs, New Mexico, Lea County. I am a private pilot, own my own aircraft, and use it quite extensively in this area of the country.

I am coming to support Alternative A; leave

27

it alone. We have an expression in aviation that you have heard, which is "If it ain't broke, don't fix it." And you people are trying to fix something that PD-2 isn't broken. It's very simple to move the airplanes to where the airspace is that's currently available.

I have encountered B-1 bombers on TDY of Dyess Air Force Base -- from Dyess Air Force Base, over in Roswell many times when there were military exercises being performed in our area. Move the airplanes to Nevada; move the airplanes to North or South Dakota. You are running B-2s out of Whiteland Air Force base up there. Run the B-52s out of there on a temporary basis, and forget about this.

We, in New Mexico and West Texas, do not want any more noise-creating, environmentally-polluting aircraft in our environment. I am about as fed up as a pilot can be AF-6 with encountering military aircraft at odd altitudes, day and night, not talking to anybody on the radio. It's dangerous and it's life threatening.

The Air Force, according to my AF-2 understanding, should be flying IFR minimums, a thousand foot HDL. They currently fly at 300 feet, they tell me. And I have observed personally aircraft well below 300 feet.

28

The military is continually gobbling up airspace. An example would be even after Reese Air Force Base closed in the Lubbock area, you came in and gobbled up airspace right over the City of Hobbs where I live. I can hear the stealth fighters practicing at night, up well past midnight. Your problem arises because of so many base closings. It is more convenient for you to fly locally here instead of areas in Utah, North and South Dakota, and Nevada, et cetera. You closed your bases for economy purposes, but you are still gobbling up airspace at the expense of the public. Move the planes to the airspace.

As far as the economy goes, no one can work under conditions when you have B-1 bombers coming in BR-4 at 300 feet at 500 miles an hour. You are going to stifle the growth of industry, whether it be agricultural, manufacturing, or otherwise, here in the Pecos area and in many of the other towns, as the gentleman before, Mr. Vernon, said. We don't want it. And we would appreciate it if you would consider Alternative A.

My last point is, why won't the Air Force agree or consent to a noise monitoring demonstration? Run a B-1 bomber over an open space at 300 feet at

29

500 miles an hour and stand there without earmuffs on and tell me how it sounds. Put your professional noise monitoring equipment down there. Let's really see what the decibel level is. Thank you.

COLONEL BURD: Now, I call on Sue Toone. And then after that, I will be calling on Chip Love.

008084

MS. TOONE: Hello. My name is Sue Toone, T-o-o-n-e. I live near Saragosa on a farm, and here is what I know. The routes; didn't know about any routes until one night in the middle of the night, a low-flying jet bomber flew over our house and scared us to death. And I have documented flights over our home and flights over Saragosa, February through July of 1998. And what an invasion of our privacy these jets are.

To the noise level, bottom line, we shouldn't have to contend with the noise level. It is awful. No matter where you are; if you are in your house, outdoors, driving your vehicle, it scares a body. The roar that sounds like the tornado we had several years ago, rumbles on and on in our valley.

CU-1 Structural damage has occurred in the adobe part of our house; new cracks, doors won't close, and an unleveled wooden floor. In the cinder block part,

30

a large picture fell from the wall and broke the glass on the coffee table we've had there for 30 years. A book about Indians fell from the shelf near the ceiling. My pictures in the hall move sideways. I have to straighten them. I have to push the cut glass things I have on the shelf back up on there.

And, No. 4, emissions; I have been out in the back yard when you have come across our home and farms. You were so low; but this time I saw you in the plane before I heard the noise. You were between our fence and the Turnbough's barn over here. And you were beginning your turn, and all this black AO-11 stuff was coming out of your plane over on our yard and where I was. So I went in the house. And this is another blatant invasion of our property.

No. 3, effect on animals. Another time I was in the yard when you came over our home and farms. This time I didn't see the plane, but I got the full effects of that horrid noise. The two owls BI-4 that had lived in our tree for years flew out, seeming disoriented. Bottom line, they haven't come back. And it's a shame because we enjoyed the soft hooting during the night, and it did help control the rodents.

Last, No. 6, is the pollution on crops and

31

farm workers. That bomber goes over our home, our farms, and the farm workers. We receive that pollution right away. And then our prevailing westerly winds brings all that pollution back because the plane is going in circles. And here all this stuff is coming out, and it goes all around. And all that stuff -- because it's coming from the west to my house, all that stuff is coming back on us.

Bottom line, I think it's awful that you want to add more pain and suffering and misery these things cost with this initiative. And we have no privacy, no peace, and no knowledge about the long-term effects of your pollutants. Thank you.

COLONEL BURD: I now call on Chip Love, and then I will be calling on Mack Arthur Pineda after that.

008085

MR. LOVE: Hello. My name is Chip Love and thank you for receiving my comments today. I ranch in Presidio County underneath this route, so I have experienced the planes firsthand.

I disagree with your Environmental Impact Statement on several issues. The EPA standards for BR-1 the way the noise estimates are calculated, you said it's a day/night level. The problem with that is that might be suitable to an airport area where there

32

BR-1 is a constant noise. But when you go from a completely silent environment to an extremely noisy environment, the noise contrast is greater. And, therefore, the average system, I think, is inappropriate the way it's being used along these rural routes.

You said that there is no impact on socioeconomic because the planes have been flying on these routes in the past. That does not take into AO-82 account the type of airplanes being flown in the past. The newer planes are noisier, louder. They GE-29 are faster. And that doesn't account for the types of planes you may be flying in the future, which could be louder.

The socioeconomic; I disagree with no impact because there is lots of areas it affects. It affects agriculture. It affects tourism. But this SE-1 Environmental Impact Statement doesn't take into account future uses of this land. There may be other uses of this land that we haven't yet envisioned that these routes will hamper. And so that's -- what I don't like about the impact statement is it is static, not dynamic.

AO-23 This Environmental Impact Statement does not consider other airplanes from other bases that are

33

being considered along these routes. It only considers Dyess and Barksdale. And there are currently proposals from Holloman to fly aircraft along these routes. This Environmental Impact Statement only addresses those particular planes, not the other planes that may be coming through.

So I think this environmental assessment is flawed. I think there needs to be some more work done on it. And I would agree with the Option A for -- I had the -- in my opinion, the Air Force owns some of its own land. I think this is better suited for the Air Force's land rather than private property. Thank you for your time.

COLONEL BURD: I would like to call on McArthur Pineda. And then after that, I will be calling on Steven Pineda.

008086

MR. McARTHUR PINEDA: Good afternoon. I am speaking as a concerned citizen here. You know, I don't think anybody is questioning anybody's patriotic duty. I think everybody is real patriotic here, which it seems to be for this type of thing. But if there is some other place you can move, please do so. Because, you know, you are impacting this area quite a bit.

From what I have observed in the past ten

AO-23

34

years, working out in the canteloupe patch and the contract loading out there--you are asking for this proposal here--but in the past we have had all sorts of planes. I have got pictures of them. Some I took as far as SR-71s. The other planes have been flying over this area for years, coming down as low as 200 feet. Because we threw a tennis ball at one time -- we've got a picture of a crop duster coming by, and we would shoot those tennis balls up. So we decided to shoot them up, and I have got a picture of that thing coming up, and that tennis ball was going higher than that damn airplane. And leaving a lot of pollution around there, we are concerned about this. And you ought to move that someplace else.

You know, this area, you know, we got a lot of agriculture, livestock, a lot of things; you know, communities like all these places. They were talking about Saragosa. You've got three or four little communities. Before you get to Saragosa, you've got Brogado. You've got lots of people living out there. You've got Saragoso there. You've got Brogado. You've got Balmorhea; a lot of people. And those people are scared. This thing has upset them, and this is going to impact them.

We have also got -- this shows that you've

AO-1

35

got -- certain planes are going to be flying this area. Like I said, SR-71s have been flying, I remember, since about 1989, when I first saw them. And we've got pictures of them. And there has been other planes right now currently over the City of Pecos. And I took some. They didn't come out. But you can see the identifying marks on the VF-17s. And they are doing maneuvers directly over the Pecos area, a populated area.

What I am concerned about, a lot of them -- I think there is some German planes and one other nationality is going to be flying these planes overhead. Who is to say that they are not going to have nuclear weapons on board. We want some guaranty that they are going to have -- that this is not going to happen. We don't want another accident. We have had accidents in the past over here. We don't want a catastrophe, you know.

Dealing with the noise level, and the livestock, and so forth, and everything, and some of the aircraft fuel pollution, which also -- you know, it destroys vehicles. We have had some of that stuff out there. A lot of people -- as a matter of fact, the old boy that runs K & D Farms had a Cadillac out there; ruined his paint job, a complete new paint

AO-11

36

job, from that aircraft flying over it. And I am concerned about this.

Like I said, if you can move it someplace else, please do so. This is not the right area for it. We spend millions and millions of dollars, you know, moving the Air Force bases, closing them down and everything. And I think you can do better than this. This is not what we need here in West Texas.

One of these days you are going to get a rancher upset enough, he is going to take a weapon out there, it might even be a missile, and shoot the plane down. You know, you get somebody pissed off enough, they are going to do it. Thank you.

COLONEL BURD: I would like to call on Steven Pineda. And then after that, I will be calling on Clark Lindley.

008087

MR. STEVEN PINEDA: Hello. My name is Steven Pineda. I would just like to comment on the various aircraft. Other than the ones that you have stated already, there will be the S-17 stealth fighter, the Apache helicopters, and other types of aircrafts. There is a new aircraft and it's not named. We don't know the name of it. It's a propulsion system. It's called a pulse propulsion system. And there is a gentleman here which has

PD-53

AO-41

taken pictures of it. And it leaves a trail of smoke rings. It's a series of -- like you are smoking a cigarette; it will blow a ring of smoke. They will have the propulsion like this.

This, as I stated to one of your officials, any and all aircraft under this proposal can use this airspace. And this, all of the jet, and the fuel, and the exhaust from this will impact the environment greatly. As well as it will be a detriment to the owl, also the American bald eagle.

BR-2

And, currently, you do have specific routes for your military aircraft, which it's going to interfere with crop dusters, also commercial jet aircraft, as well as aircraft used by other individuals, personal vehicles -- personal aircraft themselves.

And I don't believe that putting these proposed targeting sites is going to outweigh the effects where we currently are experiencing and the effects we are experiencing. And y'all should just leave it like it is. And you guys using military routes which are already in existence, using all sorts of military aircraft. And there is really no point in using the targeting except to get more experience for your jet fighters. Thank you.

COLONEL BURD: I would like to now call on Clark Lindley. And after that, I will be calling on Gloria Evans. **008088**

MR. LINDLEY: Colonel Burd, I am Clark Lindley, C-l-a-r-k, L-i-n-d-l-e-y. I would like to amplify on a point that I was making in Big Lake last night, in regard to the impact studies involving soil and water resources.

The study itself only discusses, in the Summary of Comparison Impacts under Table 4.6-1, the potential impacts on the construction sites. And I raised a concern that soil and water may be impacted by pollutants that are not properly evaluated in terms of the MALS studies that are projected at a elevation of 5,000 feet above ground level.

The concerns that I have are that the actual flight elevations are estimated at 400 feet in Reeves County. We are asking for some clarification as to whether the pollutants that would be driven groundward eventually become a problem for our agricultural products, which include products like cantaloupe, bell pepper, onion, products of that nature. Does it impact on those agricultural products that are critical to the economic viability of this county? Be aware that the county is under

AO-11

some pressure economically because of the drought, anyway.

AO-125

We are also concerned about the eventual impacts involving pollutants that may get into the aquifer. I have discussed this issue with Colonel Wheelis. And I would like to read into the record that in Reeves County and in Loving County, we have one of the nine major aquifers in the State of Texas. And the potential is that the TNRCC has looked at this area as a priority groundwater assessment area.

And as secretary of the proposed underground water conversation district, they have called me even in this last week, expressing concern about the quality and the quantity of the water that is available for the next 50-year period. We are particularly concerned about the ability of this area to remain able to use the aquifer that we have.

I have some additional concerns and I am not -- shall I quit at this time and resume after the others have spoken? Thank you.

COLONEL BURD: Gloria Evans. And after that, I will be calling on John Keifer. **008089**

MS. EVANS: My name is Gloria Evans. I live in Midland. We have ranching property in Reeves County and Jeff Davis County, where our son and his

son live full time.

I attended the initial meeting that the Air Force came -- when you came at Alpine the first time, and Fort Davis. Your presentation now is more polished, but the message is the same. The Air Force is taking over our airspace. I fiercely object to low-level flying over private property. West Texas is filled with hundreds of private pilots in small planes. And the airspace above the private property should belong to the landowners.

BR-2

BR-5

You Air Force personnel are here on an assignment. The folks at this meeting, and all of the other meetings that are taking place, are represented by people concerned about their homes, their families, and their livelihood. And the more flights that take place, the greater the risk. So I ask you, if a jet plane collides with a propeller driven private plane, which plane has the advantage? Thank you. **008090**

COLONEL BURD: John Keifer. And then I will be calling on Steve Jones.

MR. KEIFER: John Keifer. I represent myself and my wife. We are residents of Balmorhea. I would like to thank the Colonel and the Air Force for giving me this opportunity to talk.

41

My wife and I, we moved to Balmorhea a year and a half ago. We were residents of El Paso, Texas. Everyone in El Paso lives next to an airport. We moved to Balmorhea because of the lake and because it was quiet.

Our primary concern is the noise pollution from the jet aircraft flying over our homes, which are not even in your flight path, according to your flight charts. I can see that the airplanes have to make a turn, and they are probably overflying. I don't know what the terminology for this is, but they are not turning their aircraft soon enough. They fly over the City of Balmorhea during the daytime. And when it is dark at night, I don't know exactly what time it is, but it will wake you up out of a sound sleep. It is noisy.

AF-2

My primary concern is the noise and, of course, disturbing the peace. I was overwhelmed with all of the paperwork. I have not had time to read it all. I have written a comment. I would like to say about my wife, she is American-German. She was born in Germany. And she has been diagnosed with post-war stress syndrome. And when the jets come over, they excite her very much. She takes medication for this. The only reason I am bringing it up is because she

AO-18

42

said I wouldn't mention it. I did. Thank you.

COLONEL BURD: Steve Jones. And then I will be calling on Kay Kelley.

008091

MR. JONES: My name is Steve Jones. I am County Commissioner at Loving County, Texas, Precinct No. 3.

I would like to start off with thanking you for giving me this opportunity to speak this evening. I would like to commend the Air Force for what a great job they do preserving our country, keeping us safe and sound in our homes. I would also like to commend the Air Force and the military for their training exercises, but I think it could be done somewhere else.

I have some viable concerns. Being commissioner of Loving County, I might point out that Loving County is the least populated county in the United States, so habitation is not a great problem there. But if the corridor that you propose goes into effect for the training exercises, there is a concern as commissioner on land values and future habitation of the county. I think it will deter that.

BR-4

Also, I would like to voice my concern about the effect that your proposed training exercises will

43

have on ranching operations, which I am also a part of; livestock on my ranch, wildlife, and the employees. I think there will be a startle effect. In fact, I know there will be. Like everybody else has already said, that there is a startle effect from the noise of these aircraft. You don't see them coming. You hear them first. And whenever you look to see them, you have to look 300 or so feet in front of them, because the noise is behind them. They are traveling nearly faster than the sound.

BR-3

I would like to agree with everything that's been said about the air pollution, the emissions from the aircraft and also the noise pollution. I would like to reiterate my statement about the startle effect, not only on wildlife and livestock, but also on human habitation.

Also, I would like to express concerns for migratory birds that come down from the north during the wintertime, going south, following one of your corridors along the Pecos River, which are waterfowl and morning dove. I don't think that your environmental statement has made an issue of that.

BI-2

And I also would like to voice my concern for one of my most important environmental impacts that this will have, and that's the impact on my

44

life, my house, my home, my children, and my community.

I agree with Alternative A; move it somewhere else, especially, or mainly, federally-owned land. Thank you so much.

008092

COLONEL BURD: Okay. Kay Kelley. And then after that, I will be calling on Bryan Kelley.

MS. KELLEY: Thank you. My name is Kay Kelley. The last name is spelled K-e-l-l-e-y. I am with the Trans-Pecos Protection Group, which is a nonprofit organization which supplies information to anyone that can use it.

We oppose the expansion of the military airspace over the human environment. The military already controls almost 40 percent of airspace in the United States, with 35 or more proposals on the table. While we want our military to have the best training possible, we strongly feel that there is a much more reasonable location for these low-level realistic combat training flights, than over populated private property where they will have a huge detrimental effect on the people, on the ground, and with pilots.

This Draft Environmental Impact Statement does not properly address how these dirty, noisy,

45

terrifying war machines are going to forever change West Texas. The Draft mentions our concerns but ignores their real impact. These low-level realistic combat training flights will cause headaches, stress, hypertension, sleep deprivation, lower immunity, hearing loss, and psychological problems, particularly in children. The startle effect can cause horses to buck uncontrollably and livestock to panic where they can run through fences or desert their young. **BR-3**

Military bombers and the jets that fly with them pose a great danger to pilots in small planes and helicopters. Our border patrol, soil and water district pilots, customs pilots, cloud seeders, and crop duster pilots will be at risk, along with ranchers that use aircraft for game counts, checking waters, transportation, and gathering cattle. **BR-2**

When one of these bombers or jets crashes, lives can be lost and fuels and toxic chemicals released. They will cause an immediate decrease in the land values, resulting in a loss of the tax revenues for our schools. This area will no longer be attractive to hunters, resulting in a loss of lease income. This income is critical to the survival of some ranchers. Diminished hunting **BR-4**

46

activity will also have a substantial effect on motel, restaurant, and supporting goods sales.

On Page 3-10 and 3-11 in the Draft Environmental Impact Statement, we repeat the statement that "For almost nine years, the pilots, their crews, and their aircraft have successfully co-existed with the people and the environment of the RBTI study area." I guess the military's idea of successful and the people whose complaints have been ignored's idea of successful are not the same.

We are not antimilitary crackpots out here. We are patriotic, hard working Americans that are fighting for our homes, our lifestyles, and our constitutional rights. Remember, the military is in the business of death and destruction. The decision-maker needs to isolate these low-level realistic combat training flights from the human environment. We are not the enemy. Thank you.

COLONEL BURD: Bryan Kelley. And then I will be calling on William Wendt. **008093**

MR. KELLEY: I would like to ask if everyone here in the audience who received a copy of this Draft Environmental Impact Statement, please raise your hands to be counted.

The only thing I have to comment on after

47

Kay's comments would be that it's very important that all of us react to this Environmental Impact Statement by contacting the Air Combat Command with their comments, pro or con, whatever your opinions are. We would like to see you participate. If anything, the National Environmental Policy Act is participating in these federal legislation. It is a federal law. You are obligated to do this. If you would please, make a point of contacting your elected federal and state officials, doing the same thing.

My only comment is the study and the analyses that we have done relative to this particular program indicates there was insufficient notice when it first started. There was insufficient scoping at the time. It really didn't ever exist, and that's the second step. There has been an insufficient contact and information and -- well, mostly contact between the Air Force and the citizens. That's all I have. Thank you. **GE-22**

COLONEL BURD: William Wendt. And then I will be calling on Margaret Lindley. **008094**

MR. WENDT: I want to thank you for the opportunity to speak this afternoon, and I thank you for having these meetings. I am definitely not against training. I am an EMT/paramedic, and I

48

understand training and how essential it is. I do have some concerns.

The first one is where I live, there at Saragosa and Balmorhea. One night I was sleeping very soundly. And in the early hours of the morning, a plane came over. And at first, it sounded like somebody dragging corrugated metal down a gravel road. And it got louder and louder. And pretty soon, I realized that it was a plane, but I couldn't understand how it could be so loud. And all of a sudden, the walls and the ceiling were shaking and the loud noise was deafening. And I thought, I have now ended my life; that plane is crashing into my home. And the walls and everything were shaking tremendously.

As it was, it didn't hit. But I immediately called the hospital and asked if there had been any reports of a plane down. I called the sheriff's office and the PD, also. Because I said, that plane had to have crashed. It could not be flying that low and pull up. And that's how low these planes fly over us. There is a lot of talk about the fact that they are 200 and 300 feet. But there was a man on a well drilling rig, and he was up 40 feet. And he looked out level. And from eye level, the plane went

49

exactly eye level. These planes are flying tremendously lower than 200 or 300 feet. (AF-39)

They also are crossing I-10 three different places in our area. I know what happens when these planes come across when you are driving. I have slammed on the brakes and swerved into the ditch a couple of times because of the fact that all of the sudden that "whoom," and it just -- it shakes your car.

One lady came into the hospital here about two weeks ago with an anxiety attack. She believed that her car was being picked up by a UFO because the car was shaking and vibrating, and she was believing that she was going to be transported.

Another concern I have is with helicopters coming to rescue people that are in motor vehicle accidents. We have helicopters come out. And helicopters mixed with these low-flying jets -- I (BR-2)

don't know; I heard a rumor today that there could be up to as many as 70 flights in a 24-hour period, if all of these other countries start flying this route. That would mean one every half hour, or less. If that happens, we are going to have a lot more pollution than what this environmental study has indicated. (AO-83)

50

Also, children in school; we do have a very good community there in Balmorhea. And when these flights go out of their path -- like the other gentleman said, they are not staying in the path because of this curve. And they cannot maneuver that curve, and they are flying past the edge of their boundary and going right directly over Balmorhea and even to the south of Balmorhea. And this is - my home is outside of the boundary, too, just a little ways. But Saragosa is right in it. (AF-6)

And I would like to go ahead and suggest that could we not -- not have it go directly over Saragosa. Move the path north or south, in order to miss the populated areas. Thank you, sir.

COLONEL BURD: Margaret Lindley. And then I will be calling on Jim Scudday. 008095

MS. LINDLEY: My name is Margaret Lindley. I am a rancher. I have owned a ranch in Loving and Reeves County over which the planes will be flying if this goes into effect. And I thank you for having the hearing today.

The proposal to fly B-1 and B-52 bombers on low-level training missions over West Texas area has us crying out in terror. Our West Texas counties may not be worth much to you, but these are private-owned

51

lands on which some poor sucker will have to make a living, and pay taxes and leases, and keep up the improvements.

These are low-flying planes. The wind turbulence from the aircraft flying that close to the ground will spook the cattle, the horses, and the wildlife; which will tear up fences and water (BR-3)

troughs. And then just from turbulence to the windmills, it will be unbearable and unaffordable. (AO-2)

These planes have a devastating effect on ranching. I do not feel that the government has fully addressed the horrific impact bomber runs will (BR-4)

have on our fragile economy, and the environment, and the quite unique area that we live in.

The government has lands of its own in New Mexico, and Arizona, and other western states which they can very well use for this purpose, and they own the lands. Nothing has been mentioned about (BR-5)

compensation over these private-owned lands where damage is done to the value of the lands.

I have been ranching in this area for 58 years. We have had experience with low-flying aircraft during World War II, and I know what the damage can do. And this will be much worse.

To find anyone or an entity in the military (AF-37)

52

who is accountable to listen to the legitimate complaints by citizens is impossible. Please take your low-flying aircraft over the lands that you own in fee. I thank you for your earnest consideration, and I thank you again. (AF-37)

COLONEL BURD: Jim Scudday. And after that, I will be calling on B. R. Begay. 008096

MR. SCUDDAY: My name is Jim Scudday. I live in Saragosa. My biggest question is how the Environmental Impact Statement was written, and who wrote it, and what guidelines they were using as far as how correct it is.

I know that these planes right now, presently, I would have to bet you that some of the pilots are using my house that sits out there by itself as a -- not primarily a target, but as something to pick a fly-by; that probably four or five times a month that a plane will fly right over the top of my house, right over the top of my house, sitting at about 400 or 500 feet at about 11:30 at night. And during the daytime, probably four or five times a week, planes will come flying right over the top of the house. (AF-55)

And I don't think there has been enough study on loss of productivity and livestock. A lot (BR-3)

53

of the people in this country, this area, are involved in ranching. And what impact do these planes flying over have on reproductivity in this livestock.

As far as impacts, support communities, that looking at y'all's flight patterns out there, everyone of them goes primarily over what the government would call socially disadvantaged populations, as well as economically depressed areas. I know that here in Balmorhea over the past few years, there has been a big reduction in the amount of migratory birds coming through, and especially dove. And dove hunting is a big business around there.

And then there is a lot of talk there in the community now, with the lake out there, that it has been wintering grounds for lots of migratory birds, in trying to get some people coming into the area, birdwatchers, which is big business. Well, there is several birds that you just don't see out at the lake anymore.

And one of my biggest fears is if there is an accident, these planes fly right over the top of Saragosa and right over the top of Balmorhea and right over the interstate. And if one of them does

SE-5

BI-2

54

have an accident, we have got real good medical personnel here, but one or two ambulances isn't going to cut it. There could be a big loss of life if there is an accident, because of the lack of medical response in this area. Thank you.

COLONEL BURD: B. R. Begay. And then I will be calling on Helen Weinacht.

008097

MR. BEGAY: Good evening, sir. My name is Berta Begay, B-e-g-a-y. I live in Toyah, Texas, 14 to 16 hours a day. And 8 to 10 hours a day, I live in Saragosa, Texas.

And this week in California, in some cities, they have already put regulations into effect regarding leaf blowers and the noise and the impact that leaf blowers make in communities. How much more is the effect of these big jets flying directly over us, than the effect of the noise of leaf blowers in California communities?

If these pilots are truly the very skilled professionals they purport to be, they can learn structure avoidance. I am here almost with fear, trembling, because it's hard for me to talk like this. But I have no ill feelings against the Air Force. I have members of my family in the armed forces and have for years. I have great respect for

AO-16

AO-4

55

the military. But carelessness, horseplay, jokes, pranks involving these big aircraft, there is no place for them. And when they fly directly over our structures, they can learn -- you said that they are learning terrain avoidance. I petition you to teach them to avoid structures, whether they be a hen house or a mobile home; whether they are any type of storage structure, whether it be a grain bin, or an oil field battery, dirt tank, any kind of water structure. Establish a limit on how close these aircraft can fly to all types of these structures, including living structures, flocks of hens, birds, herds of cattle.

On April 1, I was literally stunned. I could not even move as the mobile home I sat in trembled. I mean, it didn't shake; it trembled. The aluminum roof felt like it was going to come right off the top. And I was literally, literally stunned. And I have spoken to quite a few people that have had the same experience.

We have a huge underground storm shelter under the Headstart School in Saragosa. Structure damage can involve dirt, cement, cinder blocks. Please consider rerouting your airplanes. Thank you.

AF-6

CU-1

56

COLONEL BURD: Helen Weinacht. And then if Helen Vernon is here and would like to speak, I will be calling on her after we finish speaking.

MS. WEINACHT: My name is Helen Weinacht. Can you hear me?

COLONEL BURD: Yes.

008098

MS. WEINACHT: W-e-i-n-a-c-h-t. I am here, first of all, on behalf of the Balmorhea Chamber of Commerce.

The other night on TV, some guy said--talking about George Bush--that Texas is the 11th largest economy in the world. The second largest industry in Texas is tourism. And nature tourism is a 20-billion-dollar-a-year industry. And we have had a little bit of talk about birds. Where Texas does this (indicating), that's a major flyway, and we are right in the middle of it. Of the 900 birds, 300 of them are in Balmorhea.

In all of the magazines that I read as a chamber employee, the Big Bend area is one of the top three destinations, because of bird watching, and the wildlife, and whatever people do in Big Bend. I can't help but think this would impact that. I don't know what a non-environmental subject is. I guess this would be environmental, the birds. It would

BI-2

BI-3

57

seem to me if that spotted owl can do what it did in Oregon, that our 900 birds should be able to get someone's attention.

My son-in-law is a graduate of the Air Force Academy. I am very proud of his education. I am very proud of the Air Force. I am very proud of my son-in-law, but I don't want him to live with me. Thank you.

COLONEL BURD: Helen Vernon, if you are here and would like to speak, please come forward.

I have now exhausted all of the cards that indicate the individuals who wanted to make comments. I would like now to ask if anyone who has not filled out a card and who has not had the chance to make comments, if you would like to come forward now and make some comments, you are free to do that since we have some time.

Is there anyone who has not spoken that would like to come forward and speak?

MS. EVANS: I wish to.

THE COURT: Please come forward. And any of you who do come forward now, if you would please clearly indicate your name. **008099**

MS. EVANS: Yes. My name is Charlotte Evans. Can you hear me?

58

COLONEL BURD: Yes.

MS. EVANS: I would wish to speak on behalf of the children, and I wish that you would keep this in consideration when you make your decision.

Most of the children in this area, as you know, it's a rural area, so they put in very long hours. They get up around 6:00, if they are lucky. And they do not get home until 5:30, or maybe after. And your fly-bys in the middle of the night is very disruptive. My child can wake up at least twice in the evening, or at night. I feel as though she is being robbed of her childhood, because by the time she gets home, there is homework, eat, and then in bed again. She is exhausted.

AO-26

And I have been on a military base. My sister and my brother-in-law are in El Paso right now. So I do know the difference between a plane coming in and landing and taking off and a full-fledged fly-by. There is a great amount of difference. And I just -- I just wanted to say that.

COLONEL BURD: Is there anyone else who has not had a chance to comment that would like to come forward now and make comments?

Is there anyone who has already made

59

comments that would now like to come forward and make additional comments?

Please come forward. And then I will have you up next. And if you could, again, state your name when you come up. **008100**

MR. LINDLEY: I am Clark Lindley, L-i-n-d-l-e-y. I would like to continue the remarks that I was making earlier in order to be more specific.

We would like to have the calculation involving pollution at 400 feet, because those flights actually are at 4000 feet rather than the existing calculations in Table F, at 5,000 feet. And we would like to have some information in regard to the effect of pollutants, particularly on people who have breathing conditions and on the conditions that might exist for small, young children.

AO-62

I have discussed briefly with Colonel Wheelis a report that we have been handed in regard to what his alleged -- and I do not know that it's true; alleged to be a component of jet fuel. I believe it's JP-8. But I want to at least read that into the record.

"An extremely hazardous pesticide, EDB, ethylene dibromide, was banned by the U.S.

60

Environmental Protection Agency in 1983. But in 1991, the composition of jet fuel used by commercial and military jet aircraft in the United States was changed from JP-4 to somewhat less flammable JP-8. A Department of Defense source says the move has saved some lives; air crashes. Ethylene dibromide is a key component of JP-8."

I am asking that in the environmental study, that it be determined whether ethylene dibromide is present. Am I going to be limited to three minutes?

COLONEL BURD: Yes. But after anyone else who would like to make additional comments is through, then I will give you another shot at it.

MR. LINDLEY: Okay; thank you. We want to be assured that there are no other additives in the JP-8 that ultimately has some damaging effects to humans that would be in the areas immediately under the flight patterns at 400 feet.

AO-66

We are also concerned about the report that fuels are dumped at some point in the flights. We do not understand what the effect is on human beings. And we would like to see some evidence that this act is not going to be damaging to people, to water, or to animals in the areas they are under. Thank you.

AO-50

MR. VERNON: My name is Joe Vernon,

008101

61

V-e-r-n-o-n. And I would like to continue and add to the comments I made earlier.

I think one of the big issues, at least to me, and I think should be to a lot of the people, is this study that was supposedly done. I think people need to know that probably most everyone here didn't know anything about this study, about this proposal, or even this meeting this evening, until the last 48 to 72 hours. It was amazing to me the number of people that I talked to that knew absolutely nothing about it.

You know, we trust the government to take care of us. And that's -- you know, that there is one of the worse wrongs you can do. What are you trying to do to us that you don't want to tell us about it?

I don't want it to sound like I am against the government or against the military. I am all for it. I signed up to be in the Air Force. I am a pilot. I love to fly. I love aviation. I have got a son that just graduated, going into the Army. Sorry, it's not the Air Force. But he is going to be a helicopter pilot.

It's amazing to me the difference between us as civilians and, particularly, civilian pilots, the

62

BR-5

extensive training we go through to learn the limitations we have; and yet, the armed forces pay no attention to those. We want this. We are going to go get it. That -- I don't know. It creates so such distrust, it's unbelievable.

And as a lot of the people have said already, the government owns land everywhere where they can do this. And I want to remind you, they own those lands and you people, pilots included, everybody, you make your living off our taxes. Don't make me pay you to come in and take away my freedom and what rights I do have. That's not right.

And consider the safety issues. After all, if you are going to mess us up and take a chance of killing us, how much is that worth? You know, you are supposed to be here to protect us, not run us off and kill us. Thank you.

COLONEL BURD: Would anyone else like to make comments?

008102

TY

MS. WEINACHT: Yes. My name is Helen Weinacht, and I wanted to speak to the 46 jobs that will be created in Reeves County. I think that's piddley compared to what the nature tourism can bring in.

And earlier, you mentioned something about

63

flying 600 miles before they got to where they would do the realistic training. And thank God, pilots are having to fly that far before they would take any sort of aggressive action. I don't think it's realistic just to go up and practice that. We want it that far away, do we not? Thank you.

COLONEL BURD: Would anyone else like to make any comments? Very well.

008103

MR. LINDLEY: Clark Lindley, L-i-n-d-l-e-y. I was told after I finished speaking just a moment ago that I had made the mistake of saying that I wanted the studies of pollution levels at 4,000 feet. I intended to say 400 feet.

I would now like to begin to speak as chair of the committee appointed by Reeves County Judge Jimmy Galindo. During the scoping process, the County Commissioners Court prepared a letter dated March 31, 1998, addressed to RBTI EIS at Dyess Air Force Base, Texas. We sent it by certified letter on April 1st. I would like to read from that letter so that there will be a record of the position taken by the Reeves County Commissioners Court in regard to the Environmental Impact Statement.

"The council on environmental quality regulations state that local governments and the

64

public have equal authority in the decision-making process relative to all federal government actions, relative to the national and human environment. Therefore, we ask and require that you respond to the following requests for information and take account of our requirements stated in this letter regarding methodologies and perspectives on issues to be developed in the Draft Environmental Impact Statement and in the Final Environmental Impact Statement.

AF-40

"We are, by this letter, notifying you that we are requiring you to let us participate in reviewing methodologies, selection of studies, selection of organizations doing the studies, and development of the DEIS, and approval of the final FEIS.

GE-22

"The Reeves County Commissioners Court requests that you provide us notification of any EPA related hearings, public meetings, and provide us with information related to all environmental documents as required in the CEQ regulations.

GE-22

"We request that you provide us with a copy of the Draft EIS, all revisions, and a copy of the Final EIS. We ask that you provide us with a full statement of our due process rights in regard to each step of the RBTI process.

65

"As a part of the requirements of the CEQ regulations on the National Environmental Policy Act, please respond to the following questions and/or include their standards in the development of the Draft EIS and the Final EIS." Do you want me to --

COLONEL BURD: How many pages are you intending on reading?

MR. LINDLEY: Four, four additional pages.

COLONEL BURD: And this is something you just can't present in writing?

MR. LINDLEY: Well --

COLONEL BURD: I mean, I would like to note that 80 percent of the people attending the meeting have gone. And you are imposing on our goodwill by continuing to read something that you could just introduce in writing.

MR. LINDLEY: Well, evidently, you may feel that I am imposing on your goodwill. Does the audience feel that way?

AUDIENCE MEMBERS: No, no, no.

COLONEL BURD: Are you going to continue to follow us around and make these long presentations at the subsequent hearings?

MR. LINDLEY: This will be the only --

66

COLONEL BURD: If you do -- I am not suggesting that you not attend other hearings. But if you do, I would like you to organize yourself better, make better use of your time, and present the essence of what you have to present.

It's inappropriate for you to exploit this hearing to read a long document that you could submit for the record. And that's the point here, other than just simply -- what you are doing now is taking the opportunity to get up on a soapbox, which is something other than the purpose of this hearing.

I will permit you to read what it is that you have. But I want you to know I personally feel it's inappropriate for you to do this. Go ahead.

MR. LINDLEY: "As part of the requirements of the CEQ regulations on the National Environmental Policy Act, please respond to the following questions and/or include their standards in development of the Draft EIS and Final EIS.

PD-35 "We request that all data in the EIS include the base line conditions prior to the development of the U.S. Air Force flights in Reeves County, and include all cumulative increases from that base line for current and all anticipated flights, thus showing the total cumulative

67

environment effects.

BR-5 "Please provide full evidence of your legal authority underneath to be making current flights over the southern part of Reeves County. Please

AO-84 furnish us with documentation showing what additional incremental flights in Reeves County beyond the present proposed RBTI have been discussed or proposed by the U.S. Air Force.

"We request a history of complaints made to the U.S. Air Force regarding actual low-level flights and a complete statement of the procedure in making complaints that become a part of the historical records.

AO-85 "In your analysis of the air pollution, please provide statements of increases in particulate matter at both the 10 and 2.5 micron levels. Please provide your analysis of increases in particulate matter based upon actual flights at elevations of 100 to 300 feet, rather than at irrelevant higher attitudes. Base the figures on the immediate period of the overflight and not on longer periods such as an hour or 24 hours.

"In regard to the effect on stress levels in human beings, please review and include objective studies bearing on the immune system, the nervous

68

system, endocrinal system, and cardiovascular system. Please evaluate the effects on children, the elderly, and those with impaired physical and/or psychological

AO-1 conditions. Give particular attention to the effects on people with impaired lung conditions. What is the spectrum of potential effects upon each of the preceding of continuing day and night flights on the maximum number of flights proposed.

"Please include in EIS an estimate of the

AF-41 number of the close passes within 100 feet and 300 feet of individuals walking on foot, riding horses, or driving a vehicle or farm equipment in the period of one year. Please base your environmental analysis on actual flight test data obtained on each of the proposed aircraft flying at their lowest flight levels above the ground, at their maximum training speeds, with measurements six feet above ground and directly under the flight paths.

"Please provide decibel levels, wind force levels and direction, and all EPA air quality

AF-42 parameters under these specifications. State how many aircraft flights will be made under maximum anticipated proposal on a weekday, weekly, monthly, and annual basis.

AO-86 "Will in-flight refueling take place over

69

AO-86 Reeves County, and what amount of fuel will be lost or dumped? What will be the effect on humans, animals, and the land beneath? We request that you
AO-125 study the geology underlying the flight zone and determine potential effects of pollutants upon the water in the underground water table. What is the
AO-125 effect of pollutants upon surface water over the periods of a month, six months, a year, five years, and ten years?"

I think that's probably as much as I want to attempt to read from this. We did not receive any response at all from the Air Force to the Commissioners Court of Reeves County and are still concerned that we are not being included in a participatory way. Thank you.

COLONEL BURD: Is there anyone else who would like to make any comments? Yes? **008104**

TY MR. TARIN: Herman Tarin. I just would like to note that -- let you know that the Court did appoint Mr. Clark Lindley to work on this issue, and we really would like to appreciate him and what he has done for us. As far as any response from the Air Force, we have not received a response at all, except a copy of the environmental draft that we received about three weeks ago. Thank you.

70

COLONEL BURD: Would anyone else like to make any comments? Ladies and gentlemen, that concludes this public hearing. Thank you for your participation and input. Remember, the public comment period will extend through June 16, 1999.

This public hearing is adjourned. Thank you kindly.

(Time is 7:31 p.m.)

20

recognized you and please address your remarks to me.

Please speak clearly into the microphone, starting first with your name. Please spell it out if it's difficult to spell, and the capacity in which you appear if you are representing anyone other than yourself. This will ensure the Court Reporter gets an accurate record.

Each person will be allowed three minutes to speak. This time limit applies to public officials, spokespersons -- **008105**

GE-6 MS. SMITH: I would like to object to the three-minute time limit. There is no legal authority for that. NEPA does not set any limit. This hearing is for the public and is not under the means of the Air Force. I would urge the people who have taken the trouble to come here to make their comments recorded by the Court Reporter. And I would like this recorded by the Court Reporter. Those people have the right to speak as long as they want.

COLONEL BURD: Well, I am sure that all the remarks that are made, including unsolicited outbursts, will be recorded.

As I previously indicated, if you speak --

MS. SMITH: This is a hearing and that is a legitimate objection. I have a right to make an

21

objection. I have a right to make it on the record.

COLONEL BURD: Anyone who desires to speak, as I have indicated, will be given an opportunity to speak after I have recognized you. Please address your remarks to me at that time.

As I indicated, each person will be allowed three minutes to speak. This time limit applies to public officials, spokespersons, and individuals speaking for themselves.

You do not have to speak for the full three minutes. However, if you choose to speak for the full three minutes, when you have only one minute remaining to speak, a yellow card will be raised. And then when your time has expired, a red card will be raised.

Out of respect for the others who would like to make comments, I ask that you please honor any request from me to stop speaking. If you think you have more comments than you can present in the time allotted, make the most important comments first. If you don't get a chance to voice all of your comments, you can and should submit them in writing.

If we have the time, we may give you an opportunity to expand on your remarks later at the end of the hearing.

22

You may have noticed that a Court Reporter will record verbatim everything that is said tonight. The transcript -- or today; excuse me. The transcript of these proceedings will be become a part of the record of the hearing and will be included in the Final EIS. The Reporter will be able to make a complete record only if she can hear and understand what you say, so speak clearly and slowly. In addition, if you have a written statement, the Court Reporter would appreciate you handing it in so that any names, places, references to scientific terms, or other information can be recorded accurately.

Finally, I would like to remind you to limit your comments to the Draft EIS. That is the purpose of this public comment period. Also, I ask that you avoid repeating what other speakers have said. There is nothing inappropriate about agreeing with what other speakers say, but to repeat the same thing just delays others in making their comments. If you agree with a previous speaker on a particular issue, you can state your agreement. Of course, you may make any comments you wish about the Draft EIS.

If you would like to turn in your written comments, you can place those in the box provided in the back of the room.

23

Now, we will start with comments now. We do not have any elected officials, so I would like to, from the cards that have been handed in, call now on the individuals who have indicated a desire to make comments.

And the first person I would like to call on is Bernie Zelazny. 008106

TY MR. ZELAZNY: My name is Bernie Zelazny. That's B-e-r-n-i-e, Z-e-l-a-z-n-y. As many of us here are, I am opposed to any flight training in the area. It seems to me the best place for the EIS is the trash; that there should be no action; that they should move the aircraft closer to the already set up testing and training areas and let the pilots train there, as they have in the past. That would eliminate all of this and the need for it. It would cost us all a lot less in taxpayers' dollars, and the training could take place as the Air Force wishes.

COLONEL BURD: I would like to now call on Steven Posner. 008107

DR. POSNER: I am Dr. Steven Posner, P-o-s-n-e-r. We are relatively new residents to Alpine. My main concern is, speaking as a civilian pilot, of these aircraft's safety in this area.

24

Generally, airflight safety is accomplished with what the FAA calls "see and avoid," which works quite well utilizing speeds under 250 knots, which the FAA requires under 10,000 feet.

With nearly double the speed on these Military Training Routes, "see and avoid" is an impossibility. There is just no time for a B-1 or a B-52, going six to eight miles per minute, to see a small general aviation aircraft and to take evasive action, for either aircraft. I know the Air Force certainly doesn't want to lose any aircraft or any personnel. Certainly, the civilian community doesn't want to see that happen either.

AF-43 Again, the FAA makes this rule for a reason and that safety "see and avoid" will not operate at air speeds that are planned for this Military Training Route.

COLONEL BURD: I would like to now call on Hal Flanders. 008108

MR. FLANDERS: My name is Hal Flanders, H-a-l, F-l-a-n-d-e-r-s. I agree with the civilian pilot speaker, and I will leave that go. I don't understand how the ranchers, DEA, border patrol, and anyone else flying around down here can do any avoidance, because their mission requires them to be

BR-2

25

looking down all the time. They are not looking out there for spots in the sky. And I don't think it's a matter of if there is a collision, I think it is a matter of when.

In addition, I am upset with the environmental aspect of that many flights in this area, which is already in serious trouble with air

AO-1 difficulties, air particulate matter reducing visibility. You know, if I understand it correctly, when an airplane is flying level, it is not really

AO-5 pouring gas, so to speak, out of the back end. But when it's pulling up, which you must do if you are going to be following the terrain, there will be a lot of this and there will be dumping a lot of their fuel on this ground here, which has already been punished for a long time, and severely. So I don't think we can afford environmentally more degradation when we are fighting hard to try to clean up the area. Thank you.

COLONEL BURD: I would like to call on Dan Decker. 008109

TY MR. DECKER: My name is Dan Decker, D-a-n, D-e-c-k-e-r. I am a retired Air Force Tech Sergeant, and I speak from experience on working on these aircraft for 20 years.

First of all, I am here because this is the best show in Alpine today. Secondly, I am here to apologize to Colonel Burd and other Air Force personnel for some of the things they are going to hear by people who speak here today. And that is on behalf of the sane and patriotic citizens in Alpine.

I would also like to say that continuous training is required. It's not a nicety. It is a requirement. Their hours, their line hours, are continually being decreased. And they are continually being exposed to hostile environments. We have Air Force personnel, and Navy personnel, and other personnel right now under fire. Right now they are being fired at.

From 1947 until 1991, the military was deployed into a hostile environment eight times. That included Vietnam, Korea, and the Gulf War. Since 1992, the military has been deployed into a hostile environment 33 times. Our involvement worldwide is increasing.

One of the things that happens with pilots, Air Force pilots don't get paid a whole lot of money. Pilots with the civilian airlines do get paid a lot; $50,000.00, $60,000.00, $70,000.00 and more for a pilot of a Boeing 747 or a commercial line. That's a

huge, huge draw to pull pilots out of the Air Force, trained pilots. So this need to continually train is something that is accepted.

During World War II, we were unprepared. Japan could have taken this country, or at least a huge portion of it, because we weren't ready. Since then, we have continued to be ready. These pilots need to train. They need to fly here. You don't want them flying over Dallas, do you, or Houston, or Los Angeles to train, to drop bombs. There is nobody out here to object -- or not to object; there is nobody out here in comparison that would cause -- if a plane crashed here, which one did a couple of years ago, it wouldn't hit anything. If it had been in downtown Dallas, several thousand people might have died. Bring it on, gentlemen.

COLONEL BURD: I would like to now call on E. L. Pitman. **008110**

TY MR. PITMAN: Colonel, my name is Earl Pitman, P-i-t-m-a-n. Under the conditions that we find ourselves today in Kosovo and Yugoslavia, I think that the importance of what we are speaking about here today takes on new real incidence. And I would hope that as a community and as a nation -- this is not something that just affects Brewster

County, or Alpine, or the West Texas area, but this affects the very core of our American way of life, and our democracy, and the freedom which all of us want to enjoy. And every person here is here today for the purpose of expressing an opinion about some aspect of their own freedom, personal freedom, or the national freedom. But I would hope that our pragmatism, and having lived and having read history, would not be overcome by what I would call causism and we would not be led astray by that and not understanding the real issue which we are dealing with here today.

I have reviewed the impact statement in fairly close detail. And I have found no pertinent impact that would really cause us as a community to be against it because of the fact that it would impact our community as a whole. It might impact some of us individually more than it does others, and we might not prefer that impact upon our own lives.

I worked for the state highway department for 32 years. That doesn't qualify me for anything except to say that during that time, in the early '50s, I was a part of establishing and locating new highways in this state, a long time before the interstate system was here. And it was amusing to

me, though I found it to be somewhat -- I couldn't rationalize it. And we would interview people and speak to them about where do you want this road? Do you want the road at all? Oh, yes, we want the road. We want to get out of this mud; and where would you put it? Well, we want to put it right out here in front of your house. No, I don't want it; put it over on my neighbor.

So I would just say to the Air Force today that whatever you do, you should pursue this until you implement B, C, or D. Because I balance my budget at home. I expect Brewster County to balance its budget, and I expect Washington to balance its budget for the benefit of us all. And when that takes place, then we are not going to see 40, 50, 60 percent of air time training funds wasted in in-transit flight big as a ho hum, give me a donut and a piece of coffee (sic). Thank you, sir.

COLONEL BURD: I would like to call on Betsy Brown. **008111**

MS. BROWN: My name is Betsy Brown. I would first like to say that I don't think that any of us here are against pilots training. That's never been the question. The question is where. Also, I don't think any of us are saying don't do it over me;

30

do it over my neighbor. We are more saying there are other places that there are no people, or very much fewer people, than there are here.

Basically, I am not, you know, really educated on this. I don't know the technical terms. I do know that these training flights impact me personally and very negatively. And I know the more they are, the more the flights there are, the more negative this becomes. And the number of flights has already increased tremendously in my lifetime out here, and I am not sure why. They fly right over our house. I am not sure why. They say they try to miss our house, and that's a little difficult to believe. We can call and complain. Maybe it does a little good for four or five days; then guess what, they are flying right back over our house.

AF-55

I don't think it's necessary. That's the point. I don't think it's necessary for them to do this out here. I don't think it's necessary for them to increase the number of flights. I think it is necessary for them to train. I am patriotic. I don't want them to stop training. But I think there are better options, better alternatives, than over us. Thank you.

COLONEL BURD: I would like to now call

31

on Jack Brown. 008112

MR. BROWN: I am Jack E. Brown. I live in Presidio County, Texas, not far from here. We own private land there and try to get by with a cattle operation, which is not profitable. I think that's pretty well known. The Air Force is violating our rights. You are trespassing on our rights in using our air space and part of our property without compensation. I believe, traditionally, a landowner in this country owns rights under the surface and in the airspace above the surface, and that is not being respected.

BR-5

Your flights, your training flights, are affecting our operation in a number of ways. Just one example, we have some guests. We have some paying guests. We have three different residences on our country. We have some hunters that pay us that help us stay in business. I think you can imagine what that might do to a hunter when he is stalking a trophy buck and one of your planes zooms down close. It scares him and scares his prey off.

BR-4

You are affecting us in a lot of ways. Our livestock, our riding horseback, for example. I am not doing that at the present time. I am almost 83 years old. And I was and really not too long ago. I

32

wouldn't dare get on a horse now at a time when one of your planes might come over, because it wouldn't take much to get me off and break my leg or something.

BR-3

We support the training. We are patriotic, always have been. But we believe in private property rights. You started this and you continue it without consulting us about it. We don't have time to come to these meetings and do everything that we could do to protest this. We don't have any help. My daughter and I run those ranches, and we can't take time to do what we would really like to. Thank you.

COLONEL BURD: I would like to now call on Mimi Smith. 008113

MS. SMITH: My name is Mimi Smith. That's M-i-m-i. I am the attorney for the Trans-Pecos Protection Group, which opposes the Realistic Bomber Training Initiative. And I would like to note, first of all, that the cards were not left in order, because I signed up long after Bryan Kelley. I oppose any violation of the process as set forth.

GE-30

And I also strongly oppose and I am offended by the United States Air Force stopping our citizens from speaking. How dare you? And don't call me

33

unpatriotic. My father was injured, and has suffered that injury the rest of his life, in World War II. My mother worked tirelessly as a volunteer in World War II. My nephew was in the Persian Gulf War. And I supported the soldiers when they were in Vietnam, so don't you dare call me unpatriotic.

The reason -- I was raised on a Houston military base. And the generals that used to come to my birthday parties when I was eight years, told me this: They said the lowest civilian outranks the highest military personnel, and that's why we are civilians. That was when the military respected civilians. How dare you hold up cards in front of these people. They've lived here for generations, generations. We have something to say. We are going to say it. And we are trying to be polite. And we have been treated like your servants, that we are supposed to sit here and obey and be silent and follow your rules.

GE-6

This hearing is mandated by the NEPA. There are no three-minute rules. The Air Force is here because they have to be if they want to have their bomber initiatives or even if they even want to change them. And speaking of change, what most of you don't know, the so-called No-Action alternative

34

is inaccurately misrepresented. If the Air Force wants to come up and say, well, this site has no action, therefore, there is no environmental impact, what they are not telling you is that the No-Action alternative is an action alternative to lower flights from the limits of 500 feet now, to 200 feet. And as many of you know, because you have looked out your windows and seen the faces of the German pilots, not the American pilots, flying these planes, they are flying at 200 feet.

PD-40

The last speaker spoke of the dangers of horseback riding. Maybe that doesn't mean anything to somebody from San Antonio. But I am not so unemotional. It is extremely dangerous. So far, one of the planes has not come over at 100 feet; but I am on the ground if that happens. There is no way that we are surviving that. That's a tiny alternative. The only reason this area is proposed is because there is nobody to object. There is not enough of us. At least that's what it is believed. Texas, when it joined the Union, didn't make the deal that the other states made. And that's why there is so little federal land in the State of Texas. There are over six million --

COLONEL BURD: Mrs. Smith, your three

35

minutes has expired.

MS. SMITH: That's fine. There are over --

COLONEL BURD: As I have indicated to you, your three minutes has expired. Can I interrupt you a moment? What I would like to do is what I have done in each of the previous hearings we have done, which I am sure you are aware of in your capacity, and that is to go through all of the individuals who have indicated a desire to speak, and then ask if there is anyone who has not spoken that would like to speak and give all of those people three minutes --

MS. SMITH: The cards weren't even kept in order. I am not --

COLONEL BURD: Just a moment.

MS. SMITH: No.

COLONEL BURD: Just a moment.

MS. SMITH: No.

COLONEL BURD: Well, then, I am going to continue to speak over you --

MS. SMITH: That's fine. That's your Court Reporter's problem. And as you know, a Court Reporter can't take down both people. And this hearing is for that Court Reporter to take down the comments of the public, not the United States

36

military. The purpose of the hearing is only for our comments.

COLONEL BURD: Ms. Smith, can I ask you a question? Are you an attorney?

MS. SMITH: There is no legal -- yes, I am. And there is not legal authority to the three-minute limit; none.

MR. COLONEL BURD: Are you an attorney in the State of Texas?

MS. SMITH: Yes, I am. There is no legal authority for the three-minute limit --

COLONEL BURD: Are you aware of your ethical obligations?

MS. SMITH: There is no three-minute limit.

COLONEL BURD: I consider your behavior to be unethical.

MS. SMITH: There is no legal authority, and I will not obey it.

COLONEL BURD: The rules that we have established --

MS. SMITH: There are --

COLONEL BURD: -- and the rules I am employing at this hearing and all other hearings --

MS. SMITH: What is that --

37

COLONEL BURD: Fairness.

MS. SMITH: Fairness to who?

COLONEL BURD: I ask that you be fair and to give everybody a chance. Now, as an individual early on that has not --

MS. SMITH: Fairness to whom?

COLONEL BURD: To everybody here. You are going to be given all the opportunity to speak, but at the appropriate time.

MS. SMITH: There is plenty of time for everybody to speak.

COLONEL BURD: I am asking you to sit down. I will call you back up after everyone else has been given their three minutes.

MS. SMITH: The Court Reporter can't take anything down, which makes this hearing illegal.

COLONEL BURD: Would you please sit down?

MS. SMITH: No.

COLONEL BURD: You are creating a disturbance. I can see from your behavior that --

MS. SMITH: Are we going to act rationally? I will be finished in 30 seconds.

COLONEL BURD: I would like you to sit down. When everyone else is finished taking their

38

three minutes, I will give you another three minutes.
MS. SMITH: I just want 30 seconds.
COLONEL BURD: If you want longer than that and no one else objects, I will give you additional time.
MS. SMITH: Then I would ask that you not --
COLONEL BURD: But it's not fair for you to demand your rules. Who are you to demand your rules?
MS. SMITH: My rules are designed by the National Environmental Policy Act.
COLONEL BURD: I am simply telling you that these rules are going to be enforced, and your belligerence is not going to force me to deviate from the rules that I have decided are fair.
MS. SMITH: Did you also decide not to leave the cards in order?
COLONEL BURD: I am asking you to sit down.
MS. SMITH: Did you also decide to leave the cards out of order, because they were taken out of order. Bryan Kelley was not allowed to speak in the order in which he signed up. Thank you.
COLONEL BURD: I am asking you to sit

39

down. Thank you.
I would just like to say for everyone who is here, that we have had several hearings and we have several more hearings planned. We have had people attending previous hearings who have attended some of the other hearings. We have people here today who have attended all of the hearings, which is fine. The Kelleys, I expect to see them on our whole trip. And I personally like the Kelleys. I have had some good conversations with Mr. Kelley, and they are fine people. I have no problem with anyone who has made comments.
But what I have tried to do -- and I am real sincere in this. I have tried to maintain fair and consistent rules. We were in Snyder, Texas, and we had over 450 people in attendance. And we had about 58 speakers, and we had a limited period of time. And providing three minutes for each speaker without taking any breaks gave us enough time to get through all of those people.
Now, one of the concerns I have had is that in an event like this where we have got a smaller group, if I just say, okay, let's do away with the rules and let people talk for as long as they want to, the word would get around to these places where

40

there are going to be larger groups, like where we had them at Snyder. And that people -- then it would then get out of control.
And these rules I have implemented for the purpose of giving you all an opportunity to speak. And at every hearing, I have ended with what I am going to do here. And that is, giving you all an opportunity to speak, even if you haven't filled out a card. Even if you have already spoken, I am going to give you additional opportunity to speak. So nobody is going to be denied anything. 008114
I would like to now call on Earl Lively.
TY MR. LIVELY: I am Earl Lively, and I am an old Air Force man from World War II. And I am just -- I am probably not going to use up my whole three minutes because I am not a public speaker. But I remember what it was like in World War II, when I was 19 years old and I entered the Air Force. We were totally unprepared. And we certainly need for our Air Force to fly and get training. And if they can't fly and get training out here, where in the world can they fly? I mean, they can't fly over Dallas and Houston and places like that. So we need this training.
And, also, I might say that I heard one of

41

the gentlemen speak about his cattle being scared and all of that. I have flown right over cattle and they haven't even looked up. And the same way with deer and other animals. They don't even pay attention to the planes. So I think that's a little bit on the ridiculous side.
From my part, after all we have gone through in World War II and these other places that our Air Force has served, I am 100 percent for our Air Force. And we need -- we need the room to fly, and we don't need all this talk about people being against our pilots flying and training. Even if they are German pilots, they don't have room to fly over there either. They need the room out here to fly.
So that's all I have got to say. As an old Air Force man, I say gung ho.
COLONEL BURD: I would like to now call on Gerald Puckett. 008115
MR. PUCKETT: Thank you, sir. I am Gerald Puckett from Fort Stockton. I operate Puckett Ranches, Limited. And on my country, I have what I understand from the Abilene Country Club's rumors, the Moscow waterworks you raid quite frequently. And I have prepared a statement to read.
To the Senior Officer at the Air Force

42

Public Hearing at Alpine today: Subject is startling. Thanks for the invitation to tell you my side. For 20 years I have been hearing and watching your trainees on your regular flights, day and night. I haven't liked it but thought maybe, well, patriotism. But German fliers; I served in World War II to prevent that over my pasture. You are a nuisance. You scatter livestock everywhere. You have affected lactation. The calves are missing that meal when you fly over. BR-3

Have you ever thought of making a financial offer to compensate us? The oil patch has other problems. Would you like to work on a high pressure gas line under a drilling floor or inside a compressor building and be startled by a fly-by? It sounds like a ruptured gas line. It raises your blood pressure. BR-5

Go to the many, many miles of federal lands we have that don't pay taxes and leave us alone so we can get our ad valorem taxes paid. Thank you, sir.

Any questions?

COLONEL BURD: As I previously indicated, this public hearing is not an opportunity for a question and answer session.

I would now like to know if there is anyone

43

who has not had an opportunity to speak; if anyone would like to speak now from that group? Anyone who hasn't spoken that would like to speak, please come forward. Mr. Kelley? 008116

MR. KELLEY: Thank you. I would like everyone here, if you would please, remember what we are here for, and that is to conduct a public meeting relative to the Realistic Bomber Training Initiative Environment Impact Statement.

In doing so, it requires that we all give our comments. If you would, please, write to the address that the Air Force has given us, giving your comments, your opinions, pro or con; participate, please participate. Write your federal and state senators, write your federal and state representatives; give them your opinion. It's very likely somewhere down the road you are going to need your opinion heard relative to this particular proposal by the U.S. Air Force.

What we have done -- I am a spokesman, by the way; Harold Bryan Kelley. I go by B-r-y-a-n, K-e-l-l-e-y. What we have done with the Trans-Pecos Protection Group to attempt, by executives, by legislative, now in some cases through the federal courts, to convince someone that the Air Force has

44

for the past, say, 20 years, since about 1980, been attempting to perfect a mistake. The mistake was ever creating any military training routes over the Trans-Pecos area. This, of course, is a national problem. It isn't local at all.

We would like to see the Air Force move their military training routes where they belong. Stop trying to perfect a mistake. The mistake is to fly over populated private property when we have some six million acres of federally-owned land in existence now where these flights can be conducted without disrupting private property or too much of the environment, really. PD-7

So if you would keep that in mind when you contact your elected representatives. You can, in this case, call us, get some of our literature. We have our fax number on it, our telephone number, our mailing address, our e-mail address. Contact us for any further information. You may want to write to the branches of the United States Air Force, to the Department of Defense Air Forces, which include the Marine Corp, the Navy, and the Army.

Contact everyone. When you do so, please send your letters certified mail and return receipt. Keep the receipt. It may be very important for

45

future litigation. Thank you.

COLONEL BURD: I had a card provided to me. And I would like to now call on Norma Kiser. And excuse me if I mispronounced your last name.

MS. KISER: It's Kiser. That's okay; no problem. 008117

Good morning. These comments are from the Davis Mountain Trans-Pecos Heritage Association on behalf of the members. And any comments are addressed to Major Brent Adams, and it is in regard to the Realistic Bomber Training Initiative Draft Environmental Impact Statement.

Dear Major Adams: The Davis Mountains Trans-Pecos Heritage Association represents landowners owning hundreds of thousands of acres of private land that will be impacted due to the Realistic Bomber Training Initiative. Thus, our association has an interest in the initiative on behalf of these members. The United States Constitution protects the sanctity of private property ownership and guaranties these rights. That protection is provided by many provisions in the original Constitution framed in 1787, and ratified in 1788, and the Bill of Rights framed in 1789 and ratified in 1791. Property rights are also secured

46

in Section 1 of the 14th Amendment, which was framed in 1866, and ratified in 1868. Little doubt should exist as to the constitutional importance of property rights. Yet, we specifically address the federal government's apparent disregard for private property rights of the members of the Davis Mountains Trans-Pecos Heritage Association. The RBTI invades the airspace of hundreds of landowners, bring undue interference with their right to the use, management, and peaceful environment of their land, which is being used without their permission. The Davis Mountains Trans-Pecos Heritage Association appreciates the opportunity to comment on the RBTI EIS. Please register our strong opposition to this initiative. And this is submitted by Norma Kiser, Executive Vice-president. Thank you.

BR-5

COLONEL BURD: Is there anyone else who has not made any comments that would like to make comments? Please? And if you could, state your name, please. 008118

TY

MS. FRANCES: My name is Cheryl Frances, Cheryl with a "C", Frances with an "E". I thank you for the opportunity to speak. I would just like to make a couple of points. I am here just as a citizen, landowner, taxpayer, voter, and

47

conscientious objector. Due to the history of this initiative that was referred to by Mr. Kelley, I feel that the details of this environmental impact analysis are acting as a distraction from the underlying issue. Also, due to current and inevitable future environmental impacts that will be and are being caused by this low altitude flight training over our private land, as well as state and national park land, I must object to all of the proposed alternatives, preferring what I would call Choice E, none of the above.

Lastly, I love my country. I love it very much, and this is why I cannot support the initiative.

COLONEL BURD: Is there anyone else who hasn't made comments who would like to make comments? Please? 008119

TY

MS. EATON: My name is Leigh, L-e-i-g-h, E-a-t-o-n. The only thing that I have to say about this is if we need protection from our Air Force, where are we going to get it if they don't have any place to train? And what I am disappointed in today is the people here that did not show up for this; if they have a support, if they don't understand the issues, if they don't care what the

48

issues are here. But the only people who show today are the NIMBYs. If you don't know what that means, "Not in my back yard." But if your back yard is attacked, you are going to want some protection from our servicemen.

So I urge you to give this a little bit more positive view. Because I just learned a few days ago that these bombers have been flying over some of these areas for weeks, months, Monday through Friday. I'm go in the back country as much as I can. I stay outside. I have never heard one little noise from any aircraft. And I know for a fact that if they fly over a cow -- you can shoot a gun about that far from a cow's head, and if she is busy eating, she is not going to look up. I know this for an absolute fact.

So just give it a lot more consideration. We need these guys. We need protection. I am willing to give them some of my space so that they can protect us. Thank you.

COLONEL BURD: Is there anyone else who has not spoken that would like to speak?

Is there anyone who has already spoken that would like to make additional comments? Please? 008120

TY

MR. DECKER: Again, my name is Dan Decker. One of the reasons they want to fly here, we

49

have one of the lowest population densities of any area in the United States. Any large area that makes a 40 to 80 in area, 40 to 80 or 90 nautical miles, you don't have any areas that large with nobody in it.

The question is disturb hundreds of people or disturb millions of people. That's the options. As far as disturbing the environment, the animals and the environment, I've raised Arabian horses. I no longer do so. Arabian horses are perhaps the highest strung horses of any kind of horses in the world. I lived right next door to an Air Force base. The other side of the fence was Ellis Air Force Base, the 28th bomber unit, B-52 Hs & Gs. These horses never looked up. They don't have any natural enemies above their heads. They don't care what's going on above their heads. They hear the planes coming from a long way off, so it's a gradual, to them, increase in any noise that they might hear. It's not startling.

These planes are not going to be breaking the sound barrier. It's my understanding it's against the law to break the sound barrier over the continental United States. They have to go out over the ocean to do that. So that sudden noise is not going to be there for the animals. They don't care.

50

I would also like to address rudeness. I thought people in Texas were polite. If you are being rude, you are being rude. I don't care what your profession is or who you are, be polite. Everybody has an opportunity to talk. Don't go and hog the mic.

Addressing the issue of flying with other people from other countries. Right now, our men are flying with Germans, Frenchmen, Italians, and they have to practice together, both. All these countries have different ways of doing things. They must practice together; required.

A compensation; if you want compensation for it, you are talking to the wrong people. These gentlemen don't make law. If you want compensation, you need to talk to your congressman. That's where the laws come from. Thank you.

008121

COLONEL BURD: Yes, sir?

TY MR. BROWN: I am Jack Brown. Again, I want to make a few comments about patriotism, and the national defense, and things like that. I think you all know that our defense budget has been cut quite a bit in recent years. I am against that. I think the United States of America is in peril, particularly from China. I don't think we have anywhere near

51

adequate protection from incoming missiles and so forth.

I have read that the Air Force is short of pilots. I would like to see them be at full strength, all the military forces of this country. I can prove that I have written the congressmen and different people, encouraging them to keep a strong national defense and not cut the budget for those things. I just want you to understand that, that we are patriotic. We support the Air Force. But we want them to make some changes in this low-level flying. Thank you.

COLONEL BURD: Is there anyone else who would like to make additional comments? Anyone else at all that would like to make any comments?

Well, ladies and gentlemen, this concludes our public hearing. Thank you for your participation and input. Please remember the public comment period will extend through June 16, 1999. This public hearing is adjourned. Thank you again.

(Time is 11:55 a.m.)

22

any names, places, references to scientific terms, or other information can be reported accurately.

Finally, I would like to remind you to limit your comments to the Draft EIS. That is the purpose of this public comment period. Also, I ask you that you avoid repeating what other speakers have said. There is nothing inappropriate about agreeing with other speakers, but to repeat the same thing just delays others in making their comments. In you agree with a previous speaker on a particular issue, you can state your agreement. Of course, you may make any comments you wish about the Draft EIS.

If you would like to turn in your written comments and you haven't already done that, please place them in the box provided in the comment area there in the back of the room.

And I do not have any cards indicating any official representatives indicating a desire to make comments, so I will move to the list of individuals. And, again, I would like to remind you of the three-minute time period.

008122

I would like to first call on K. J. Remme.

MR. REMME: I am Karl Remme, and I am one of the owners of the McCoy Land Cattle Company. And I hope that all of you will really consider how

23

short three minutes is to address this, and remember your opportunity to submit comments in writing.

A couple of significant factors that I would like to address following the cultural and heritage. One of the things we worry about considerably in the Agricultural Extension Services Center on grazing land and ranch management and other production stewardship programs, are some of the very important aspects of the agricultural production industry, and some of the terrible burdens that the landowners face, and some of the motivations for being in agricultural production. The ability for a nation to produce its own food is surely as important as its national defense. They are both extremely important.

In America, it's possible to own your own lands. And a lot of people who -- or most of the people who participate in agriculture have a very small return on assets. Those sorts of investments would make no sense except for the fact that the way of life, the cultural and inheritance benefits of raising families this way, and the extreme challenges of stewardship in this very complex production and natural environment are extremely challenging and are an award to themselves.

We don't want to end up like the Russians

24

where nobody owns the potato patch and you get to end up with the Army digging the potatoes up. There is plenty of federal land in the western United States. I think that that should have been the No-Action alternative. **PD-4**

I really do feel that these cultural and heritage impacts are of very great national significance. I think that inefficiently considered also has been the tremendous economic impact. **BR-4** Another fault of the EIS is that we get no credit for the consideration we have given the military in the past, where they have directly accumulated increasing noises. They have determined now that this cumulative noise is the reason to not consider the noise analysis for what they consider to be a small incremental increase in noise from this route. 30 PDL, proposed daily noise accumulations--or the DNL, it is called--is about what the normal desert southwest is. Particularly jacked up to already 60 of a factor of six. That's worth nothing to you now because it's considered to be so noisy from their own intrusions that it's not worth doing a noise analysis to consider the small incremental change. And mark my words, there will be another increment after that. **AO-87**

Even the No-Action alternative puts in

25

routes which are very new to us. The original IR-178 left the area in the Big Bend park and headed off to the northwest. It's only recently that we have seen aircraft flying in Brewster. Now effected as an No-Action alternative and it's not charged as an (inaudible) -- **AO-88**

COLONEL BURD: I would like to now call on Emmett McCoy. 008123

MR. McCOY: I am Emmett McCoy, McCoy Land and Cattle Company. They say that a picture is worth a thousand words. This map appeared in the Fort Davis paper some time back. You don't have to get very close to see what it is. It shows everything in black that's federal land, land owned by the federal government. I don't think any of us would object to the Air Force flying over our land, but I mean the land that's black. That's our land, too; and yours, and mine. And there is certainly so much of it that I don't think hardly anybody realizes how much of the land is federally owned in the west. **TY**

The Alamogordo deal is in the middle of this black mark right here, that land all around it and all through here. And they have chosen to come down into Texas here and fly over our lands, private land.

26

I have a lot of problem with that. Thank you.

COLONEL BURD: I would like to now call on Tom Curry. 008124

MR. CURRY: Tom Curry, private citizen. The Big Bend area has always been a place where people can still live in peace and quiet away from the noise and the chaos of the cities and the industrial areas. The Air Force would like to change all of that. They want to turn our home into a Military Training Area. Make no mistake, these flights, one after another, will be extremely loud and dangerous.

Are these flights really necessary? Already the U.S. has more military weapons than just about every other country combined. This country spends more on the military in five hours than it does on health care in five years. We must be the most war mongering country in the world. And we, the people, the taxpayers, are sick and tired of breaking our backs paying for this.

I believe the purpose of this hearing is to find out how we, the community, feel about this proposed realistic bomber training. So let's take a vote. The Air Force can't vote, please. If you would like to see your home turned into a training **GE-30**

27

area for the Air Force, raise your hand. All opposed? Okay; Air Force, there is democracy in action. Maybe you should go back and tell the government you work for to try it sometime. Thank you.

COLONEL BURD: The next person, it looks like that it's just a last name indicated here, Daileen. 008125

MS. DAILEEN: Colonel Burd, I just have one name. My name is Daileen. I am here. I don't have anything prepared to say, but I do have a very strong feeling about having the Air Force, whatever form you come in, whether you are in jets, or bombers, or anything that flies over our head that makes noise.

This is one of the few last places on this planet where you can sit outside and hear the birds or watch the ants and be really quiet. I was in Arizona with a friend, and we went hiking for three hours to get back into the boonies. We were sitting there. We didn't talk on the hike. We were sitting there quiet, and "caboom"; and that was the end of the fun. Because when you live in an environment like this, you appreciate the quiet. You people that are in the Air Force live a high-stress job -- I

28

mean, live in a high-stress environment. We used to. The reason we don't anymore is because we chose to move out here where it's quiet. I am sure there is not one person in this room that can't say I came from somewhere to get away from the noise, to get away from the pollution that hits you every day; not just one caboom that you hear out in the quiet.

We don't want any noise out here from the Air Force over our heads. We really don't. We appreciate what you are doing, but there is so much land that you could fly over other than ours.

Tourism is on the increase out here, because people are constantly wanting to come out here to get away from what you people have to work in all the time. And we would appreciate it very much if you would let us have one spot on this planet that's quiet so that the people who live here can appreciate and stay that quiet; the people who visit here can be in quiet. Thank you.

COLONEL BURD: I would like to now call on Edward Holland.

008126

MR. HOLLAND: Thank you. I would just like to explain that there is severe problems with this Draft EIS. The noise levels and the environmental impacts are all based upon 500 feet

BR-7

AO-57

29

above ground level. This is not the situation that exists. Despite over a dozen complaints from me to the Air Force about pilots violating the 500-foot AGL restriction over structures, people in vehicles, they continue to do it on a continual basis. Until all the numbers in this report are changed to reflect distances of 200 feet and full-power throttle settings in these aircraft, it is no -- it is not at all accurate; a severe technical flaw in this entire process.

The second thing is that I attended all these scoping meetings around here, or I should say one in each series. The message that we gave to the Air Force, overwhelmingly, was to move these flights over federally-owned property. It is the responsibility of the federal government to provide a place for the Air Force to train. It is not my responsibility to provide them a place to train.

The four alternatives selected in the EIS completely ignore all this input. I don't understand why, but it -- we have seemed to make a joke of the entire process. Thank you.

COLONEL BURD: Now, I would like to call on Karen Reimers.

008127

MS. REIMERS: Thank you. My name is

AO-57

AF-2

AO-47

GE-3

30

Karen Reimers. I am a private resident of south Brewster County. I also didn't really prepare a comment today.

I have several problems with the Draft EIS as it appears. The first being that I only received my copies of it 12 days ago. And as I have a medical disability and have had two minor medical crises during this time, I have not had an opportunity to review all of the voluminous data that was presented. But I plan on making written comments to address each issue, however.

I also have a problem with the format of this meeting, in that I travel 70 miles each way to attend each of these meetings. I have attended in '96 and '98, and today. And there was not a schedule published in the paper. I would have liked to have attended this morning, had I known that that's when the open house would have been. And I could have had a question-and-answer session then. But it just appeared that there would be two sessions. And as I was driving a long distance, I chose to arrive this afternoon. So I have not had an opportunity to meet one-on-one for more than about five minutes. And I do protest that as well.

GE-26

GE-22

31

Also, just in the cover of the Draft Environmental Statement, the need for process is described, and it's described as an open forum for discussion. I am dismayed at the fact that there is very little discussion going on here. Again, maybe if I had been notified and would have attended the morning session, we could have had a open discussion about the issue. But discussion involves give and take, both ways. And it appears to me that you are making your presentation and we are making our comments, and there is not really discussion and not much opportunity for feedback.

Now, I am going to ask a question, although I don't expect it to be answered. But it would appear that any written comments that I address to you will be answered in writing, which is what I read again on the inside cover of the Draft EIS. And I would hope that that would, indeed, occur.

My primary concern is airspace management and air safety. These are the issues I have had the most difficulty with, as a resident living very near IR-178. We have conflicts with the INS border patrol low-level flying missions. They have appeared before you and stated that they have had near-miss incidences with your aircraft. We have a certain

BR-2

amount of drug smuggling in the area. And these people do not file air plans. They do not call in the AGL in the air. And we have private aviation in the area.

Also, I have been attempting since 1976, to have my residence published on your maps as a low sensitive area. To date, it still has not been done, even though Captain Myers came to my residence and used his global positioning satellite and equipment to locate my coordinants. And I was assured at that time that that would be published.

AF-10

So there are many flaws in the study, and there are many problems with the residents here regarding this EIS. And I would hope that we can address them in the very near future. Thank you very much.

COLONEL BURD: That exhausts the cards. Well, no, I have a couple of more cards; excuse me. I would now like to call on Bryan Kelley.

008128 MR. KELLEY: I am Harold Kelley, Harold Bryan Kelley. I go by Bryan as an alias. I think everybody needs one occasionally. I am a spokesman for the Trans-Pecos Protection Group. I've met most of you, I think.

What I would like to bring up now is we

object and complain about the U.S. Air Force flying those low-level realistic combat training flights over populated public property. We are told in our investigations and analyses, there are some six million acres of federally-owned public land that can be flown over. There is no reason that we can find not to move these flights to federal property.

We also have discovered in our analysis, and discoveries, and so forth, that over a period of two and a half years, that these flights are at 100 feet or 500 feet. Where they happen to be flying happens to be an invasion of our property. They are trespassing, by law. What I do mostly is legal work. My background is what I do. I do contract management as a profession, as a legal profession.

BR-5

We have also found, to our amazement, that no one listens. The only buffer we have discovered now days is the National Environmental Policy Act. That requires that all of us participate. If you do not participate, then you are not playing the game or you are not in the game. What you need to do, by all means, is write to the Air Force and give them your opinion, whatever it is; write to your federal and state senators, your representatives; write to the FAA, the Federal Aviation Administration; write to

the Environmental Protection Agency, the EPA; whatever you do to participate.

What we are trying to do is get the Air Force in the position as are our tank regiments who do not train on the ranches around here or in Coconut Park. We do not want the artillery battalions training in Coconut Park, your backyard, or your ranches. We see no reason in the world, logically speaking, why the Air Force would train on our property; on our property; not over it, on it.

You get down to 100 feet, I can guarantee you, you are going to have gale force winds and it's going to be extremely hazardous, physically hazardous.

AO-2

If you would like more information, remember we have our organization to contact and Mr. Sforza. He is an aeronautical engineer and a test engineer; aeronautical and test engineer. He can give you all the physics of low-level combat training flights. If you need it, he will give you some information. Call us; write us. We would like to talk with you. Thank you. Thank you, Colonel.

COLONEL BURD: I would like to now call on Kay Kelley.

008129 MS. KELLEY: Thank you. My name is Kay

Kelley, K-e-l-l-e-y. I am with the Trans-Pecos Protection Group, which is a nonprofit organization which supplies information to anyone who can use it.

We oppose the expansion of military airspace over the human environment. We have attended some of the other public hearings for this Draft Environmental Impact Statement in Snyder, Big Lake, and Pecos. Over and over, the people spoke to the tremendous damage they have already experienced from these low-level realistic combat training flights.

One man in Snyder brought up that a friend of his who sold real estate in the Big Bend area informed him that when one of these flights goes overhead while he is showing property, the potential buyers just get back in their cars. The impact will lower our real estate values, will lower our school taxes.

BR-4

People spoke again and again of how these low-level realistic combat training flights have done physical, economic, and psychological harm that is not compensable.

While this Draft EIS is beautifully presented with its charts, pictures, and maps, the information about the environmental impacts in it is flawed. These are realistic real life people out

36

here. But this draft deals with is statistics and percentages. The repeated use of words like "might," and "may," and "negligible," and "inconsequential" when describing the impacts felt from the low-level realistic combat training flights are insults to our intelligence. Anyone who has ever been under, or had a near-miss with, or had property damaged by, these war machines can attest to a very definite negative impact.

AF-44 This draft does not address the new wing of the 37 B-1 bombers that is coming to Dyess Air Force Base and where are these additional bombers are going to be flying.

One question I have never gotten an answer to concerning the FAA, Federal Aviation

AF-6 Administration's, regulation that require pilots to fly 500 feet from people's structures or vehicles, is how is the military going to avoid us when they don't know where we are? These are active businesses trying to operate under these low-level realistic combat training flights. The bombers and jets flying this fast and low are not going to be aware of other aircraft and people working or recreating on the ground until it is too late to avoid them.

The draft has not adequately given the

37

alternatives required by the National Environmental Policy Act. The Alternative A, which is supposed to be the No-Action alternative, will have chosen

GE-41 certain justified routes used for bomber training that have not gone through the legal formation process. Instead of being a No-Action alternative, in reality, this draft has three alternatives of low-level realistic combat training flights over West Texas, and one in New Mexico, with continued flights in Texas.

There is no plan to remove these flights from West Texas that are already disrupting the livelihoods and well-being of its residents and visitors. Only a few citizens have received a copy of the Draft Environmental Impact Statement and had the time to read it, or went to the library to share that copy of it, will, in fact, have a chance to see Alternative A that is -- --

COLONEL BURD: Ms. Kelley, you are well beyond --

MS. KELLEY: Do you have anyone after me, Colonel?

COLONEL BURD: I don't know. I need to ask. But you are well beyond your three minutes.

MS. KELLEY: Do you have anyone after

38

me, a card?

COLONEL BURD: I do not have any more cards, no. But --

MS. KELLEY: Well, if you are going to ask people, I would like to continue now instead of sitting down.

COLONEL BURD: Well, I would like to have you finish now.

MS. KELLEY: I am just about done.

COLONEL BURD: How much more time do you need?

MS. KELLEY: Well, just two paragraphs.

COLONEL BURD: Well, I would prefer to do is stick with the rules, as I have indicated. And you have been at each one of these hearings, so you are as well aware of these rules as I am.

MS. KELLEY: Uh-huh. I didn't see anybody waiting.

COLONEL BURD: You also know that I am very fair about allowing everybody to come back up to make additional comments as long as we have the time.

MS. KELLEY: If you'd like me to do that, I will.

COLONEL BURD: I would like to stick with my rules.

39

MS. KELLEY: Okay.

COLONEL BURD: So I would like you to stop speaking now.

MS. KELLEY: Yes, sir.

COLONEL BURD: And what I would like to know now, since I have exhausted all the cards, if there is anyone who has not made comments who would like to come forward and make comments now? Apparently not. Yes? 008130

TY MR. DECKER: My name is Dan Decker. I was here this morning. I didn't sign up a card this afternoon, because I didn't see any reason to repeat information that you had already heard, which apparently is being repeated again, and again, and again at various locations, so you have several copies of it.

One thing I haven't heard anybody talk about is why we practice low-level. We are not the only nation in the world with high technology now. Most people have radar. We must practice flying, low-level. Flying under the radar gets them there without them knowing we are coming; make our bombing, our strafing, or whatever they drop down behind -- below the radar, so they can't find us out. Don't want these missions, these combat missions. One

40

way -- we want them to be able to fire again, so we practice low-level. And you can't just say, okay, guys, you're off to bomb a site, go out and go down to the altitude -- at very low altitude and make your bombing run or whatever happens, not without having those people having practiced this particular mission. It's a very difficult thing to do; very difficult. You must practice. Where are you going to practice? They choose a low population density area for this. I saw the map one gentleman was displaying for the federally-owned land in west United States, western United States. It looked to me like Denver belongs to the federal government, and I know that that land is not owned by the federal government. Private people own it as well. And you can't have two owners of the same piece of property.

One question somebody else hadn't brought up is the pollution from the aircraft. They are skirting around the edges, but they haven't brought it out yet. What comes out of a jet exhaust? Anybody know? Mostly water. You burn a gallon of fuel, you create more than a gallon of water. From a high school chemistry teacher, she confirmed that. Something else I was going to say is that the amount of water is minuscule. There is even less pollution.

41

These aircraft are the cleanest fuel-burning engines we've ever had in the history of the world. There is very little pollution from them; very little. That's all. Thank you.

COLONEL BURD: I have been handed a card. The name isn't indicated here, but representing Fox Canyon Ranch, if that person would like to come forward. If you would, please state your name when you begin your comments. 008131

MR. ROSS: I am Hunter Ross with the Fox Canyon Ranch. We are located in northwest Jeff Davis County, right south of the I-10/I-20 interchange. And we have had that military -- this training route goes exactly right over both of our ranch houses, and it's just -- basically, I am not going to get real technical and detailed about it. But for the last 20 years, ever since I have grown up out there, these aircraft fly right over these particular houses. It's a disruption, you know, to our private rights out on this ranch.

PD-4

And one thing that I don't understand is with all of the public land that is in New Mexico, Oklahoma, and Arizona, Colorado, I don't understand why some of this is not done in that area, you know, with all of the public land. Texas is mainly 90, 95

42

percent private land. And anybody that -- I don't know, you know, how many of these pilots or people in the Air Force have ever owned private land of their own, but it's kind of disruptive to -- and I am not necessarily talking about the pollution effect of it, but just -- I also do hunting guiding and outfitting. And when you have people out there hunting and, you know, you've got these low-level aircraft coming over -- and I have had them so low that the pilots have waved at me before, when I have been up on the side of the mountain and they come by. And it's been just a continual thing that's gone on.

And I don't know exactly all the details and everything of what's going on. I wanted to come and speak for, you know, our part of the ranch and for my father, which he is out of town today.

But that's one thing, is with all the other public land access in the United States, I just don't understand why Texas, being all private land, formally owned private land, why it has to be done in Texas, with all the public land in southern New Mexico and eastern New Mexico. I mean, all that area down there is all public land. And, basically, that's just my point. And so that's all I have to say.

43

COLONEL BURD: I have a card and I would now like to call on Anthony Sforza. 008132

MR. SFORSA: Hi. I am Tony Sforza. I am opposed to the military flights in this area. I feel the Air Force has not given this thing any true alternatives. The alternatives you propose are unacceptable, especially the ones on not training your pilots. We think you should train your pilots. That would be a ridiculous alternative.

However, it seems like you are giving us a choice between washing the dishes or taking out the garbage. It's really not a choice. You haven't put a viable alternative in this. There is really no alternative to say why some private lands in Texas, and it may interrupt their lifestyles, and it's going to relatively dangerous for the people on the ground, hiking in the hills that we do. And yet, you say that's your only choice. To me, that's not appropriate.

PD-42

Another alternative should be looking at the two-thirds of the western United States that is owned by the federal government. It appears from my reading and my research, that the only reason that the Air Force is taking this tack is that when they fly upon other (inaudible) lands, forestry lands,

they get into a lot of trouble with these big agencies that have millions of dollars. And you can look at the reports of the congress that have been funded by these agencies, probably at the cost of millions of dollars which we can't afford. So my perception, it may be true or not, is that there is a viable alternative you have not even considered. And that the reason you don't consider it is you would rather take on small communities like this, rather than take on major national agencies.

AO-62 As far as your documentation, your MALS report, it's totally inaccurate. They are showing mission heights of 5,000 feet, instead of 100 feet where they are showing it. When we looked into the documentation, it shows that the MALS report they are using in their air pollution is totally inaccurate and does not apply at 100-foot altitude. They are assuming that information at 5,000 feet. That's the equivalent of me dropping a bucket of paint from 5,000 feet versus 100 feet. I guarantee you are going to get covered with a bucket of paint if I drop it from 100 feet on your head. I doubt you are going to be covered with hardly any paint if I drop it from 5,000 feet. Talking to the various people in the environmental agency, that is not a valid model.

The other models you are using, they are also inaccurate. We've asked that you do appropriate tests that we can monitor. You refuse to do those.

In response to your integrity, we have had problems in Langley with Jayhawk aircraft flying over our site. When we reported it and we videotaped them flying over our site, we were told that they would be responsive. We wrote the FAA and sent the tapes to the FAA, and to the Air Force. The Air Force response was that they looked into it and there was no problem, even in the face of the videotapes showing them clearing our hilltops by 200 feet.

To date, I have not received any official response from the Air Force regarding that. And I think this is the response we can expect to get. Thank you.

COLONEL BURD: Ms. Kelley, would you like to make further comment? 008133

MS. KELLEY: I would like to continue where I was talking about the Alternative A, No-Action alternative.

There is no plan to remove these flights from West Texas that are already disrupting the livelihoods and well-being of its residents and visitors. Only the few citizens that received a copy

the Draft Environmental Impact Statement and had the time to read it, or went to the library to share that copy of it, will have had to see Alternative A as it has been presented in the latest RBTI newsletter brief and in this Draft.

PD-33 Before this, the No-Action alternative A was illustrated by flights going only to the training areas far from West Texas. Most readers of this Draft EIS in the third newsletter will not understand the significance of Alternative A. For all of the people attending the hearings that had not read them, there has been no opportunity for the public to view Alternative A because the Air Force did not make a poster of it for the open house part of these hearings. They might erroneously think that the No-Action Alternative will solve this problem.

BI-2 Another impact that is not properly addressed in this Draft EIS is the effect on waterfowl and migrating birds. Tourism is the second largest industry in Texas, with nature tourism bringing in over 20 billion dollars per year. The Big Bend has always a been one of the top three tourist attractions in Texas, and birders love this area. No one wants to vacation in a war zone, and our economy suffers.

Again, we want the best training available for our military. These low-level realistic combat training flights need to be isolated from the hard working, patriotic Americans our military is supposed to protect. Thank you.

COLONEL BURD: I would like to know if there is anyone else who would like to make comments who has not made any comments?

And is there anyone who has made comments who would like to now make additional comments? Yes?

TY 008134 MR. DECKER: Dan Decker. I would just like to address the tourism thing. Perhaps the number one tourist location in the United States is Las Vegas, Nevada. On the northwest boundary of Las Vegas, Nevada is called Ellis Air Force Base. It is called the home of the fighter pilot. These bombers don't carry a candle as far as the noise and so forth as a fighter does, F-16s, and F-4s, and A-7s, and A-10s, and all those. Nobody that goes to Las Vegas knows that the fighters are there. They don't see it. The noise level is negligible. It just doesn't happen. That's all I have today. Thank you.

COLONEL BURD: Yes, Doctor, you wanted to make additional comments? 008135

TY UNIDENTIFIED SPEAKER: Somebody has to

48

rebut some of the ridiculous comments made sometimes. I was brought up in New York City. I guarantee an F-4 could go over the Empire State building and I wouldn't hear it, because I am hearing the ambulances, and sirens, and everything else. Well, in Las Vegas, Nevada, (inaudible). Have you ever been in Las Vegas, Nevada? All you hear is bells going off and the jingling and the jing-a-ling. That's absolutely a ridiculous statement.

There has been documents in these reports that have been funded and paid for by the federal government and the National Park Service that indicate that a wilderness area like this, the noise impact is equivalent to 30 times what it is in a city area.

Out at our place, it's so quiet that we can hear a rooster crow a mile away, easily. I doubt you would be able to hear a rooster crow in Las Vegas, Nevada. If someone fires a gun off, we all go, "Who is firing the gun?" It's a guy two hills across. We are in a canyon area. Out here it is very quiet and noise carries a very long ways. And when it's this quiet, you notice the difference. Just like in this room here, you can hear things pretty well and you are getting an echo in here. If we had a big

49

convention going on here -- you people have been at parties. Sometimes you go hoarse talking so loud to talk to your neighbor to two feet away. The comparison is utterly ridiculous. Thank you.

COLONEL BURD: Is there anybody else who would like to make any comments? Yes? 008136

TY MS. Daileen: My name is Daileen, and I would like to add one comment. About four years ago, there were bombers that were coming over the Davis Mountains. And I don't know why they were flying so low, but they were about one times as high as the trees are. And in the daytime, it was an irritant. But at night when they came over, and I didn't even know they were going to come over, I was so frightened, had I not been in good health, it probably would have thrown me into a heart attack. And I don't know -- like the gentleman that spoke, the quiet out here is very quiet. And when you have something like that happen to you and you are not used to it, it's very disrupting to the nervous system. I mean, it took me about three hours to calm down after these five bombers flew over, because I wasn't aware that they were coming and I was sound asleep. Thank you.

COLONEL BURD: Would anyone else like

50

to make any comments? Yes?

MR. LITTLEFIELD: I am very familiar with these flights the lady was talking about.

COLONEL BURD: Sir, could you identify yourself? 008137

TY MR. LITTLEFIELD: Gary Littlefield, Fort Davis. I also experience those flights. And I am a licensed pilot. I can judge altitudes quite well. They were under 1,000 feet when they hit my place. I was outside in the open, and it had the effect of almost bowing me off my feet.

The reason the gentleman didn't see airplanes over Las Vegas is because it's a very restricted airspace. By the time they get into that airspace, they are up pretty high. You wouldn't hear them in here either necessarily. So, again, this is not valid. Thank you.

COLONEL BURD: Would anyone else like to make any comments? Yes? 008138

MS. REIMERS: My name is Karen Reimers. I am a resident of South Brewster County. Again, I just want to reiterate that what we are talking about here with the Draft Environmental Impact Statement and with these hearings is the impact that this training will have on the people who live here, on

51

the land, on the animals, the waterfowl, on our way of life. Let's not lose that focus.

I don't think anyone here would argue with the military's need to train their pilots. I surely wouldn't. I support them. I support their need for training. I sometimes question their need for low-level in light of our current technology and the ground to air missile capability that most of the world has these days, but I will leave that to experts to debate. PD-1

It's just think that we need to look at the environmental impact that it's going to have on the people who live here and have their livelihood here, and also the safety concerns that have not been addressed.

My biggest problem that I have had has been the military not following their own rules. If I could just see them stay within their own guidelines and follow their own rules, I would be 100 percent behind this. As it stands right now, I can't support it. That's all I have to say. Thank you.

COLONEL BURD: Would anyone else like to make any comments?

Ladies and gentlemen, that concludes this public hearing. Thank you for your participation and

input. Please remember that the public comment period will extend through June 16, 1999. This public hearing is adjourned. Thank you again.

(Time is 2:31 p.m.)

will get back to you after everyone else has had a chance to speak.

You may have noticed that the court reporter will record verbatim everything that is said. The transcript of these proceedings will become a part of the record of the hearing. This will be included in the final EIS.

The reporter will be able to make a complete record only if she can hear and understand what you say, so speak clearly and slowly.

In addition, if you have a written statement, the court reporter would appreciate you handing it in so that any names, places, reference to scientific terms, or other information can be recorded accurately.

Finally, I'd like to remind you to limit your comments to the Draft EIS. That is the purpose of this public comment period.

As indicated, we would start with comments from elected officials and then individuals representing agencies.

In this case we have no specific elected officials here, but we have a couple of representatives. And I'd first like to call on Clint Henson who is from the New Mexico Department of Game and Fish. 008139

MR. HENSON: Good evening. My name is Clint

Henson. I am a habitat specialist in the northeast area operations from the New Mexico Department of Game and Fish. Previous to that I was the Clayton District Officer.

First of all, I would like to discuss some omissions, I feel, from the Draft EIS. Omission of part of the Carson National Forest represented as the Valle Vidal unit. This area does have flights over it at this time, but the last three years that I have worked in the Valle Vidal areas and the Clayton area, I've seen two low level bombers.

ED-2

This area is important for us as an elk habitat, deer habitat area. This area is a once-in-a-lifetime hunt area. If a gentleman is drawn or a lady is drawn for a hunt in this area he can only be drawn once in a lifetime. He does not have the opportunity to go back. This makes it a very prized area to hunt in New Mexico.

BR-4

I feel that this would be significantly impacted.

Another area which was omitted was Clayton Lake, which is a large reservoir for migratory birds, primarily the Canadian geese. Also bald eagles and other falcons. They home probably between 250 and 4,000 birds over the winter.

ED-3

Another area I'm concerned about is flight safety. The Department of Game and Fish flies very often through the year at low levels throughout all of this area, primarily April and October we fly the entire month on antelope surveys in small aircraft from anywhere from 15 AGL to 1,000 AGL all throughout the MOA area.

BR-2

February and March we fly deer and elk surveys in helicopters randomly all throughout this area.

Our hunt areas and hunt times run from September 1 through December for elk and deer. August, we have an antelope hunt where we again fly low level law enforcement activities. And I feel that this would impact all this.

Thank you for your time.

THE HEARING OFFICER: I'd now like to call on Rebecca Montoya, who is representing U.S. Senator Jeff Bingaman. 008140

MS. MONTOYA: Good evening. I'm Rebecca Montoya. I'm the constituent services representative for Senator Jeff Bingaman out of the Las Vegas office, and the areas that I cover are Mora, San Miguel, Harding, Colfax and Union County, which is the area that most of you live in.

TY

The reason I have come is because of the number of calls that our office has received regarding this

issue. And I do thank the Air Force officials for coming to Roy and listening to your concerns. And basically I'm here to hear from you, our constituents, your concerns, so that I can bring that information back to the Senator before we pursue into this issue.

I'd like to hear all your comments from the constituents to, like I said, relate back to the Senator on your concerns.

Thank you.

HEARING OFFICER: Now I'd like to call on the group of individuals -- I'd like to first call on Jeffrey Lane. **008141**

MR. LANE: My name is Jeffrey Lane. I'm president of the Bell Ranch, which is the land underneath the RBTI program that we are talking about here today.

And I have sort of a note I wrote down here.

As I was reading through the Environmental Impact Statement one point made by that in regards to the La Junta County, those "emitter sites," quote/unquote, the land does not have the variable terrain needed for realistic terrain masking and terrain ordinance training.

Well, what that means to me is they are going to use our terrain for bomber training and so forth. That's obvious. It means that I'm going to have jet traffic along and under, within our beautiful canyons and

rim rocks in our country that I, and all of us, appreciate.

This is a significant change to the quality of life to all who use or live or make their livelihood from this area.

I believe that there are many issues involved here, probably the most significant of which is, you know, our private property rights. Ironically, some of the same values which our military whose mission is to uphold and protect. And I, respectfully, you know, appreciate that very much, too, their protection.

These rights are very real and very important to those of us that work very hard to protect, preserve, and make our livelihood from these same lines.

BR-5

It's an important issue or distinction here; that is, these land are privately owned and their value, like our mineral and our forage, our cattle, our wildlife, the beauty, the serenity, the water are all important considerations in determining, you know, this value, this value to us.

But along that note, I also have had experiences with jet aircraft in my lifetime on the Bell, my 25 years that I've been there. And on one such occasion I was out with my kids and -- I know this is not a common practice, but it does happen, and I know --

I am also a pilot. One tends to veer off their, you know, course a little bit, or look, or whatever. And I was out with my young kids on horseback, and I did have an F-111 jet fly over the top of me. And it startled the Bejesus out of me, and my older son got bucked off. I

BR-3

was holding the reins of my other two horses when that did happen. Fortunately, nobody was hurt on that.

I believe -- Okay. Thank you.

HEARING OFFICER: Again, as I said --

MR. LANE: Can I keep going?

HEARING OFFICER: No. As I said, I'd like everybody to keep to the three minutes, and then when everybody has had a chance to speak, if you haven't had sufficient time I'll ask -- what I'm going to do is first ask if anybody who hasn't spoken wants to speak, and once all of those people have finished, then I'll ask that anybody who has already spoken if they want to come back up, and ask just raise your hands if that is the case.

Now I'd like to call on John Gard.

MR. GARD: I'll donate my time to let him finish his.

HEARING OFFICER: Well, that's not consistent with my rules. I'm not going to permit that. If you have some comments you'd like to make, come on up and make your comments.

008142

TY

MR. GARD: Thank you. We have two places that come under these in the northeast corner, and we have jets coming over on both sides of our house already now. And like Jeff says, they don't always stay on the course. Sometimes they are right over the house, and we have had our boy had lost a horse due to running him through the fence. And, I -- for one, I'm an ex-Air Force man, and I don't see why you can't stay out of northeast New Mexico where the biggest part of cattle in New Mexico are, the heaviest population is up in Harding County, Colfax County, and Union, and use the desert land that the government owns down here in the southern part of the state.

I know we got to take real care of that for the environmentalists, but I think the government should be having -- as much land as they have in Texas and New Mexico, they don't have to get up where the most of it is private land.

Thank you.

HEARING OFFICER: I'd like to now call on Thomas Mitchell, then after Mr. Mitchell I'll be calling on Martin Mosimann. **008143**

MR. MITCHELL: I'm Tom Mitchell. We have a ranch. We are basically in the middle of the racetrack that you have laid out. As was mentioned earlier, we

27

have cattle that we are quite concerned about. We also have an airport landing strip to the ranch that's right in the middle of the race track, which is not marked. I've gotten some information today to try to get that taken care of. Sounds like with anything it will take time.

I'm a helicopter pilot and I'm a single engine instrument rated pilot. Flying out of that ranch with the helicopter before we have had near misses with the jets that were flying at that time, the F-111s. **BR-2**

It is a very real concern for us. We understand that you have to have military preparedness and training, but it's one of those things -- for us it's a whole lot more personal because we are in the middle of the noise zone.

That's it.

We also have an historic old Catholic church on the ranch which has been overflown also, and I'm not quite sure how the -- I know they alluded to the vibration and the noise earlier but these old structures it doesn't take a lot of vibration, and we're also concerned about that. **CU-1**

Thank you.

Martin Mosimann, and then Beckie -- **008144**

MR. MOSIMANN: Martin Mosimann, General Burd,

28

and my concern stems from self preservation. I ride colts for a living. And I know there's rules these airplanes are supposed to fly at a certain elevation. Guarantee you, it's an individual thing, I believe, with these pilots. They do not stick by the rule. They have flown over my round pen. My round pen is just below a bluff, and you don't know the plane is there until he's right on top of you. It terrifies me; it has terrified my horses. I couldn't hardly blame my horses when it terrified me. **BR-3**

I have reported it before. I don't ever really get a feedback to the disciplinary action that was taken.

I definitely have been hurt. I haven't been hospitalized, but I have been hurt because of the -- a particular instance, and I think it was four years ago. I don't have the time documented but I'm sure your records do. And so, yeah, my concern is self preservation. I'm thinking of myself. And I'm kind of consistent with Mr. Gard's beliefs, that if you have the government land why not fly this aircraft over government land? **PD-7**

Thank you.

HEARING OFFICER: Call Beckie Mosimann, and after that I'll be calling on Frank Bond. **008145**

MS. MOSIMANN: Colonel Burd, my name is Beckie,

29

B-e-c-k-i-e, M-o-s-i-m-a-n-n.

I live at the east end of Wagon Mound at the south base of the Los Vasas de Canjillon. For the record, I would like to say I am in favor of Alternative A, no action. My comment concerning the Environmental Impact Statement concerns noise levels of the aircraft and how it will affect our environment in making a living.

We make our living in the cattle business and also training horses. We have previously been under the flight path of the fighter jets from Cannon Air Force base and have been -- on several occasions had our livelihood threatened by the low flying aircraft buzzing the barn and the house and having a number of valuable horses hitting the fence and facing potential injury, which would prevent us from making a living if they were injured. **BR-3**

Also, as Martin previously mentioned, he was injured during a buzz, and if that injury had been serious we could not continue making a living in this part of the state.

I would appreciate the Air Force considering one of the other areas that they have as a choice, and preferably Alternative A, to fly where they are now.

Thank you.

30

008146

HEARING OFFICER: After Frank Bond, I'll be calling on Francisco Vallejos.

MR. BOND: Thank you, your Honor. First I'd like to comment that the Draft EIS has not been received by all the people on the list; therefore, I think you have a procedural due process error by having these hearings before people have actually received the Draft EIS. **GE-22**

In the scoping hearings you had the scoping hearings in Tucumcari and Clayton, and you admitted them then, and I suggest you go back and have hearings now in Tucumcari and Clayton, and I would also suggest Raton. Without those, which are the biggest part of the population of northern New Mexico, you are deliberately omitting the greatest part of the population and the greatest opportunity for comments. **GE-2**

Recommendations. Alternative A. Alternative A does not mean no training, it means the continued existing training, and by virtue of what we see in Serbia obviously the pilots are being very well trained.

I turn to the issue of notice and turn to the comments made by Dr. Weida in Snyder, and reiterate some of those: that this review of the noise impact here in northern New Mexico is on the basis of the faulty analysis technology developed by Mr. Schultz in the **BR-1**

31

1970's. It is not the best means of noise analysis that is now available to the Air Force.

The noise conferences held in Brooks Air Force Base gives the Air Force previous knowledge starting in the beginning of this decade that there's far better technology for the noise analysis because the results that you have now where you have a single event in a relatively quiet area give you ludicrous results when you're talking about DNL averages over a 24-hour period, analyzed and then taken spatially, horizontally and vertically in terms of averaging that space over the MOA. **BR-1**

Also, using -- as something of a baseline that Schultz did, where he took the urban ambient noise of the places like, for example, Copenhagen, Paris, New York, Chicago, it makes it ludicrous to think you can compare that to here in New Mexico, and I think that must be addressed and considered here.

As I said, what we are talking about is a shocking, stunning, single example of a B-1 coming over in a relatively quiet place. Anybody who would do any on-the-ground analysis, which has not been done in the EIS here, would come to a very different result on any given day here in Northern New Mexico.

The Air Force has failed to do any on-the-ground analyses of any kind of studies here,

32

failed to do any noise studies on the impact within northeastern New Mexico on humans, livestock and wild life. **BR-1**

And we are not talking about just threatened and endangered species, we are talking about the hunted species.

If you will consult the gentleman from the Department of Game and Fish, you will begin to understand the importance of hunting to the operations and to the economy locally, and you must understand what this landowner permit system is like within northern New Mexico. **BR-4**

I'll continue my comments later. Thank you.

HEARING OFFICER: Thank you, Mr. Bond.

Francisco Vallejos, then have --

Reverend, I apologize. I thought that was a first name and I didn't understand what that meant. **008147**

FR. VALLEJOS: Father Francis V-a-l-l-e-j-o-s.

I'm the pastor of Roy, Mosquero, Wagon Mound. I am the pastor of Harding County, a little portion of San Miguel, and half of Mora. And in this area, just Harding County, I have four churches, very historical churches. One is in Bueyeros, the one I'm most concerned about, 105 years old, a lot of history and a lot of cultural history for New Mexicans. It's a beautiful

33

structure, beautiful church constructed with lots of care and lots of devotion, and the history that goes with that as well as the culture of this part of New Mexico.

There have been flights over this area and low-level flying, and there has already been structural damage to the stone churches we have here in Harding County. And I'm afraid a loss of these churches would be a loss of a great part of history in this part of New Mexico. **CU-1**

Daily I receive calls asking for baptismal records, and the people talk to me about how important that church is to them. There's not a big population in Harding County, but in passing history there is a lot of population that came out of this area, and this is a very important to all these people.

So culturally, personally, these structures are very important and vital to this area.

I still serve these churches. Three of them just once a month, but we still have mass there. The Bueyeros church, I have a mass once a week, every Saturday, and Roy and Mosquero I have it every Sunday.

And this is just 50 miles of my parish.

And I'm really concerned.

There has been structural damage already done to the church in Bueyeros. It's a church that is 105

34

years old, and any more flying over it I think we would lose that church.

It's important for us. Thank you.

HEARING OFFICER: Thank you, Father.

I now call on Phil Bidegain. After that I will be calling on Tamara Flowers. **008148**

MR. BIDEGAIN: Thank you, your Honor.

Phil Bidegain.

I wish to address the EIS, as it's called in NEPA, how many dimensions it does not address sufficiently.

I think a disproportionate burden will be placed on a minority. Rural people are a minority in this country and fast going away. **SE-5**

As addressing the noise in the Appendix G on page G-13, I quote, "Large livestock have been reported to respond to aircraft noise by sporadic jumping, galloping, vocalization and random movement."

I don't think it's addressed sufficiently what happened if you are on one of those large livestock. I think you've had examples talked to here. **BR-3**

Also, I'd like to -- I would like to address a concern over the helicopters. We have a helicopter on our ranch near Tucumcari, and we have also had near misses. **BR-2**

35

In closing, I would like to see the minority of rural people addressed a little more sufficiently.

Thank you.

HEARING OFFICER: Ms. Flowers. And I'll be calling on Chester Gallagher. 008149

MS. FLOWERS: Yes. My name is Tamara Flowers, and I'm here representing my family ranch, F & F Cattle Company. We have four different ranches below the hill, ranging from below David Hill to Gallegos. And our concerns regard spooking of horses and cattle, not only in the pasture but when working cattle, and also when riding young horses. BR-3

Also we are concerned about a historical church, Catholic church, in Gallegos that's located there. CU-1

Thank you.

HEARING OFFICER: Chester Gallagher.

MR. GALLAGHER: Everything has been covered.

HEARING OFFICER: I'll call on Joe Culbertson.

008150 TY

MR. CULBERTSON: My name is Joe Culbertson. We have a family ranch east of here down in the valley in Harding County. Over the years we have had a lot of flights of F-111s and recently F-16s, and back in the '60s and '70s we had a B-52 route over our ranch. In all those years, fortunately -- and I say fortunately after

36

hearing some of the stories -- we have had no mishaps. We have had a lot of flights over the -- while we were gathering cattle and over the corrals and had a few horses jump a little. Nobody has gotten bucked off, but I say we are fortunate and I understand other people have had problems.

I support the U.S. Air Force in their efforts and their training. I have to agree that the government has a lot of land that it seems like they could utilize more, maybe.

I like to see the jets, I like to see them flying and doing their maneuvers over the valley, but I know they can cause problems when they are flying low, and after listening to a lot of my friends and neighbors and their concerns here tonight, I stand with them.

HEARING OFFICER: I would now call on Ed Sanchez. 008151

MR. SANCHEZ: Your Honor, I'm Ed Sanchez, retired Game and Fish, presently trying to make a living guiding.

I'll make this story, which is lengthy, as short as possible.

The Air Force actually ruined a high-dollar elk hunt for me, my client. This jet come over and buzzed us tree-top level, scared all the elk away. The weather

37

that particular day was perfect, we were stalking what I would classify as a 360 point bull elk. The date was October 19 of last year. Remember, this is a once-in-a-lifetime opportunity. I think the Game and Fish covered that quite well a while ago.

I was -- I called Kirtland Air Force Base, Cannon Air Force Base, and I got the runaround. This was really disheartening to me, knowing I'm a taxpayer trying to make it on what little retirement we do get after we serve.

Also, I did not get a response until I called Jeff Bingaman's office, and Ms. Montoya can verify this. Then we started getting results.

Now, then, my main concern is why cannot the Air Force coordinate season dates with Game and Fish. They were set two years prior. If they are going to buzz, you know, one of the prime game areas, why can't they coordinate and do it some other time than the hunters being out there. AF-45

And also, why do we have to go to our U.S. Senator to get any results?

I think that the prime wildlife areas should be kept only on the fringe areas, not in the heart of the prime game and fishing areas. It's a great disruption for wildlife in the calfing areas, in the wintering

38

areas, and in the hunt areas. And I rely on hunting and fish guiding as part-time for my livelihood.

I think my client is going to file with the SB-95.

Thank you.

HEARING OFFICER: Well that is all the cards that have been handed in, so what I'd like to ask now is --

And we have a volunteer.

AUDIENCE MEMBER: I had a card that was in there.

AUDIENCE MEMBER: I had a card.

MS. HEFNER: But I'll volunteer, anyway. And probably because I wasn't on the list, that means I get six minutes.

HEARING OFFICER: Please, I'd just like one person at a time, please.

MS. HEFNER: We are just getting loaded.

HEARING OFFICER: Let me explain something about the cards, because we have had a couple of other hearings where there have been a little bit of misunderstanding about the cards.

One of the things you have to do is check off that you wanted to speak, not just simply fill out a card, to be able to speak. So my guess is the reason I

don't have your card is that you didn't check that off. But if you did, then I don't have an explanation as to why I don't have the card. 008152

MS. HEFNER: Probably someone was smart. But...

My name is Tracy Hefner. I'm a rancher just south of Wagon Mound, just south of the Mosimann ranch.

I have dealt with the flights of various aircraft in the 25 years that I have been on the ranch. The first time that I actually called the Air Force about a flight -- we live in a canyon; it's a small, narrow canyon -- what I assume was an F-111 dipped so low into the canyon over my house that -- this is a 200-year-old house, the walls are three feet thick -- dishes fell off the shelves in that house, and the small children that I had at a birthday party dove under the table.

I called Cannon Air Force Base, and at the time the man that you got ahold of to talk about these problems name was Major Menace.

Now Major Menace explained to me my patriotic duty, and I listened very carefully, but he also explained there was supposed to be some rules for those pilots. And I can give you a list of numerous occasions where we have been actually harassed by pilots. I mean, these are young guys, these are the best pilots in the

country, these are the hottest aircraft in the country. I have a 24-year-old son and you don't have to say anything else. I know how they drive. I have had them not only buzz me on a horse, I have had them make a circle before me and do the little wing wave. You know.

And the gesture that I gave back to them, I'm sure they couldn't see.

But I would like to see the Air Force -- I suppose Alternative A, but I would certainly encourage the Air Force to make it far easier for us to let you know when your pilots are going beyond your rules. And also, I would like some feedback. I have probably called in six or eight times to the Air Force. I have warned -- I now wear a watch so that I can find out the exact second that that plane has gone over. I have copies of all my telephone maps, so many I can send in a copy with the map and pinpoint my exact location.

AF-37

I have been run over by horses, I have been bucked off of horses, and I have filed numerous reports, and I have never had any feedback.

What I would like you to do is just give me one of those pilots and let me put him on a two-year-old colt and somebody that doesn't like him flying up there in the air, and see how he likes it. It's no fun.

It's our livelihood. I have X-rays, I have

documentation. I would encourage you to be more responsible for the pilots.

Thank you.

HEARING OFFICER: Yes. 008153

MS. HAYOZ: My name is Loretta Hayoz. I'm a lady of Harding County. I love my people here. I love my county. I'm also speaking for San Miguel and all the other counties involved.

What type of responsibilities can the Air Force cover if there's damage done to any type of historical site or any type of building that is damaged, because of houses that are very elder here. There's elder windows that need to be considered.

AF-15

What type of surety will the Air Force have to be willing to accept that type of a responsibility?

And what type a surety will the Air Force have to the designation of the flights from 300 to 400 to 1,000 feet as stated on the book.

Also, what type of a surety is considered for the cattle ranchers here in this area? There are gopher holes out there. Cattle and horses do not see these gopher holes. We have had a member that is totally incompetent because of an issue that has happened. Not the Air Force, of course. But this gentleman, who is my cousin, totally incompetent. He is not able to do for

himself anymore.

And this can happen.

HEARING OFFICER: Is there anyone else who has not spoken that would like to come forth and make comments?

(Note: No response.)

HEARING OFFICER: Now, Mr. Lane, you appeared to not have finished your comments. Would you like to have another three minutes?

MR. LANE: Okay. 008154

Thank you, Colonel Burd.

I guess this is more, probably, reiterating of some of the experiences that probably people have had with the aircraft out there. And I guess my point is that as with anything there are certain guidelines and rules that we all abide by daily, and as a young pilot, as a trainee, we tend to exceed those parameters sometimes, from occasion to occasion, and I guess it's just our concern that you all are aware of just exactly what happens to those of us that happen to be on that fringe, or underneath, or whatever.

I was talking about being out with my kids gathering cattle, and I guess I'd like to go on and talk about our livelihood.

I have a trail ride that I have each year, and

it happens to be under what is referred to as the racetrack. And people come to the trail ride because of the -- because of the wilderness-type effect, the quietness of the area. And there's no question that that -- there would be an effect on those customers and my business if I had significant bomber training runs over the top of that. That would definitely, you know, diminish the pleasure of being out here, because one of the reasons why they come from the cities to our rural areas is for its quiet and its peaceful ways, I guess.

BR-7

I guess I'm not real excited about having these bomber runs fly over my house, which my house is also underneath this racetrack circle, at -- during the nighttime hours, which it looks like the equivalent of 2,000 feet from a B-2 bomber might be lthe equivalent of a chain saw.

Anyway, I mean those are little inconveniences, and I believe that I, as we all do, put up with a lot of that. I mean, that's part of the strength of the Air Force and so forth. I just think that we are already have numerous Air Force activities in this area, and, you know, we are now considering possibly doubling that. This is a significant renewed burden on us.

Anyway, I yield, and thank you all for that.

HEARING OFFICER: Mr. Bond, did you want to

finish your comments?

MR. BOND: Thank you, your Honor.

Just for the record, I am a rancher with a piece of property next to Mr. and Mrs. Mosimann.

Colonel Mason indicated that the Mt. Dora Military Operations Area floor is 3,000 feet, but the failure of that is that the new MTR that has been created, IC-153, has a floor of down to 300 feet. And as you heard in the hearings in Snyder, Texas, John Oudt indicated and covered all those things to indicate that with that understanding where a military training route transects an MOA, in fact people have to understand that these jets, whether they be fighter jets or military bombers, have the opportunity, under all, some circumstances to go all the way down to 300 feet, that the impact is startling, it's shocking, and the results are what you have seen described.

Also at hearings in Snyder, Texas, Mr. Rich Anderson let you know that the low level flights through his air spaces above his private property is trespass. The Air Force has not offered any compensation for trespass of private property through the overlying airspace.

BR-5

You have heard many comments this afternoon and previously on the noise pollution and the nuisance it

creates and the damages people have already suffered. What the Air Force is seeking to do, it seems to me, is for the sake of the shortness of transit, for the sake of convenience of the Air Force crews, and even for the ostensible benefit of taxpayer dollars, you ask the rural communities of Texas and New Mexico to shoulder unilaterally that responsibility. And you smile when Buzz Welsh told you if every colonel and general of the Air Force would forego their retirement and thereby save the government a lot of taxpayer dollars you might find a whole lot more willing participants in this crowd and the other crowds. But the fact is that is not the case, so you ask the rural community and Mr. Lane and Mr. Bidegain to shoulder this responsibility.

As you know, also, because I have been retained as counsel for the Heap (phonetic) group in Texas, there is similar counsel in New Mexico, this is a woefully inadequate EIS for failure to do the kind of studies that are necessary with the modern technology. You either do your work now, you do your work later, but I assure you, you will do your work.

And so I give you that particular guidance. Thank you.

HEARING OFFICER: Is there anyone else who has already made comments who would like to make additional

comments?

Yes.

MR. HENSON: Clint Henson again, Game and Fish department.

I would like to also add to Mr. Sanchez' comment as far as guides and outfitters. Not only are the hunters affected by this but also the guides who are employed by them.

BR-4

One of the things that I forgot to mention about the Valle Vidal area that is so important to us is that it is closed to all public between January and July, and it seems strange to me that we would allow disturbances of this nature through there during the calfing periods for elk when we do not allow any public people to step out of the vehicle and walk.

BI-1

I also find it strange that you did place this meeting in this community. I know that it is more metropolitan areas in Clayton and Raton.

GE-2

Hopefully that the comments that are given here tonight aren't just on how many people showed up. A lot of these people had to travel many miles to get here to speak tonight.

I would also like to ask for more scientific information as far as not only noise but also for emissions.

47

I believe that from eight to ten flights of B-52s, the amount of emissions testing that was given in the EIS was very insufficient. I didn't really see -- I didn't see hardly any testing at all of that multitude of flights over a given area.

008157

Thank you.

HEARING OFFICER: Is there anyone else?

Yes, please come forward.

MS. HEFNER: Again, my name is Tracy Hefner, and I would like to see the Air Force define the limits on what airspace they are allowed to use over private land.

BR-5

When you're talking about airplanes that are going 300 feet above the ground, and I have had people at Cannon Air Force Base assure me that these planes often fly over, and that you can take them off automatic pilot and go as low as you dare to go, we have had occasion and our neighbors to have occasion to have the heads of windmills suddenly and unexplainably fly off the top of towers. It is our feeling that it's possible this is from jet wash from these jets since we see them cut very close to windmills sometimes when we are out in the pasture.

AO-2

I have called in complaints to the Air Force and they have asked me -- and when I described the plane,

48

they have asked, "Did you get the numbers on the bottom of the plane?"

Well, I was face down in the dirt, so it was a tough go.

But they have asked me, "How do you know it was one of ours?"

We would like a little more respect. I would like to -- you know, if you know when you're going to be flying routes that are over our ranches, it would certainly be helpful to us to know when that was going to happen, because we could plan our work so that we weren't moving a lot of cattle and we weren't in a dangerous situation.

If we get hurt and we can't be out there with our cattle, that is the end of our livelihood. And we don't have any kind of, you know, insurance that's going to pay our bills while we are laid up.

So I would like to be able to identify the aircraft, I would like to know when they were flying, I would like to know what you do when they fly below the recommended levels, and I would like to know how much of that airspace over my private land I can count as ours.

AF-8

BR-5

I can't even build a second story on a house in Santa Fe because I'm in the way of someone else's airspace, but I would like to know how much of that peace

49

and quiet am I entitled to for owning that land and paying my taxes?

Thank you.

HEARING OFFICER: Would anyone else...

Yes.

008158

MR. LANE: Could I just say one follow-up?

Again, my name is Jeffrey Lane. And I have an air strip, actually two air strips on our ranch. I am a Cessna 185 pilot, been a pilot for 20 years, and my air strip happened to be underneath that racetrack cycle, also. And obviously my concerns are with my safety up there with the increased air traffic.

BR-2

Thank you. That's my last comment. Thank you.

HEARING OFFICER: Would anyone else like to make comments?

MS. HAYOZ: Just one more.

008159

HEARING OFFICER: Yes.

MS. HAYOZ: This is just for the record, that there are three historical churches that you must consider.

CU-1

HEARING OFFICER: And what was your name again?

MS. HAYOZ: Loretta Hayoz.

008160

HEARING OFFICER: Yes.

MS. GONZALES: My name is Rita Gonzales, and we have a ranch in Bueyeros, and I also wanted to comment

50

that we have called numerous times about the planes flying so low, scaring, you know, my nephews, the cattle. And we have never ever gotten any comments back. No one has returned our call. We have just been ignored.

AF-37

I just wanted to get that for the record.

HEARING OFFICER: Would anyone else like to make any comments?

(Note: No response.)

HEARING OFFICER: Ladies and gentlemen, that concludes this public hearing. Thank you for your participation and your input. Please remember the public comment period will extend through June 16, 1999.

This public hearing is adjourned.

Thank you, again.

(Note: Hearing adjourned at 6:55 p.m.)

public comment period.

And if you have written comments and you want to turn those in at the conclusion of the hearing, you can put those in the box provided in the back of the room.

I'd like to get started now and call on Eugene Erb, who is Mayor Pro Tem.

Since you're mayor, if you would like to turn around so that you can address -- 008161

MR. ERB: You can leave it that way.

They see me enough.

Colonel Burd, thank you for the opportunity, and I would like to represent the mayor and the Village of Angel Fire and welcome you to God's country. We hope you take full advantage of the environment that your RBTI will impact as long as you are here.

I would encourage all of the population here to be as specific and as cogent and as telling in their remarks as they were last time, because I thought the population did themselves proud here, and also to represent themselves as professionally as they did last time.

From the standpoint of me as an individual, rather than mayor pro tem, I'll speak against the RBTI, even though I spent a lot of my life analyzing the

sufficiency and the need for military tests and training ranges and also training aircrew members in the Air Force.

I applaud the Air Force for seeking low-cost training, given the cost of the Department of Defense today. I also applaud their efforts to assess the environmental and operational impact. I think when I look at the assessment, perhaps not enough is given to what I would call the esthetic character of the impact on areas, and I think the kind of comments you get from an area like this reflects an intensity of feeling for this area that needs to be recognized and perhaps isn't well enough.

BR-7

For example, I think the impact on native people's sacred land is something that isn't recognized as well as it needs to be; the intensity of the feelings, I think, of people that have elected to live in this area because of its unique character, perhaps differentiates this area; and then third -- and I know you're going to hear more on this from some people to my right -- having taken people's youngsters that approach Philmont in the numbers of several thousand per year, I think that is a unique experience for young Americans that deserves to be eliminated from impact by this kind of activity.

CU-4

BR-6

Most importantly, when I look at the results

of your analysis, I find that the operational and economic benefits generally are better for the Air Force if they go elsewhere. The environmental impacts are less if you go elsewhere than if you go to Alternative D, so I look forward with great anticipation to whether you are going to pick the status quo alternative or go to West Texas.

Thank you.

HEARING OFFICER: I'd like to now call on the individuals who have indicated a desire to speak. And what I'll do is indicate the first person, then to give you an idea who's on deck I'll indicate who I will be calling on after that.

I'd like to first call on James Henschkei, and then after that I'll be calling on Hoot Gibson. 008162

MR. HENSCHKEI: Colonel Mason, Colonel Burd, I appreciate you letting us come and speak here.

I'm a retired biologist. Give me where I'm coming from.

I question some of the accuracy on the part of the study concerning the effect on the wildlife. My concern is primarily pollution: noise pollution.

BI-3

Many of us escape the urban lifestyle for the peace and tranquility of some of these less traveled byways.

I served in the Navy during the Vietnam era. I fully appreciate the need for training and the need for practice. It is important that our young men and women are well prepared when they are called on to protect our national interest such as is happening in Yugoslavia at this time.

How can we balance the needs of citizens to taste a wilderness experience and the military's need for preparedness? I propose the use of existing military reservations. Why not use the White Sands Missile Range?

What about Fort Hale that's abandoned near Leadville, Colorado? I understand that it's totally abandoned, although there's some public access to it at the present time.

PD-4

What about the Air Force Academy, Ft. Carson?

I understand none of the military bases are being used for this type of training. Surely there are sufficient military reservations scattered throughout the U.S. to provide ample topography variations to properly train our servicemen, including our airmen.

I have only two animals, a llama and a donkey. Heck, they spook even they when they see another donkey and a llama. What will a B-52 or B-1 do when they fly over?

25

BI-1

They addressed that the antelope won't be -- pardon me, the prong horn. I watched a heard of prong horn be spooked by a few turkey. What are they going to do when a B-52 or a B-1 flies at 300 feet overhead? I've seen them go through fences when a car passes.

Let's make a deal. You don't fly low -- and I want to emphasize the "low" -- over public accessible land, private land, and we won't invade the military reservations.

I appreciate your time. And I'm sure you get all kind of static, but I really do appreciate the chance to speak.

HEARING OFFICER: I'll call on Hoot Gibson, and then after that Kelly Davidson.

008163

MR. GIBSON: Colonel, my name is Hoot Gibson, and I'm the president of the Angel Fire Property Owners Association and represent the 5700 property owners in the Angel Fire area.

We voiced our concerns over the environmental -- this coming over the RBTI proposal -- to the Secretary of the Air Force last year, and we have been very closely monitoring the EIS, and have only two real concerns with the EIS as we understand it has been presented.

The first one is that I don't believe that

26

we've covered the socioeconomic aspects of the impact on the Moreno Valley as deeply as we should have. As I understand, most of the impact, the socioeconomic impact, was in terms of the land to be purchased and used at the sites that where the threat emitters were going to be installed. Here in the Angel Fire area we have just come out of a disastrous bankruptcy situation in the last several years, and I have considerable concern that the number of low-level flights that would be presented to us in this area hear would have a serious impact on the evaluation of the land in terms of its saleability; also, would have an impact on the number of visitors that would be coming into the area, which would have a serious impact upon the socioeconomic impact on the valley.

BR-4

And I think we ought to go into that a little more deeply.

I also have some concerns in the assessment relative to the safety consideration.

One of the pieces of correspondence that we provided to the Secretary of the Air Force, and also to our political representative, is a listing of the number of bird strikes that have occurred over the last year to Air Force aircraft. As an example, from 1985 until February of 1988, 34,856 bird strikes occurred to Air Force airplanes in the United States, resulting in death

AO-19

27

to a considerable number of people and over $38 million worth of repairs that had to be conducted by the Air Force.

If you were to analyze that, we would then anticipate that 52.6 percent of these strikes occurred at below 500 feet. And I'm uses Air Force terms here, Air Force -- an Air Force document here. 52.6 percent of these would be analyzed where we could expect somewhere in the neighborhood of about 1367 bird strikes to occur at low-level flights in the coming year.

AO-19

Here in the -- we just came out of a disastrous -- I'm sorry, am I over time?

Sir, I would like to present this, then, to your secretary for your records.

HEARING OFFICER: Or if you want to hold on, after we finish everyone else we'd be happy to call you back up.

Let's now call on Kelly Davidson, and then after that on Les Davis.

008164

MR. DAVIDSON: Thank you. I'm Kelly Davidson with the resort, and I'd like to welcome you to the resort and also thank you for this opportunity that you have provided for the community.

First of all, the owner of the resort is Tim Allen, who it is unfortunate could not be here this

28

evening, and he sends his regrets, but he does want to represent that the resort is supportive of the needed military training. I think you will learn from everybody in the community it's just Alternative D we feel is not realistic for this community.

Hoot Gibson made a reference to the socioeconomic impact in the community. We are fortunate that the industry here is based on tourism. That's a clean, non-polluting industry.

We are concerned about the impact of Alternative D, of what it will have on businesses, on jobs, on people being able to support their families, being able to continue to have their homes here. We feel there will be a loss, and there will be a negative impact because the resort is the main attraction, winter and summer, and provides businesses and earning power for people here in the community. We are afraid that will be lost.

BR-4

The Second item we are concerned about is safety. We have an airport here, 8900-foot runway. Currently we have private pilots flying in here, and we are in the process right now of marketing that and increasing the usage of the airport through the Chamber of Commerce, the fixed-base operator and the resort so we will fly more flights, private pilots coming in here.

AO-30

The resort is also in the process right now, in negotiation to bring charter flights -- and this will be coming for next winter -- and eventually commercial flights.

So we are concerned about safety.

And lastly, we are also concerned about the sound and the noise. Currently, we enjoy the sounds of nature here, but we are concerned what 2600 flights a year may represent.

And if I may have a moment to play this.

(Note: Tape played.)

2600 flights a year.

I'm sure you're used to it. I'm afraid people wanting to come here and live here and invest probably would not be.

Thank you for your time.

HEARING OFFICER: I'd like to call on Les Davis, and then I'll be calling on James Smith after that.

008165

MR. DAVIS: Colonel, I am very pleased to welcome you to Colfax County and the Moreno Valley, one of the prettiest places in New Mexico.

I'm Les Davis, president and general manager of the C.S. Cattle Company. Like all the rest of my neighbors here, the C.S. Cattle Company, now entering

it's 126th year of operation, is concerned about the effect of this bombing program on people, livestock, and wildlife.

We have a unique position here. The C.S. Cattle Company, my grandfather Frank Springer and his brother Charles Springer, built the largest manmade structure in the Moreno Valley. You might have heard of the Eagle Nest Dam that forms the lake a few miles down here. It's a gigantic concrete structure. It holds 80,000 acre feet of water. And at the time in 1980 when the dam broke in Idaho and killed many people, every dam in the United States had to have an engineering study, complete engineering study. We hired Gordon Herkenoff's (phonetic) firm in Albuquerque, a top-notch firm. They examined, took core drillings, they gave a rating of AAA to Eagle Nest Dam, the structure and its condition.

We have never had any test of what the ground vibrations of heavy aircraft flying over is. I was there a year ago and two jet fighters buzzed it, and I guarantee that the ground shook.

AO-12 Now, I have no -- We have no idea what the effect of these planes would be on the dam. That is one of our primary concerns and why we are appearing here, in addition to our concerns about humans, other structures, wildlife.

Now, some people we heard at the other meeting were anti-military. I am not anti-military. I'm a World War II vet, went from France to Czechoslovakia with the 14th Armored Division, had wonderful training at Ft. Sill (phonetic) as an artillery man, and I appreciate good military training.

We want to figure out these routes where they don't hurt people or things. And we are all for you, but let's use lots of common sense in picking out those routes.

Thank you, Colonel.

HEARING OFFICER: James Smith. And then I'll be calling on Leigh Sprowls.

008166

MR. SMITH: Colonel Burd, Colonel Mason, thank you. I'm here for the community of Ute Park, which is about 13 miles below Eagle Nest, equidistant from Cimarron and Eagle Nest, and also directly under the flight path in Section G/H in your proposal.

We are concerned in Ute Park. As we have had in the past four months, the prevailing winds during the fall and the winter and into the spring are from the west, average gusts of wind, 25 to 40 miles an hour, with occasional gusts to 50 or better. We are very concerned

AO-6 as to what will happen to aircraft flying at 400 feet over our valley when hit by a 50-mile-an-hour gust of

AO-6 wind from the side. Very hard to recover from that instantly.

Due to the mountainous terrain that surrounds our valley of Ute Park on all sides we are always concerned that the aircraft that would come down over the top of Baldy into the valley and experience technical problems with the engines would have to be able to get over the mountains on the other side, climb for 6- or

AO-50 7,000 feet to get out, and we are very concerned we might have a many-thousand-gallon fuel jettison over our community.

We have 200 homes in the community, fifty of those homes occupied year round and another 150 occupied recreationally during the summer and during the ski season.

In addition to that, a route over our valley will go over two wildlife management areas and also impact a state park which is right on the western edge of our community.

Those are my comments, and I would like to also enter this into the record, if I might.

008167

Thank you very much.

MR. SPROWLS: Colonel Burd, I'm Lee Sprowls. I'm here as a private citizen, and I would like to discuss what I think is a threat to our biological and

33

environmental resources that was not addressed.

I have recently become aware that in 1991 the composition of jet fuel used by commercial and military jet aircraft in the United States was changed from JP-4 to JP-8. A Department of Defense source says that the move has saved some lives in air crashes because the JP-8 is a little less volatile. **AO-50**

Ethylenedibromide happens to be a key component of JP-8. Ethylenedibromide is an extremely hazardous pesticide that was banned by the U.S. Environmental Protection Agency in 1983, so I'm wondering why it's a component of JP-8.

The 1991 edition of Chemical Hazards of the Workplace warned that repeated exposure to low levels of Ethylenedibromide results in general weakness, vomiting, diarrhea, chest pains, cough, shortness of breath. On and on, the maladies that can occur in humans, and I'm sure also occur in animals and birds. It causes, additionally, deterioration of the heart, liver and kidneys, and hemorrhages in the respiratory tract, and can result in -- all of these things can result from prolonged contact with ethylene dibromide.

That is JP-8.

According to the EPA, EPA's hazardous materials list, ethylene dibromide is a carcinogen and must be

34

handled with extreme caution. A seven-page summary of the pesticide's extreme toxicity warrants that ethylene dibromide may also damage the reproductive system. The EPA also cautions that exposure can irritate the lungs, repeated exposure may cause bronchitis development, or cough, shortness of breath, it will damage the liver and kidneys.

It is 5.6 times heavier than air, so my concern is that we all know jet engines do not burn 100 percent of their fuel. I know that the B-52 cannot jettison fuel, but the B-1 can, if necessary, and they supposedly only do that in emergency situations. Flying at 400 feet or in that vicinity will not allow the residue from the jet engine, from this JP-8, to dissipate like it would, say at 40,000 feet. And it's probably not terribly harmful at 40,000 feet, but at 400 I'm sure it will go directly to the ground and contaminate whatever it is contaminating there: animals, birds, or people. **AO-5**

And I don't think this is anything that we really would like to see happen in our valley.

Thank you for my opportunity.

HEARING OFFICER: I would call on David Patton and then on Ken Edens.

008168

MR. PATTON: Sir, my name is David Patton. I'm a resident here. I'm speaking for myself.

35

I have, and well over 1,000 of my neighbors in Angel Fire and Taos have, already made clear all the reasons these training flights should not take place anyplace in this area, last year.

Among them were: Disturbance of wild life breeding grounds; flying over designated wilderness areas; flying through a major sandhill crane migration route on a low level, with great likelihood of encountering one of these large birds; crashing; flying a bare mile from our elementary school in Eagle Nest; the danger of major forest fires should the crash take place in the dry conditions we have here; the continual disturbance of wildlife, domestic animals, and people in the area, not to mention the incredible impact on a resort and real estate land based economy in this area where people come to escape the stressful realities of life in the city and in our modern world. **BI-3**

Would you spend $300,000 to buy a house here so you could listen to between 10 to 12 low-level bomber flights daily?

Our senator and our congressmen and every village and county government in the area, including Taos and Picuris Pueblo, have all issued statements against it, but this doesn't seem to be enough for the Air Force. They make us wait in limbo for nearly two years for a **GE-8**

36

decision. They try to placate us by moving the route a mile to the east. **GE-8**

The EIS states there is no appreciable economic and social impact to be felt from these flights. How can any true assessment of the impact come to these conclusions? The socioeconomic impact will be devastating. Devastating. And the environmental impact be will be significant. **BR-4**

My wife and I have lived here for 20 years. We have seen B-1 flights go through this valley in the 1980s when there was no input or warning, and they were most disturbing.

My point is: How many good reasons do you need to scrap this ill-conceived idea?

If you want community input, you got it last year. Your minor changes and bogus impact statement are not going on make us change our minds. If you truly want our input, then heed it. Don't make a mockery of it. If the military can force this on us no matter what the consequence for this area and no matter what the people here say, then you really won't be protecting our democracy, you will be protecting a military state. **GE-3**

This really boils down to who has the power here, the military or the people. I was under the impression that it was supposed to be the people.

37

I recommend for Alternative A, no action.

HEARING OFFICER: I'd like to call on Ken Edens, and then after that Bill Spice. 008169

TY MR. EDENS: My name is Ken Eden. I live in Ute Park. Mr. Smith has given you some of the stuff about Ute Park, and I would just add that this is a unique, beautiful place to live, abundant wildlife. I've lived there for several years, and I would hate to see this change.

But that said, let me tell you I support the proposal that the Air Force is doing here. If this is the best thing for the aircrews to train, if this is the best place, then I support this. I don't always agree with the politics, but I support our troops in combat. Probably as we are speaking tonight we have pilots and crews flying low-level combat flights in the mountains of Yugoslavia. This country, on television, looks kind of like our country. I think we owe it to these people to give them the best possible equipment, the best possible areas to train. I think anybody that has been in combat will tell you that the more realistic your training can be, the safer you are. You know, the more lives will be saved.

I expect that most Americans would agree with that, but what I'm hearing here tonight is do this

38

someplace else, it messes up the esthetics of this beautiful place. And I agree with that. But how can we be so selfish as to say, "Send this someplace else. It's not me, not mine. It impacts the value of my property, scares my dog."

Given our declining military budget, I would like to see this money spent as effectively as it can, and I trust the Air Force to develop a plan to do this.

Over the past several years we have had some low-level jet fighters over Ute Park. I have never heard anybody say it negatively impacted anything.

I suspect that there's few folks here that agree tonight with my opinions, and I doubt I will change anybody's mind, but if this is way to give the best training for these aircrews that will save their lives, let them do their jobs, then as far as I'm concerned, bring them on.

Thank you.

HEARING OFFICER: Bill Spice. And then I'll be calling ON Bob Ricklefs after that. 008170

MR. SPICE: Colonel, thank you very much.

My name is Bill Spice. I'm the national director of high adventure programs for the Boy Scouts of America, and also the general manager at Philmont Scout Ranch.

39

The position of the Boy Scouts of America and Philmont has not changed. We believe the Air Force should be the best trained, best equipped, best prepared fighting force in the world. However, we find it hard to believe that the best place to train your fighter crews are over Philmont Scout Ranch.

GE-19 When we last met as a group in this building we were led to believe our comments were being recorded and considered, only to find we were attending a fact-gathering meeting and not a scoping meeting.

ED-4 On pages 10 to 13 of the EIS there's no reference to the meeting held at Philmont with Air Force representatives.

As we read and reread the Draft EIS, there are conclusions drawn that are not correct.

Page 4-76 you imply that there are very few population centers affected. On any given day during May through August, directly under the flight path shown there, there are over 5150 young people living at Philmont.

BR-6 On page 4-81 you state that the initiative would not threaten public safety. At any one time we would have 120 youngsters hanging on rock faces doing their rappeling, several climbing spar poles, and, more importantly, over 160 on horseback.

40

AO-89 On page 4-79 when we read table 4.2-12 you are proposing to overfly 114,000 of our 137,000 acres of program. That is totally unacceptable, because this means, according to your own calculations on page 4-81, the estimated time of each flight over the Philmont would be 3.3 minutes, and if there are a minimum of 16 flights a day, that equals 52.8 minutes, and in our young people staying with us only 12 days, they will be exposed to six and a half hours of noise and disruption.

So much for the mountain wilderness experience.

ED-5 Page 4-77 is incorrect. Philmont is not range land. Over 60 percent of our property is wooded terrain.

On page ES-5, Cultural Resources, there seems

CU-8 to be no mention or our two national historic sites, the Kit Carson/Maxwell Abreu house at Rayado, and the Villa Philmonte.

Also, we can find nowhere what the effect of

ED-6 low-level noise violations will have on the hundreds of abandoned mines and semi-active mine shafts in these mountains, including the two active gold mines at Philmont that our youth tour each summer.

The last sentence that causes us great concern: "Effects from aircraft emissions and potential of

41

aircraft mishaps would be inconsequential for all alternatives."

AO-5 An aircraft coming down on our tent city, or dumping fuel to gain altitude on cook fires and camp fires is certainly not inconsequential.

HEARING OFFICER: I'd like to call on Bob Ricklefs, and then I'll being calling on Doug Tappen (sic). 008171

MR. RICKLEFS: Thank you, Colonel Burd.

My name is Bob Ricklefs. I'm the ranch superintendent at Philmont Scout Ranch.

Like most ranches in the area, Philmont has abundant wild life, game animals. We have livestock. We have a beef cow herd, we have 75 burros, we have a buffalo herd which provides buffalo for our participants. We also have 250 horses. These horses are used in the summertime to provide rides for inexperienced people. And when I say "inexperienced," this is probably the only time this person will be on horseback. They know nothing about it. But we have a very good safety record with these people. In the summertime we might take out 9,000 people on horseback, most of those for their first time.

Alternative D concerns me greatly. On page 4-81 it states in part that flight operations would not threaten public health and safety. And I feel that that

42

is incorrect. I've ridden these mountains, and I'm an experienced horseman, and I have been on horseback with an inexperienced horse when low-level flights -- the smaller bombers that fly over occasionally, and I know that horse grabs his tail. And I'm experienced enough to know what's coming. These inexperienced people would not know what to do. They would be as fearful as the horse. And I'm greatly fearful that many, many people in one horse ride could be dumped, dragged, bucked off, et cetera.

At any one time during the day we might have 165 people horseback in various parts of Philmont. They can be on horse rides in eight different areas of Philmont. I believe that the startle effect of a high-decibel low-level flight is going to be catastrophic to our youth, and eventually may cause death or injury to somebody who does not know what a horse is about. BR-3

I would also say it says that applicable regulations would not be harmed. We looked up an FAA regulation which says that you cannot fly over an open-area assembly of persons. I would feel that 35 people on horseback would qualify as an open air assembly of persons, and we feel that that does go against FAA regulations. AF-6

Also, personally I would say that more than a

43

year ago I wrote for the Draft EIS, and according to NEPA regulations anybody showing interest in this is supposed to receive that, and I did not receive my own copy. GE-26

Thank you.

HEARING OFFICER: I would like to all on Doug Patman, and then it will be Ron Bromley. 008172

MR. PALMER: Colonel Burd, I'm Doug Palmer. No one else can read my handwriting either, so that's fine.

I want to continue with Philmont's statement. The Draft says that noise levels will average between 62 and 68 decibels. The noise level of the B-52 at 300 feet is 117 decibels. This increased noise level will greatly interfere with our staff as they instruct our participants, and their safety can sometimes be dependent on this instruction. Imagine trying to teach young people to climb safely on a sheer rock face and having to compete with these flyovers. If a participant can't hear the information being passed along, he or she could possibly be injured, or worse. AO-8

AG-13 you state that local residents will get used to the flyovers and will be able to sleep through them at night, much like living near a railroad track. What you don't take into account is our participants will BR-6

44

be here for about two weeks, not enough time to get used to it. BR-6

We have tents instead of housing. That record says 20 percent of the flights will occur between 10:00 p.m. and 2:00 p.m. There's no doubt this will have a serious effect on their health.

We have many questions and concerns still unanswered. For instance, what is the negative effect on wild life and domestic livestock? What would happen to our radio system? Would there been an interruption of our radio systems or yours? What happens, God forbid, if there is a mishap? How can we shut down part of our situation to investigate who is liable morally or financially?

If you read the Federal Aviation Administration Title 14 Code of Federal Regulations, Section 91.119, minimum safety altitudes, if the FAA regulations apply to the U.S. Air Force, we certainly have a conflict. Item B, over congested areas, would also raise serious doubts that the FAA would allow such flights. BR-6

Let me conclude. We are in total support of our military. We want our men and women to be the best-trained fighting force; however, we have tried to share with you some of our beliefs how the RBTI Alternative D is unwise and unsafe. Parents send us

20,000 young people each year. We are responsible for their health and safety. Please don't create a situation where we have to call a parent and tell them their child is severely injured or dead because of a fall, or being drug by a runaway horse, or what might be caused by low-flying Air Force bombers.

I may be the only person who has lived in both Alternative D in the Davis Mountains. I directed Buffalo Trail Scout Ranch for nine years, which is 12 miles west of Bal Morey (phonetic). I know a little bit about the environment out there, and I certainly know that is a much less populated area than ours.

And we would certainly recommend you to enjoy Texas.

Thank you very much.

HEARING OFFICER: Let's now call on Ron Bromley, and then I will be calling on Mark Anderson after that. 008173

TY MR. BROMLEY: Colonel Mason, Colonel Burd.

Just one night out of 15 weeks 200 young people and adults sitting around a campfire in a pristine mountain wooded scene, an area shattered by the noise of a military aircraft flying at a very low level shattering their environment.

That is not safe. It will never be safe.

We have 30,000 people at Philmont each year. They would all be part of one of those campfires.

I defer the rest of my time to Bill Spice for closing comment.

HEARING OFFICER: Well, sir, I'd just like to remind you that everybody is going to be given an opportunity to speak again, so you don't need to defer your time. He will be given additional time. So if you have some more remarks to make, please make them.

(Note: No response.)

HEARING OFFICER: Very well.

I'll be calling on Mark Anderson, and after that Richard Mahalik. 008174

MR. ANDERSON: My name is Mark Anderson, and I serve as director of program at Philmont Scout Ranch.

We brought two maps of our Scout ranch, and have them displayed here. Just for the record, one of the maps depicts -- or each map depicts the area in which the three sections of the MTR will fly through: E/F, F/G and G/H. And the maps that are displayed, one of the maps depicts the various places that we have staffed camps in the back country.

Our general manager a few moments ago indicated that 5100 people at any one time are camped in that corridor, roughly 111,000 of our acres are included

within the MTR area.

The second map that I show in front of us indicates the routes that the treks that our young people are hiking on, and as a person can look at that, they look at the various color combinations indicating those map trek routes, can see that probably 80 percent of those particular routes are within the E/F, F/G and G/H portion of the MTR corridor.

The fact that very little was given to the population in the area -- and I understand that just

BR-6 because we are seasonal from May to the end of August, we do have a significant population in this Section D or Alternative D at any one given time.

There are other small communities and large communities that weren't taken into account with the Environmental Impact Statement. We feel like we are a significant community, and as Bob Ricklefs referred to a

AF-55 few moments ago in referring to the Federal Aviation regulation, we have a large group of people gathered in various spots along the ranch.

Just to start at the top of the map in the E/F and F/G portion, we run from Baldy camp to Tom -- at 10,000 feet of the 12,441 foot Baldy mountain where kids are gathered together for programs at that point, down through many staffed camps that Bob referred to with

horses, our Ponil, our Clark's Fork and Baulien area, as well as kids that are on what we call a cavalcade ride, which means for 12 days they are riding their horses.

So throughout their 12-day experience they are encountering roughly an average of ten flights per day at that particular time.

We feel we are a significant community, as well as our neighbors around us are significant

BR-6 communities, and for that reason need to have more emphasis on that portion of the Environmental Impact Statement.

Thank you.

HEARING OFFICER: I'd like to call on Richard Mahalik, and then Ken Taylor. 008175

TY MR. MAHALIK: Colonel Burd, my name is Richard Mahalik, and I'm the associate director of program at Philmont Scout Ranch. Part of my responsibilities include personnel and hiring of our seasonal staff.

We have over 850 staff members that work at Philmont during the summer period, virtually from every state in the union. In fact, every state in the union except Hawaii.

Part of that staff, incidentally, are representatives from each of the military academies. I think we have about 25 members from the Air Force Academy

49

that will be acting as rangers and be here for this coming summer. In, fact two weekends from now about 65 cadets from the Air Force Academy will be out there for some training, weekend training leading up to their job this summer.

When our staff come to Philmont they have some pretty high expectations. Those expectations are also true for the 30,000 participant that we have. Those expectations include a safe and healthy environment. I am personally concerned that they may not be able to get that if this program takes part over Philmont.

I would simply urge that you consider looking in different direction so that we can continue the program that we have for the young people of our country.

Thank you very much.

HEARING OFFICER: Ken Taylor.

Mr. Taylor?

AUDIENCE MEMBER: Ken Taylor had to depart. He wished to echo everyone else's concern on Alternative D.

HEARING OFFICER: Then I'd like to call to Cliff Bain, then after that Linda Vaughn. 008176

MS. BAIN: My name is Cliff Bain. I live north of Taos but I've spent much time in the last year

50

and a half helping to organize and inform my fellow residents of this area of just what this proposal would mean for our lives.

I'm not comfortable with your study or your conclusions. You are bound by the National Environmental Policy Act to study the cumulative impacts of this action, combined with existing use of the airspace, and any future use, and I don't think you've done that in an honest way.

The existing route where I live north of Taos is primarily intermittent fighter planes; occasionally a pair of them will come over the ridge. And it may happen on two successive days, it may not happen for another six months. Sometimes some larger aircraft come, but I have never experienced -- although I've seen a B-52 fly over my house, I've never experienced them at anywhere close to the speeds that will be used in this realistic training.

PD-35

So there's a real qualitative difference between what we experience now.

Your study shows that the increase for Alternate D is perhaps 15- to 1800 percent increase in flights, but what is particularly impactful is that you are creating a corridor, what, six to twelve miles wide something like that. These flights will be so

51

concentrated, in effect we will have a highway of B-52 and B-1 bomber flights, 10 or more a day, day and night. Very, very concentrated.

I don't know how you can consider -- well, perhaps communities elsewhere, we don't rise to the level of a community when we have a hamlet of several hundred people, but I don't know how you come up with five communities as your slide show has shown. There are scores of communities where people live, where livestock reside and wildlife breed, and you're completely changing the quality of life, the tranquility of the area within these zones.

LU-2

BR-7

I certainly hope that your Final EIS will look at this.

You have not come here or sent people here to study what it's like, what impacts can be predicted in this area, and you just can't do this with statistics. You can't do this with studies from elsewhere. You have had plenty of opportunity to come and spend some time at Philmont and elsewhere, and it hasn't been done yet.

HEARING OFFICER: I'd like to call on Linda Vaughn, and then after that Mark Griffin. 008177

MS. VAUGHN: Colonel Burd, Lieutenant Colonel Mason, my name is Linda Vaughn, and I am the assistant to the chief executive officer of Angel Fire Resort.

52

However, I come here tonight as a 21-year resident of the Moreno Valley.

I had a short -- a limited time to review the draft of the Environmental Impact Study, and I searched for information about Angel Fire, the fact that it is a resort. I searched for areas that would speak about Colfax County, and I couldn't find anything that specifically spoke to this area.

PD-36

I did find on page 6-3 of the public involvement process a paragraph that reads: Post scoping public meetings. In this paragraph it states that it was -- that we actually followed the formal scoping period. And I do recall that you were invited after that scoping, that initial scoping period was held.

It also mentions that over 370 people attended in Taos and about 180 in Angel Fire, and approximately 50 commentors spoke at each location. However, I didn't find any information about the impact that these commentors had made.

GE-3

And I just wanted to be absolutely sure that with this particular hearing that we will be noted, and that you will have that opportunity to recognize that we are a resort area and we do have thousands of people who come here on a regular basis to enjoy the environment and to seek a little peace and quiet. Sometimes they come to

GE-36

53

play, sometimes they come to just be quiet.

But it's a beautiful place to live, to raise your children, and the impact that I think that this particular situation is going to have on the environment is what I'm most concerned about.

I appreciate your time, gentlemen.

And I, too -- my son is a -- spent ten years in the Air Force, and I love you guys. You do a great service for your country, and I appreciate that very much. I will express the sentiments of one of the other gentleman that said, "Please enjoy Texas."

Thank you.

HEARING OFFICER: I will call on Mark Griffin, then Jennifer Cavan.

008178

MR. GRIFFIN: Thank you, Colonel. My name is Mark Griffin, and I'm speaking as president on behalf of the members of the Cimarron, New Mexico, Kiwanis Club.

We strongly oppose Alternative D of the Realistic Bomber Training Initiative. While we fully appreciate the mission, we firmly believe Alternate D is ill advised. Nearly all the economies of the communities surrounding Cimarron -- Philmont, Ute Park, Rayado, Miami -- depend on the recreational and lifestyle opportunities of our area. Skiing, hunting, fishing, camping, ranching, tourism, viewing wildlife, and

54

retirement bring people to our area, keep us in business, and our communities alive.

BR-4 We believe the constant low-level bomber flights called for by the RBTI will adversely impact, if not curtail, these activities, and then the very survival of our small communities.

BR-6 We believe the direct flights over the Philmont Scout Ranch, the largest single economic force impacting our communities, will cause the facility to be less desirable due to the noise, safety concerns, and elimination of the wilderness experience amongst Scouts and Scout leaders who attend the programs at the ranch each year.

During each day from the beginning of June to the end of August there are about 5,000 additional people in Cimarron from all over the country arriving, departing, or participating in programs at Philmont, and thousands more visit in the non summer months, a total of about 30,000 Philmont visitors each year.

CU-2 We believe that direct flights over our museums, petroglyph sites, and two facilities on the National Register of Historic Places, the Villa Philmonte and the Rayado Community, which are among our area's most popular tourism sites, will endanger those sites and lessen visitations.

55

Just outside the corridor are two other sites on the Register: The St. James Hotel and Cimarron's Old Mill.

We believe the deer and elk herds that are so important to those who enjoy our mountains for either hunting or viewing will migrate away from the route, causing these activities to end.

BI-5 We believe the noise and low-level flying aircraft will cause our predatory bird population, including endangered species, to be adversely impacted.

We believe the many, many members of our communities involved in local ranching operations will be impacted as cattle, bison, and horse herds are disturbed by the flights.

We believe those who have retired to our communities because of the peaceful lifestyle will choose to relocate, further impacting our economy.

ED-5 Further, we believe the Draft EIS that has been prepared is full of inaccurate statements about the area considered as Alternative D. Our area is not "rangeland." We are a population center for much of the year. We do have cultural resources in the area, and we do have domestic and wild animals that will be impacted.

While there are currently overflights in our area, the proposed altitude deviations make this

56

precedent irrelevant.

We urge you to reconsider RBTI, and especially Alternative D.

Thank you.

HEARING OFFICER: I just have a quick announcement to make.

Is Ernest or Cheryl Lopez in the audience? There is an officer in the back of the room that would like to see you.

AUDIENCE MEMBER: Right here.

HEARING OFFICER: I'd like to now call on Jennifer Cavan.

Please forgive me if I am butchering your name. Looks like C-a-v-a-n.

Is there a Jennifer here?

(Note: No response.)

HEARING OFFICER: I'd like to then call on Betty Stisser, and after that Mark Thibeault.

So Betty is gone?

MS. STISSER: I'm here, but I don't choose to speak. Thank you.

HEARING OFFICER: I see. All right.

Mark Thibeault.

MR. THIBEAULT: I'm going to pass. Thank you.

57

HEARING OFFICER: Daniel Williams. 008179
Then after that David Vackar.
MR. WILLIAMS: Colonel Burd, Colonel Mason, welcome.
My name is Daniel Williams. I'm a retired major from the National Guard, training officer for two military units and director of operations for one.
I am by no means against the military, Air Force, or against training. I believe that providing our young people with the finest necessary equipment and the finest training is absolutely critical if we are going to send them into battle. However, I am convinced that the RBTI Alternative D would have a devastating impact on Northern New Mexico.
I have a number of concerns about the EIS.
The slide did say there were only four or five communities would be overflown and affected with increased noise levels. There would, in fact, be dozens. I have taken the coordinates provided to me by Major Adams, have plotted those, and in only the first third there are literally dozens of communities there. The Denver Sectional Flight Chart posted in the lobby shows these areas, and I will be submitting a copy of that, and I respectfully ask that that flight chart in its entirety be published in the Final EIS so that

LU-2

GE-35

58

people will be able to really see how their homes and area is going to be impacted.
I do believe that the maps and the EIS are grossly insufficient because of the lack of detail. When you have got a map that represents several hundred miles of air space, shown on an 8 1/2 x 11 piece of paper, there's no way you can provide the kind of details that you need.
The route has been referred to by a biologist friend of mine as an aerial tour of the scenic and wilderness areas of Northern New Mexico. I think that is very accurate.
There are some changes in the route. Now, Colonel Wheelis (phonetic) promised the Angel Fire meeting that the route would not come within five miles of Angel Fire, and in fact the changes in the route do show it is now five miles east of Angel Fire ski area. What that doesn't account for is that the town of Angel Fire has annexed property to the east and that that, as it's developed, will be closer to the route.
There is also a tremendous impact for Philmont Scout Ranch. As these gentlemen have said, there are over 20,000 campers that come every year. Many are not used to being in wilderness areas. Many are first-time riders. We are talking about an area -- As a Scout back

GE-35

ED-7

59

east, I dreamed of going to Philmont, and never had than opportunity, and I look at the Scouts that are going to come there and have what would be their first wilderness experience for many of them shattered by the sound of the bombers overhead.
If this area is selected, I do predict there would be a huge public outcry from across the United States from former Scouts, from Scout leaders, from Scouts themselves, and I also predict there would be headlines in many areas that read: U.S. Air Force versus the Boy Scouts of America.
Sir, I do have a additional comments I'd like to make later, if I may.
HEARING OFFICER: Yes. 008180
David Vackar.
MR. VACKAR: Gentleman, my name is David Vackar. I'm the general manager of the Vermejo Park Ranch, Northern New Mexico, owned by Ted Turner of Atlanta, Georgia.
We believe you have significantly understated the environmental impacts through your EIS and totally ignored the socioeconomic impacts for our region. However I'll restrict my comments to just those impacts to Vermejo Park.
It is 600,000 acres, of which 200,000 is your

60

northern pivotal point for your bombers coming from the west across the Costillo peaks, coming across at 13,000 feet and then turning directly south to come across the Valle Vidal, the units which don't even show on the maps, to come across then towards Philmont and Angel Fire.
There are significant populations of bald eagles, peregrine falcons, several other potentially identified endangered species on Vermejo Park, specifically, that I don't believe you have correctly addressed. We have significant projects to protect the Rio Grande cutthroat trout, which has been requested to be listed under the Endangered Species Act, although at this point has not been officially listed, projects up in the Costillo basin.
We have significant populations of elk, especially cows and calves, that spend the summer from 12- to 13,000 feet on those peaks over which you are anticipating flying bombers at just a few hundred feet.
Wildlife, actually, in many ways can adapt with overflights; however, we believe especially with these cow/calf populations above the treeline, you have not anticipated the nature of the impacts on these areas.
We have started discussion with New Mexico Game and Fish to reintroduce Rocky Mountain Big Horn sheep on the peaks. Flying over that certainly doesn't

ED-2

BI-5

BI-7

BI-1

61

bode well for that reintroduction in those areas.

Quickly, before the sergeant brings up his red flag, I will also mention the socioeconomic impacts.

Basically, the EIS doesn't even recognize that we have a lodge at 10,000 feet directly under your flight path at which we have four staffers and 12 guests that are there continuously from late May until the 1st of November each year. In addition, in those areas we have, in most cases right under the flight path, 10 guides and 10 hunters continuously from the middle of September to the middle of December hunting elk in those areas. So when you talk about no socioeconomic impact in our region, well I can tell you specifically there will be the loss of a considerable number of jobs on Vermejo Park if those flights go through, because of the loss of hunting and fishing guests we have coming into those areas involved.

BR-4

I believe that at this point we have no information that would change our minds to significantly oppose the designation of Alternative D as the preferred alternative. Just like everyone else, gentleman, we concur with the need to have the best-trained pilots in the world, but as we assess the alternatives, without a doubt Alternative D -- alternatives in West Texas make much more sense than flying Northern New Mexico, and we

62

will aggressively continue to bring that to your attention and also to persuade our Congressional delegation to help in that regard.

Thank you.

HEARING OFFICER: Terry Patton. 008181

MS. PATTON: I have a letter from Charles Striker, who is a recent homeowner in this area. And he couldn't be here because he lives in Kansas, but he wanted a portion of this read, because it hasn't been addressed yet.

He flys here from Kansas, and his concerns deal with the local airport, so I'm going to read a portion of his letter.

"We have purchased property due to the attractiveness of the area and the access to it by flying into the local airport (here in Angel Fire). We are very concerned that the use of the Mt. Dora alternatives will result in restricting the use of the airport due to the anticipated restriction of air space while the low-level military operations are active. Our experience with other airports located in other parts of the country have shown also that access" --

Let me see. Excuse me.

"... have shown that access to local airports while the military operations are active is

63

significantly restricted. We have also experienced considerable rerouting when military operations are active.

"The unique location of the Angel Fire airport with the high-altitude narrow mountain range, unusual wind conditions and location in proximity to the Village of Angel Fire make modifications to the access route hazardous. The access to the east of Angel Fire is restricted to a few areas. The flight route proposed by the military will be in direct conflict with access to the local airport. The elevations required to land at Angel Fire is restricted by the FAA by oxygen requirements at 12,000 and more than 14,000 feet MSL, and will be further complicated by military restricted airspace. It is expected that further restriction will result in additional accidents at the main Angel Fire airport."

Then the final paragraph:

"We spent a considerable time investigating airport availability along the Rocky Mountains before we selected Angel Fire as our choice as a resort area. I am pleased to say the Angel Fire airport is uniquely located and one of only two airports available along the eastern Rockies that provides immediate access to local resort areas. The airport is only one mountain ridge over the

64

plains, which virtually assures access. The restrictions the military operations will place on the airport will make this airport resource diminished and will force other potential persons such as ourselves to move to other areas where such restrictions are not present."

AO-30

For myself, I would like to say that there are definite problems with the EIS concerning the socioeconomic situation in our area, and as the end of this letter suggests, people will go elsewhere, and this will be a ghost town and you can have it for 10 cents on the dollar and fly all you want.

BR-4

HEARING OFFICER: That exhausts all of the cards that have been turned in.

What I would like to know now is if there's anyone who has not spoken and would like to come forward and speak.

Sir, you are raising your hand. Please come forward. 008182

MR. BURNETT: Lieutenant, my name is Grove Burnett, and I'm director of the Western Environmental Law Center in Taos, New Mexico. We are a regional public interest environmental law firm with an office in Taos and an office in Oregon. We represent environmental organizations, citizen groups, county and municipal governments, and Indian tribes all across the

65

western United States.

I'm here tonight representing a coalition of county and municipal and tribal governments here in Northern New Mexico who are opposed to the proposal by the United States Air Force. These counties include Taos, Colfax, Rio Arriba. All these counties, their county commissions have formally adopted resolutions opposing this project and have submitted them to the Air Force. In addition, members of this collision include the towns and Villages of Taos, Angel Fire, Red River and Eagle Nest. It includes the tribes of Taos Pueblo and Picuris Pueblo and the Angel Fire Resort.

As we have stated repeatedly, we support the military in its mission, but our review of this project leads us to believe without question that it's going to have devastating impacts on Northern New Mexico, both its human environment and the environment as a whole.

The first thing I would like to do is to formally request, on behalf of all the members of this coalition, an extension of the comment period for an additional 30 days in which we may comment on the Draft EIS, as well as other members of the public. Typically, the Air Force and federal agencies will take more than a year to develop a Draft EIS, and then provide the public less than 90 days to review it and comment on it. We

AF-50

66

formally request that the period be extended until July 15, an additional 30 days, in which we can review this document which is grossly deficient, underestimates the impact of noise, impacts on wildlife and livestock.

The one distinctive thing that can be said about the socioeconomic impact analysis is that it is not one. You simply have not performed a professional analysis of the impacts on the fragile economic base of Northern New Mexico, and we urge you to provide us more time to comment on the EIS.

Thank you for your attention this evening.

HEARING OFFICER: Is there anyone else who has not spoken that would like to speak?

Yes. **008183**

MS. FRITH: I'm Marcia Frith, and I'm here just to say a few words.

No one wants the Air Force training to be better than I do. I have a son in the Air Force, my husband served a career in the Air Force, and I was blessed enough that he came back safely from Vietnam because he was well trained.

Philmont is dear to my heart, not because I have ever had a part in it but because I know that it's one of the few organizations and places left that train our young men to be patriotic. Even in the public

AO-55
BR-3
BR-4
TY

67

schools not many of them say the Pledge of Allegiance any more. I would hate to see a place like Philmont become a place where parents wouldn't want to send their young men, who might be the future of the Air Force. We have young men and women in the Air Force who have been taught to be Patriotic, and if they don't have that training then we are hurting ourselves as a nation.

So I would ask that you consider the importance of the future as it's begun at this stage. If this is the best place to train our young men and women, then I would just pray and ask that you consider not affecting a place like Philmont.

Thank you.

HEARING OFFICER: Is there anyone else who has not made comments that would like to make comments?

Yes. **008184**

MR. ROBERTS: Colonel Burd, I'm Jerry Roberts. I live in Wichita, Kansas at this time. I'm a landowner here in New Mexico, hoping to retire here in a few years along with my wife. I live approximately five miles from O'Connell Air Force base, which has a wing of B-1s at this time. I believe that's seven planes. And we continually have take-offs and flyovers that we hear every day. We are quite used to it in a metropolitan area. We have over 300,000 people. We are very proud of

68

them, we request them at festivals and things. They do low level flyovers over one of our large river festivals for our river's opening ceremonies. Very, very impressive. It's an awesome sight. We used to have them at 500 feet, which is right over our river. Very impressive. Very loud. For safety reasons the Air Force told us they had to go up to 1500 feet since they were over a populated area, and still at 1500 feet parents are cautioned to put their hands over the ears of the small children because it's a very loud thing when it comes down through there.

And we are virtually flatland, of course, out in Kansas, and I really find it hard to believe that the noise level down here -- where it's a pristine valley and pretty much up-and-down area that we are going to trap the noise, and we're talking about 3- to 400 feet instead of 1500 -- that it's not going to affect very much the wildlife, the economics, and the social lifestyle here.

If I had known of this years ago when we bought the land, it would have been a very large consideration to me whether we would have purchased the land here or not, and now it's a large consideration of whether I want to continue with my plans to build a home and actually retire here.

So hopefully you will take that into

AO-90
BR-7

69

consideration. And thank you for the time.

HEARING OFFICER: Is there anyone else who has not spoken that would like to speak?

(Note: No response.)

HEARING OFFICER: I'd like to give -- Yes. Please come forward. 008185

MS. WOOD: Welcome colonels, and welcome Air Force officials. We are glad you're all here tonight in the beautiful Moreno Valley.

I haven't had much time to do my homework today; I've been putting out the local newspaper. And I do, as a newspaper publisher, know from the letters to the editor we have received that there is a great concern in this community about what will happen to our quality of life. And I think that's one area of your EIS that is flawed. I think that the comment that you can't measure quality of life successfully is not really true. BR-7

I wish you could spend more time here in our valley and hear the bugling of the elk, or the bird songs, or the coyotes sing at night. It's something that will be shattered if we have low-level bomber flights through here day and night.

I also have concerns, as all of these other people here have stated, for Philmont Scout Ranch and the Boy Scouts of America who are trying to enjoy a

70

wilderness experience.

I also think that New Mexico is a fragile economy. This part of -- particularly Northern New Mexico. BR-4

If you look at the statistics, we have a lot of unemployment. This little area right here probably is healthier than the Taos area or some of the other areas that you will be flying over. But I do hope that you will look again at quality of life and our economy and try not to change the things that people here value so much.

It's interesting to me that there's national interest in what's going to happen in this area. We had a Web site request today from Cornell University, who wants to link to our newspaper and also use articles that our reporter Jo Bynum has written.

And so I'm going to sit down, but please do remember our quality of life.

Thank you very much.

HEARING OFFICER: Is there anyone else who has not made comments that would like to come forward and make comments?

Don't be shy. 008186

Please.

MR. BLEVINS: Colonels, my name is David

71

Blevins. I live in Cimarron. I'm just speaking as a private citizen.

And I wasn't going to speak tonight, but there's one thing that hasn't been really addressed, I think, by the Air Force, and even people that have come up here. It's one word: Fire.

I haven't heard much about fire. No. 10 on the list of risks in the fact sheet, public safety, is a risk, and it mentions forest fires.

Our state officials right now are worried to death about the fire season this year. Could be next year, too, who knows. Lightening strikes, we have enough fires. There is going to be events -- with 2600 flights, there is going to be a fire caused by an aircraft. You can take that to the bank and put it in the bank. AO-7

And I thought there might be somebody from the Forest Service come here tonight and talk about that. I am very disappointed, because they are more qualified than I am. But I know what it is to lose a home in a fire, so I can speak from that point of view.

So fire -- and fires in these areas could just about impact all these other things these people have talked about tonight. If you have a big fire you can forget the rest of the stuff.

So I think you ought to take those planes

72

somewhere else. I'm not anti Air Force. I put my time. Military retired, 22 years active and reserves.

So I just want to have the chance to mention that word "fire," and I hope our Forest Service -- Maybe they were told to stay home. I don't know. But I think they ought to speak up.

HEARING OFFICER: Sir, the court reporter didn't get your name clearly. Could you just tell us what that is?

MR. BLEVINS: David Blevins.

HEARING OFFICER: Thank you.

Now, is there anyone else who hasn't made comments that would like to come forward and make comments?

Very well.

Mr. Hoot Gibson, would you like another three minutes? That doesn't mean that's all you'll get. That just means we will continue this process until everyone is completed. 008187

MR. GIBSON: The second point that we thought was underplayed or understated in the EIS was the issue of safety.

What I had mentioned before is I took the Air Force study that has recently been published on bird strikes, and I analyzed that out, and in analyzing it, it

would appear to me like the Air Force this year is going to suffer some 13,678 bird strikes, which could result and probably will result in some aircraft losses.

BI-2 As I look at the bird migratory patterns, I see that the -- one of the major migratory patterns is right

AO-61 in the path of Proposal D, my point being that I think the Environmental Impact Statement has understated the impact, or the potential for safety in terms of an aircraft accident. And as was so eloquently pointed out just a minute, ago we had some devastating forest fires in the Angel Fire area last year. The year before Red River suffered the same type of thing. It appears like this year and probably the coming year we are going to

AO-7 have a very dry season, and a fire created as a result of an aircraft accident would not only be devastating to the aircrew but to the community, as well.

We think that the Environmental Impact Statement has under estimated the impact that may result as a result of the safety issue, and we certainly suggest that you take this into consideration.

Thank you very much.

HEARING OFFICER: And Mr. Daniel Williams, did you wish to make additional comments? 008188

MR. WILLIAMS: Thank you, sir.

The first concern I've got has to do with the

Chama River Canyon Wilderness Area. Looking at the route, the route starts five miles north of the Chama River Wilderness Area. The closest point is two miles from it.

AF-46 When I, at the January 29, 1999 meeting asked at what altitudes the aircrews would cross this area, I heard different attitudes. And it was interesting. When I asked a Lieutenant, I heard altitudes of 5,000 feet, and the higher the rank of the person I asked, the higher the altitude I was told, up to the highest being 23,000 feet from a Lieutenant Colonel.

My concern here is simply that it's not specified.

There is an existing route under that, and so it's logical that after the aircrews have refueled, generally the Abiquiu area, they will be cleared off by a controller, they will descend, they will want to make the entry point, which is again just miles northeast of that wilderness area. Here is the catch. The area floor is 400 feet. If they do that, there is a danger of them impacting peregrine falcons that are nesting directly under the flight path.

AF-46 So I ask that area, the minimum altitude to pass over the Chama River Canyon Wilderness area be raised to at least 5,000 feet and the point be moved to

AF-46 at least 10 nautical miles northeast of the Chama Canyon Wilderness area.

I did submit that in writing previously, however did not see it reflected in the Draft EIS.

In addition, at the meetings that we had on April 7 and April 9, we -- a number of people had expressed concern about live ordinance being carried on the aircraft.

AF-47 I understand this proposal does not call for delivery of ordinance, but I would ask the question: Is it possible that an aircraft would be on the route carrying ordinance which might, in the case of an aircraft accident, be detonated or accidentally dropped? And I was assured by Colonel Wheelis that, no, that would not happen, that they absolutely would not carry it.

But we would like to see that in writing. That is not in the Draft EIS, best I can tell.

Also, there is a ski resort, the Ski Rio ski resort, which is within a half mile of the corridor. I can show you where it is on the chart I have got plotted outside.

But I'd ask that be considered. I know that bomber aircrews tend to be extremely well disciplined, yet there's always danger when you have airplanes and ski lifts. They don't mix well.

Finally, regarding correspondence, I've seen a letter from the BLM asking that RBTI Alternative D not fly directly over Ute Mountain or within -- I'm sorry, I

ED-8 don't have that letter in front of me. I believe it was one to three miles of Ute Mountain during certain months, the nesting season, I believe. That letter is not included in the correspondence section of the appendix. And I would refer you to Mr. Sam DesGeorges with the BLM in Taos, New Mexico.

And sir, I have some additional comments if I may later.

Thank you.

HEARING OFFICER: All right. I'll call on you later.

Is there anyone who has already made comments that would like to make additional comments?

Please. 008189

MR. PALMER: As I mentioned earlier, I'm Doug Palmer. Also, if I didn't mention it I'm the associate director of programs, and I also direct the back country operations.

One of the things that was not included in the environmental impact study with any seriousness was the culturally rich historic area. In the North Ponil area -- in the North Ponil country we have the only

77

Tyrranosaurus Rex footprint ever discovered in the world.

We also have a number of tracks up there, one of which is hanging in a mud stone formation overhang -- an underhanging formation that we are concerned that that could fall at any time, and are really concerned about the impact it might have if a bomber were to fly over. **CU-2**

Also, in the North Ponil country is one of the few places in the Rocky Mountains where one can see the famous clay layer. If you are familiar with the big bang, the impact that probably put an end to the dinosaurs, that is obvious in our North Ponil country.

We are concerned also there may be some problems or could be some damage to the petroglyphs. And it says in the EIS that there are no petroglyphs. In the North Ponil country, there are several hundred documented and mapped petroglyphs up there. Much of this work has been documented by Harrison Goodcall (phonetic) former -- retired paleontologist with the USGS.

Thank you, Colonel.

HEARING OFFICER: Sir, do you want to make comments?

MR. PATTON: Yes, sir. I'd just like --

HEARING OFFICER: Your name?

MR. PATTON: David Patton. **008190**

I'd like to address the Environmental Impact

78

Statement itself again, and how this came about.

I don't see the gentleman here that I talked to earlier in the evening that was from the company in Oregon that did the impact statement, he doesn't seem to be here listening to our comments, but it's been pointed out significant deficiencies in the Environmental Impact Statement. Everything from the number of communities affected, to the wildlife affected. As the gentleman recently spoke of, the fire danger here, which is very significant. Very significant. **LU-2** **BI-3** **AO-7**

And I'm also concerned that the whole process taking place here is a very bogus one. The Environmental Impact Statement is obviously bogus from a number of standpoints. It's already been pointed out. I won't go over that again.

One thing that I did notice that was said, the Environmental Impact Statement apparently says there were 187 people at the meeting here last year in Angel Fire and about 300 in the meeting in Taos.

That is also false. I was at both meetings. There was clearly close to 1,000 people at the meeting in Taos and close to 300 people here in Angel Fire. **GE-37**

So I don't know where they are getting their facts and figures from, but on every count they seem to be misleading.

79

And I'm very disappointed, very disappointed in the Environmental Impact Statement that was done for this alternative. I don't know if it was as bad for the other alternatives as it is for here, but if it was, you know, I don't know what the Air Force is paying good money for to have these Environmental Impact Statements done by such incompetent people. I know that you are required to do an Environmental Impact Statement, but you ought to get somebody that knows what they're doing and will at least come to communities like Angel Fire and Taos and at least some of the major communities around here, and at least talk to some people and get some input from those people. Because the Environmental Impact Statement that has been presented here is of no value whatsoever, as far as I'm concerned.

Thank you.

HEARING OFFICER: Yes, the gentleman with his hand up, please come forward. **008191**

MR. MELZER: Thank you. I have not previously spoken.

Please excuse me if stutter. I just wrote this, and I don't have my reading glasses.

But I want to tell you that you can measure quality of life. There are common mathematical tools to do so. The fact that they were absent from the report I **BR-7**

80

think is egregious. It's professionally offensive, also.

The tools that I have used to look at this region show a fragility to the quality of life in Northern New Mexico. It's a fragility of the ecosystem, the local economy, and the at-home community.

That fragility is due already to the short growing season, the scarcity of water, and our remoteness. The RBTI, your Routine (sic) Bomber Training Initiative will target the region's fragility with the real possibility of killing, in the end, the human community.

Thank you.

HEARING OFFICER: Is there anyone else who has made comments that would like to make additional comment? Sir. **008192**

MR. BLEVINS: David Blevins, again. Cimarron.

One thing I forgot to mention when I was talking about the fires. It was more of a question.

These fire fighters, tankers, helicopters, making retardant and water drops on to these fires -- If we get a big forest fire in the training area where they are making their training runs, how is that going to impact? If they continue to make the runs on a schedule, so many a day, how is that going to affect these firefighters coming in and making these drops on these **AO-24**

81

fires?

I don't know the two can go together. So they do not fly when you do? I don't know you can get them out at the same time. So what are they going to do? Just sit, let it burn?

I don't know. I think it's a big concern.

Thank you.

HEARING OFFICER: Is there anyone else that has made comments that would like to make additional comments?

Mr. Williams, did you want to come back up?

Sir, I'll call on you next. **008193**

MR. WILLIAMS: Thank you very much.

The gentleman that was just talking was talking about fire. That is an incredible danger for Northern New Mexico. What we have is a high mountain geological environment where you've got a lot of trees, you've got forests at a high area, and the catch is that the most trees here are pinon trees, cedar trees that don't require a lot of water. But there are a lot of trees here. So it's not like the Pacific Northwest, for example, where you fly. If a plane crashes, it's a wet area that is not likely to catch on fire.

There is a huge concern throughout Northern New Mexico, and actually all of New Mexico, for fire, and

82

because of the way that it's set in with the environment, the danger is very, very real, and it's very difficult to put out.

For example, I live in Taos Canyon between Taos and Angel Fire. That is the not an area flown over by an RBTI, but it is typical of many of the areas where you have the canyons. One of concerns is that a forest fire in the canyon could sweep through the entire canyon and be impossible to put out, because you have only one route going through.

That's true of many of the areas the bombers would be flying over. So a fire started as a result of a crash could be incredibly devastating, and because we are a rural area it would be difficult to put them out because of limited resources. Very dedicated individuals that would come to do that, but limited resources that would have to be drawn on from many areas. **AO-7**

Another concern that I have not heard mentioned at all are hot air balloons and gliders. These are operated very frequently in Northern New Mexico. There are a number of regional balloon rallies. **AO-91**

I offer that as a concern.

I do know that there are companies that have balloon tours up and down the Rio Grande. So, as you know, the balloons can't maneuver out of the way of the

83

bombers, the bombers have to go around. But I do feel there is a danger both for the balloons and gliders.

Another is the floor of the route. There are places where the RBTI Alternative D route and on the other alternatives show the floor being 200 feet. Over and over we have been told that bomber operations for the B-1s and B-52s would be 300 to 500 feet, so I ask why it is that the floor is shown at 200 feet.

When I asked Major Adams, I was told the reason is because there may be other types of aircraft that would be using this route, they would be the ones using the floor at 200 feet.

I ask that be clarified in the Final EIS. If it shows 200 feet, in fact what you are giving us in writing was different from what we are hearing verbally, and the two need to be the same. We need to be consistent. **AO-57**

I believe I'm about out of time, sir, but when I may, I have additional comments.

HEARING OFFICER: Very well.

Sir, you wanted to make comment? **008194**

MR. COOK: I haven't spoken before. My name is Harry Cook. And I don't wish to seem flippant or antagonistic or anything of the kind, but when I read the reports through the paper, we have our editor here, it **TY**

84

was as close as I got to reading about the statistics for the thing.

And the Air Force is telling me this, and I believe that. I come to this meeting, and I'm hearing a lot of different things.

You guys didn't do your homework, obviously.

You have displayed very nicely, Colonel, your meritorious service to this country, and very many of us here have also served our country, me included, and one of the things we served for and fought for was mom, home, and apple pie. And there was a lot of other things that go through your mind when you are sitting down in the bottom of a muddy foxhole, and one of them occurred to me while I was here. And I'm only going to change one word of this quote.

This poem is known to all of us. You people are going destroy it.

And it is: Home on the range, where the deer and the antelope play. Where never is heard a discouraging word, and the skies are not noisy all day.

HEARING OFFICER: Sir.

MR. THOMASON: I have not spoken. **008195**

My name is Jeff THOMASON. And welcome.

What I would like to address are the concerns that have obviously been developed in the remarks of

85

people who are making the policy for the people, and how those concerns have been incorporated in this draft impact statement.

I am aware that the Department of Defense has entered into agreements with the various environmental groups creating policy with respect to process and decision making. In particular, the Department of Defense and the Nature Conservancy in 1996 issued a handbook for preserving biodiversity on military land, which lays out a detailed criteria and agenda for the decision-making process.

Of course, those criteria are relevant to bases, in particular.

AF-14 I would be interested in just making a note for the record to see how those same kinds of standards in terms of soliciting stakeholder involvement in communities, landowners, people that enjoy the resources that are impacted by military land have been addressed, and so there would be consistency in the impact statement that we see and other decisions that are made relative to military land.

It's a very detailed study, and I think those standards are pretty well set out there.

BI-9 Additionally, a program known as The Partners in Flight Program, which is designed to address the

86

BI-9 impact of military flights on subtropical birds, I understand has a representative in the Department of Defense that coordinates that information and data. I'm not aware that any reference has been made to that coordinator in the Environmental Impact Statement, and, just for the record, I would think that would be significant in determining the impact, specifically in this region.

Thank you for the opportunity to comment.

HEARING OFFICER: Is there anyone else that would like to speak before I call on Mr. Williams again?

(Note: No response.)

Mr. Williams. 008196

MR. WILLIAMS: Sir, these will be the final comments I've got tonight, but thank you very much.

AO-92 Regarding noise levels, one of my concerns -- I know there's -- the way the noise is calculated is averaged, and so you take a 24-hour period, look at what the noise is currently over that 24-hour period, and then have the overflights, and then look at it still over a 24-hour period. And what I am concerned is that that is the real emphasis of the EIS is the DNL.

I'm not real familiar with the noise studies but when you stretch it out and you're looking at something that's going to last a matter of seconds, as

87

far as the overflights, but when you stretch it out over a 24-hour period of time, it's going to appear to be relatively low; however, I don't believe that will accurately reflects the impact it's going to have.

I was pleased to see a chart that shows the single event noise level, and would like to point out it shows noise from either B-1s and B-52s at 500 feet as being somewhere in the range higher than a chain saw, higher than a lot of the loud things we tend to hear: trains you are very close to, or a rock band.

The representation here told us what they sound like. What they didn't give us is an idea how loud it was on the ground. I was on the ground as an enlisted man working drop zones prior to getting a commission. When even one C-130 came across, even though we knew they were coming, it was still scary. It was a very scary thing.

I would ask more emphasis on the single event noise levels and impact.

Secondly, I would like to say thank you to Lieutenant Colonel Wheelis -- excuse me, Colonel Wheelis, Colonel Adams. These gentlemen, when I have asked for information, have done a great job of coming forward with it and been very professional throughout, and I appreciate that.

88

Thank you.

HEARING OFFICER: Is there anyone else who would like to make comments?

Please.

TY MR. SPICE: Bill Spice. 008197

I don't believe you don't believe in deja vu all over again. I thought you might like to know in the last 40 years there have been two Air Force planes crash on Philmont Scout Ranch in the flight path on training missions.

Now, they both happen to be World War II bombers, but maybe there is some magical force in those mountains that are -- you know, we talk about blue lights on the mesa and aliens, so that you never know.

But let's just hope it's not deja vu all over again.

HEARING OFFICER: Would anyone else like to make any comments?

Last chance.

(Note: No response.)

Very well, ladies and gentlemen. That concludes this public hearing. Thank you for your participation and input. Please remember the public comment period will extend through June 16, 1999.

This public hearing is adjourned. Thank you

have a written statement, the court reporter would appreciate you handing it in so that any names, places, references, or scientific terms or other information can be recorded accurately.

Finally, I'd like to remind you to limit your comments to the Draft EIS. That is the purpose of this public comment period.

If you have written comments that you would like to turn in at the end of this hearing, then there's a box in the back that you can place those in.

As I indicated, we will start with comments from elected officials. Following that period we will then take oral comments from those of you who have asked to speak.

Again I wish to you remind you of the three-minute time limit.

I would first like to call on Gustavo Cordova who is Town manager of Taos.

008198

MR. CORDOVA: Thank you. My name is Gustavo Cordova. I am the town manager of The Town of Taos, and I've been asked by the mayor and council to present their views on the proposal by the United States Air Force and how it will affect our community.

As governmental officials and leaders of our community it is our responsibility to ensure that the

quality of life for our citizens is not adversely affected by the actions of our federal, state and local governments. We have a duty to evaluate proposals from our state and federal partners and to determine whether or not they serve the interests of the taxpayers of our state.

This community has long been a strong supporter of our military and the needs for a well-trained national defense force. A great majority of our citizens have served in the armed forces of the United States, and many serve today. We recognize that military training is critical towards preserving a force that is capable of winning in the battle field.

As a field grade officer, myself, with the military reserves, I too, recognize the importance of training of our uniformed forces. I had the misfortune of serving in combat during the Vietnam war and witnessed firsthand the value of military overflights over the forward edge of the battlefield.

The United States Air Force proposes to select our community, along with others in Northern New Mexico, as a training ground to be used for preparation for combat in the battlefield. They also propose to expand the current overflights over our community, and do this at all hours of the day. Worst of all, the Air Force

proposes to conduct this training at altitudes just a few hundred feet above the ground. This would be a scary thought even for a small aircraft, but the proposals goes much further than that. It proposes that B-52 and B-1 bombers, amongst other aircraft, fly at such a low altitude over our community.

Perhaps the United States Air Force is not aware that Taos, New Mexico, is one of the foremost tourist destination communities in the United States. Taos is well known across the country as the soul of the southwest. Taos is a place where tourism is the No. 1 industry and the No. 1 employer. It is where art and the creation of art is a haven for some of the country's foremost artists. It is a place where people come from all over the country to ski, to whitewater raft, to vacation, and to enjoy the natural quiet of our beautiful environment.

Perhaps the United States Air Force is not aware that over 80 percent of our gross receipts come from tourism and tourism-related sources. Our fragile tourism base can easily become fragmented through the introduction of high-speed bombers flying over the environment that we have tried so hard to protect.

I do not see anywhere in the Draft Environmental Impact Statement where the Air Force

BR-4

proposes to make up the loss of tourism revenue or the significant economic loss that this bomber route will bring to our community.

The proposal by the Air Force will not create new jobs, not result in any economic benefits for our community, will not protect or enhance the fragile environment we have known all our lives; however, it will take away the natural quiet of our wilderness areas, it will be destructive to our tourism base, and it will change the quality of life in our community.

This morning the Taos County Intergovernmental Council met in open session at the Kachina Lodge in Taos."

HEARING OFFICER: Sir, can you --

(Note: Outburst from several audience members.)

MR. CORDOVA: I just have one -- I'm here representing several elected officials. I'd like to finish my statement.

HEARING OFFICER: Well, since you are the only official appearing, I will -- notwithstanding the outbursts from the public, I will permit you to continue.

MR. CORDOVA: Thank you, judge.

(Reading) This morning The Taos County Intergovernmental Council met in open session at the

Kachina Lodge in Taos. The Council consists of elected and appointed officials of Taos, Taos County, Taos Ski Valley, Red River, Angel Fire, Eagle Nest, Questa, the school districts, and the tribal governments of Taos Pueblo and Picuris Pueblo.

By unanimous vote of all of these communities, a formal resolution was passed condemning the proposal before you from the United States Air Force. The resolution will be mailed to all the members of our United States congressional delegation.

Our elected officials all agree that this proposal is very bad for Northern New Mexico, it is very bad for our tourism economy, it is very bad for the quality of life of our citizens.

Make no mistake about it, our elected officials are prepared to fight this proposal. We sincerely hope that our proud members of the United States Air Force will see fit to abandon any of the proposed overflight routes forever over Northern New Mexico."

Thank you.

(Note: Applause.)

HEARING OFFICER: Ladies and gentlemen, one of the dynamics I've noticed in the eight prior hearings that we have held is that people -- some people wait to make their comments, and once they make their comments

they leave. And that's one of the reasons I have implemented the three-minute rule. Nobody is going to be prevented from saying everything they want to say, but to give everybody a timely opportunity to make their comments -- And not everybody wants to make lengthy comments; some people make comments in the neighborhood of one, two minutes. And I've determined that three minutes is a reasonable period of time to accommodate everybody. But if you have comments that are longer than that, you will be allowed to make all the comments you want to make, but what I've asked you to do is please be considerate to others who may want to make comments and leave. And by extending your comments beyond three minutes, if I allowed everyone to do that, you're requiring those people who would want to make short comments and leave to sit here and wait for a much longer period of time than they would have to, otherwise.

I would now like to begin calling upon the individuals who have indicated a desire to make comments. And one of the reasons that we placed the microphone out here where we have is, if you recall earlier I said, "Please address your comments to me." The court reporter needs to be able to see you. In my experience as a judge, the court reporters have a much easier time taking down what's said if they can actually see the person

speaking, so if you turn around and are addressing the audience, it makes it harder for her to hear you, and she won't be able to see your face and see your mouth as it's moving.

I'd first like to call on Michele Hermann.

Just to give you an idea how we will be proceeding, after Michele I will indicate who's on deck. And the next person after Michele will be John Lathen.

008199 MS. HERMANN: Good afternoon. My name is Michele Hermann, with one "l" in Michele and two "n"s in Hermann. I'm a resident of Abiquiu, New Mexico.

I did receive and read in tis entirety the Environmental Impact Statement. The concern that I have about the Environmental Impact Statement is that it equates issues like efficiency and less time in the air for bombers to travel with issues like the survival of endangered species and the quality of life for both humans and wildlife, in general, in Northern New Mexico.

Of all of the alternative sites that are discussed in the Environmental Impact Statement, only in Northern New Mexico do you have the number of endangered Species who are threatened, the number of different special use areas whose use will be compromised by the flyovers, the industry based so much on tourism and enjoyment of the outdoors. And to sacrifice these

BI-5
BR-4

qualities for the efficiency of saving time and money in the air and not having the trained pilots be away from their bases for a long time seems like a really disproportionate set of values.

I myself moved to Northern New Mexico because I wanted a quiet and a peaceful environment, and yet when I read the Environmental Impact Statement it seemed to discount the noise and the visual impact and, indeed, talked about the people in the wilderness might get joy and pleasure and excitement from being flown over at 200 feet by bombers two thirds the size of a football field.

That made me really question the neutrality of this document, as I was led to question by the fact that the U.S. Fish and Wildlife Service has suggested there would be significant environmental impact here in Northern New Mexico, and yet the EIS seems to discount that.

So I very much hope that in considering alternatives that the alternative of no action on it will be selected and that the quality of life for humans and animals in Northern New Mexico will be given greater weight than the efficiency of shorter airtime for bomber training.

Thank you.

(Note: Applause.)

GE-38

28

HEARING OFFICER: John Lathen. And then I will be calling on Ann Lemogge.

John Lathen, are you here?

(Note: No response.)

Well then, Ann Lemogge.

Then after that I'll be calling on J. R. or Joyce Franklin.

008200

TY MS. LEMOGGE: Good morning. My name is an Ann Lemogge. I live in Abiquiu, and I have recently begun weaving at home. And I have noticed that just since I've been home this last year that we're having flyovers over Abiquiu, and they are absolutely horrible. You lose total concentration. All my animals, outside and inside, get terribly upset.

And I just wish you would listen to the Fish and Wildlife. They also run up and down our rivers counting eagles, and of course it's very disruptive to the eagles when they are counting them. So I feel like we are already being invaded just where I live.

And I'm not going to be living near Taos, and I feel very sorry for these people, and I'm here to support them.

HEARING OFFICER: J.C. or Joyce Franklin, and then after that I'll be calling on Scott Thomas.

(Note: No response.)

29

HEARING OFFICER: Is J.C. or Joyce Franklin here?

(Note: No response.)

HEARING OFFICER: Very well. Then Scott Thomas.

008201

MR. THOMAS. Hello. My name is Scott Thomas. I want to thank you for being here today to hear our comments about the proposed RBTI.

I have been a resident of Taos County for over four years, and most of this time I have lived on Lama Mountain, located 25 miles north of here and lies south and west of the proposed flight path.

I am a member of the board of directors for the La Lama Neighborhood Association, as well as a member of the Lama Foundation, an intentional spiritual community and retreat center.

All residents of Lama are opposed to this flight path because it threatens the sanctity and peaceful nature of Lama, especially the Lama Foundation, whose livelihood as a retreat facility is dependent on this sanctity and quiet.

As a sovereign and concerned citizen, I am opposed to any proposal which further increases the scope of military action here or abroad. The Air Force use of weapons of mass destruction has caused extreme

30

suffering worldwide, particularly in Iraq and Serbia where people are dying by the thousands directly due to air strikes, for no other reason than the need to economically control regions for American corporate interests.

We are told again and again by the military as propaganda machine that these RBTIs are necessary to train military personnel to protect our freedom, yet in reality, the use of the military force only continues to oppress and destroy freedom at home and abroad, and those who refuse to the play the corporate game are eliminated.

No one is being fooled.

This is my third time standing before you, having attended last year's public comment meetings in which public comment was obviously and emphatically opposed to this RBTI, making this and future comment periods farcical and patronizing, the same thing done by the Department of Energy about WIPP for over 20 years with overwhelming public opposition.

GE-3

You should have heard us the first time. No military, period.

The people of Taos are strong, we are peace loving, nature loving, and we love each other, and those who share these values are welcome, but not weapons and other expensive military toys. In my opinion, even the

31

National Guard Armory is an unwelcome enigma in this town.

The U.S. Air force already claims 50% of all U.S. airspace exclusively, and now wants more for its war on the people. It wants to own everything, the land, the sea, now the air, in the interest of national security, which really translates as destruction of the planet for profit, a game which we know has no winners, not even corporations.

We know who you really work for, and we say: No. We do not support the global enslavement and the use of our tax dollars to do so.

Therefore, I humbly ask you to adopt Alternative A, no action, in the interest of peace, harmony, and the well-being of all living creatures present and future.

Please remember what Chief Seattle told us in his letter before selling land to the U.S. Government.

"We are children of the earth and what befalls the earth befalls the children of the earth."

Her children include me, you, all of us.

Thank you.

HEARING OFFICER: Michael Andrews.

After Mr. Andrews I will call on John Painter.

MR. ANDREWS: Colonel, my name is Mike

008202

Andrews, and I life in Arroyo Seco. I personally have experienced a low-level B-1 bomber fly over in Vail Creek, Mt. Belle Rouge (phonetic) River area.

In my opinion the EIS has several flaws. One is related to the sound levels, to an averaging. The nearest thing I can represent the flyover, to me -- I didn't expect this at the time -- was a sonic boom, and to say that you're analyzing the sounds and averaging and modeling, is like saying a rifle shot can be analyzed by a time averaging --

BR-1

The EIS shows that the B-1 -- you experience 120 db at peak, yet modeling this is 40 to 50 db average. It's just like saying the average from a rifle would be no value.

This translates in comments on the EIS to the fact that there was no impact on the socioeconomic analysis. Our tourist-based economies in this area, Northern New Mexico, will certainly be impacted.

BR-4

At the time when I experienced the flyover it was awesome. I mean, that is not a nice term to me, only because this was: What the heck's happening? My God, what was that?

That is how I see it more than an average, than it was experienced by an individual.

In addition, I've been -- I have experience

preparing EISs for a large oil company in the past, and I would say there is another flaw in that usually it amazes me on existing -- the no-action alternative is not considered putting electronic sites in the existing fly pass in Montana and around to the north, northern states, which usually is required, in order for you to say no impact by adding only the electric points.

PD-1

So that there is another value in there that is not addressed, is what would happen if the Air Force would use that.

An operational consideration is being given equivalent value to economic or to environmental impacts: The fact that there is dead time in the flights going up there. Well, that is an operational consideration that is driving the EIS. It's not really being reflected in terms of how it reflects the environment.

PD-37

Thank you.

008203

HEARING OFFICER: John Painter. Then after Mr. Painter I will be calling on Dr. Thomas Meehan.

MR. PAINTER: I thank you. I've lived here -- My name is John Painter, and I've lived here in Taos for 32 years. I presently manage a ranch out on the west side of the gorge river where we raise buffalo.

That area all the way from the Colorado border down to where the ranch is and a little further south has

a lot of wildlife in it. We have a lot of elk, deer, and antelope that winter range on that particular ranch. And I can tell you from personal experience that overflights of aircraft do have an effect. They also have an effect on the buffalo, in the fact that I think sometimes the national guards will fly their helicopters up in this area three or four at a time, and when they go over that ranch fairly low, all the animals really scatter around, because it does short of shock them, initially.

BI-1

And I would see your B-1 bombers at times are -- I have observed them refueling overhead, and they're at pretty high altitude at that point. And you cans always tell it's a B-1 bomber, because there's a lot of noise, even at that altitude, and when you would have those much lower, I think you would have a much higher impact on the wildlife, as well as these -- as well as the buffalo.

And i had one experience one day. They have very keen sight, as well as hearing. I was out feeding a group of cows one morning, and all of a sudden they looked up to the southeast, and then took of over the hill very quickly.

And I was looking out across the land to see what the problem was. Sometimes we have a hard time.

The person who works for us comes -- walks to work over the hills, and that will spook them, too. But I noticed that particular morning 10 miles away by the gorge bridge there was a hot air balloon going up, and one of those animals had seen that, and off it went, and it just sent the whole situation over the hill.

So I would like you to know from my own personal experience that this will have an impact on the wildlife and it will have an adverse one.

The other thing is I also feel it will have economically an adverse impact, because the person who owns the ranch spends quite a bit of money in this community, and he came here for the peace and quiet and not a lot of noise. And he was very upset when he heard about this proposed route of the Air Force training things. He says, "Oh, that's terrible to have that in this area."

BR-4

And I think that speaks for most everybody here, is this, again, the way of life, and the relative peace and quiet that we have here.

We are getting pushed on all sides by a lot of other factors, too, which have an impact on the wildlife and open spaces in this area.

Thank you.

(Note: Applause.)

36

HEARING OFFICER: Dr. Meehan. And after Dr. Meehan, I will be calling on Arthur Schiller, I believe.

DR. MEEHAN: Good afternoon, Colonel. **008204**

My name is Dr. Thomas Meehan, and I'm the head of the department of veterinary services at the Brookfield Zoo in Chicago. I have worked in the area of veterinary area limited to zoo and wild animals for the past 25 years, and I'm here to testify regarding the proposed bomber training exercises to be held over the area of the Bell Ranch in New Mexico.

The Bell Ranch houses a herd of 15 addax antelope owned by the Brookfield Zoo. This species is native to North Africa and is listed as critically endangered by the International Union of Conservation of Nature. Estimates also place the wild population at no more than a few hundred animals. This herd has been at the ranch since 1986 when Brookfield Zoo entered into a cooperative agreement to maintain and breed endangered hoofed animal species.

The ranch provides an opportunity to house and raise animals in conditions similar to natural habitat and more suitable for animals that may be available for future reintroduction programs in the wild.

The herd is managed as a part of the Species Survival Plan that maintains this species in captivity in

37

cooperation among an international group of zoos.

Addax and other wild hoofed animal species respond to sudden noise as a potential threat, and respond by fleeing. Nondomestic hoofed animals are considerably more sensitive to these stimulae than domestic horses or cattle. Addax that are startled in an open pasture setting could be expected to run, and risk injury from running into fences or exerting themselves sufficiently to cause indirect muscle or cardiac injury and death. Young animals also may panic and leave the areas where they have been hidden by their mothers, and may becoming separated, risking starvation.

BI-1

It is common practice in zoo settings to desensitize species as the addax to sudden noise, by providing background noise from a radio. When loud noise is anticipated the animals would be held inside in a familiar environment where the animals also feel sheltered.

During my tenure at other zoos, I have had experience with hoofed animals exposed to loud noises, including planned firework displays or military flyovers associated with airshows, including B-1 bombers. The animals were held inside holding areas with masking background noise, and did show evidence of being startled by the associated noise.

38

We would not be able to place the addax at Bell Ranch in holding areas or desensitize them with background noise. Such tactics would be contrary to the reason that they are located at Bell Ranch; that is, maintaining the herd in the semi-wild environment.

It's my opinion that the sudden noise I have experienced associated with these aircraft flyovers would be sufficient to cause these animals to flee, and I would anticipate a significant risk of injury or death to these animals if these flights took place over Bell Ranch.

BI-1

HEARING OFFICER: Arthur Schiller.

After that I will be calling on Richard Fabbrini. **008205**

MR. SCHILLER: Arthur Schiller, S-c-h-i-l-l-e-r.

And I am here this afternoon on behalf of the Lane family, who are the owners of the Bell Ranch, which you just heard a few comments about.

The Bell Ranch is one of New Mexico's largest beef cattle operations and comprises 286,000 acres in Northern New Mexico. Approximately 10,000 head of cattle are currently resident now on the ranch.

Much has been made in the EIS, and even this afternoon, that the use of existing military training routes minimizes the impact of these overflights.

39

With respect to the Bell Ranch, we would like to point out the following: To date we have been subject to very occasional F-16 overflights. This is on IR-07, and it's approximately 100 or a little less than 100 flights per year. Under the proposal, as written, the Bell Ranch would be subject to as many as 4,000 flights per year, which results from both area TATB, which would bring 1100 low-level bomber sorties over the ranch, more than 200 what we term ultra-low-level bomber sorties under routes AC/AD and AD/AE, and the relocation of the Mt. Dora MOS will introduce, which currently does not extend over the Bell Ranch but which is reconfigured to encompass the northern portion of the Bell Ranch, would introduce up to 2,250 bomber sorties, as well as 400 new F-16 sorties than currently operate.

These would, in reconfiguration of the MOS, be brought down under the Bell.

This, in our opinion, will result in a change from less than 100 to more than 4,000 flights per year over this ranch.

As we will demonstrate in written testimony, which we will provide later, this abuse of the airspace above the Bell Ranch will severely and materially adversely affect the health, quality of life, and economic viability of the family's domestic cattle,

BR-7
BR-4

40

managed and endangered species, and indigenous species which call the Bell Ranch, which has been a piece of the Heritage of the Southwest and is one of the original Spanish Land Grants, home.

On the behalf of the Lane family, our employees, vendors and neighbors, we vehemently and strenuously oppose Alternative D or the RBTI.

Thank you.

HEARING OFFICER: Richard Fabbrini.

Then after that I will be calling on Michael Abbey.

008206

MR. FABBRINI: Thank you. My name is Fabbrini, F-a-b-b-r-i-n-i. I also represent the Bell Ranch located near Tucumcari.

And I just have a few brief comments.

First of all, I understand that this Draft EIS was issued around the 19th of March. It took awhile for it to reach me, and I've been studying it ever since. I found it incredibly difficult to get through this amount of material, to analyze it, study, and prepare for today's hearing, and I think we should have been given additional time, frankly, in order to get through this and to be able to talk to others as to the meaning of some of the points contained here.

GE-22

Secondly, I observed today individuals asking

41

questions of the United States Air Force. We certainly appreciate that opportunity, but we cannot share with one another what we have learned. And I think it would be incredibly useful if the process were allowed so that we could write our questions to the Air Force, you would respond in writing, and then we could each see everybody's questions and responses.

GE-11

And I think that would be an incredibly useful process.

Third, I found the maps in here to be woefully inadequate. I mean, it is incredibly difficult for us to pinpoint, and we tried our best -- and the debates between each other as to where precisely these boundaries fell on the Bell Ranch. And I think it would be really important for us to get better maps. I see you have some here, but I wish -- obviously, we have a limited opportunity to review them today.

GE-35

Finally, looking at the noise levels, we are using all of the grassland on our ranch for our current herd operations, and if we have any problems with noise at all we, cannot confine our animals to a smaller area. It's not going to work. Just looking at your Figure G-1, a B-1 at 2,000 feet approaches the noise level of a chain saw in your hands.

I mean, that is incredibly noisy. And that is

42

at 2,000 feet. I can just imagine all kinds of problems it's going to have on our cattle operation.

My suggestion would be that the U.S. Air Force provide a demonstration of these airplanes. Why not fly B-52s, fly B-1s over the designated areas, publish it in advance. Fly the minimum, at the lowest level, so we can see how low it will be to the ground, and give us an opportunity to be out there and observe it, and then give us an opportunity to give comments.

Thank you very much.

HEARING OFFICER: Michael Abbey?

(Note: No response.)

HEARING OFFICER: Is Michael Abbey here?

(Note: No response.)

HEARING OFFICER: Ray Lutz.

(Note: No response.)

HEARING OFFICER: Is Ray Lutz here?

(Note: No response.)

HEARING OFFICER: Richard Wallick.

MR. WALLICK: I decline to comment, and will submit in writing. Thank you.

HEARING OFFICER: Larry Bell.

MR. BELL: I'll be happy to forfeit my time at this point.

HEARING OFFICER: Warren Spehar.

43

008207

MR. SPEHAR: I thank you. My name is Warren Spehar, S-p-e-h-a-r. I'm a resident of Taos, have been for about the past year or so.

Gentlemen, I come here to speak to you as a fellow flyer, the first one, I think, this afternoon who has addressed you. And I speak entirely for myself and for no particular community except perhaps fellow pilots who may have the same concern I do, which is essentially one of safety.

Now, under the FAA rules, as I understand it, as I understand this particular one, restricted air -- we are not flying in restricted airspace when we are flying in the Taos vicinity, and the proposed corridors that the Air Force would be using here for overflights are in open airspace; that is to say, allowable airspace for both civilian and military flights.

BR-2

Now, the rule governing safety regarding dual use airspace is the principle of the "see and avoid" technique, as I understand it, for flying in VFR conditions, which, for our audience, is under Visual Flight Regulations.

Now, I fly a glider. Okay? I am a general aviation participant. I have a right to be in that air space until I'm prohibited by the FAA, or some emergency power by Congress or the president says not to be in that

44

airspace.

Now, it seems to me to be unreasonable -- and my appeal is not to the emotions here but to some sense of rationale here. It's unreasonable to expect a general aviation pilot in command of his aircraft at anywhere from 500 feet AGL to 3,000 or 5,000 feet AGL to see and avoid a military aircraft flying at 350 to 400 knots. Okay?

BR-2

We are confronting here a major issue of safety given the number of overflights that the Air Force has, is proposing here in this Alternative D.

And my concern is not only for my own safety but for the safety of other general aviation pilots, as well as for the safety of U.S. Air Force bomber crews. But if there is a mid-air collision between a general aviation aircraft and one of these military types, it's almost a foregone conclusion that both aircraft and the personnel on board will be lost.

Thank you for the opportunity, sir.

HEARING OFFICER: Burt Bota.

And after Mr. Bota I will be calling on Harvey Blaustein.

008208

MR. BOTA: Thank you, Colonel and all the other officers at this endeavor. You can add me to your list of aviators. I was in the military, an IISV, and I

45

also flew as instructor for AOS pilots for 26 years before I took early retirement in 1992, and I've been a resident of Taos for the last three and a half years.

And my appeal to you is tacked onto all the issues that have been raised here prior, in that it is my experience as an instructor in relationship to the corridors that exist, under the best circumstances during military training, concentration lapses, the possibility exists for an overfly of the military corridors. I've seen time and time again in commercial aviation where the intention of all three pilots in the cockpit plus the jumpseat pilot, there have been transgressions of the corridors that we attempted to fly in. Inadvertent, obviously, but nonetheless actual.

AF-6

So I am appealing to you if this were to be approved, the military route, the MOA-D proposal, that could exist. The possibility of overflying the existing corridors could exist.

A kind of an example of this was for me really indicated in that prior -- in fact, one or two days prior, if I am not mistaken, to the last RBTI hearing, there was a B-52 -- and I was flying for the Civil Air Patrol at the time at Taos field. I think it was two days prior to. We all stopped and looked as this B-52 came flying up the gorge at approximately 2- or 300 feet

46

altitude -- and his timing couldn't have been worse -- and then flew out, I guess it was about on a north, northeasterly direction right over the Pueblo.

AF-6

And so everybody was very aware at that point of the transgression, of some particular violation of airspace right there.

So I just want to speak out again against the proposal for the MOA-D.

There was a kind of a pop saying in aviation when I was flying, "You have to kill somebody before you get their attention," and unfortunately in many instances that was the case, to get the powers-that-be's attention to take a closer look at safety violations or potential aviation problems.

Thank you very much for the opportunity to speak. I do not want that to happen here.

(Note: Applause.)

HEARING OFFICER: Harvey Blaustein. Then I will be calling on Fr. Chavez.

Harvey, are you here?

(Note: No response.)

008209

HEARING OFFICER: Father?

FR. CHAVEZ: My name is Reverend Vincent Chavez. I'm the pastor of Holy Trinity parish here in Arroyo Seco, also chair of the Archbishop's Commission

47

for Historic Churches.

My experience with low-level flights came when I was the pastor for Harding County. You had a hearing in Roy on Monday evening; I was the pastor of that county. And several of our historic stone churches in that county used to be used as simulated bombing targets for pilots, top gun pilots from Cannon Air Force Base. And they would dip close to the churches, practically graze the roof of the churches, and then ascend higher into the air space.

CU-1

Several of our stone churches there with real foundations had major cracking due to the vibrations of these low-level flights.

Also, I had to come in contact with several parishioners out there, ranchers in Harding County,

BR-3

patriotic American citizens who fought and served their country, who would have their herd disrupted with low-level flights.

And my concern is I've seen what low-level flights do to stone structures, and Taos County doesn't have too many stone structures, they are mostly out of adobe with little or practically no foundations.

Most people that oppose these are, like I said, loyal citizens of this country who appreciate their armed forces; however, there is the concern for their

48

properties and their values, also as private citizens of this country.

HEARING OFFICER: Eugene Dobos.

Eugene Dobos.

(Note: No response.)

Vicky Pfeiffer. 008210

MS. PFEIFFER: Hi. My name is Vicky Pfeiffer. And I didn't really come prepared to speak today. I didn't think I was going to speak. But since I'm here, I just wanted to say I moved here five years ago. I lived in an area in Michigan where we experienced low-level military aircraft flying over our homes. And this was our reaction to it (indicating).

It was terrifying. It was really terrifying. We were -- like, you would just be outside and be totally afraid -- you didn't know what was going on. You felt attacked.

AO-45 So my main concern is the effect it's going to have on the human beings. That's what I'm really worried about.

CU-2 Another main concern I have is for the Taos Pueblo. I read recently it's a classified World Heritage Site. It's the only one in the United States. The only one.

And it just seems to me that we might be able

49

to find another flight path. Thank you.

HEARING OFFICER: Ed Slook. 008211

MR. SLOOK: Good afternoon, ladies and gentlemen, people of Taos.

It's too bad our cameras aren't here. I'd like to see our cameras going, too. All this should be public record. All this should be in the Library of Congress.

We are setting a precedent here, and I think most of you know what the outcome is going to be.

Four weeks ago, on a Sunday afternoon, I had a C-4 transport buzz my place out on the mesa. And they didn't fly 200 feet over my place, they didn't fly 100 feet over my place. They flew less than 50 feet over my house.

Well, I'm an old warrior, and I can take it. And I'm a veteran of peace. I've been shot at by the police, and the bombers don't worry me, and the other harassment doesn't worry me. What worries me is escalation of the military, escalation of what are around the world -- Am I going out now? (Referring to microphone.) That's convenient.

GE-30 What worries me -- What worries me is the way that things are manipulated, and the way this meeting is being manipulated by breaking it down into four groups of

50

GE-30 people -- today, tonight, Saturday morning, Saturday, night -- instead of all at once, where we should all be hearing one another's comments and we should all be able to have it filmed.

Since we brought our own cameras here, this is being filmed.

Let me focus for a minute.

Is this working now? I'd just as soon not use it.

There's a lot of things I'd just as soon not have, a lot of things I'd just as soon not see. And I don't mind, personally, being harassed by the Air Force, Army, Marines, what have you. They have all had their shots at me. Let's not take it personal. Let's look at the global effect. Let's look at who the 40 percent of the airways are now owned by. Your comments in the EIS study. And you're clamoring for more? Why say less?

I say a lot less. I say de-escalation. I say put your planes in the hangars and do something peaceful.

(Note: Applause.)

I'm not done.

I didn't bring a prepared speech, and I'm not angry, but I'm here. I'm still alive. And I'm going to put my words against your words and your planes any day

51

of the week.

The people in Taos, the people in this country are looking for peaceful solutions, and that does not mean escalation with war planes, playing games in our skies, playing games with our lives and our tax dollars. There's plenty of other work to be done on this planet, and it doesn't have to be done with killing machines.

You have to make these decisions now and hold firm. It doesn't give. Your private concerns with these planes, like I do, is one thing. If you are looking at the global effect of the escalation of the war machine in our skies and everywhere else, then the message has to be: We don't want it.

(Note: Applause.) 008212

HEARING OFFICER: Dr. Yamamoto.

Mr. Yamamota. After him, Alex Carpenter.

TY MR. YAMAMOTO: Thank you very much today be here.

The '95 in --

(Note: Reporter unable to understand accent.)

....of your human life.

The American president supported us. He say American citizens once again to lead beginning of the new United Nations Charter.

I memory for the war B-52. Is important for I

52

am a child, Korean War. All American military come to our land to practice, to war practice. My grandma, grandpa growing water melon. I am on the other side on the (inaudible) bam into fence. All military come to our land, eat our water melon. It's good for to eat, but everybody after military test going to war never come back.

What's going on right now in this world?

Say 50 years ago United Nation come to this world. More and more and more are (inaudible) separate.

Something wrong.

Today, right now, people have to change consciousness to win all life.

Behind your eyes, everybody have a fear as a human being. I hope grow for peace right now. This is a world emergency. Always temporary (inaudible), didn't represent of human life. Today good sleep, to take tomorrow be wonderful new human being.

That's what I want. That why I want human being, respected.

Before you come to United Nations all living being in the world united. Why separate? Why killing the people?

I pray for global peace now. Global peace now.

53

Mayor Taos, '95 declare global peace zone. Global peace zone is military language. You should know what means, this symbol as a human being.

HEARING OFFICER: Alex Carpenter, then after Alex I'll be calling on Aromi Hiro(phonetic). 008213

TY MR. CARPENTER: Thank you for hearing my words. Family, thank you for being here.

Much is necessary. All over here, the pain, the sorrow, killing each other. Why?

Not only talk to you. Even find my ownself. Your own people fight with me. I am not here fight with you. Please understand what being said. Very important. People dying other side of the world right now because of war. They fly here, they fly there.

You have family. You love them. People dying. You have family. You love your family like I love my family. Why? Why we want kill each other? I want to know. I want to know.

My grandmother's back pushed to the ground by the oppressor man, push her down, down. Oppressorman, see what you doing. Oppressor man is creating a ruin. Oppressor man, here what I say. I saying, "Oppressor man, change your ways now. Her body is not a commodity. Her body is not a commodity. Not a product to be bought and sold. Not to be mined for oil and gold. She gives

54

what she's got to give so we can live. Why bomb? Why do that bomb to Mother Earth? Mother Earth keep us alive. Why? Why drop bomb on Mother Earth. Without Mother Earth we all die. Why commit suicide?"

Please. Please wake up to the truth of what happening here. No fight, please.

Here what I say.

Does that mean my time over? One minute left?

Someone else have one minute, then.

HEARING OFFICER: Aromi Hiro. Did you wish to speak? 008214

TY MS. HIRO: I came from Japan, and I love Taos. I love New Mexico, and I love Taos' nature. And we have the same sky as us, so in that maybe we don't need some culture so much.

I'd like to find some skill and knowledge from ancient, so -- and I came here.

So we have same earth. Thank you.

THE COURT: Tuyo Setara.

(Note: No response.)

I hope I'm pronouncing this right.

Tuyo Setara?

(Note: No response.)

Charlie Myers.

MR. MEYERS: Good afternoon. I am a resident

008215

55

of Tres Piedras, New Mexico, vice president of the Tres Piedras Neighborhood Association, and a member of the Taos County Planning Commission.

I come here with a number of concerns. I'm going to try to be brief and get right to the point with them.

In your analysis of your proposed flyway over Rio Arriba, Taos, and Colfax County, I notice that ED-2 you've missed quite a few different wildlife sites and flyways that exist within this area. Most importantly include San Antonio Mountain, the sandhill cranes that regularly migrate to the south during the spring -- I mean in the fall, and in the spring head back north, and the Valle Vidal.

Not once are any of these things really mentioned ore gone into in detail, so let me give you a little bit of an idea what areas we are talking about here.

San Antonio Mountain is a very significant winter wildlife area with up to 5,000 elk that winter there every year. It's part of what's identified by the New Mexico State Game and Fish Department as Unit 52, which is just about the most popular elk hunting area in the entire state, and it's well known throughout the country as one of the best elk hunting areas that is in

56

the United States. The proposed flight route goes directly over and includes San Antonio Mountain.

The sandhill cranes that migrate back and forth do so over the course of the months of October, November, into December, during the fall, and in the spring during the months of February/March, primarily.

That is a significant amount of times.

These -- How many minutes do you get?

AIRFORCE SERGEANT: Total of three.

MR. MEYERS: These birds fly almost exactly in the type of elevations that you are proposing to fly in.

ED-9 Thirdly, the Valle Vidal, which is a special management unit within the Carson National Forest, is one of the most significant wildlife areas in this entire state. It's -- it has a significant amount of elk, wild turkey, bear and bison. And nowhere do you mention this in your document, and yet this is an extremely significant area which your proposed flight path would go directly over.

As a member of the Tres Piedras community, I'm pretty surprised that nobody from the Air Force has ever contacted our community, which is actually one of the communities that would be flown over. Our community is rather small, but a lot of people live in the area that you have identified as what you're going to fly right

57

over. Many of them are ranchers, many people have

BR-3 horses. I own horses. I have livestock, also. And I have seen how when airplanes fly low horses are particularly susceptible to be spooked.

And a lot of people from that area are not going to come here, because they are 40, 50 miles away and they don't feel like they have been included in this process.

GE-22 I don't think you have done enough outreach to the communities of Tres Piedras, Costilla and Amalia, which are on your flight path, and I would suggest that you contact these communities directly, as we're the ones who you're going to -- actually proposing to fly over, and you'd get a lot more significant commentary from people who aren't as willing to drive all the way over here to Taos to make comments to you.

I think that, in general, our neighborhood association is against this idea, that we feel it's going to have a terrible impact on some of the basic aspects of our lifestyle, which is peace and quiet near the national forest of the United States.

And I think you have to look a little more closely as to what areas you are flying over, as some of them are very significant recreational areas that people from all over the country come to enjoy.

58

Thank you.

HEARING OFFICER: I'm having trouble reading the last name on this particular card.

D-e-l-e-c-a-s-t-r-o?

TY MS. BELCASTRO: Belcastro. **008216**

Thank you for giving me the -- Opportunity to speak. I come from Spokane, Washington, Fairchild Air Force Base. I know what it's like for people to have to live in -- I can't even describe it. Just a weird energy, like -- there's -- I don't know.

And I just wanted to say I want peace. And that's all I have to say.

HEARING OFFICER: I'd like to finish with the cards, then the court reporter indicated a desire for a break.

Bjorn Halberson.

(Note: No response.)

HEARING OFFICER: Is Bjorn Halberson here?

(Note: No response.

HEARING OFFICER: Jean Harrison. **008217**

MS. HARRISON: I'm Jean Harrison, and I've been in Taos 38 years, and I'm a native of New Mexico, grew up near Cannon Air Force Base.

I'm mad. And I have a lot of friends here, and I want them to speak, too, because I know they are very

59

upset.

AO-27 Nobody has mentioned the snow and avalanche problems. You're going to be flying right over Ski Rio, which can cause a lot of avalanche. You're going to be flying over Valle Vidal, you're going to be flying over Philmont. You're asking for big trouble, the National Boy Scout place there.

And nobody's talking peace at all. The military isn't. There's not a Defense Department of Peace. We have a Department of War.

I think it's about time that people stand up -- I have grandchildren. I've never done anything like this before, but I can't sit back and not do it.

I know you have your job to do, but so do we.

I think maybe you think this is a nice place to

PD-4 come and fly. Why don't you go to the White Sands Missile Range and maybe a few of those missiles might -- for practice, I mean.

GE-3 It's a very serious thing that's happening here, and the people are against it. I don't think it's going to make any difference. If you want this, you're just going to go ahead and do it.

I did hear, though, that maybe the Air Force might be a little more in tune with what the people want, and I just hope that you will think twice about

60

this. There's no need for this.
I know with the B-1's and the B-52 --
What is that card? What does it say?
AIR FORCE SERGEANT: One minute remaining.
MS. HARRISON: Thank you.
-- that you're going to push this through because you think you need the practice.
Well, that's unfortunate, because I feel that we should not be talking war, and that we should be trying to live together in peace.
And the United States is not doing that. This is all for the corporations, for the industrial complex. They are making a billion dollars a day. And you guys are earning your money -- I don't know what you get paid, but you get paid a lot more than people in Taos County.
We came here with three little kids, no jobs, in '61, to do what we wanted to do.
Thank you.
HEARING OFFICER: What I'd like to know before I decide whether to take a break or not is if there's anyone else, just so I can get a show of hands how many people would like to make comments who haven't made comments, or people who would like to make additional comments.
I'd like to go ahead and give the court

61

reporter a break, because she is experiencing a need for that. It's a job I wouldn't like to have, myself. It's a very difficult job from what I've seen of it.
Five minutes, then we will pick up from there.
(Note: Short recess taken.)
HEARING OFFICER: Ladies and gentlemen, we would like to continue on now, so if you could please take your seats.
I know some of you have come in late so you don't have the benefit of my initial explanation of how we are conducting the comments portion of this, so I'd just like to go back over that a little bit.
We would like to limit your comments to three minutes. That does not mean that that is the only amount of time that you'll get to speak. I now have five additional cards with names of persons who would like to make comments, so when you come forward to make your comments, if you could just state your name, speak clearly and slowly so we can understand and the court reporter can take down accurately everything that you've said.
And the sergeant to my right will be holding up a card, and when you have spoken for two minutes, he will hold up a yellow card to give you the warning that you have a minute remaining, and then he'll hold up a red

62

card when your three minutes has expired.
As you should have noted, I won't stop you if you continue going past that, but I will say you're taking away time from the other individuals who are waiting patiently for their turn to speak.
And please remember that even though you stop at three minutes, I'll call you back up if you want to continue on and give you another three minutes, and then I'll ask if you have more, and if you want to speak for more than that additional three minutes, I'll let you do that as long as there's no one else to speak. Ultimately, we will stay here until everybody has had the opportunity to say everything they want to say. **008218**
So I'd now like to call on Gretchen McGregor.
MS. McGREGOR: My name is Gretchen McGregor. I'm a resident of Taos since 1982. I'm in school now, going to medical school and am an EMT, Emergency Medical Technician.
And my concern with the EIS, I feel it has inadequately addressed the potential health risk if there were an accident.
I would assume that with the proposal, the flight route that's being proposed, it covers nine counties in Northern New Mexico, which is nearly 30 percent of our state. New Mexico is the second most

63

fatal state in the United States due to long transport times, and we only have one Level 1 hospital in the entire state. And so I would assume that proposing 2,600 flights per year over, let's just take for example, Philmont Ranch, which has a very high population density in the summers with Boy Scouts, pack animals, and if there were an accident there, the EIS should somehow address the potential effect of trying to get injured people to a hospital on time. And I don't see anywhere in the EIS the health impact of an accident. **AO-16**
We are also the poorest state in the United States, and because we have 80 percent of our income based on tourism, it would seem that this amount of overflight is going to completely wreck the economy even further, an economy that's already extremely poor compared to other places. **BR-4**
I also had spoken with, I believe his name was Duane Williams, the man who is in charge of putting together the corridor, and he told me -- we talked about the natural amphitheatre effect of the Taos mountains. And even though it's not flying right over the Town of Taos, I asked him, "Won't everybody hear the flights?" and he said, "Yeah, everybody will hear the flights." **AO-13**
When a commercial airliner flies over at, whatever, 10,000 feet, we hear them. Every person in the

64

valley hears them. And the fact that he already conceded that everybody is going to hear a plane that has a 185-foot wingspan with eight jet engines, flying 200 to 500 feet above ground level, it seems like the sound analysis, no matter how it's been tweaked, basically right up front we are all agreeing that everybody is going to hear that.

And I know that has a very bad impact on children. Countries like Germany have banned such low-level flights, and send their pilots here to train because of the bad effect on children.

Thank you.

(Note: Applause.) **008219**

HEARING OFFICER: Mr. Arthur Palish.

TY MR. PARRISH: Thank you kindly. My name is Scott Parrish. I would just like to say in case it hasn't happened yet, I'd like to thank you, y'all. I was raised on an Air Force base, McGuire Air Force Base and various other places, and I would like to say thank you for the initiative you are taking and the measures you are going through to find a good place to put your bombers.

I was really -- actually, growing up Air Force, I liked the sound of B-52s when I was young, always liked the idea of people who would actually go

65

through any amount of trouble to protect my life and welfare and well-being.

In a community like this, there's a lot going to be said about who actually has the right to lean against you, say hello to you, and that sort of thing. It's a different sort of thing for tone, it's more of the ear than the eye, and it's something you have to work around some days. So to actually say there's generalized opinion about you actually have the right or the responsibility to protect my life or my well-being is not something a lot of people have taken into account.

I'd like to actually say thank you to both the Air Force and the community here, because the dissonance in this argument is very well stated, in that a lot of people would actually like to see the people who are running Serbia right now come to its best peril. I think the idea that people who wear stripes in the Air Force, or other insignia that would actually go out and defend us against like people on Slobodan Milosovich, it's not something heard in your opinion. Like, inside the body. My people, my father and other people in my family have protected myself and such as others from such tyranny.

There is a lot of people here that don't really believe in noise. The generalized opinion is that they

66

are poor, that they might not want the sound because it's really on their nerves.

So on the one hand to say, yeah, sure you are taking the time to account for our own protection, and on the other end that, you know, because it is such a poor place it might be just another strain on our nerves, that is something that maybe hasn't been taken into account.

I, on my part, would like to say thank you to both the community and the Air Force.

HEARING OFFICER: Grady Taut. **008220**

MS. TAUT: I'm from -- My name is Grady Taut. I'm from Tierra Amarilla, which is considerably west of here.

Where you're flying is just beside where I live. You are not flying directly over me, but I do have airplanes, some C-130s, fly over me at 400 feet, and they rattle my cupboards, and they are annoying and loud. And when I'm walking, they run the elk off and run the deer off. And they just take off, and how they keep from getting injured, I don't know.

AF-6 I also know that sometimes flights always don't stay on path, and as close as we are to your flight pattern, it concerns me that you're flying so close to us.

Based on what the last lady said as far as the

67

noise, I'm going to hear you. And I know your airplanes are considerably louder than the C-130.

But I would like to thank you for the opportunity to at least talk and tell you I just don't want you flying over my area. I just don't want it.

Thank you. **008221**

HEARING OFFICER: A.G. Deherrera.

MR. DEHERRERA: My name is Gus Deherrera. I served with the Air Force, and I've always looked upon the Air Force with pride. And I recognize the need for training our airflight crews, I just don't like the idea of using good land for a test range or a training range.

I live in Tres Piedras, and I'm president of the Tres Piedras Neighborhood Association. I live right underneath the westernmost part of the proposed range.

BR-1 And two concerns that I have. One of them over here is I just know that jet engines are much louder than the report indicates that they are.

BI-2 No. 2, there's a migratory bird route that runs parallel to highway 285 and intersects, or would intersect this proposed flight path, and it appears to me it would not be very wise, you know, to put in a training range that would collide with migratory birds.

And so I just wanted to make you aware of that, and would ask you to look into that to see how serious

68

that is.

And that's it. Thank you.

HEARING OFFICER: Michael Haye.

MR. HAYE: Hi. 008222

A couple of things. One is that I'm very concerned that I know that people don't -- that we are talking about human beings that fly these machines. And I know some of the people that are flying them now, kids that are raised here that are fighter pilots down in Portales and places. And I watched them grow, and I know they are very well trained, but I also know they commit a lot of errors. And I also know their egos really get involved when they go they get in these wonderful machines so wonderful to fly.

AF-6

I remember living here in Taos when somebody flew through the gorge in a fighter and tore the hell out of the gorge and themselves and hit a wire. And they weren't supposed to be there, but, by God, they were there. And they raised a lot of havoc.

So there is a lot of human error. A fighter flew through here the other day. Some of the people might have heard it here. And that was not a bomber, just a fighter, and it scared the hell out of me. It was, "What the hell is this thing coming real low through the Taos Valley?"

AF-8

69

I don't know if that was in the flight path, but it was there, and it came through here last week. And I wondered what that was all about.

So I know you have good intentions, and I know you have to train your people, but I'm really concerned about the human element, because people really make mistakes, and it's costly. And then it's, "Oh, I'm sorry, we didn't really mean to do that."

And, you know, human things happen. They are not going to stay within the flight path, because they are human beings and they get excited.

The other thing is I'm a therapist here in town, and I'm really concerned about the people. The people that live here have a different mission than the people that you represent. I understand you live in an urban area, live in Air Force bases, you life in noise, you've been trained all your lives to -- that the mission is the most important thing, and your mission is very important to you. And at times it's important to us, too, but we are not always in full agreement with that. But our mission is different here. The people --

I can't read. Two minutes? Three minutes? One minute?

The mission is different here.

We have a different use for technology. Some

70

of us have moved here, some of us were born here. My kids were raised here. They have a different reason for being here, and they are more earth based, and they want to be more earth based, and you're going to fly through here and really disturb the families, disturb the kids, and it's going to have a major impact. I don't care what you say, it's going to have major impact. People aren't going to like it. People are going to get really upset.

The only thing I hope will get through to people is to keep on electing people that just vote down appropriations for you people all the time. I am certainly going to do it, mobilize all my efforts to make sure I vote against all appropriations to people as much as possible, because I don't want you in my community.

No offense. I just don't want you here.

HEARING OFFICER: That exhausts all the cards that have been turned in, so what I would like to know now is if there's anyone who has not come forward to make comments who would now like to come forward. Please come forward, the lady in the back. 008223

MS. JACOBS: Thank you, Colonel.

I have trouble reading this. I wrote it this morning, so just bear with me.

I'm a newcomer to Taos, but I lived under

71

flight paths of Tinker Air Force Base and Will Rogers Air Force Base in Southeast Oklahoma City from birth to age 32. Because of my early experiences, I want to speak out for the children of Northern New Mexico and how this may directly affect them in permanent, negative psychological ways.

AO-18

I was born during the height of World War II in 1943. My earliest memories include chronic national community fear of being bombed, and when planes flew through over us at normal level, time stood still while we checked to see if our insignia was on the wing.

War and threat of war was the primary topic of conversation, and it's that way today. Our children are watching newscasts, and among the significant persons in their environment these children are impressionable, and they hear talk of war non-stop.

Children do not understand the difference between potential danger and actual danger. Imprinting our future generations with low-level intrusive bombers is sending them one message: That they are in imminent danger.

The proposed flights will directly imprint tiny children, teaching that there is no safe place, no safe time, and no way of staying safe. Cults use the same thought to brainwash their victims. Wartime torture,

72

from what I've understood, works using that method, as well.

We already know what happens to children who grow up in families where abusive dynamics explode and where there's no safe place, no safe time, and no way of escape. Some only permanently -- Excuse me. Some not only become permanently hypervigilant, wary, depressive, and unaware of their personal boundaries, but they will also suffer physical exhaustion, especially through their adrenal glands and the fight-or-flight syndrome. Some chronically violated children, such as this would violate our children, may even become psychotic as a result of it.

If our Air Force explodes upon our skies in terrifying, threatening overflights -- and that's the way children will see it, trust me, I've been there, I lived it, will the Air Force be willing to pay the ultimate price for having emotionally raped Northern New Mexico's most vulnerable asset? Children acquiesce to power, but they don't understand it.

HEARING OFFICER: There was a lady that was -- Yes.

MS. WALTERS: Okay. Oh, you were not speaking to me?

HEARING OFFICER: That's all right.

73

008224

MS. WALTERS: I'm Anna Walters, speaking for myself only.

I recently moved here. I retired from the government. Twenty seven years of the 33 were with the Air Force, so I do appreciate your mission.

I was in Germany for the last 15 years. I've seen a lot, and a lot of changes when I was over there.

I came here because it is physically a beautiful place, but primarily because it's a place of healing. This is a very unique place in the world. I would hate to see it ruined. I believe that the State of New Mexico has been -- has done their patriotic duty to the country. A lot of nuclear testing has been done here. There's not enough money in the world to clean up the nuclear waste here. I do believe that this place should be spared additional disruption. And of the whole state, Northern New Mexico is the most beautiful.

And I think the reason that the place has been chosen for so much of this kind of work is because it's densely populated -- I mean not densely populated. We have very few people here, and a lot of the people that are here are very poor. Some of them have to work three jobs to stay here, to remain in this area. And this would extremely affect them economically, but more than that, spiritually, and the healing place that so many

BR-4

74

people have come to would not be the same.

And I would -- I think equal value should be given to this type of problem. I really believe that this would ruin this area of the country, and I think we have done enough before.

Thank you.

008225

MS. CHRIST: I'm sweating.

Hello. My name is Susan Christ. I live in San Cristobal, New Mexico, and I'm here representing myself. And because I live here, I represent the people that I live around.

The comment that I had today was regarding the EIS, about the RBTI training over Northern New Mexico and its direct socioeconomical impact on the people in Northern New Mexico.

The comment I have is that we are a very interdependent people and group of communities here.

If the Boy Scout Ranch that has 30,000 visitors a year is impacted, so is the Town of Taos. The person who hunts on Vermejo Peak comes and send their children to the Boy Scout Ranch. Following their hunt, their children come and go to the Boy Scout Ranch in the summer; their parents come and golf and have a good time in Angel Fire. Then in the fall or the late summer they come and they visit historic Taos, and they raft in the

75

Rio Grande River, which we all admire. Then the people go and they hunt up on San Antonio, and then they ski in the winters in Red River, in Angel Fire, in Taos. And we all like our wonderful restaurants and our local grocery stores and all the people that support these things.

So we are very much an integrated hoop in Northern New Mexico, that if one part of our hoop is disrupted, the domino effect affects us all.

If the people stop coming to Angel Fire, those few people don't come to Taos. If they don't come to Taos, we can't send them to beautiful Santa Fe or to the beautiful pueblos for their art ware.

We are all interconnected in this Northern New Mexico community, and I feel that the low-level flyovers would have an adverse effect on the economical balance of this state. I request that you not have them here, and that you choose to select a different alternative from Northern New Mexico.

BR-4

Thank you.

008226

MR. SCHINLUND: My name is Gus Schinlund, and I've been living here for about three years.

TY

I worked for a long time for mass media. We are in a very serious crisis in terms of the information that we receive about military actions, about our government, about our political systems. We are -- and I

would like to stand with what the previous speaker said about the interconnectedness. We are all interconnected.

We have a highly effective, sophisticated propaganda system which is advocating killing, bombing, warfare over an indefensible situation.

This, to me, is part and parcel of that process. It is injurious to us all. We have replaced, in the words of Susan Griffin, a very fine poet and thinker, "responsibility with respectability."

With all due respect to the armed forces, there's no more responsibility for our actions. We are aggressively promoting warfare. Our leaders are aggressively lying to the public about it. And we are all part of that process. If we do not wake up now, there will not be a future for any of us.

So I plead to you to think and to feel, to connect this (pointing to head) with this (pointing to heart) your heart, and consider your actions as sovereign individuals in a time of crisis.

Thank you.

HEARING OFFICER: I've just been handed a card.

Mary Ann Calvert, would you please come forward? **008227**

MS. CALVERT: My name is Mary Calvert. I've

lived -- I've lived north of Valdez, New Mexico, for 25 years, and I have repeatedly observed overflights on Flight Pattern 1147. And it's a training route which I have reported to various Air Force bases over numerous years, and I have never, except once, received a positive response from any Air Force official. The positive response I received was due to a B-52 overflight two days prior to the last RBTI hearing. On that day we had a B-52 flying a technical -- Let's see. It was an instruments data check, and he was flying approximately 200 feet over the Valdez rim. And I was literally frightened to such a degree that I hit the floor thinking there was an incoming to my dwelling.

During the previous 20 years I had contacted four Air Force bases and had never received a response, either according to the officials about what or who could be flying at such a low altitude, or where the aircraft was stationed, or how I could even pursue this issue even further. The FAA neither, or the local areas that are supposed to be notified when one of your flights drops in below 3,000 feet had never been notified, and neither had any of the Air Force bases that these aircraft had come from.

AO-93 My concern is that when we start having 2600 overflights in Taos County, that numerous of these

AO-93 flights will be dropping into other training routes and flying sorties without any oversight, without any scrutiny, without any enforcement, and without any safety for the public. And I have serious concerns for both the citizens and the wildlife that live in this area, and I would hope that you consider removing the RBTI Alternative D, from your list of proposed training routes.

Thank you very much.

HEARING OFFICER: Is there anyone else who has not made comments that would like to?

Yes, sir. **008228**

MR. HALVORSEN: I haven't prepared anything in an organized way to say, but I've lived here about 21 years. I guess the math is very simple that it works out to seven flights a day. Is that correct? 2600 a year.

AO-15

I had a similar experience to the gentleman who was just speaking, coming out from Arroyo Hondo, that hill heading south, and a plane came over so low that it appeared to me to be below the treetops at the top of the valley, Arroyo Hondo. I mean, of the bottom of the valley. It probably was 200 feet. It didn't look like it was going to hit my car, but it was a huge plane, very low, and very loud, and very scary. And I had my little boy with me then, so that's probably got to be probably

10 or 11 years ago.

A good friend of mine who had lived in Farmington for years told me today, when she was there planes going over vibrated the buildings so badly that they cracked one to two inches wide. This is school buildings in Farmington.

The computer has probably churned out all this information already, but I don't know.

BI-2 The Rio Grande Valley has been one of the two flight paths for the sandhill cranes for, they figure, three or four million years, and they are still flying up to Canada on that pathway, as somebody mentioned. They winter down in Bosque del Apache.

And I don't want to sounded cynical or simplistic, but I, too, am concerned about how carefully the homework has been done by the military -- or the government, in any event.

And I remember that in the early '50s they tested in Nevada, the nuclear tests. When soldiers were sometimes asked to witness them within a mile of ground zero, they were given sunglasses and skin cream. And the fall-out from that went over the southwest corner of Utah, St. George and all.

Anyway, just one more person making my little speech. I don't expect it to have a big impact, but

80

maybe cumulatively we will make some impression on the people who make this decision.

Thank you.

HEARING OFFICER: Could you spell us your name?

MR. HALVORSEN: My name is Bjorn Halvorsen, H-a-l-v-o-r-s-e-n.

HEARING OFFICER: We had a card, called you earlier.

Is there anyone else who has not made comments that would like to come forward and make comments?

MS. HARRISON: I've already made one, but I want to ask questions.

HEARING OFFICER: Well, when we first started, one of the things that I said was that this would not be a question-and-answer session. That does not mean that questions posed are inappropriate. If you have questions you want to pose for the record, any of you, certainly you can ask questions as a part of your comments, but we will not answer any of your questions this evening.

008229 MS. HARRISON: Well, what is your schedule for answering, for showing us a flight schedule, the electronic stations you're going to build? I understand there's to be five of those. What time schedule can we --

81

HEARING OFFICER: What I would like you to do, ma'am, is if you would like to make additional comments, please come up now and make those comments, and if you have questions to pose as part of your comments, please make those.

If you could restate your name for us.

MS. HARRISON: It's Jean Harrison.

PD-39 And I would like to know your flights -- where we can expect this. I've heard so many different places. And I didn't realized it was this close to Taos. I knew it was going to be over the Chama area. I'm hearing now it's not, it's going to fly -- and I read also that if

PD-10 you choose this, you are going to have five electronic stations where you simulate actual war flights. I'd like to know more about this.

And I imagine there's a lot of things you won't tell us, but maybe you could be as honest with us as you could. We all would appreciate it.

Thank you.

HEARING OFFICER: Is there anyone, whether you have made comments or not, that would like to come forward and make comments?

Yes. 008230

MS. RYAN: My name is Nancy Ryan, and I live out at Tres Orejas, which is not far west of Tres

82

Piedras. And I'm trying to build up on the buffalo ranch, which has already been discussed.

BI-1 There aren't many buffalo ranches left, and animals like that are like people, because we are animals, too, and I feel -- I heard on the radio, I think about a month ago, they went and did military exercises in Oakland, California, right in the middle of the city, and now we are going to be a war zone here.

I thank you for the opportunity to say that. At least I could speak about what I feel. I have nothing to say about what's going on now that our government is doing that, I have had nothing to say about this, but I have to listen to how sound affects people in Belgrade. How will that sound affect communities here?

Please, listen to us. Listen to the numbers of us. You're like us. You respond to sound, I'm sure, the way we do, the way the animals do here. When the earth starts vibrating, we start vibrating.

Thank you very much.

HEARING OFFICER: Is there anyone else who would like to come forward and make comments?

I would like to remind you that at 18:30, 6:30 this evening, we will have another open house, and at 19:05 or 7:05 we will begin our second public hearing with an introduction, then the Air Force briefing, and

83

then the comments period for that hearing will start at approximately 7:30 a.m.

So I'd like to ask one more time at this hearing if there's anybody that would like to make comment, please indicate now.

Yes, sir. 008231

MR. BELL: My name is Larry Bell, and I'm from Abiquiu, and my comment has more to do with the actual structure of this meeting, the way the dynamic is set up.

GE-30 It seems like giving a larger time frame is a way of dividing and conquering. It seems to me there's more strategy that has to be looked at in the way these meetings are held that I would call into question.

It's always -- seems like there is the polished brass sitting -- you know big guns sitting behind a barricade, and then you have your P.R. point men out here trying to outflank the enemy. And I would just like to invite whoever it is that's writing the manuals to do a little sensitivity training, instead of having it confrontational, or trying to outflank.

GE-6 Allowing three minutes for public discourse is really offensive to me, it really is, and I think it's a way of muzzling the opposition, and I think it's designed more tactically than it is for open dialogue. I think if you would take off your uniforms and come out from behind

84

the desk and rub elbows with us common folks, you might hear. It might be more honest interaction.

And I just am offended by the fact it's broken up into such a big time frame that you don't get a collective response to a very overpowering and imbalanced event that's happening in our community.

Thank you.

MR. SLOOK: I do have a question for you.

HEARING OFFICER: Could you tell us your name, sir?

008232

MR. SLOOK: My name is Ed Slook.

And the question is: Basically, I'd like to get some copies of what you have in that camera for this community, and for the archives for the Library of Congress, so that none of these comments are lost strictly to the military. **GE-36**

And since you can't answer me on that, well then, we are going to keep the pressure on 'til we get a copy of it.

Thank you.

HEARING OFFICER: Is there anyone else who would like to come forward and make comments?

008233

MR. CALVERT: My name is Maury Calvert, and I'd like to read you an excerpt from a letter that I wrote as an editorial to the Taos News.

85

(Reading) On February 12, 1998, I received a letter from Tinker Air Force base in Oklahoma stating that the B-52 aircraft operating within the lateral and vertical confines of the low-altitude training route did not violate any operating instructions; however, effective immediately the Tenth Flight Test Squadron has agreed to halt all training operations over Taos, Blue Lake Wilderness, and Angel Fire areas. These areas will no longer be flown over by any aircraft owned by the Tenth F -- flights, "flts."

I have photographs to refute their denial that it was operating within the vertical and horizontal confines. My photographs were sent to the flight test squadron.

On January 29th at the Realistic Bombing Training Initiative scoping meeting held in Taos, I questioned the pilots of the airplane who had flown this training route, and they had no information or familiarity with this area. I was not reassured by their knowledge of the area and insensitivity to the citizens concerned.

During the summer of 1992 this route was frequently utilized by B-1, F-4G and F-22 aircraft. Many phone calls and complaints yielded only vague information and denial of any ability to track the movement of

86

aircraft in transit. Seemingly they can drop in any training airspace and independently conduct exercises at the pilot's discretion. If this is the case, it would account for the numerous flyovers which have occurred at Taos Ski Valley, the low-level flights over the ridges of Gavalon Canyon which I have observed. **AF-8**

Has anyone in Taos ever received a satisfactory response or acknowledgement of any complaints which have been filed with the appropriate authorities? The question I would like to pose to you is: Who is the enforcement agency that I could contact when there are low-level flyovers on this existing training route and other areas. I've seen the pilots' heads in aircraft above Gavalon Canyon, and they have flown so close to the ridge that, you know, I could identify two different heads within the aircraft. That's far too low for my comfort level, and I would like to know from you who I could contact when I observe these low-level, dangerous situations. **AF-37**

If you could respond to me, I'm at P.O. Box 2364, Taos.

Thank you very much, sir.

HEARING OFFICER: Is there anyone else who would like to come forward and make a comment?

008234

MR. THOMAS: My name is Frank Thomas. I am a

87

local area pilot. I've only been here several years, and I'm somewhat discouraged by what I've heard.

I fly regularly from Taos to Durango, which crosses the line of flight of the Brazos Pass. I spoke to someone earlier today and I was assured if I called the FAA I would have plenty of notice about when these flights would occur. From what I'm hearing now, I'm not so sure I could depend on that. **AF-48**

My little airplane would be a bug on their windshield if they hit me.

And I do want to make it clear that if this does occur, the Air Force has to let us know when they are taking that route.

Thank you.

HEARING OFFICER: Is there anyone else who would like to make comments?

(Note: No response.)

Ladies and gentlemen, that concludes this public hearing. Thank you for your participation and input. Please remember the public comment period will extend through June 16, 1999.

This hearing is adjourned.

(Note: Proceedings adjourned at 11:40 a.m.)

21

this individual first.

And that is Cathleen Michaels. 008235

MS. MICHAELS: Good evening. Do I face this way?

My name is Corn Bringer, and I'm a representative of Media Council. And it's a coalition of Native American representatives who are professionals in the media industry. And we are from all the nations across the country in North America, and our concern is -- and a representative of also Taos Pueblo -- a violation of the sacred skies, and the infringement that it brings to us during our ceremonies. Every day is a ceremony to us, and it's just not an option to have these bombers training here. CU-4

I am aware that your program in Colorado Springs probably offers you the same terrain, that you really don't need Taos, and it's not advisable.

Karmically, it's just not correct. Thank you.

And that's as constructive as it can get.

HEARING OFFICER: There were a couple of other remarks, I wanted to make. You may have noticed that the court reporter will record verbatim everything that's said tonight. The transcript of these proceedings will become a part of the record of the hearings and will be included in the Final EIS. The court reporter will be

22

able to make a complete record only if she can hear and understand what you say, so speak clearly and slowly. In addition, if you have a written statement, the court reporter would appreciate you handing it to her so that any names, places, references to scientific terms, or other data can be recorded accurately.

Finally, I would like to remind you to limit your comments to the Draft EIS. That is the purpose of this public comment period.

If you would like to turn in written comments at any time, either during the hearing or afterwards, there is a box in the back of the room where you can place those comments.

And I'd like to remind you of the time constraints we are operating under, and I'd like to call on the first individual Eric Kuerschner.

And at all of the previous hearings I butchered several individuals' names, so please forgive me if I do not pronounce it correctly. 008236

MR. KUERSCHNER: You did fine. My name can be butchered, but not the EIS.

HEARING OFFICER: I'll be calling Clifton Bain after this.

MR. KUERSCHNER: My name is Eric Kuerschner. I am a resident of Taos and also an economist, and I had

23

the privilege of working on what I believe was the team that did the first Environmental Impact Statement in the United States, Skid Morse & Merrill (phonetic). I joined them after they completed the Baltimore study on the (inaudible) freeway.

I have also worked with Simmer, Gonzales & Fresca (phonetic).

I'm sorry. I also worked for Gonzales, Simmer * Fresca, can who got the 1991 AIA award.

I wish to address only the economic components of the Draft EIS, specifically for pages 109 through 113, and then Appendix I.

I realize this is both a draft, and NEPA is a nonbinding statement, but the biggest point I wish to make is I totally believe in the process of economics, the science of choice, and all these subjective statements that you've heard can be quantified and put in the hat of a positive or negative. And it's only through this process that I think we will come to some rational conclusion of, A, whether any of the alternatives really improve the situation; and then, B, which one of those is really the best, by noticing how much it exceeds that situation.

Okay. The other point I wish to make is that all costs are subjective. And this is what's really

24

difficult to relate and is the major flaw in this study. For example, you can't look at a Mark McGuire 70th home run ball and notice Rawlings is on it, and call up the company and ask for the price of that.

One minute? Okay. You'll get a written statement from me.

AUDIENCE MEMBER: I will happily concede three minutes of my time to the gentleman speaking. Is that possible?

HEARING EXAMINER: Well, as I said, I'm not going to stop anybody, so this gentleman can talk for the next two hours, if that is what you want.

MR. KUERSCHNER: Thank you, both audience and judge.

I have had the opportunity, if I have a little bit more time, I'm not going to be -- I'll be quick, but not quite as brief. No. 1, I want to thank you, both the colonel and the judge and the consultants, the staff that was brought with -- I mean, this is the right way to do things. I have made some contacts with both the consultants and the person that did the selection process, and I have offered -- you know, we are going to work this thing out to the best interest of both the Air Force and the Town of Taos. I can assure you that Senator Dominici is also aware of this problem.

25

Basically, his concerns are exactly as mine. I intend to cooperate fully with him and assist him in what economists exist that are capable of doing non-market evaluations, because all these subjective causes that have been mentioned can be quantified. This is the reason they got me here, because I affected to be talking about methodology and whether we were talking about $15 million costs or $25 million costs.

And I'm -- you know, what can I say when I see those costs are negligible? There's a really serious flaw coming in. And I think economics is the tool to help put this in a rational perspective.

SE-2

The only place that I noticed that there was any real economic analysis was in the case of where you discussed income as being an impact. In my opinion, while that is a real methodology, the actual methodology used is flawed. It actually overstates the impact because you can't -- if a person is employed in Texas putting gas in a plane and he is no longer required, you can't consider that a loss to Texas any more than you can consider the guy putting the gas in New Mexico as a gain. Each of those guys, if they are paid their market value, will go to their next best alternative, and the effect should be trivial. What is not trivial is these non-market evaluations.

26

BR-5

As you know, the FAA owns the airspace above 300 feet, so there's no real way, just like the Mark McGuire ball, you can't look and say is it $10 new or $5 used. If it's a used baseball, we are talking about a $5 item. We know it went through the market. While the value is subjective, it's real in every sense of the word. This is a million-dollar item you are talking about.

And I noticed this over and over, when engineers get involved in evaluating studies like a Van Gogh painting, you can say you are looking 75 cents worth of canvas, say the paint is, say, 30 cents worth of paint, and say 90 cent item. You run it through Christie's and find you are talking about a $45 million item.

I am pointing out this is the magnitude of the mistakes being made, and I think if we all work together, we have the same interest at heart, counting all the beans, but we have to know what a bean is and know which hat to put them in.

I will more than help you select competent people that are able to do this.

Two types of studies, since if you go to an engineering approach that I would recommend you look at -- contingent evaluation is one. There I recommend

27

Ron Mendelson (phonetic) in Vail. He's worked on the Valdiz studies, using that process of going around and asking people what -- Am I done?

-- by asking people what would they be willing to throw into the hat to not have an oil spill.

And he came up that people putting their money where their mouth is were willing to throw $30 into the hat. Multiplying with a number of people, he came up with the $4 billion settlement in Valdiz.

This is the type of error in analysis that we are talking about.

Another way of doing it is --

AUDIENCE MEMBER: Next speaker, please.

MR. KUERSCHNER: Thank you.

HEARING OFFICER: Clifton Bain then Marcy Pierson.

008237

MR. BAIN: My name is Clifton Bain. I'm a resident of Arroyo Hondo just north of here.

We have all experienced military overflights. They happen where I live irregularly. Quite frequently, if you count through the whole year, but nothing like what you have planned for the route that runs through Rio Arriba, Taos County, Colfax County, Guadalupe County and Harding County.

What you have planned is a highway, a highway

28

AO-55

for B-52s and B-1 bombers flying at 2- to 500 feet, with incident sound levels of 117 decibels, while your chart, which is supposed to appease us with an average of 64 decibels, is dishonest.

(Note: Applause.)

Even your analysis tells us we are going to experience some 1800 percent increase in flights for this area. And that impact is going to be quite concentrated if you are within anywhere close to these areas that we treasure as our wilderness.

LU-2
ED-10

You say there are five communities that are overflown by this route, and there are scores of communities. They may not be communities like Abilene, but they are communities that are not resigned or accustomed to ever hearing this kind of destruction of our tranquility, not to say the impact on the wildlife, the impact on our economy.

BR-4

We struggle for a living up here, and it's a pretty fragile economic system. And it's based on visitors, it's based on people who choose to live here at a great sacrifice in terms of economic opportunity. And they do its for one reason: They do it because we want to enjoy our contact with the earth, we want to know ourselves in that way.

And you're going to take that from us. And

29

we're going to do everything in our power to stop that from happening.

(Note: Applause.)

HEARING OFFICER: Marcy Pierson, it looks like, then I'll be calling on David Kruskil. 008238

MS. PIERSON: Cliff just spoke for me. I'm going to let that be my record.

HEARING OFFICER: You're Marcy?

David Kruskil, then Ron Gardiner.

Yes. 008239

TY MR. KRUSKIL: My name is Dave Kruskil. I live up about five miles south of that strip that you're suggesting, and I work in that area quite a bit. I know a lot of people in that area, and I deliver gas to them.

I'm aware that in times of war they use these low flights over people with the specific idea of demoralizing and destabilizing those cultures, and I think that would happen here. I know that would happen here.

I'd like to reiterate what Les said. This is not an area where people are going to habituate. These people didn't decide to live around an airport or Air Force base, they moved here because they wanted to live in nature with peace and quiet. They didn't want that.

I wouldn't have lived here if this was going on

30

or if I knew this was going to go on. I wouldn't have thought of living here.

BR-1 And I also thought that it was deceptive, your playing with figures, with decibels, and people barely know what decibels are, but then to throw these other terms on is quite confusing.

I felt like kind of like you are saying you can come and hit me with a baseball bat and say, well, since there was five hours you didn't hit me with a baseball bat, then you were the just caressing me.

(Note: Applause.)

And I can tell you that people are struggling here, and that amount of money you're talking about to do whatever you have to do is not that much when you think of the loss to the community which lives on tourists, basically.

I find this a violent assault on the community I think it's very serious.

(Note: Applause.)

And it's a very beautiful place, and a very unique place, and people are very excited and passionate about living here. That's one wonderful thing about it, among others. And I can't imagine anyone living here for a week's time and suggesting doing to this area what you're suggesting doing to it.

31

I can't imagine that.

So thank you.

(Note: Applause.)

HEARING OFFICER: Ron Gardiner, and then Gail Viola. 008240

MR. GARDINER: Judge and my neighbors, good evening. My name is Ron Gardiner. I represent the Rio Grande River Restoration Nonprofit Group. I'm a long-time field biologist here in Northern New Mexico. I've had the privilege to conduct many of the field surveys of the birds of prey along the Rio Grande Wild and Scenic River corridor.

As Alternate D exists, it's pretty much a tour of all the sensitive wildlife breeding areas in Northern New Mexico. You probably couldn't hit many more sensitive areas along the Southern Colorado/Northern New Mexico greater bioregion than Alternative D. With no doubt Alternative D will have adverse impacts on birds of **BI-5** prey, birds that you yourself in the branch of service have taken the design from, and taken a lesson from in learning how to fly.

Yes, people live here for the purposes of being connected to Northern New Mexico, and the deep part of that is its wildness.

One of the aspects of wildness here is it is

32

just one of the few places that harbors this kind of landscape still yet in the southwest region.

Alternative D starts on the Rio Chama Wild and Scenic Wilderness area over peregrine falcon areas that are protected under the Threatened and Endangered Species Act. It goes on a tour of antelope and elk habitat on the way to San Antonio Mountain, and crosses the Wild and Scenic River corridor around Ute Mountain in Sunshine Valley. That area is probably one of the highest density areas in the southwest left. I emphasize "left."

BI-5 I have conducted surveys in this area for about 13 years and I have recorded behavior and nesting productivity. I can assure you that the jets that used to fly across the corridor had impacts, and they are recorded in the BLM documents here in the Bird of Prey Monitor Survey at the local Taos Resource Area.

Under the multiple use management of BLM and the Forest Service there are special management scenarios such as wilderness and threatened/endangered species breeding areas.

Alternative D stands at counter purposes of managing federal lands and also stands at counter purposes of protecting public resources.

And yes, people do live here, make sacrifices so they can have this in their life. Without this in

33

their life, it would be quite a void.

So thank you very much. Please take --

(Note: Applause.)

MS. VIOLA: I have nothing to say --

HEARING OFFICER: Gail Viola.

MS. VIOLA: Yes. -- beyond what he has. No one could improve on that.

HEARING OFFICER: Robert Hughes and then Carilene Newby.

Robert Hughes.

MR. HUGHES: I'll give my time to the next person.

HEARING OFFICER: And Carilene Newby. After Carilene Newby I'll be calling on Dean Fulver. **008241**

TY MS. NEWBY: My name as Carilene Newby. I moved to Taos four months ago because it is peaceful, undeveloped, has less versus more, technologically speaking, and has miles of peaceful undeveloped surrounding wilderness, and because my maternal grandparents are from here.

For many years now my major source of pleasure, inspiration, and joy has been to spend time in the wilderness because of the loving acceptance and wisdom it offers me. Trees, animals, rocks, open space, rivers, mountains, air and sun have all contributed to years of

34

healing for me.

I speak out against low-flying, ear-splitting airplane noise which shatters the rare peace Taos and its surrounding wilderness have to offer.

There are many like myself who wish to be far away from much of modern technology with its noise pollution. That is why we choose to live here. I have visualized this area free of intolerable airplane noise, and my daily prayers are for love, peace, and harmony to be present here and globally.

Thank you.

HEARING OFFICER: Dean Pulver.

MR. PULVER: I'll pass my time on to the next person.

HEARING OFFICER: Antonio Trujillo, and then after that Manuela Maeder. **008242**

MR. TRUJILLO: My name is Antonio Trujillo. I'm from Questa, New Mexico.

It's not the first time a superior force has come into New Mexico with promises of not affecting a pepper or an onion or anything like that. Interestingly enough, they were always based in Texas and La Junta, Colorado.

The things that I remember are that a lot of people died. Things were changed to this day. A lot of

35

PD-4 the national forests or the land around our communities were nationalized. Large areas were turned into military bases in later years. They are still there. They were blasted 'til their aquifers are no good anymore.

I don't see why those areas, they have the same altitudes, and the mountains are just as high, and they are already affected and off limits to most of the population.

This is just a ploy to get towards more areas and affect more of the population and cause more distress so that people in power can have more to be able to have their thumb over.

HEARING OFFICER: Manuela Maeder, then after that Christina Sporrong. **008243**

MS. MAEDER: Hi. My name is Manuela Maeder. I work in Taos County as a massage therapist, and I want to speak about different factors. For one, I work I in

BR-4 tourism, like so many other people here do. Anything that's going to have an impact on tourism here is going on put a lot of people out of work. It's already hard enough to make a living here, and tourism is definitely one thing that helps us out in this area.

New Mexico is already one of the poorer states in the country. There's a lot of people here who are unemployed and a lot of people on welfare, and I don't

36

think it would be wise to do anything that would increase the struggle in this state.

New Mexico already has been the target for many military actions. We had the first atomic bomb dropped here, we have Los Alamos. We have a lot of different military things here. The last thing we need is to be the target of another military project.

(Note: Applause.)

The other thing I want to address, speaking as a massage therapist, I'm working in the healing profession, and New Mexico is probably one of the most important places as far as alternative medicine is concerned. There's a lot of massage schools here, acupuncture schools, traditional Native American healers, and this area has attracted a lot of healing people because there is a special spiritual energy about this place that I do not like to see -- that I don't like to see destroyed.

So I would like to invite everybody from the Air Force to come to New Mexico and to experience the relaxing and the healing parts of New Mexico, and to leave your airplanes at home.

Thank you.

AUDIENCE MEMBER: Christina Sporrong made a written statement, will pass her time to the next person.

HEARING OFFICER: Dwarka Bonner. Then I'll be calling next Tanya Valentine. **008244**

MR. BONNER: Good evening. That is D-w-a-r-k-a Bonner.

And it's something I am not well prepared to do, to get up and speak now. I think many people in this room must be experiencing that, and I'd like to thank everybody who has gotten up to speak. I think it's really important, even though it's intimidating, and especially so because I feel that I fear that it's really not significant to these proceedings what I may have to say. I say that because what little opportunity I've had to look over the materials already, I've seen that it doesn't seem -- there's some standards can be set for how much disruption in one's life is acceptable, and then we can be told: Well, here's the Environmental Impact Statement, and this impact to your lives, this impact to the lives of animals, people, and plants is acceptable, And whatever we may feel about it really doesn't seem to matter at that point, which is so unfortunate, because the quality of life here is everything to all of the beings living here in this region.

BR-7

And -- I don't know what to say. I hope that somebody will look at this statement, and the Environmental Impact Statement and consider -- you know,

we all live in this country, by and large overall with an elevated level of stress. The stress of noise, background noise, violence, military violence around the world, so much stress that is somehow accepted as an acceptable standard that moreover can be -- How do I go on? This standard -- I don't believe the standards of this impact statement are appropriate. They are not a high enough standard.

(Note: Applause.)

HEARING OFFICER: Tanya Valentine. Then I'll be calling on Dallas McClemons. **008245**

TY

MS. VALENTINE: I'm Tanya Valentine. I live in Taos. I hadn't planned to talk.

So first I wanted to say, statistically speaking if you know what someone wants to hear, inevitably somewhere there is a statistic that will back that up. And I think that's what your impact statement has done. In that twisted little pamphlet is a statement that says that one of the species affected is the peregrine falcon. That is on the federal endangered list. It's also on the state endangered list. And one day I think I would like to have a child, and the thing I would dread to have happen is to have that little girl come up to me and say, "Mommy, what did a peregrine falcon used to look like?"

I don't want to have to open a book and say, "I'm sorry, I can't show you, but here's a picture," because the Air Force of the United States of America made a bad decision.

HEARING OFFICER: After Dallas McClemons, I'll be calling on W. L. Welsh. **008246**

MR. McCLEMONS: Good evening. My name is Dallas McClemons. I live in Upper North Colonias, just north of Taos. I run a little horse operation. Prior to the horses I was 37 years with the Federal Aviation Administration in airspace and procedures.

I, too, find that this report is somewhat flawed. Mr. Bain, who was up here earlier, spoke about the single event noise level versus the DNL, and I find it very difficult to ascertain how you can put a DNL, which is a daylight/nighttime noise average, on a route that basically has single-event noise levels throughout the daytime.

BR-1

DNL originally was set up to use at airports, major airports where there was an established noise pattern. And they would make a footprint of this noise pattern and subsequently put monitors all over the place, and where there was great impacts of noise the airport authority bought up the houses and the land.

I see no proposal for this along this route

using DNL.

Another deception in the report that was very obvious to me, it's on page 4-18, and it's stated that, reference wake turbulence -- and I think the general population probably doesn't understand wake turbulence, but as a pilot and somebody that would like to fly across these areas, wake turbulence is a very big factor.

The report says that at cruising altitudes wake turbulence can cause handling difficulties for following aircraft. Especially when a small aircraft trails a larger, the FAA states or dictate the safe following distances and procedures for landing and take-off behind these airplanes.

AF-49

Ladies and gentlemen, small aircraft behind a "Buf," which is a B-52, in wake turbulence is five miles at 2,000 feet.

Thank you for the time.

So I think that is a misconception.

And after reviewing the summaries of the comparisons of Alternative D, which is the Mt. Dora, I find it has the most environmental impacts of any one of the proposals.

It would appear this proposal should be eliminated without further consideration.

GE-3

(Note: Applause.)

41

We call these proposals, when I was with the FAA, throwaways. I would urge you to throw it out as soon as possible, save our taxpayers the time and money of these dog-and-pony shows.

(Note: Applause.)

HEARING OFFICER: W.L. Welsh. Then I'll be calling on Trudy Healy. 008247

MR. WELSH: My name is Lowbetz Welsh, and I just moved here from Gallup, New Mexico, where a stealth bomber crashed into the Zuni Mountains three years ago. So I think the environmental impact here is fairly serious.

The other thing is that the noise level of the bombing flights, it's going to cause a lot of stress with everybody, because noise is stress, and this kind of stress is going to be pretty severe. **AO-18**

But I think the plan is a very poorly worked-out plan on the part of the Air Force, in the sense that the environment and the terrain is really very unpredictable. The winds here can be quite terrible and quite unpredictable, and it's going to create some loss of life for those doing these bomber training flights. **PD-45** **AO-6**

I don't have a lot more to say, but I think it's a desecration of the sacred mountains, and I think that in itself is probably enough to make everyone

42

realize it's not the right thing.

But keep in mind that three years ago a stealth bomber, which is supposed to be a highly -- a real high-tech bomber, did crash in the Zuni Mountains. And it was all covered up. A short little notice in the Gallup Independent about it, but nothing was ever heard about that afterwards.

So I hope that this bombing plan will not proceed any further, that you will find some other area that's more suitable to make the noise.

Thank you.

HEARING OFFICER: Ms. Healy, then after that Roberta Flowers. 008248

MS. HEALY: Yes. My name is Trudy Valerio Healy, and I live right here in Ranchos de Taos.

My voice is as simple as the sound of the trickle of the acequia. I'm a daughter of a mayordomo of two acequias in Ranchos De Taos. When I was small and fishing, my dad was leaning on his shovel early in the morning, silhouetted against a clear, quiet New Mexico sky. He said, "Jita, when you grow up you won't impress me if you drive up in a Cadillac with a mink coat, because your only wealth is this." He points to the water, he points to the sky, as we quietly listen to the trickling sounds of the water. **TY**

43

You must know we will not give up this wealth.

(Note: Applause.)

HEARING OFFICER: Roberta Flowers. After Roberta Flowers, Edmund Healy.

MR. HEALY: I'll concede my time. 008249

MS. FLOWERS: Judge, please be advised this is not barren desert land but a thriving community. Most of our income is from tourists who come from all over the United States and the world to enjoy our peaceful valley, fresh clean air, year-round sunshine, and to visit, among other attractions, over 100 art galleries and quality museums. Taos has been an artists' community since 1898, with more artists in residence than are in Paris, France.

Two, Taos Pueblo. The Tewa tribe of Native Americans have been in residence here for centuries. Their living structures, as are many here in Taos, including my own, are or of adobe construction. Subjected to the stress of vibrations of large low-flying bombers, these adobe structures will crumble. **CU-1**

There is also an AAA class ski resort, Taos Ski Valley. I'm sure you are aware of the recent tragedy that occurred in Italy concerning a low-flying plane. True, it was another type plane, but once the corridor is open it will be available to other types of planes, I have no doubt. **AO-13**

44

There's an old Mid-Eastern expression which is applicable today: Do not allow the nose of a camel into your tent, because the body will soon follow.

Since the United States is not in a declared state of war with a foreign power, or in immediate danger of invasion by any such foreign power, your proposed operation does not supersede our rights as U.S. citizens.

(Note: Applause.)

I am aware that your allegiance is to other superior officers in the U.S. Air Force, but other higher powers are in place. For one, the U.S. Senate. For another, the U.S. judicial system.

Under the U.S. Constitution every U.S. citizen is guaranteed the right to life, liberty, and the pursuit of happiness. Your proposed operation will infringe upon all of these rights. Our source of income will be destroyed because tourists will not visit here in a war zone of your making, our homes will be destroyed, and our peaceful way of living will not be possible. **BR-4**

It was my understanding the purpose of the U.S. Air Force is to protect us from foreign invasion. I assure you no foreign invader could do more damage.

(Note: Applause.)

HEARING OFFICER: Mr. Healy?

MR. HEALY: I'm conceding my time and position

45

to the Taos County Planner who, according your rules, should have already been called.

HEARING OFFICER: David DiCicco. 008250

MR. DICICCO: My name is David DiCicco. I am the planning director for Taos County -- Still.

Taos County for the last four plus years has been working on a comprehensive plan involving neighborhood associations throughout the county. We currently have 33 active neighborhood associations, three associations on deck to become recognized and present their plans. Twenty three neighborhood associations have adopted their plans to the Taos County Comprehensive Plan. All expressed a desire to maintain the rural/agricultural quality of life here in Taos County.

BR-7

Four of the neighborhood associations currently in the comprehensive plan will be directly flown over, and six others are within a few miles of the path.

I also want to talk about the inappropriateness of using the average DNL numbers for sound levels in the Environmental Impact Statement.

BR-1

I was the -- I taught acoustic at Arizona State, at the university there for five years, and I do have some figures on accoustic noise that may be interesting to you.

There are -- I first want to let you know that

46

accoustic noise sound levels, decibel levels, are a logarithmic progression. In other words, a 120-decibel noise is not twice as loud as a 60-decibel. A 70-decibel is twice as loud as 60-decibel noise.

The long term exposure to noises of 80 decibels or more causes permanent hearing loss. Short-term exposure to 100 decibels cause permanent hearing loss. The pain threshold is 110 decibels. At 120 decibels instantaneous hearing loss, permanent hearing loss occurs.

When you state in the Environmental Impact Statement that no vibration from low flyovers will effect historic sites, I want you to remember that all sound is vibration. All structures, animals, and biological entities are subject to the effects of vibration.

CU-1

If efficiency is your true goal, you have the technology to use any terrain to simulate any other terrain, or even just use simulators.

Thank you.

(Note: Applause.)

THE COURT: Grove Burnett. After that Seth Rolland. 008251

MR. BURNETT: Good evening again. I'm Grove Burnett. I'm an attorney and director of The Western Environmental Law Center, a non-profit public action

47

environmental law firm with offices in New Mexico and Oregon.

We have an office here in Taos, our southwest office, with six lawyers. We all live here in Taos. We represent citizen groups, environmental organizations, municipal and county governments and Indian tribes on a wide range of environmental issues across the western United States.

Our office represents a coalition of municipal and county governments that are opposing this project.

This coalition includes the county commissions of Taos, Rio Arriba, Colfax, the Town of Taos, the Town of Angel Fire, Red River, Eagle Nest, and the Angel Fire resort.

All of these governmental agencies, including, I might add, also the Pueblos of Taos and Picuris Pueblo, have banded together to oppose this dreadful project.

It is clearly ill conceived and flawed.

And let's be clear about what this project is. Is it not a new proposal you're advancing here. You are already conducting this flight training in Utah and Wyoming. It's important to understand that these flights originate from Texas and Louisiana and that you're currently having to fly to Utah and Wyoming to do this training. This proposal really is about one of

48

convenience for the Air Force of relocating what you're already doing to Northern New Mexico in order to save one hour of flying time. That's what this is really all about, and nothing more. There are no issues of national security involved here, because no one is proposing to cancel this project in any way.

We are saying this is not the appropriate place to do it. There is clearly nothing that can be more antithetical or repugnant to the way of life here in this valley and these mountains than your proposal to have B-52s thunder through our skies.

BR-7

We intend to continue our opposition, to coalition against this project, including taking the Air Force to court, if necessary, to challenge it.

(Note: Applause.)

It's clear that we are united in our opposition. Every single town, every village, every town, every citizen has said no to the bombers in Northern New Mexico.

We request, finally, an extension of the comment period until July 15 in which to submit comments for the public record. You spent a whole year preparing a Draft EIS and then put it out to the public -- in some cases late, I might add; some people haven't even received the Draft EIS yet -- and then give us less than

AF-50

90 days to comment on it. It is only fair that we be given an additional 30 days to July 15 to comment.

Thank you very much.

(Note: Applause.)

HEARING OFFICER: Seth Rolland.

AUDIENCE MEMBER: He's not here anymore.

HEARING OFFICER: Lyra Geroy.

Next I'll be calling on Arthur Schiller. 008252

TY MS. GEROY: My name is Lyra Geroy, and I've lived in Taos County for 13 years.

And I feel like it's our right as a citizen of this country, and our duty to stand up and speak out against atrocities that are about to happen when we see this happening, and I feel like this initiative would indeed come into that category.

I feel like your impact statement doesn't have any real depth to it, doesn't really address the issues here.

We have a precious environment here in Northern New Mexico, one of the few precious environments left on the planet and in this hemisphere.

People come from all over the world. And why do they come here? They come to experience something unique, beautiful, a healing place where they can have a peaceful reunion with the natural world that they can't

find in very many places left anywhere.

What you're proposing would irrevocably damage those opportunities for all of those people to experience something very precious in their lives, and very important.

As such it's so important for us to stop it and choose another alternative.

The only acceptable alternative is Alternative A. Do nothing. Continue to do your training where you're doing it now.

I recently went on a special journey to a desert environment which was south of Phoenix. It was called Table Top Wilderness. And I went there to go on retreat and to be alone with the desert.

And it was a very pristine desert, and it was beautiful in many ways, but it was marred for me, very much marred by what I experienced in the sky every day. There was low-level military flyovers, and it was unbelievable the way that it marred my experience of peacefulness that I had come to the desert to experience.

And this is what I really pray: That you will hear our voices. We are all united in saying, "Please, no."

Thank you.

HEARING OFFICER: Arthur Schiller, and then

Richard Fabbrini. 008253

MR. SCHILLER: I am Arthur Schiller. I did testify earlier this afternoon, but there are things that bring us back. And one, they are -- I'm here on behalf, as I said this afternoon, of the Lane family of the Bell Ranch. And what they are, get at the heart of this book, which is nothing more than a patchwork of assumptions made by individuals sitting in an office somewhere who clearly have not visited our communities, have not talked to the landowners, have not really done much other than resource materials without any correlation to the reality here in New Mexico.

This afternoon we commented on an assumption made that existing military -- the fact that an existing military training route was in place somehow could be correlated to the impact of the proposal. I think when we talked about changing overflights from 100 to over 4,000 we showed the fallacy of that assumption.

Next we talked about the issues in here dealing with the effect on wildlife and other -- and the native habitat. Haven't addressed clearly the realities here. I believe that Dr. Thomas Meehan, who addressed you earlier, taught us differently, that there are realities here that you do not know and have not taken into account. Assumptions were made that were false.

There have been assumptions made about sound. I won't go into what everyone else said here, but there

BR-1 are assumptions made here based on 20-year-old laboratory models. Those assumptions, I think by what you have heard here from professionals in the field, tell you that those assumptions are false.

We also made a proposal earlier that someone roll out several of those bombers and fly these routes and let people hear what they sound like.

Finally there are assumptions made, and these are addressed briefly earlier but they are probably on the level of the most blatant incorrect assumptions made,

BR-4 and that is the socioeconomic part of this discussion, where, one, any economic effect on anything other than a scoring site was not considered, that there could be no economic effect from overflights over rural lands. Someone sat in an office and made that determination. I see no reference to either discussion with real estate professionals, local residents, or anything else.

It may have taken a year, but what it took a year for was to come up with clever language that sounded good. It didn't take a year to do the research, to understand what this proposal meant and what its effect was.

The only appropriate thing at this time would

53

be to withdraw the draft and start over.

Thank you.

HEARING EXAMINER: After Mr. Fabbrini, I will call Betsy Morrison. **008254**

MR. FABBRINI: My name is Richard Fabbrini, and I'm also here representing the Bell Ranch, which is near Tucumcari.

I know this process only allows for us to make comment and it doesn't provide for you to give us responses, but I'd like to include in the record just a few examples of things I just don't understand after having read as much of this as I possibly could in the time that I have.

For example, if the environment is truly a controlling factor, I don't know how you could possibly choose Alternative D when the Draft EIS clearly states on page ES-3 that it is the least desirable in the areas of airspace and aircraft operations, land management use and biological resources. And that's especially true in light of the fact that Alternative A has a negligible effect in all of these areas. **PD-18**

And it seems to me that if you do consider Alternative D, it must be because from a military point of view, not an environmental point of view, there is an advantage. And we haven't heard what that is, and I

54

don't understand why that is. It seems to me after looking at 72 options and narrowing it down to three, you must have an idea of, from a military point of view, which option is most favorable, and I don't understand why you can't share that with us. **PD-2**

Secondly, I don't know why you haven't considered just leaving the current training routes alone and just moving the bases out of which these planes fly in. I don't understand that. And if the answer to the question is because in the last few years we closed some bases that we otherwise could have used, I don't understand why the environmental impact of closing those bases and factors that are considered in here weren't brought up at that particular point in time. **PD-2** **PD-18**

Thirdly, I don't understand how we can impact the Bell Ranch in such a significant way and have no mention of that in here. And I say that because we are impacted in multiple ways. First of all, your TATB approach to the MOA comes right across the Bell Ranch. What you refer to as "the racetrack" covers yet other parts of the Bell Ranch. You have expanded the MOS in one corner, and that impacts yet other parts of the Bell Ranch. And all of that is on top of data your existing AR-107 already covers, and crosses the Bell Ranch, and you have the F-16s currently flying across the Bell **ED-11**

55

Ranch.

I think that's significant.

Finally, I don't understand why as part of this process, rather than me just putting all these in the record there isn't some way where we can submit written questions for you, and allow you to respond to them in writing in a way that everyone in the communities and elsewhere can share and read those responses. **GE-11**

HEARING OFFICER: After Ms. Morrison, I'll call Ron Gersten. **008255**

MS. MORRISON: I'm Betsy Morrison. I live in El Rito, New Mexico.

And in October of 1985 I took a wilderness trek with my horse from Salida, Colorado, to the eastern edge of the Sangre De Cristos, and then I crossed over Music Pass to the Sand Dunes. It's approximately 100 miles, and I walked and my horse carried the pack.

I had no idea I was on the Air Force bomber flight path for training, and the first time I heard the noise, I hit the ground. I thought it was the end of the world. I had no idea.

And then I realized I was still alive. I got up, and the next day the noise happened again, and I was able to see they were the Air Force bomber things flying down the valley.

56

And this happened quite a few more times. And one time there was a little bridge across a creek, and that's -- the noise didn't come up on you -- it doesn't come up on you, it explodes, and you have no preparation for it. And the next time we were on a little bridge across a river, and my horse flipped out and knocks me off the bridge, and I hurt my shoulder. I was fine, but I felt sorry for the people of that valley, because it's a beautiful valley, and it totally impacted the valley, I thought. **BR-1**

I did have a lot of questions.

There is a lot of back country skiers that ski all over these mountains, and they were told from Silverton to Ouray, Colorado, there is a bad avalanche path, and you're told not to get out of the car and slam the door or it can create an avalanche. And I thought, "What will these bomber things do for the avalanches?" **AO-27**

Thank you.

(Note: Applause.)

THE COURT: After Ron Gersten, I'll be calling on Carmen Acosta. **008256**

MR. GERSTEN: Ron Gersten. I've lived here four or five years, and I moved from New York. And I point that out because I grew up about 10 miles from Kennedy Airport, and it was noisy. And we got used to

57

it, but it was a lousy thing to get use to, reduced our quality of life.

One of the reasons I have left to come to a place where the people cared about noise not about night life, not about making money. We, certainly most people came here 500 years ago or five years ago, or were here forever, stayed here. I don't think for economic reasons but because of the quality of life that you're threatening to take away. **BR-7**

I'm amazed that I now am here and worried about B-52 bombers coming through where I lived. When I lived in New York they wanted to fly the Concorde from Kennedy Airport, and they do, but only allowed them on the condition they turn their jets off when they coasted into the airport and when they were flying they went straight out over the ocean so that not one house was impacted by it. That was in a place -- and I point this out because you say -- It's crazy to me, or wrong to me, the idea of communities affected, only five, or whatever you say. **LU-2** Certainly if you flew over Nassau County, where I'm from, there would be hundreds of communities affected, but how can you really study that, because these would be people who chose those lives, chose to make money, and did not care as much about the noise. You have five communities, here maybe only five people, but they are people who

58

chose happiness in this place, and you're trying to take that away.

At a time when our Air Force, when we are in Kosovo fighting, and I agree with that, to defend the quality of life these people have and have chosen, we are threatening, with our own taxpayer dollars, to come into a place in this state, this country of America where the people who live here overwhelmingly don't want you.

So how about our quality of life?

I want to point out how wrong it is here in Taos, where we make these economic decision factors and weight them to our airport -- we could have an international airport here, but the people don't want it. And we would all be much more wealthy.

What are you going to do for us?

HEARING OFFICER: We have a special request from an individual, who has a young child who would like to make comments, and leave with that young child. So I think that is reasonable to let this person go now.

And I'd like to call on Kali Little. **008257**

TY MS. LITTLE: My name is actually Kali, K-a-l-i, and I just wanted to make a point of saying that I've practically lived here since I was born, and I mean I think that only idiots would be able to know that the world isn't working like that. There shouldn't be war.

59

It should only be peace.

That's pretty much it.

(Note: Applause.)

HEARING OFFICER: Carmen Acosta.

MS. LITTLE: You can't have Taos.

HEARING OFFICER: Carmen Acosta, are you here and would you like on to speak.

(Note: No response.)

HEARING OFFICER: Marilyn Hoff, then I'll ask Kim Buehre. **008258**

MS. HOFF: My name is Marilyn Hoff. I am -- I live near Arroyo Hondo, and I'm a mere citizen of Taos County and work at the library.

I've been to a lot of EIS hearings, and I'm always struck by the fact that the terms are defined in advance by the EIS. We are not supposed to comment except on the EIS, which is a document that's created by people under the employ of the people with a vested interest in doing whatever it is they want to do. **GE-30**

So I feel like I'm going to be breaking your rules and saying that one of the important things I think that's happening when these bombers are flying over Taos County is that they are training young men to drop nuclear weapons on other human beings.

I don't support that.

60

(Note: Applause.)

I'd like to propose a different alternative to the action alternative and the new action alternative. I would like to propose a retroaction alternative, which is we abolish nuclear weapons from the United States arsenal.

(Note: Applause.)

Then there will be no need for these flights menacing this neighborhood, the neighborhoods in Texas, the neighborhoods in Wyoming, the neighborhoods all over the world over, which the United States keeps trying to be a bully.

(Note: Applause.)

008259

HEARING OFFICER: You're Kim?

MS. BUEHRE: My name is Buehre, B-u-e-h-r-e.

To save time, I'll say I agree totally with everybody who spoke before me. I want to present one small perspective from my own point of view.

I'm a certified flight instructor for sailplanes. I have done a lot of sailplane rides and instruction around this area, which is a part of the tourist industry, and of course my concern for myself and other general aviation pilots is we don't get run over by these flights. **BR-2** And although you say there will be a minimum impact on small aircraft, if I or any one of my

61

friends get run over, it won't be minimal to me or my family, or hopefully my friends.

But I'll just tell you one story. There were -- there was a routine training flight on sailplanes around the Black Forest, Colorado -- and I read this in Source Magazine several years ago -- where an instructor and a student were in a sailplane, heard a loud boom, and saw a fighter flying away from them. And they landed back at Black Forest Airport, and they noticed that their wingtip wheel was missing, which was a string and a little wingtip wheel. And later, the story is, the Air Force jet pilot found that wheel embedded in the leading edge of their fighter jet, and that the pilot flying the fighter never even saw the glider. It's like the glider is going so slow, and he was going so fast, he didn't even see him, didn't know it happened. He might have felt a slight bit of unusual turbulence.

That is my perspective and point of view. I agree with the gentlemen who mentioned that the wake turbulence is a serious factor for general aviation.

Thank you.

HEARING OFFICER: Julie Sabia, and then I'll call on Neal Thielke. 008260

TY MS. SABIA: My name is Julie Sabia. I live off of Highway 64 in Tres Piedras. I moved here from

62

Southern California. When I lived in Southern California, I became used to noise pollution. When I moved to Northern New Mexico, one of the reasons I moved here and my partner and I built our house here was to get away from that kind of a lifestyle.

Several years ago I experienced my first -- I had my first experience with a military overflight out here in my house. The windows rattled, the roof rattled. I actually thought it was an earthquake. I thought, "God, I'm back in Southern California," ran outside, and there was a military plane flying over our house.

I'd like to know how many people here have experienced an overflight. It's not that we don't know what goes on. And I think what most of us are concerned about is that the noise levels will increase, they will be more frequent occurrences, and the flights will be lower.

And I think this should stop right now.

Thank you.

I'd just like to note when that question was asked, it looked like the vast majority of the audience raised their hands. 008261

TY MR. THIELKE: My name is Neal Thielke. I live in Llano San Juan. I've been a resident here for 19 years.

63

If you bear with me, I'd rather read off of my statement than loose it and have to leave the auditorium.

We have an endangered species here that needs our concern and our respect. I would be relieved if others would speak up also for Vietnam Vets. More Nam vets have died of suicide since their return than died in combat. I've had personal friends check out early because their ability to heal and endure and feel safe was too fragile to cope with violation.

I honor all of these survivors who are here with us tonight and vow to work with you, and I vow to work with you to do whatever is necessary to defeat this absolutely unacceptable proposal.

Thank you.

(Note: Applause.)

HEARING OFFICER: Mr. Slook. And after Mr. Slook, I'll be calling on Matthew Higginbotham. 008262

MR. SLOOK: Good evening. Good evening my fellow Taosenos. First time I've ever said that.

I spoke a little earlier today here and I told them about the C-4 transport that flew 50 foot or less over my place on the mesa four and a half weeks ago.

And you talk about nervous. Why, I've been real nervous since then, and at least 120 decibels right in my face wasn't nice.

64

AO-61 I'd like to know for the record, eventually, just how many accidents, how many situations, how many losses of fuel, parts, people has occurred in all the other places in this country with these military flyover training missions, and I'd like that answer before you start talking about doing them here.

(Note: Applause.)

I'd like to mention also the two stealth bombers, who two weeks before this recent attack on Iraq came flying behind me -- and I live on the Rim Road, as everybody knows, because you're visiting me with your bombers, right across the gorge, a mile down from me where the eagles fly, a family of seven eagles that I go to visit, and these two stealth bombers came up behind me and I heard a lot of the swoosh, there was no noise because, you know, they have the technology now to make them silent. And I heard a swoosh and what, and turned around, and there is a stealth bomber going across the Mesa and another one right behind it. And they both dive right down to the gorge where the eagles, down there five or six seconds, I counted it, and up and away off towards Los Alamos.

So now there is a record of it, isn't there.

They were real fast. And you got to be fast, huh?

65

No, you don't have to be fast.

And, you know, I'm not going to be fast with this. I'm going to talk until I find something that I think we are all going to agree on, and that includes the Air Force.

Now, I'm not going to talk long. I love you all and I've been doing peace work for 30 years, and I don't want it to get in the way of this little mosquito that is coming to us, wearing us down, dividing us in these four sessions, and wearing us down in our time, in our everything else that we have left after years and years of military dominance.

(Note: Applause.)

I'd like to make it perfectly clear that not just because I'm a peace activist, and not just because you're not happy with big planes and invading your peaceful life, well, I want you to remember that all over the world people are dying because they let this kind of thing continue.

I don't have to remind you people here. You're way above me. I love you all. I know how this thing is going to work out, and I know that the Air Force will finally see the light, and if it's not our light, it will be light of God or the light of their own spirit leaving this realm of existence.

66

Thank you all for coming here. Keep up the good work. Don't let this happen. God bless.

(Note: Applause.)

HEARING OFFICER: Matthew Higginbotham, and then after that I'll call on Stephanie Harrison. **008263**

MR. HIGGINBOTHAM: Hi. My name is Matthew Higginbotham.

I don't think I will be able to beat that.

Well, over the years I've gone through several areas of the country, visited several areas, lived in several areas. And Montana was one of them. Then Spokane, Washington, was another, and now I'm down in Northern New Mexico.

Well, south side of Montana, on the side of Belle Fouche (phonetic) -- I think that's how you pronounce it -- two years ago a B-1 bomber crashed. Spokane, Washington, two and a half years ago a B-52 crashed. And now I'm here in New Mexico, and I thought, "I hope it's not following me."

And then another speaker mentioned that the Zuni Mountains, another B-1 crashed, as well, or stealth bomber.

First of all, I want to mention I respect you coming out like this, setting up the information outside, providing water, sitting here, filming. In some ways it

67

seems like a formality, and I hope that it's working, what we're saying is -- what you're writing down is going to be taken to the Secretary of the Air Force, who I guess makes the final decision. I hope it's not just him. I hope there is a hell of a team of people that are making that decision with him. **GE-39**

I would like to mention I talked to an officer out there about the decibel ratings. He told me the pilots in the planes, the B-1 bombers, wear ear protection. Now, that was a revelation to me. And when I realized that these B-1 bombers are going to be over at 800 feet, that's what I was told, outside of Questa, just north of Questa a few miles at 800 feet, less than what a hot air balloon flies, that's amazing.

Okay. One minute.

Decibel 120. That's ear shattering.

So if the pilots wear ear protection, what about us on the ground? **AO-20**

Questa, 800 feet. That is really bizarre.

Okay. One last thing. Your decision, your last decision-making process is called ROD. That really struck me. ROD. It's so straight. You know. Let's being more flexible here.

(Note: Applause.)

Okay. Time is up. Thanks.

68

HEARING OFFICER: After Stephanie Harrison, I'll call on Rachel Ryer. **008264**

MS. HARRISON: Hi. I feel like many of the people here. I feel very nervous coming up here and trying to explain how this might affect this community and the environment around here.

I grew up here. I was born here. I'm bringing my own kids up here. And it -- I do feel that we are a little bit worn down not only in this community but just trying to make a living. I've been waiting tables, raising two kids, and the whole thing, and now instead of being home with my kids, I'm here talking to you to try to get you to understand, as are many people, that this is not really okay for you to come here and fly bombers.

I mean just -- It blows my mind. You know, we are actually considering flying bombers in this area. These are not airplanes that just, oh, yeah, let's go train, like pilots flying from here to there and carrying people. These are carrying bombs that we are going to go kill other people with. I mean, that is the whole purpose of a bomb.

And I know that is probably illegal to talk about right now since this is an Environmental Impact Statement and we are not supposed to talk about what bombs are actually for, but that is part of the purpose.

69

(Note: Applause.)

And, in addition, environmentally it seems that there has been a number of people who have said, you know, environmentally this is going to impact the bald eagles, impact the peregrine falcons, this is going to impact the spotted owl. We have a forest that can't be used for timber because of spotted owl, but, you know, we are going to be able to fly bombers over them?

BI-5

I mean, I realize you all are just are trying to do your best, and whatever that is -- I'm sorry, you know, I question it, but I realize that you're just coming along and trying to -- just a reaction there.

We are all just trying to do our best, you know. And part of the best is really doing no harm before you decide to do harm.

You know, bombers today might have just hit a refugee camp in Kosovo. You know, maybe, maybe not. We are not really getting the full impact, we don't really know for sure. But what if they did. What if it just happened, people are killed.

It matters. It matters. And we need to understand that, you know, this matters. And it's not just about whether, you know, what's convenient for the Air Force. It's about what are you doing, and questioning that before you decide, you know, whether

70

you're going to impact economically a small Northern New Mexico community.

How convenient we don't have money. You know, how convenient it's not, you know, Arizona or near Phoenix, or whatever. It doesn't really matter, you know. It's very nicely put together there, but, you know, it does matter. And regardless of whether, you know -- regardless of whether you -- you are doing your job. Please try to reach in your heart. Understand that it matters whether you are flying bombers. That matters. And when you're affecting this community, and we're all struggling and the people who are out here, it took a lot to get us out. And there's a lot of people that are, you know, native New Mexican Spanish, have been here 200 years. There is not a huge representative of those people here, and it's because everybody is working hard to try to just make it, and fighting this is just way more than we need to be doing.

So I just really appeal to your hearts and your sense of, you know, community and humanity, to think about what the whole impact is, not just on each community and not just go to Texas or go to some other place. Think about the whole thing before you make decisions about moving more bombers around.

Thank you.

71

(Note: Applause.)

HEARING OFFICER: Our court reporter has indicated a desire for a break in a moment, but I'd like to let you go ahead. I'd also like to let you know we have an hour. I have 30 cards that remain. 30 times three minutes is 90 minutes. That is an hour and a half.

008265 MS. RYER: Good evening. My name is Rachel Ryer. I've lived in Taos for eight and a half years, and I live in San Cristobal just out of town.

AO-1

My main concern is with the population of multiple-chemical-sensitive people in Taos County. This is a haven for people who are extremely sensitive to small, even small quantities of chemicals. It's an increasingly recognized disease which is debilitating and life threatening, similar sometimes to chronic fatigue syndrome, asthma, M.S., creates a complex, overpowering reaction to even minor quantities of chemical after a prolonged or intense exposure to a chemical. Benzenes are especially disruptive to the majority of environmentally ill.

How often would the addition of the pollution from these jets cause someone to be confined to their home or commit suicide due to this systemic immune nervous disorder?

These MCS sufferers are dependent upon

72

Organically grown produce to maintain their health. Spraying from chemical pollutants will alter the quality of local produce, yet the EIS does not address this concern.

AO-1

How much pollution will migrate from the water shed into the water table we drink and from there leach into our soils far from the original site in the air. This is also not addressed.

AO-1

Many Taos resident drink surface water, either collected from their roofs or acequias. I wonder about the cumulative effects over time of ingesting the pollution that comes down through this water. I cannot believe that it is insignificant.

Another concern I have is with a specific part of the route. The beginning of the route is only between 6 and 8 miles from the Christ of the Desert Monastery northwest of Abiquiu, New Mexico. This is a secluded community of contemplative Benedictine monks, not to mention the wildlife that lives there. The terrain in that area is cliff and rock, which will reverberate with echoes of the planes.

BR-3

In this wilderness area and Ghost Ranch, as well as other parts in these eastern mountains in Taos County, pack animals are used, and there could be possible accidents as have been described before.

There are a couple of studies that I don't know much about but I think are very important, which one, from a German study that indicated that low-level flights caused post traumatic stress syndrome in inhabitants, and there's a study called the Goose Bay, Labrador did an independent study in Canada, that I'd like to mention and see if you could address it in their findings. **BR-1**

Also, one quick note about the hot air balloons that fly in this area along with the sailplanes that fly in this area. **BR-2**

Thank you very much.

HEARING OFFICER: We will take a break.

(Note: Ten-minute recess taken.)

HEARING OFFICER: Ladies and gentlemen, I'd like to get started again.

I've had a couple of requests from individuals with children to be permitted to go ahead in and make their presentations, so hopefully I won't create a riot by allowing these individuals to speak now.

I'd like to now call on Franco Mares. **008266**

MR. MARES: Good evening, your Honor, Lieutenant and respected members from the military.

My name is Franco Mares. I was born here in Taos, New Mexico. My parents were born here in Northern New Mexico. Their parents were born here in Northern New

Mexico, and I represent hundreds of my personal family who could not be here tonight. And I represent thousands of my friends who could not be here tonight, who live around the world. All of these people love Taos, and part of what they love about Taos is our skies. They are very sacred and important to us, the people who live here.

I represent our old people, our elders, the adults here in Taos who work hard, have three or four children and could not be here tonight because they are home taking care of their children.

I represent our children who appreciate the way of life we have here as being unique, magical, spiritual, mystical.

And again, the people from around the world who love Taos. They number in the millions. They come here, they enjoy what they share here with us. It's something very special, something you don't find everywhere, judge, everywhere. **BR-7**

I would like to do something right now. It's for the record, and I would like the court reporter to show the audience.

Is there anyone in this room that thinks Alternative D is acceptable to the people of Taos County or Northern New Mexico?

There is nobody here.

Do we all stand united in agreeing, say "aye," if you agree that we don't want this military project or any more military projects in Taos, over Taos, or around Northern New Mexico everyone.

(Note: Audience response.)

Loud and clear.

Your Honor, with all due respect I think the "Ayes" have it.

We do not want Alternative D. We do not agree with military solutions. We don't think a war brings peace and that war weapons create peace. We believe that peace and peace of mind bring peace.

Our families have sent our families to serve in the military to preserve our way of life, and our way of life includes clear quiet skies day and night. In Northern New Mexico we have suffered toxic fall-out from Los Alamos and White Sands, and more military projects in our area and more overflights in our area are unacceptable. We want less overflights. We have suffered overflights, like you said, since the 1940s, we would like no more of that. The societal, economic, and cultural impacts are devastating.

We could have -- the good people of Taos rejected a larger airport because of the impact on a

600-year-old adobe masterpiece called The Taos Pueblo, and all of the adobes that all the Spanish families have built for the last 3- or 400 years.

This land is sacred to the Native Americans, and by "land," I mean and the skies, too, are sacred to the Native Americans, the Spanish Americans and millions of Americans who visit here to share the magic and peace of mind and the prayerful spirit that can be found here in Taos, New Mexico.

We don't want Alternative D. We think that no action or a lot less military action would be much more acceptable to the people around here. We all stand united here, as you saw, and we appreciate your consideration and you honestly taking the message of we don't want any military bombers in our area. Please take that to your leaders.

(Note: Applause.)

HEARING OFFICER: Patricia Michaels.

And then after Ms. Michaels we will be back on track. **008267**

MS. MICHAELS: Thank you for giving me this headstart. **TY**

I am representing Taos Pueblo, as well as my children. A lot of people -- well, my only two questions are: What are you guys still doing here, and who invited

you back? We don't want you here ever again, not unless you're here to enjoy a wonderful meal with us, but not with the bombers, not with the uniform. We are all wearing very important uniforms we wear day-to-day, but we just accept one another as humble individuals.

We are all important people in this house tonight, and we don't go around with pompous attitudes that ones of us is better than the other.

We can't have our sacred skies disrupted or destroyed.

I am a taxpayer. I put myself through college so that I could come back to my village and be self-employed and raise my children traditionally, whereas all my native people have fought to keep what we barely have left, and our people will be damned if you take away our sacred rights and parts of our sacred rights to be able to still have our language and to have our ceremonies. And with noise destruction that you will bring into our community, we will not be able to teach our children what is most valuable to us, and that is a sense of peace and love.

And it's already hard enough as it is in the communities, and the influences that are from the outside world. But for our Pueblos, enough is enough. We don't need any more disruptions we, don't need another thing to

face for our children.

(Note: Applause.)

Thank you.

HEARING OFFICER: Beau Haworth.

(Note: No response.)

HEARING OFFICER: Jonathon Kushner. 008268

MR. KUSHNER: Good evening. I just want to quickly say that I moved to Taos because of the -- for the peace and quiet. I've lived all over the country. I've lived on the east coast, I lived in the northern Rockies, and the central Rockies, and I chose Taos because it is a peaceful place. Also because of the access to the wilderness lands that we have, the whole Latir Peak Wilderness and the Wild and Scenic area, the river, the Rio Grande canyon that was designated by Congress to be a special place where you can go and get away from modern civilization.

And I feel if I am backpacking in Wheeler Peak or rafting or kayaking on the Rio Grande, to have these planes fly overhead is a travesty.

I want to quickly go over a little story that happened to me. I was leading college students on a canoe trip on a wild and scenic river in Montana. This is the only section of river that is still like Lewis and Clarke saw it. We were peacefully canoeing down the

river, when I'm not sure if it was a B-1 or a B-52 bomber came up over the canyon walls, dropped down, and flew over us, I'd say about 100 feet overhead, completely disturbing our wilderness experience, flew up the canyon and disappeared.

Well, when I heard about bombers flying overhead, that's the first image that came to my mind. It shook everybody in that party. Here we were in a beautiful place and we thought what would Lewis and Clarke have thought if a B-52 bomber came overhead and flew over them?

I moved here from Boston, and when I was living in Boston, two to three days a week aircraft would fly over my house. They were coming from Logan International Airport. It was very disturbing morning, evening and night to have these planes fly overhead, and I thought by moving to a place like Taos, which is far from the Albuquerque airport, that I would eliminate this type of thing.

BR-6 Also, quickly, Philmont. You're going to fly over Philmont? I was a Boy Scout. I never got to go to Philmont when I was a Boy Scout, but I had this image of this wilderness place, this great place. And to have bombers flying over there would be so disruptive, and if I was a Scout there, would shatter my opinion of this

wilderness area.

PD-17 Then the last thing I want to say is: Why Taos? Why this beautiful place with wild and scenic rivers and wilderness areas? Why do you have to fly over these areas? There's a lot of other areas in the United States that are unpopulated and not designated by Congress to be special places.

Thank you.

(Note: Applause.)

HEARING OFFICER: Ed Strange. Then I'll be calling on Judy Martin.

(Note: No response.)

HEARING OFFICER: Judy Martin.

(Note: No response.)

HEARING OFFICER: Pete Makerewicz.

TY MR. MAKEREWICZ; Just Pete will do. 008269

I'd like to talk about environmental impact, and the most endangered species, human beings.

I'm from Angel Fire, and I live about a quarter of a mile away from The Memorial. I suffer from Post Traumatic Stress. I flew missions in Vietnam, and what you do are doing here is a travesty.

Agent Orange, you also had some studies, and it don't cut it, plain don't cut it. You guys are messing with the Great Spirit, and it's going to blow

81

back on you.

Noise levels you guys portrayed here, I mean a guy was saying there was no less than on the screen.

I'm part of the environment. My brothers are part of the environment. We all suffer and we are tired of it.

You guys already eliminated Alternative A on your study here that I saw, and to me Alternative A is the only alternative.

All this is basically unnecessary. You're considering doing this because, you know, build up military force and whatnot, test out more equipment. This's already been tested. And, you know, I saw this article in the paper about you don't want to have this lax deal come over, over Yugoslavia, you got to stay all ready. We don't need Clinton's diversion anymore, man, is what it amounts to. If he can't own up to it, be accountable for his things, don't put it up on us. I'm up here to gain some peace after 30 years, and you guys are blowing it.

(Note: Applause.)

HEARING OFFICER: Mary Simonini. **008270**

Then I'll call on Scott Machardy after that.

TY MS. SIMONINI: I'm Mary Simonini, spelled S-i-m-o-n-i-n-i, and I'm here to talk about -- well,

82

first of all I'm a Licensed Clinical Social Worker and a psychotherapist in private practice, as well as at Taos Mental Health, so I am working with people daily that are dealing with stress in their lives and how it affects them mentally, physically, spiritually and emotionally.

And so I'm going to talk about the terminology you use that we humans will "habituate" to the noise level, and your minimalization of the noise level that is here for we as humans.

In your draft of the EIS, it's, you know, basically we humans are going to habituate. However, as I was reading it, it was very interesting because I got to the section about wildlife, and here is what you said.

"Aircraft overflights and the associated noise can effect wildlife directly. Wildlife responses may include increased movement after an overflight, avoiding or leaving areas where overflights occur, changes in foraging patterns, and arousal of species-specific defensive behaviors; for example, the fight or flight response."

You go on to say: "The primary concern with aircraft overflights and the associated noise is the startle effect. For example, this occurs when birds are surprised by sudden unexpected loud noises and leave the nest or perch suddenly. Positive/negative impacts from

83

this behavior include the expulsion of eggs or nestlings from the nest as the parent leaves suddenly, increased creation (sic) of eggs or young when parents are off the nest, and eggs or young may become chilled if the parent is off the nest."

You also go on: "Adult peregrines have been known to step on eggs or young and occasionally kick young out of the nest following rapid exit following gunshots and other explosions."

Are we humans not, in fact, a species in the wildlife kingdom?

We do not habituate. Okay? We are a part of this wildlife kingdom.

I'm going to quote a man by the name of Hansel Yee (phonetic), who is a stress researcher, and stress as a person's response to the demands of his environment.

He goes on to state: This syndrome has three stages. One, the alarm stage; two, the stress-resistant stage; and three, the stress-exhaustion stage. The first stage of the alarm reaction is the fight-or-flight response. And many hormones are activated at that point, and affect our physiological balances. When threatened we are ready to fight or flee, then when the danger has passed, our bodies regain their normal physiological balance.

84

That is the first step.

The second stage is called the stress-resistant stage.

In this stage more distinct changes begin to occur in our bodies. And this is as there is a buildup of stress. Okay? We don't just have one stressor, we have a buildup, a cumulative effect.

With continued resistance, part of our bodies become exhausted. For example, during this stage there often is considerable increase in colds or 'flu or bacterial infection, because the thymus, spleen, and lymphatic organs shrink or begin to atrophy. Headaches, continued heartburn, stomach cramps, low energy are some of the symptoms.

It is at this stage we begin to see patterns emerge, tendencies towards deadly stress-related disorders.

The third stage is the exhaustion stage. The amount of energy we have for resistance to stress is limited as human beings and wildlife, and when it's used up, the stress exhaustion stage occurs.

So, we do not habituate. To you it may look like we do. Okay? I mean, we numb out as human beings. We do because we can only take so much, but what's going on inside is real. Okay? And people are affected. We

85

are affected. I see it daily. I know it in myself.

My husband and I live in the mountains, and two years ago when we moved there, there was -- I was there by myself. I was outside, and all of a sudden I heard this incredible noise I had never heard before in my life. And all of a sudden just above the treetops was a bomber going through our canyon. I had never experienced that before. I almost hit the ground. I mean, talk about fight or flight. It was really frightening.

And this was a pilot, and many of us probably remember, that was trying to impress his girlfriend up at Taos Ski Valley and went through the gorge, went over the ski valley, and went through our canyon.

I felt the response of that, and I do not want that here in this area or anywhere. And none of us do.

(Note: Applause.)

HEARING OFFICER: Scott Machardy. I'll be calling on Morgan Farley after that. 008271

MR. MACHARDY: My name is Scott Machardy, and I live here in Taos north of town. I'm here to add my voice to the unanimous voices of the rest of the people present and the voices of my family to those of us that cannot tolerate, will not tolerate, and cannot accept this alternative and the effects that it will have on this region: the pollution, the mental pollution that

86

this causes, the pollution of our air, and the sound. All the implications.

This is a very fragile environment, a high-desert environment. It's not difficult being a person -- it's difficult being a person and surviving in this area. It always has. It's difficult being wildlife, it's difficult being plant life here. The water is scarce, the air is thin, the economic opportunities are very precious here.

BR-4 I've already -- I'm a builder. I've already witnessed the loss of I think 10 jobs that could have been -- that could have happened here due to a client of mine that sold their property and decided not to build here because of the threat that this alternative imposes on the community.

CU-1 And as a builder I see that the architecture -- and I've witnessed the architecture here, and it's my personal opinion and professional opinion that these buildings here are fragile. Taos Pueblo is a World Heritage site and it just cannot be disturbed.

And one thing you don't do, and if you have lived in Taos for any length of time, one thing you don't do is you don't disturb the ceremony and the sacred space of the Taos Pueblo.

There is a ceremonial cycle that goes on among

87

these people, these traditional people that have lived here for centuries that is so important on a global basis that just that alone has global implication, in my view.

That and the Taos people and the other indigenous people in this area are precious to us precious to the planet.

The other thing is from knowing the people of Taos I know that this will never -- they will never let this slide. They will never go away. Our resistance to this will never go away, and the Air Force will feel it. No matter how strong the Air Force is, this will not go away, and I believe that the Air Force will regret this, choosing this alternative if they do, and I encourage the Air Force to remove this alternative and all the other alternatives, park the B-1 bombers, park the B-52s, recycle it and turn it into something that offers a benefit to the people of this world, most of which are below poverty level.

(Note: Applause.) 008272

HEARING OFFICER: Morgan Farley, and then I'll be calling on Rex Estell.

MS. FARLEY: My name is Morgan Farley. I live in a log cabin on 20 acres of wooded land in the mountains in El Rito, which is eight miles north of Questa, right between the Rio Grande Wild and Scenic

88

River and the Latir Peak Wilderness, and on the edge of your flight path.

I'm a licensed clinical psychotherapist and a published writer. Like everyone who else who has spoken tonight, I am opposed to the Northern New Mexico route. My reasons are personal and passionate.

I first settled here in 1975. I moved back to this remote rural area from the city precisely because it offered me the silence and the freedom from intrusion that I needed to accomplish my work as a writer.

I made great sacrifices to make this change. I was willing to accept a loss of income, loss of professional status, to give up the comfort and ease of city life, to leave my clients and students, my neighbors and my friends, all for one thing: quality of life.

BR-7 The bombers will destroy the very quality that I came here for.

I came here, first of all, for silence. Silence is not simply the absence of noise, silence is a crucial medium for depth and truth in human perception and communication.

I came here for safety.

I came here for privacy and solitude.

I came here for peace of mind.

I came here for empty skies. Skies empty of

89

human signs, skies that a writing student of mine, a little girl, described as: Full of the mind of God.

Most important of all, I came here to live in a place that is still pristine and wild, to experience the natural world largely unaltered by human purposes.

This way of life feeds me and inspires me. As a serious writer committed to seeking a vision of how to live, how to best be human in this world, I have claimed this place and this total solitude as the reward and the balance for the 30 years I have spent in service to this society as a mother, a psychotherapist, trainer and teacher.

I have paid my dues. Now I feel strongly called to write, and I have changed my whole life in order to have the conditions that will give clarity and depth to my writing so that it will be useful to other people. If I can't have the quality of life I need here, I may have to move again, but I built this cabin with my own hands, I have cared for and tended and protected my land for 23 if years. I planned to pass it on to my daughter, who wants to live here one day. This lands is my home, my nest egg and my legacy. I am opposed to anything that damages its beauty or its value.

I have been deeply happy here. This is my personal version of the pursuit of happiness, which is a

90

right I am guaranteed by our Constitution.

I believe our government was designed to uphold and protect the freedom of its citizens to create lives worth living. The Air Force was not created to endanger our lives and damage our environment nor to diminish the value of our land. My life matters to me and to the founders of this country.

AO-61
BR-4

The lives of my neighbors matter just as much.

Let the Air Force do what it was created to do: Protect our freedom to live good lives in the place we have chosen.

(Note: Applause.)

HEARING OFFICER: Rex Estell.

(Note: No response.)

HEARING OFFICER: Sammy Swenson.

008273

TY

MR. SWENSON: Hello. Thank you. Thank you.

It's nice to be here. I don't have anything prepared. My name is Sammy. I'm from Maine, northeast, and I'm coming through visiting Taos.

And thank you.

I find it kind of interesting, you know, talking to the people here that are representing the Air Force and taking comments, but I'd like to just open up the mind by talking to everyone.

It's an interesting life. I'm grateful for

91

this life. You know, every day I think we wake up and, you know, we go along our way, and, uhmm -- and there's this war going on, and, you know, it's like we want to try to live a more peaceful way of life. You know, that's, I think, maybe the new way we should start moving things, is a peaceful way of life.

And global peace zone is something I'd like to say something about. The mayor of Taos back in 1995 declared Taos to be a global peace zone and --

(Note: Applause.)

-- which is a good thing. And I'm doing this global peace walk where we're respecting people, walking for -- you know, walking in peace. And we are going to be doing that coming up through town, and maybe you will see us with our flyers running around, and we will maybe go to Washington and try to get the message to Washington. You know, to the people. Because, I mean, that's what we should do.

And I read this draft report and I'd like to focus on it a little bit.

I looked up the contents, you know -- and, like, I know some things, so I looked at the contents. I found socioeconomics. Maybe that's something that has information? And I looked at it, and there wasn't so much information here.

92

So I took out one of the pages and I made a little bomber.

(Note: Flying paper airplane.)

That is what I think of this new idea. Just let it fly, let that fly away and just, you know, migrate the planes back to the hangars, or turn the planes into houses, you know.

And we can't protect -- we cannot protect our freedom with war. It's not going to happen. The only freedom is peace. If we can realize this, then we don't have to do the war thing.

And that's what's happening rights now in 1999/2000. We don't want World War 111, don't want it. So the message is live a peaceful way of life, and we are going to walk it.

So everyone, thank you. Thank you.

We will talk more later, and I'd like to thank the people of Taos for really representing the true voice.

Thank you.

HEARING OFFICER: This next card says, "Three Toads."

008274

So do we have Three Toads here?

MR. THREE TOADS: Hello, gentleman.

HEARING OFFICER: Are you Mr. Toad?

93

MR. THREE TOADS: No, I'm his brother. I'm Three Toad's brother.

But this toad thing is -- the toad thing is there because with all the military flyovers, we got to go underground.

The nuclear radiation is so high above ground now because there was an accident five years ago. There was a serious accident, and one of the bombs went off. Not in Bosnia, not in Korea, not in Vietnam, but right here at home. So it's time we take this serious, as serious as you guys can get. It's real important you take this serious. And I think that serious equals mass. The more serious we get, the stupider we get as humans, and it's real important not to be stupid as humans. It's real important some days. You ever get up in the morning and it's a serious day? Oh, so serious. You know.

And I've just got to say something about seriousness. No. Being a toad lives underground, flying around, flying a jet airplane could cause a crash, you know.

One rave event and that stealth fighter down to the ground. Right? I mean chewed up in the jet engine and stuff. One little accident and all the bombs hit the deck and they all smash lives.

Los Alamos is bad enough. I have a friend from

94

the reservation who has as vision of the three nuclear blasts coming up from Los Alamos.

AUDIENCE MEMBER: We don't respect those visions anymore.

MR. THREE TOADS: Clear the air. No more accidents. Military, government are notorious for not having accidents, but they are notoriously great for having a lot of accidents. You know? I mean, just, "One of those things that happen. Too bad."

You know, "We lost a few men over here," you know, "the invasion of Europe and the Netherlands," and then the Germans go ball up all the people. Military people don't know it all, it seems.

So peace to the ravens, to the turkey vultures. A blast to turkey vultures that one of your jets never hit one, and the beautiful sandhill cranes. The sandhill cranes came gliding over right at the level you guys want on. All the lightening I heard last night, it wasn't the lightening at all, just the boom of jets.

BI-2

That's tough when I have to hear jets night and day. It's a mad bomber's disease. It's seriously time for mad bomber's disease. The cows in Europe are nothing compared to mad bomber's disease.

I'm going to shut up, and I hope you guys take it to the leaders and say: Okay. We are going to pick

95

another spot. Panama. All those places are good. We already have them.

Okay. Are you taking me serious? Do you take me serious? Please take me serious.

HEARING OFFICER: Mr. Toad, I take you seriously.

008275

TY

MS. LANOFF: Somehow I feel I've been here before three or four times already. I'm an interfaith minister as well as a healer, as well as a store owner, as well as a resident of this town.

You have listened, but I question have you heard, from our officials, elected and otherwise, from our elders, from all the nationalities and people of this place, from our community, our individuals, our children. You have heard us speak for the ones that cannot speak: our animals, our plants, our rivers, our space, our air.

But have you heard?

You may have listened, but I think everyone in this room wants to know: Are you really listening? Does this go back, and does it matter?

Because its matters to us.

What parts of no don't you get? How many ways must we tell you no? Because there's not a person that has been in this room or has left this room that won't do whatever it takes to get you to understand the word no.

96

And it's not just no for Taos. It's no for every other part of your plan.

But I speak for who is here. You have heard us talk about all our sacredness, all our specialness.

When did we become a nation of, "We, the Air Force, we the military?" I thought this was about "We, the people."

And we, the people of Taos, say no.

(Note: Applause.)

HEARING EXAMINER: Donna Lanoff.

Linda Murray Pacheco.

(Note: No response.)

Brian Rod.

MR. ROD: I made my comments in writing, instead. Thank you.

HEARING OFFICER: Mark Gould.

(Note: No response.)

Charlie McGarity.

008276

MR. McGARITY: Okay.

Hello. I've a question about the objectives of the EIS statement. It seems that it's in the best interest or in the vested interest of the Air Force. You know, this is your proposal, so it's in your interest to have it fly, if you will, and yet you're the same ones preparing the EIS.

97

GE-39

So how can there be objectivity there when you're preparing this for yourselves to say: Hay, it looks good. Let's go ahead and do it.

So for this to be an objective report it needs to be done by a separate party and not by you guys.

The other thing is the last meeting I was at here in Taos down at the Civic Plaza there was every entity in this area was unified, as far as I know the only time in New Mexican history, the Jicarilla Apache Pueblo, Taos Pueblo, there was the CNA, there was the County Commissioners, there was the mayor of Taos. Everybody. And everybody was unified in saying that we don't want this.

GE-3

And if you guys are here to supposedly protect democracy, then you have to start listening when there is a unanimous democracy saying we don't want this.

Another issue that I think is pretty obvious here, which I think is a genuine lack of respect from the Air Force, is that you're proposing to take something away from our community, something that I think a lot of people have eloquently stated tonight, and you're not proposing to put anything back. You're taking away, you're thieves, and we all resent that.

And if you don't feel a warm welcome here, it's because you're not respecting us and not offering to put

98

anything back for what you're taking.

The other thing I'd like to -- I've noticed the EIS quickly brushed aside the sort of human impacts of having, what is it, 2500 huge bombers flying 300 feet off the ground over us every year, sort of said, "Well you'll, habituate, this is no problem."

We are humans and we're part of the ecosystem and we are part of our environment, and we will be impacted by this, and our feelings and opinions are things that you're not measuring, but they are still going to be impacted. You're looking at how it might impact wildlife and how it might impact, you know, the trees. And we're feeling an impact, too, and we are stating it, and your report brushed it aside. Oh, the public's ignorant. They don't understand it won't hurt them, it will be okay.

But this is wrong. We are part of the environment and we will be affected, and we are letting you know that.

And the last thing I'd like to say is if this is something that's being economically evaluated, I think you should take into account what one of the men said tonight, which is that Taos may be small but we have got a lot of fight in us, and as long as the Air Force decides to put this program here in this part of New

99

Mexico, you can believe me we will fight it 'til it's gone. And it will cost a lot of money, but the people here don't let things go. We have a lot to protect, and we will definitely do everything we can to protect it.

(Note: Applause.)

008277

HEARING OFFICER: Lisa O'Brien.

MS. O'BRIEN: Hi. My name is Lisa O'Brien, and one of the things that's really difficult about being here really late at night is everyone who spoke before me said absolutely everything I needed to say. My best friend, Charlie McGarrett, just took the last thing on my list.

I also have an eight-year-old son who has taken to drawing on his arms, so I'm getting a little nervous.

Just very quickly, I need to speak to this entire process of these hearings.

There's a part of me when I walked in this evening I couldn't help but feel that the four people involved in this hearing felt less intimidated by the hundreds of people sitting here. There is an incredible inequity of power in this room at this moment.

GE-30

The fact that you set the tone, make the rules, tell people how long they can speak, what we can speak about is not okay.

There is not a day that I wake up in Taos

100

that -- I feel incredibly privileged by living here. I resent the fact that you feel that you can come in and take what is convenient for you to take. It's not about privilege that I see here, it's about entitlement, and that is not okay.

I also feel along that line the importance of the give and take. Again, I moved to this community and the one thing I felt very strongly from Day One is I can't just come here and take from it, I have to give back to it.

So along with my friend Charlie, I ask: What is it that you give back here? It's very clear what you will take.

And in the spirit of give and take, I would like to do two things. One is extend a portrait that my son has been working on all evening to your timekeeper; and two, I would like to extend a very gracious invitation to anyone that's here in uniform: If you would like to come to my home for a free hot meal, I welcome that. And part of what I would like to share with you, I would like to bring you to my home where I get my power from the sun and I get my water from the rain and I would like you to walk outside with, me and I would like you to listen to the silence.

Thank you.

101

(Note: Applause.)
HEARING OFFICER: John Ussery. 008278
HEARING OFFICER: Actually, John Ussery.
I'm from El Rito, the one between Abiquiu and Ojo Caliente, about an hour's drive from here.
I'm a board member of the Rio Arriba Family Care Network, which represents 25 health care providers, and I'm the chief information officer for Las Clinicas Del Norte, which has clinics in Abiquiu, Ojo Caliente, and El Rito. And not too many of our, oh, 7,000 clients are able to come.
We are spread out over 40 communities and a lot of them under the flight path. And I want to address not just, you know, the health concerns but some process ones.
I did notice -- First I saw the Draft EIS was in the lobby, so I haven't been able to research it too thoroughly. And the new nearest location of a reading room is an hour from my house, so the availability of the information was not great.
GE-26
But I did glean a couple of things that I have to object to.
First, I just want to say this is a land that we love. Many of us are immigrants from elsewhere, and we came here for a reason. This land is a beautiful,

102

lovely place to live, but a tough one to make a living in. And we put up with a lot. But for good reason, because this is a land of quiet and grandeur and beauty and peace.
I'll have something more to say about the peace a little further.
We want to keep it the way it is.
Actually, we have enough overflights already. I did a little stop motion of a plane flying by, the trail became the only cloud in the sky as it spread across. We are impacted already, but not at 300 feet 10 times a day. That's going to really make it worse.
But there are some things in here I did get out, briefly. There's identified scenic resources or vistas within visual range of each of the electronic scoring sites, and no -- the activities aren't expected to preclude existing land uses or continued use or occupation, nor will there be any adverse effects of the land use, recreation resource or individual settings.
I really disagree.
BR-4
I mean, I think a lot of ranchers, fishermen and tourists who come here for this grandeur, or the ranchers who are trying, hoping that their sheep will reproduce and not give stillborn due to the shock syndrome. Our humans aren't going to benefit much,

103

either.
And I really got the sense of peace from everyone here, but there's a lot of people who aren't here, you know -- and I say if you read our news some of the traditional means of expression announce like through burning, bomb building sites, and -- Okay. And shooting at cars, and a lot of disruptive activities. And it does say that at 65 decibels 12 percent of people would be highly annoyed.
I'm afraid this will include -- since you are planning 64 decibels, I think it's going to include a lot of people who just happen to have 30.06s out there, and although this is not the group that would do it, I think you guys better prepare for something like that.
But back to health effects.
I have a friend with post traumatic stress disorder, and she jumps enough at loud noises that aren't in the 64 decibel range, and if you want to impact her and the rest of us with that kind of noise ten times a day, it's not going to help us.
AO-18
And the other thing that I pointed out during work periods, the best enforced law in the state: Murphy's Law, that things will go wrong.
I don't wish anything else to anyone, but I want you to be aware when you're bringing that kind of

104

weaponry over us in terrain that is prone to fires and other things, one accident can take out a huge area of the most precious land in the world.
(Note: Applause.) 008279
HEARING OFFICER: Gretchen McGregor.
MS. McGREGOR: My name is Gretchen McGregor. I'm a resident of Taos since 1982. I have my degree from the University of California, Berkeley, in environmental sciences. I spent a lot of time learning how to govern an impact statement, although that is not the area I work in. And, no disrespect intended, but this is insulting, this Environmental Impact Statement.
Certain values have been knowingly corrupted. I'll give an example in a moment. There's intentional errors, of omissions, wilderness areas that weren't even mentioned in here, and also the final conclusion being stated negligible impact is -- I mean, even a high school student if you introduced a problem in a class and said here is a pristine area, you're going to introduce 2,600 flights, B-52 bombers, 160-foot wingspan, imagine two thirds of a football field with eight jet engines, and we are going to fly these not once a month, not once a week, but 10 times a day during the daytime and the night, do you think -- What is the right answer, multiple choice? There will be some impact? There will be no

105

impact? There will none of the above? Or there will be impact?

Again, I'm not saying this to be insulting, but I find the Environmental Impact Statement to be insulting. Knowingly corrupted values.

BR-1

The gentleman before me was just speaking about 64 decibels. If you actually read the Environmental Impact Statement and you don't dilute the decibels, which has been explained tonight, I don't want to go into that, we are talking about underneath the corridor 120 decibels.

This produces instantaneous loss of hearing. This is a knowing corruption of the values, and basically this will drive human populations out of the corridor. We know there's no one who can exist at that sound level.

David DiCicco, the county planning director, also pointed out, and this is a very important point I want to make -- and I know it's late, most people have left. This is a logarithmic scale, which means starting at 60 decibels, 70 decibels is 10 decibels more, it's twice as much. 80 becomes four times as much as 60. At 90, you get my point, is 8 times as much as 60.

If you go all the way up the logarithmic scale to 120 decibels that represents 64 times the amount of noise as 60 decibels.

106

This is what I'm stating as knowingly corrupting the values.

I understand my time is up.

If I could have another one minute just to read into the record. I think it's very important that we actually state into the public record some of the areas that have been excluded from this list, because these are wilderness areas that we have talked a lot tonight about.

LU-9

The Carson National Forest Rio Grande Wild and Scenic River area.

The Uroco (phonetic) Wildlife Area.

The Chama Wilderness Area.

Elliott Barker Wildlife Area.

The Valle Vidal.

The Colin Neblett Wildlife Area.

Cimarron Canyon State Park.

Santa Rosa State Park.

Santa Fe National Forest.

Villa Nueva State Park.

Summer Lake State Park.

Kiowa National Grasslands.

Rio Brancas National Grasslands.

The fact that these haven't even been mentioned is just -- it's not acceptable. The money has been spent producing a draft report that doesn't include

107

these, and I want them included in the record, and they need to be addressed in any natural report. How can we sum up the impact without addressing these parklands?

As far as the final conclusion of negligible impact, it's nauseating to hear that. It's insulting.

We may be poor but we're not dumb. New Mexico has the highest per capita of PhDs in the United States.

SE-5

And I just want to read, because it was incorrectly stated in the EIS, and this is last thing I'll say.

Taos County has 27 percent of its population living below the poverty line. 27 percent. We have 18 percent unemployment.

BR-4

To propose that this will have no impact, no socioeconomic impact is absurd, and I think you're wasting time and money, and I really would like you to go back to the drawing board and do a professional job that's deserving of this area and the quality of the people and wilderness here.

Thank you.

(Note: Applause.)

HEARING OFFICER: Patrick Halladay.

MR. HALLADAY: Good evening.

008280

I would just like to say that the major issue to me seems to be here quality of life and the purpose of

108

the American military I think seems to be to protect our quality of life, but in a paradoxical fashion in their effort to protect our quality of life they seem to be destroying it. That arouses many questions in my mind.

BR-7

I'd like to say regarding quality of life, too, that people are used to a certain esthetic around here, and I don't know that the Air Force or any military appreciates that esthetic, and it's kind of hard to define esthetics to people who are numb to it. I suppose you'd have to live here.

But there are some people who feel that what is happening with these planes is a form of terrorism. And that's something that comes up in the news more often these days: Domestic terrorism. That's paranoia that comes up. The government seems to be worried that somebody, maybe it's a Moslem fundamentalist or somebody, is going to blow up buildings, and actually that does happen, but I feel that we already have a lot of domestic terrorism, and you are the perpetrators.

(Note: Applause.)

Regarding domestic terrorism, like begets like. Bad actions create bad Karma, and somebody who is not able to habituate is going to take a -- is going to make a reaction that is along the same lines. It's going to be labeled domestic terrorism, but they will be

fighting you in defense of their quality of life.

I work outdoors. I plant trees on the Indian reservations Bureau of Land Management, National Forest, private land. I'm outdoors an awful lot. I've been doing this for 15 years, and I've never been on any single job where I have not been terrorized by your planes.

Every time -- I don't have post traumatic stress disorder, I'm not a veteran, but, every time, my heart jumps in my throat. And I'm sure it is the same to all the animals and wildlife living out there.

And we don't like it. It's not esthetic.

Every time I hear it, for 15 years now, I think this is an incredible lack of respect. You guys are really pushing it, and now you are talking about doing more. That's like, really, pushing it.

That is what I had to say. You guys are really pushing it. I'm not going to be a domestic terrorist but you're going to get some flak from somebody.

HEARING OFFICER: Shane West. Then after Mr. West, I'll being calling on Daniel Williams. 008281

TY MR. WEST: Check the decibel levels.

Just kidding.

I love you Three Toads.

I don't know what I'm going to say. Great spirit brought me here tonight, and I don't know, I guess really all I have to say -- Spirit is filling my heart -- is that esoterically and all that stuff -- I went to college and all that stuff and studied noise. I'm a music major. And I don't like the environmental impact of these things. And I studied esoterically, and what I've read and talked with people from Tibet and guys from East India, and the Hopi Indians, that this is the heart chakra of the Earth Mother, and that might be something to be taken into consideration.

I don't know. I love my earth. I love this planet. And I guess the big thing was they opened up the pyramids, you know, the other day -- and I was out praying with my medicine drum. I saw a large, giant red pyramid come down. They said on T.V. a couple of days later it looks like we migrated from this planet to that planet, because there are pyramids on Mars the same exact shape as the ones in Egypt and China. They all match up to the constellation Orion.

It's kind of interesting if anyone is interested.

But anyway, this is the heart chakra of the earth, and that's all I really have to say, except I love you guys, and good night.

HEARING OFFICER: Daniel Williams.

After Mr. Williams, I'll be calling on Juan Montes. 008282

MR. WILLIAMS: Sir, thank you very much for the opportunity to speak again.

Most of the people I've had the opportunity to meet last year -- My name is Daniel Williams, as you know, a retired a major from the National Guard.

As a former military officer I very much understand the need for military training and respect that, respect the fact, love the fact we live in a country where people can share their ideas and nobody will go to jail for what they have said tonight.

My position is a little different. I'm not opposed to the military and I'm not completely opposed to RBTI. Admittedly, I wouldn't want to be living under it, no matter where it was, but frankly my concern is Northern New Mexico and what I believe would be devastating impacts.

During my comments at the meeting at Angel Fire last night, I mentioned a letter from the BLM. I was able to get a copy of this today. It was addressed to the RBTI EIS, To whom it may concern.

"After reviewing the Realistic Bomber Training Initiative, we have the following comment: Recommend no

flyovers between April 15 and September 15 in the Ute Mountain area."

ED-8 For whatever reason this letter is not included in the correspondence section of the annexe of the EIS. And the route does go directly over Ute Mountain.

It goes on to say, to reference information which I don't have available now, I'm going to try to that get the additional information to go with that.

So I would like to submit this with my comments.

In addition, regarding whooping cranes, whooping cranes are on the threatened/endangered list, considered to be very near extinction. They are mentioned in the EIS, but there are two specific routes for migration. One directly follows the Rio Grande, another crosses the Valle Vidal shortly after the route

BI-2 turns to the southeast. So at least those two areas the bombers would be flying directly across the route of the whooping crane, and because they are so limited that does increase the threat to them.

I was quite concerned that the EIS says negligible impact regarding socioeconomics.

BR-4 Most of Northern New Mexico, the dollars for this area and the economy for this area are 90 percent tourism, so it would actually have a tremendous impact.

113

When people have a choice of coming to a vacation area to camp, to hike, to ski, and they have a choice of having 10 to 12 bomber flights overhead each day, 15 to 20 percent of those being at night, why should they come here when they can as easily go somewhere a short ways away. So it would, in fact, have a huge impact. And for there to be no cultural impact, if again showing negligible impact regarding culture, that is -- that is not honoring the people of Taos Pueblo and what they hold sacred and what so many people actually do hold sacred.

I do understand the need for training, I honor and respect that, but I do ask you look closely at those areas.

I know we would not have time for additional comments tonight, sir, but if I could just take a moment I would like to thank the people for coming out tonight. As a team I do believe that we will defeat this proposal for Northern New Mexico.

But I'd also like to thank you for being respectful. You have expressed your opinions, but in a respectful way, honored the three-minute time limit, and I'd like to encourage people to make sure you not only say I disagree, I don't want it here, but say why. Because the possible important request. This is a

114

scientific study, and the emotion makes us feel good to express it but, it won't make a difference to whether it happens. So make sure you say why.

Finally, please come back to the Kachina Lodge on Saturday. Being here, whether you speak out, whether you write your comments, it is very important.

So thank you very much.

HEARING OFFICER: Juan Montes.

(Note: No response.)

HEARING OFFICER: Michael Berral. **008283**

TY MR. BERNAL: The last name is not Berrel, it's Bernal, and I represent the Red Willow people, indigenous people to this area.

And it's good to see you people here talking about this situation that is very critical to our area. And I'm a rancher and I'm a local contractor also, so me and my father we run cattle, run like 30-40 head of cattle. And we have horses, too, and a bunch of, like, dogs and cats and stuff like that. So I believe that this flyover that you guys are proposing is totally uncalled for. This area, and all other areas, too. Not just in our area. Throughout the United States and throughout the continent, because, you know, these tax dollars that is being wasted for this type of situation should be used elsewhere to help the homeless people, to

115

help the people that are in poverty that need -- the people in Kosovo right now that the United States government has intruded on, for what reason.

You don't give the people the full picture of the reason why we're there, why my tax dollars are restoring other people's lands that is sacred to them. That is sacred to us, here, too.

The people that have moved here to Taos to be in my valley, I've lived here 36 years and my ancestors have lived for thousands of years. We haven't been raised here as a reservation. We grew up here as the water grew here and the trees and all the animals and all the living things.

And I just want to -- I just want to express myself in that way, because I am deeply concerned of the happenings in this area, and in other areas, too.

Mother Earth is very special to me, and all the living things on Mother Earth. I am -- We are living things. You have a heart. I have a heart. We breathe the same air, we have the same feelings.

Maybe not.

We go to bed, we wake up feeling the same way. Like, you know, like Three Toads said, you know, seriousness. You guys have a serious job. I know that. I realize that. But so do we as your constituents.

116

So I just, you know, I have a plea that you guys can stop everything. Stop this world war that is going on. You know, mostly effecting poor people, indigenous people throughout the country, throughout the world.

So it's -- you know, you have to realize -- you got to think about our younger generation that is coming up, like my daughter here. She stayed up to 10:30 at night just to be here to support my little family and my Red Willow people.

So I just -- you know, I just want to say, you know, you can consider my words.

And I want to thank all the people that are here tonight, too, you know, that there's a lot of the folks I never see around Taos and stuff, but, you know, these are the people, real people that stay up late here and really want to fight for what's really ours.

You know, we are all one people, not all separated. This is the way the government made us to be, for everybody to separate from each other. We all need to come together as one.

That's all I have to say tonight.

HEARING OFFICER: Mark Thomas.

(Note: No response.)

HEARING OFFICER: Alicia Johnston, I believe.

117

008284

TY

MS. JOHNSTON: First of all, I just want to come here and speak on behalf of Mother Earth. And I find it sad that we all have to come here and speak on behalf of Mother Earth, because you guys can't hear her screaming to back off.

And it's unbelievable that you're willing to destroy the earth and -- you know.

But the point is what is that saying to the rest of the people, the people in the United States, the very people that you are trying to get to support you. And there's a saying that if you kill two people you're a murderer and you go to prison, but if you kill two million people, you're a hero and you win.

So you expect people to support you so that you can become heros, and -- I forgot what I was going to say.

But I just find it appalling that you think that technology is the way when your sole provider is our Mother Earth. And sooner or later it's not going to matter if there's a government, it's not going to matter if there's an Air Force or if there is anything, because Mother Earth is not going to allow us to stay here any longer. She is not going to keep providing for us so that we can destroy her. It's not right for her to have to endure the pain we are putting on her.

118

Thank you.

(Note: Applause.)

HEARING OFFICER: Nick Rizzo.

008285

MR. RIZZO: Hi. How y'all doing?

I'm not from around here. I'm from Florida. There is an Air Force base there, Patrick, I believe. There is a forest called Ocala National. I spent a lot of time out there as a kid. All right? They had these flyovers there, and I remember the first time I heard one and I literally pissed my pants.

AO-27

Don't exactly think that's very safe around here, due to the fact that there are mountains and then there's something called an avalanche. And it happens when a stable top part of snow gets on an unstable bottom part, and it can be triggered by noise, and 64 decibels which I doubt that's even close to what it really is, I think it's more like 100, 120. They are loud. I'm pretty sure you all know. You are all probably Air Force, I see you all got wings, so you all know it's not exactly quiet. And I don't see how you guys can sleep through it at night.

Basically, what I say you do with your Project D or whatever it is, turn it into Project E, "eliminate" it, and don't come through here, just quit it altogether.

119

I mean, bombs are made for one purpose, as someone already said, and that's to kill. And it all comes back one day to you.

Thank you very much.

HEARING OFFICER: This individual has already spoken but he submitted a second card so possibly wanted to make additional.

Jonathon Kushner.

(Note: No response.)

That exhausts all of the cards.

And it's 10:30.

I'd like to remind all of you that we do have two more hearings that are set for this Saturday. One begins at 10:00, and the second one begins at 1:00 p.m. And that's at the Kachina Lodge. Both of those will be at the Kachina Lodge Convention Center.

And with that knowledge, that you have those two opportunities on Saturday to make comments, I would like to know if there is anyone who has a burning desire to make comments now before I end the hearing.

I don't want to cut anybody off. If you absolutely have a burning desire to say something tonight, then I want you to come forward.

008286

TY

If you can tell us your name.

MR. BELHORE: This is really unexpected. Hi.

120

I'd like to speak to the people and to you.

My name is Douglas Belhore (phonetic), and I teach English for a living for the University of New Mexico. I know I don't look like it, but a lot of people in Taos don't look like the standard American.

I've taught at 13 colleges and universities so I think lot about language. I talk a lot about pronouns, and I hear "us" and "them" and "you," and it's a drag. And I wish, you know, we could talk together.

I don't think we are on different sides. You know what I am saying?

We. We.

And all I wanted to say is at the University of New Mexico, a friend of mine is teaching a class called The Philosophy of Peace.

There is endless programs in Northern New Mexico centered around peace, and we should celebrate it and should be damned proud, because it doesn't exist in a lot of parts of this country.

And I think what you are hearing tonight is we don't want to go into the next millenium wasting our money in violence. We are really into peace, and we believe in it, don't we?

Peace. Anything can happen. It can.

MS RYER: You mentioned a burning desire, and

121

I couldn't resist. 008287

My name is Rachel Ryer. I spoke before.

My land that I have built my house on was part of the large fire that happened in 1995 or 1996, I can't even remember. But one gentleman did mention that a crash would have a devastating effect, and that is in the thousands of acres in just, you know, a small area.

One spark lit the fire that destroyed the Hondo area forest.

Thank you. 008288

MR. CHAVEZ-ROZE: My name is Guillermo Chavez-Roze, and I can talk about noise pollution. I come from San Diego. I've been here for 12 years, 13 years.

And my school, San Diego High School, was built right in the route of the transportation of these huge planes. Across from my house is Coronado Island. You go to the beach, and during the time that you are there resting, you get to hear all of these airplanes coming.

So we avoid going to the beach.

Our school was soon to have better windows, our City College in San Diego was reconstructed for adequate soundproofing, and that did not work. No matter how much people talk about staying one of the finest cities in the United States, they couldn't do much about noise

AO-16

122

pollution. That problem still exists. Education in those campuses were displaced -- And this is just commercial planes. What about these heavy planes, the ones you are talking about bringing here to this valley? They will be more disruptive.

And just like people mention throughout this night and the morning -- I came here to hear the comments -- all the comments was: We don't want this to happen in this valley.

There's no guarantee by even the highest -- and I mean the president, can guarantee there will be no accidents. That's the truth. That is the truth of this whole thing.

The pilots? I wanted to join the Air Force. I worked for United Way in San Diego. I talked to many veterans, I had many veteran friends, I honor the services. You guys had taken a lot of -- people on here, but you are not the person responsible.

The higher -- not even the president will be responsible. This desecration of the sky is very truthful. It is a true desecration. Here people are sending prayer to the heavens. If planes come by and say maybe that plane would take my prayer to the heaven.

When we look at this Air Force as the guardians of the heavens and do the right work and protect the

AO-61

123

world. That is what you are here for, is protect us, not to hurt us.

HEARING EXAMINER: Is there anyone else with a burning desire to make comment this evening?

(Note: No response.)

Very good.

Ladies and gentlemen, that concludes this public hearing. I'm going to remind you of the two hearings we have on Saturday. I encourage you to come out for that.

I thank you for your participation. Please remember the public comment period will extend through June 16, 1999.

This public hearing is adjourned.

(Note: Hearing adjourned at 10:35 p.m.)

2

(NOTE: From 1:00 p.m. until 2:33 p.m. no record was made.)

THE HEARING OFFICER: We have a court reporter here, and she's going to take down everything you say.

MR. MARK BLAKEMORE: Okay.

THE HEARING OFFICER: And so the first thing you should do is tell us your name. 008289

MR. MARK BLAKEMORE: Mark Blakemore, B-L-A-K-E-M-O-R-E. I was looking at where -- where you're holding these meetings, and it seems like there is a -- it's hard to tell from this map, but if you look on the larger one, there is a -- there is a pretty -- I don't know how to say. It's a pretty -- it's a pretty strong community that lives in the Chama Valley, and it looks like there is no meetings -- this would probably be the closest meeting for any of those people. And some of them are going to be directly affected, they're underneath the proposed flight line. And I think that it's sort of a stretched imagination to imagine that they would drive to Taos, or even to here, for that matter, to attend one of these meetings.

And I also wonder whether they have been -- what the -- the -- how this information was disbursed to them that these meetings are taking place, and if those people ever got that information, and how they're expected to know about this. So that's about it.

I just think you need to -- you need to -- especially

GE-2

looking at that map, you need to see some of these smaller towns where -- where this is going to be flying over, I -- I doubt that they even know about it. So --

THE HEARING OFFICER: Have you expressed that to any of these other --

MR. MARK BLAKEMORE: I mentioned it to a couple of them and they said, you know, "Get out and tell people." But, you know, it's a ways. I'm not going to drive down there and sound the alarm, but I just think there needs to be some -- some way to let -- inform people in that whole Chama Valley that, you know, this is taking place or that it's -- that it's a proposal.

THE HEARING OFFICER: It would probably be good to get the word to them before Saturday, because we're having two meetings in Taos on Saturday.

MR. MARK BLAKEMORE: Right. There is a -- let me show you that other map. There is a couple of towns that are directly -- they're, like, within the flight line that have, like, a very strong ethnic community, Hispanic, that they've already had problems with authorities over land grants and that sort of thing, and I suspect that this is going to come as a big shock to them when they find out that this is a -- not -- first of all, I doubt that many of those residents even knew of this proposal, and secondly, I doubt that -- doubt that they've had a chance to get to any of

these meetings just because of the location of them.

I think that you might want to think about -- you know, I don't know if it's too late to have more meetings, but you might want to have one closer to those people that are affected in that area. That's about it. So --

THE HEARING OFFICER: If -- if you wanted to make any other comments or if you know of anybody that, you know, you could mention to them that they have this meeting.

MR. MARK BLAKEMORE: Uh-huh (affirmative).

THE HEARING OFFICER: The public comment period for submission of written comments extends until the 16th of June.

MR. MARK BLAKEMORE: Yeah, I saw that, so -- so what's their -- what's their method of making comment at this point? Let's say that they're not willing or they're not able to drive to Taos. This meeting is, you know, obviously today and there is not much of a turn out. What -- what options do they have for making comment?

GE-40

THE HEARING OFFICER: I would say their best option, possibly their only option would be to submit written comments to the address that --

MR. MARK BLAKEMORE: That would be through one of these forms or just -- I got this from the table.

THE HEARING OFFICER: The form should indicate the address, and I'm not sure exactly what it is. It might

be this. These are all the same.

MR. MARK BLAKEMORE: I don't know. No, they look a little bit different.

THE HEARING OFFICER: They should have a document, if you ask -- oh, here it is.

MR. MARK BLAKEMORE: Oh, no, it's here. Written comments. Oh, no, this is February. That's not it.

THE HEARING OFFICER: I would say that lady up at the table over there --

MR. MARK BLAKEMORE: Okay.

THE HEARING OFFICER: She definitely is going to have addresses. She's probably got the document she can just hand you that has the address on it --

MR. MARK BLAKEMORE: Okay.

THE HEARING OFFICER: -- maybe a label she can stick on one of these. But this, this particular document, here, has the public hearing schedule. So, after two meetings in Taos, we only have a meeting Monday in La Junta, Colorado and then Harrison, Arkansas.

MR. MARK BLAKEMORE: Okay. So these meetings are pretty much over --

THE HEARING OFFICER: That's right.

MR. MARK BLAKEMORE: -- after the two in Taos?

THE HEARING OFFICER: That's right, realistic opportunity to people in New Mexico to attend a public

hearing after today will be these two meetings, one in the morning and one in the afternoon, in Taos.

MR. MARK BLAKEMORE: Okay.

THE HEARING OFFICER: And then other than that my recommendation would be to submit written comments. As far as any priority, you know -- here is the address.

MR. MARK BLAKEMORE: Okay. That's it right there. Okay.

THE HEARING OFFICER: Langly. There is no priority given to any particular type of --

MR. MARK BLAKEMORE: Comment.

THE HEARING OFFICER: Right, comment.

MR. MARK BLAKEMORE: Okay.

THE HEARING OFFICER: Same priority is given to written comments as is given to verbal comments.

MR. MARK BLAKEMORE: Okay. Well, maybe that's the best way to go, then, just get some of these and --

THE HEARING OFFICER: Well, we had a --

MR. MARK BLAKEMORE: This may not be the right one because -- oh, okay. I think that's the same address.

THE HEARING OFFICER: Yeah, that could be. That looks like the same.

MR. MARK BLAKEMORE: Yeah.

THE HEARING OFFICER: Maybe that's the best way to do it. Okay. Thank you.

7

If you'd like to make comments please come forward. Please. This is a very informal way we're doing this, here. At our previous hearings we've had a formal opening of the hearing after the open house and I introduce myself, explain the ground rules, and then we have a presentation by Lieutenant Colonel Mason to describe what we're doing. Since there are so few people here, we're just allowing people to come forward and make whatever comments you want to make, and that will be taken down by a court reporter.

008290

MS. MARY AITKEN: Okay. Mary Aitken, A-I-T-K-E-N. I wish I had a pen because I use it to organize my thoughts better. One of my concerns was that there is no public meeting in the Chama Valley. And if you look at a map, that flight line enters the southern end of the Chama Valley, and it doesn't so much affect the reservation -- in some ways I know it does, but it affects the Chama Valley far greater, and there is no public meeting in Chama, Tierra Amarilla, Cebolla. All those cities there would be far more affected, and I think that's why there is not a lot of people here. And I understand there were -- press release went out, but people from Chama aren't likely to come here, or T.A. or -- so that's one of my concerns.

GE-2

My other concern is this wild and scenic area, the Chama River, where the -- is the entering point, the flight line, that's a -- a valued recreational area. And it is also

8

national forest that continues to fly over, over Canjilon Lakes and then over the Brazos Pass and in that area. And in this area the economy is -- there is not much economy. It's largely based on guiding, on game, fishing, lumber, those kinds of things. And I know that there would be some effects in that area from such low lying -- low flying planes.

BR-4

My third concern would probably be related to that. It's just that elk hunting is a huge business here, and it is on the reservation, too, and I didn't see in the environmental impact statement, you know, how -- I know some animals do flee, some don't, whatever. But my -- my concern would probably be big game and how they would be affected by -- by this, because it's a multi million dollar business in this area. And that's all.

BR-4

THE HEARING OFFICER: Thank you.

MS. MARY AITKEN: You're welcome. So there is -- is there a chance that there could be a meeting in Chama or in the Chama Valley somewhere?

THE HEARING OFFICER: Any time soon, no. We have a schedule that we're going to complete here shortly, and the last two hearings we have in New Mexico are in Taos on Saturday.

MS. MARY AITKEN: Uh-huh (affirmative).

THE HEARING OFFICER: And after that we move to La Junta, Colorado, and meeting there on Monday, and

9

meeting on Thursday in Arkansas, and that's the end of this particular trip. And my role as a hearing officer is detached from the RBTI proposal process and the command representatives, and I'm not part of the command at all.

MS. MARY AITKEN: Uh-huh (affirmative).

THE HEARING OFFICER: So that particular question will better be put to one of the other Air Force people here. They are in the position to be able to state that, whether there is any plan or any possibility for these hearings.

MS. MARY AITKEN: They said just to pass -- to pass the sheets out, you know, to pass these out. And that -- because they're not.

THE HEARING OFFICER: Realistically, that's the best way to insure that comments are submitted.

MS. MARY AITKEN: Uh-huh (affirmative).

THE HEARING OFFICER: And the deadline, as you probably know, is 16 June, for sure, written comments to that address here at the bottom of the sheet.

MS. MARY AITKEN: Right. Okay. Is this a -- oh, you have to have your name and address. Okay.

THE HEARING OFFICER: Thank you.

MS. MARY AITKEN: Thank you.

(NOTE: From 2:46 p.m. until 2:56 p.m. no record was made.)

THE HEARING OFFICER: If you'd like to make

10

comments for the record you can make verbal comments.

MS. BERNIE LADD: I don't know yet.

THE HEARING OFFICER: This has nothing to do with your comments if you decide to make them, this is just the report I do. My job in this is to act as the hearing officer. I'm not connected with the other Air Force representatives here. They're part of the command. My normal job is a military judge. Where we have a big group of people, I act as the hearing officer and try to keep things going smoothly and make sure everybody has the opportunity to make comments.

So, if you do have something that you'd like to say, what you should do is sit down and just tell us what you -- what you think of this. And we'd like to know your name.

008291

MS. BERNIE LADD: My name is Bernie Ladd. To me, I don't care if you guys use it. It's --

THE HEARING OFFICER: How do you spell your last name?

MS. BERNIE LADD: Ladd, L-A-D-D. And as long as it doesn't bother my elk and my deer, doesn't matter to me. We tried to -- tried to stop them from putting in that airport over here, but it don't do us any good, so I'd say go for it, because they never listened to us before, you know, before when we wanted to stop an airstrip put in here. And we didn't want it put in here, but nobody listened to us.

BI-1

11

Out of, like, 30 -- there was a meeting, a public hearing, you know, for our little airstrip. And out of the 30 people there was, like, 27 that objected, and yet they still put it in.

So our council is not listening to what we have to say so, therefore, I'm going to go the opposite way and say, "Go for it." That's all I have. So that would be my -- you know, my -- as long as it doesn't go over my house, I don't care. Thank you.

THE HEARING OFFICER: Thank you.

(NOTE: From 2:59 p.m. until 5:20 p.m. no record was made.)

18

slowly. In addition, if you have a written statement, the court reporter would appreciate you handing it in so that any names, places, references to scientific terms or other data can be recorded accurately.

Finally, I'd like to remind you to limit your comments to the Draft EIS; that is the purpose of this public comment period.

If you'd like to turn in your written comments at any point, either during this period or at the conclusion, there is a box in the outer office or in the outer room, there, where you can place your written comments.

I'd like to get started now with our only public official, and that is Ralph Reyna, who is a Taos Pueblo Council Member.

008292

MR. RALPH REYNA: My name is Ralph Reyna, and I'm from Taos Pueblo, a council member for the tribe, and I'm a retired Air Force sergeant. And I'm here representing my tribe, and also for myself.

I am quite concerned about the military flights that are taking over over the northern part of New Mexico, and all the environmental things that we are worried about. The trees, the rivers, all the streams around the -- around the tributary, here.

The Town of Taos, the Pueblo, are well known world over. People come from all over the world to visit the Pueblo and

19

also the Town of Taos. Also, the Pueblo is listed under the world heritage list, and also the church in Ranchos de Taos also is a known area.

In an environmental area I'm quite concerned, all the headwater starts in our reservation, the lakes, Blue Lake, Bear Lake, Star Lake, and other small lakes in that area. That's where the water comes from, and if they get polluted, we don't want to contaminate the whole Town of Taos or any animals, wildlife, trout, eagles and falcons. They -- they come down to the Rio Grande area for their nesting time.

AO-1

And quite a few times I have seen B-1 bombers and KC-135 flying so low over the Pueblo on the western end of our reservation, and it -- oh, it's quite a nuisance to hear all that big noise.

Also, the -- back in 1994 a delegation of us went down to Clovis, New Mexico to oppose the military training flight that they used to have with F-111's intruding over our reservation, intruding into our religious doings in August, flying so low we -- you could almost reach up and touch the tail of the aircraft. The Colonel at that time told us that they'll abide with our proposal that they move their training route farther east from the reservation, from Angel Fire on east all the way up to east of Eagle Nest, and not touching the boundaries of our reservation.

I am very thankful that you gave me opportunity to speak

20

my -- my -- my opposition about this military training flight. I know it's very important to have our men ready for any combat that they might come upon in the future. So I thank you very much.

THE HEARING OFFICER: Now I'd like to turn to that group of individuals who have indicated a desire to make comments. And the first person I'd like to call on is John Acker. John Acker?

008293

Well, the next person, Andy Wasowski.

MR. ANDY WASOWSKI: Thank you for this opportunity. I have it in written form, I'll leave it here. My name is Andy Wasowski. I live in Valdez. When I was a kid going to Sunday school, I heard about something called original sin. Now, the nuns were pretty evasive about what original sin was, but I heard later it was supposed to be sex. When I grew up, I started to see the world and experience life and I reached my own conclusion about what original sin really is. It's the inherent dumbness of our species.

Now, think about it. We were given an incredibly beautiful world to live in, everything we could want, and in our dumbness we mess it up at every opportunity. We build impressive industries and turn out consumer products that we've all become addicted to, but with consequences. In doing this, we've polluted our rivers, oceans and made air

21

unfit to breathe. That's dumb. We develop high-tech means for commercial fishing to feed our hungry and we wind up emptying our oceans of the very fish we need. That's dumb. We think we know better than mother nature. Back in 1920 our government imported kudzu from Asia to be used for erosion control and it worked. So well that today they call kudzu the vine that ate the south. That's dumb.

We're continually only solving one problem to create newer and bigger ones. We're supposed to be a logical species, but as someone once said, if we were truly logical, men would ride side saddle. We think we can do anything we want without there being serious consequences. We cut down rain forests to create new farmlands, and in doing so we are literally cutting out our lungs. We develop genetically altered crops that can withstand pesticides that eradicate milkweed. But milkweed is a major food source for monarch butterflies. So, as a consequence, our grandkids may grow up never having seen a monarch. Now, what causes this dumbness? Well, in the words of Vice President Al Gore, it's our focus on short-term exploitation at the expense of the long-term health of the system, itself.

So now we're talking about training bomber pilots by flying over terrain that is in many ways environmentally fragile, and the consequences of that may well be destroying or seriously harming wildlife, livestock and the eardrums of

22

BR-4

the residents below. Certainly the consequences will include harming the tourism industry here, a major economic factor in our community. Often we don't even know the ultimate consequences of our actions. The domino that falls at the end of the line is often years, even decades away from that first domino that gets tipped over.

Now, I'm not one of those who view the DOD as an evil empire. I am neither a hawk nor a dove. I'm an -- I think of myself as a pragmatic realist. I served in the Marine Corps and I understand the need for a strong national defense and the kind of realistic training that makes it possible. But as a pragmatic realist, I have great doubts that environmental impact studies will truly reveal the ultimate long-term consequences of this fly-over training. There have been many studies in the past that have reached conclusions that in the end have proved to be false. Do you remember the Edsel? Ford Motor Company built it because extensive market research said it would be a big seller. As Yogi Berra once said, "What gets us in trouble is not what we don't know, it's what we know for sure that just ain't so."

I hope the powers that be won't wind up making another dumb decision based on short-term exploitation at the expense of a long-term health of Taos. Thank you.

My wife couldn't be here, but she asked me to give you this.

23

THE REPORTER: Thank you.

(NOTE: Mr. Andy Wasowski handed the reporter a document that reads as follows:

"April 15, 1999. **008294**

"To the US Air Force:

"The Taos area is not Everywhere USA. It is a very special place because of its unpolluted skies, its exceptionally clear air, its mountains, its beautiful native architecture, and its tranquility. People move here from all over the U.S. and all over the world because of these qualities. They come to heal medical problems, to join contemplative religious sects, to create paintings, sculpture, and literature.

BR-7

"Tourists come here because of the artists, Taos Pueblo, the health professionals, the skiing, and the natural beauty of the land.

"If the skies are filled ten times a day -- or even once a day -- with bomber maneuvers, there will no longer be clear skies, exceptional light, healthful air, contemplative religions and artistic work being created. Then there will be no tourists, no art galleries, no B&Bs, and no high real estate values.

BR-4

"The economy of Taos County will be destroyed.

24

One of the last spiritual and artistic refuges in America will be destroyed.

"Please do not fly over our clean skies."

Signed, "Sally Wasowski.")

THE HEARING OFFICER: Like to call on Ron Gersten. **008295**

MR. RON GERSTEN: I'm Ron Gersten. I own some land in El Rito and in Taos. I spoke the other day, was going to try to address some other things, mainly the Environmental Impact Statement and it's irrelevancy, in my opinion.

The impact statement talks about what costs to the economy of Taos would occur. I wonder if it takes into account the costs people have already given up to live in Taos where it's quiet? I left a higher paying job in New York to live where it's quiet. I'm sure other people have done similar things.

BR-7

My other question to you is, given the opportunity in some of these other alternatives -- because I think it's very important that we do have our Air Force trained, and I think this whole initiative is probably a good thing. I wonder about the other alternatives. Given the chance to have a big airport there, if they thought tourism would come to their areas and bring more money, too, the people would have said, "No, we don't want that"? Because in Taos we've done that.

25

We've -- your impact statement you say -- I want to know, is -- are you measuring the money that we're willing to give up to live in a beautiful, quiet place? Because that seems relevant and important.

BR-4 As far as it not having a direct effect economically is insane. We talk about the tourism that we could lose for the people that do make the little bit of money they make here. And I say if somebody is making very little money and you take away very little from them, it may appear on your impact statement that it was very little effect, whereas it's a big effect on people that don't have much to begin with but their quietness, which is why they came here.

So I just feel that it would be a gross violation of democracy for you to come here against the expressed opposition of the people who live here. And I feel, while it is a necessary thing, the RBTI, if you can't find a place where the people and the occupants of that place want to have it, then perhaps, sadly, you can't have it. Or perhaps you

PD-20 have to look to other alternatives, maybe you fly over the Gulf of Mexico and you have a simulator that if you go under 1,000 feet the plane blew up, but -- who knows.

But I'd like you, please, please don't come to this town where the people have expressed that they do not want you here.

THE HEARING OFFICER: William Brown?

26

008296

MR. WILLIAM H. BROWN, JR.: My name is William H. Brown, Jr. I live in the community of El Rito, Latir, at the base of the Latir Wilderness, and overlooking the southernmost part of the San Luis Valley where the Rio Grande Wild River area is located.

I'm a veteran of 13 years of being an officer in the United States Army and reserves, and I know very much what you're talking about when you need to have your troops trained properly. However, I speak to you today as a person who is not only a veteran, but also a victim of low level flying, because prior to moving to Taos County I lived on the eastern shore of Maryland, and we were plagued for years by

BI-3 low level flights, by the -- both the National Guard and the Air Force. It was very disruptive to us. It was very disruptive to our farm animals and to wildlife in the area. And I speak of this because I know this firsthand.

So I ask you today to please take this into consideration when you think of this area. And I'd like to speak very much for the area that we live in, because mainly my area is composed of ranchers, artists, composers,

BR-7 musicians and writers. And we came there, all -- all of us came there basically for the same reason, for the piece and quiet of this area. And we want it to remain this way. And I do hope that you will take this into consideration. This is one of the most beautiful areas in New Mexico.

27

We recently took a trip into southern New Mexico and Arizona, and this is just -- has to be one of the most beautiful places in the world, so we hope very much that you will take our comments to heart and not come to our area. Thank you.

008297

THE HEARING OFFICER: Elana Lombard?

MS. ELANA LOMBARD: Hello. I -- when my daughter and I were sitting here and you commented that her babbling might disrupt this meeting, it occurred to me that that's a lot less noise than having B-1 and B-52 bombers flying over your -- the place you live every day, ten times a day. And you've asked me to move back, and I would do so respectively -- respectfully. But I can't ask one of these loud jets to -- to move because it's disturbing my piece, it's just going to keep coming.

BR-7 And, yeah, my family moved here from the San Francisco Bay area where we made a ton more money, like the younger gentleman said, and we are struggling to live here, but we live here because it is such a beautiful and peaceful place, and a place that I wanted for my child, and to grow up and it would be peaceful. Anyway, I just don't want all the noise of the city and all that stuff to -- to disrupt her -- her up bringing.

And also I think about the endangered species that are trying to live out in the wilderness and, you know, you're

28

trying to protect we, the people of America. We are not threatened and endangered. Yet, there are these animals that are threatened and endangered. And what are we doing? We're

BI-5 not trying to protect them more, we're going in flying over them which is going to disrupt their mating habits, their feeding habits, critical activities for their livelihood to exist as a species.

So, what's more important? You know, if we were that threatened of a species, I'm sure our government would do a lot to try and protect us. I think the other species on this planet are very critical and support us in ways that we will never know. And not only for our living, but also for our peace and -- and quality of life. So I would like that quality of life for my child and her children, et cetera. Thank you.

008298

THE HEARING OFFICER: Angie Cantu?

TY MS. ANGIE CANTU: I'm Angie Cantu, and I've -- I'm an outsider, myself, but I've lived here since 1946. I came here by the fact that I got married to somebody from here, and I have raised a healthy family here, no complaints, no sick people. We've all gone to higher education, and some -- my husband, my two sons were in the military, my granddaughter is there now. She's going on to -- she's finishing training this weekend and then going on to the airborne, and who knows where from there.

29

But I am for the people that are trying to come and train here, and I think that they should come and train here because they need the proper environment and terrain to train on. And I don't see -- I really don't see that much of a problem, because planes have been flying over this area for many years. And my daughter lives by the airport in Los Angeles. She's never complained there, nothing has fallen down over there, and I doubt that buildings and the Pueblo -- and our own adobe building here in town hasn't fallen down yet, and I don't think it's going to.

So, I am for you to come and fly here over this area, and I'm sure that my husband, who was a very public minded person, would have given you the go ahead, too, but he's long gone now. And I am for you to come and train here because this is -- this is a necessary terrain that you need to train on. I'm for it. Thank you. **008299**

THE HEARING OFFICER: Agnes Anderson?

MS. AGNES ANDERSON: Thank you for giving me this opportunity. You haven't finished your Environmental Impact Statement yet, have you? I mean, they haven't finished the whole thing? Because when I was at the meeting last year, I had mentioned one of the things that I was worried about was not only the noise factor, but also the fact that we have homes in Taos, and in Taos County, that are hundreds of years old that have been owned by the people who

GE-10

30

have moved here, the Spanish, and then we have our Native Americans.

The Pueblo is documented to be 800 years old, but they're constantly remudding it and readobeing it because it is a fragile adobe, just like all the homes that are in this area are.

CU-1

Now, this morning I was told that you would be flying in an area approximately 10 miles from Taos, and in the area going up toward the -- Costilla, the Costilla area.

UNIDENTIFIED VOICE: Questa.

MS. AGNES ANDERSON: This is all a very fragile area. And we hear the bombers and the jets flying over, and they're way up there now, and so if you are only 10 miles away from us, we'll hear you.

Now, this state, the people in this state have always been military people. They've been in the Air Force, they've been in the Army, they've been in the Marines. Going back to World War II, most of the people in the Bataan Death March came from the State of New Mexico. So, these are people who are not against the military. None of us are. We know you need the training sites, but we ask that you don't do it here in our area. **008300**

Thank you.

THE HEARING OFFICER: Teri Luduigson?

MS. TERI LUDUIGSON: Good morning. My name is

31

Teri Luduigson, L-U-D-U-I-G-S-O-N, and my husband and I live out on Hondo Mesa.

I wanted to make four points. Some of them are repetitive, perhaps, but maybe some things bear repeating. The first point is one that was brought up in the review here this morning, and that is in the executive summary. The greater impact for Alternative D, which is the area that includes Taos County, is, without exception, consistent and substantially relative to the Alternatives B and C.

Number two, the concept of habituation was introduced in the Environmental Impact Statement draft report as a reason that humans will not be adversely affected. Habituation is a technical term much researched in the field of experimental psychology. Unfortunately, it's not a simple concept. Habituation in the face of a continuous, predictable stimulus is one thing, but habituation in the face of a sudden burst of sound perceived as being very loud, which is also very unpredictable, is quite another. Furthermore, it isn't necessarily true that habituation is achieved without cost.

Number three, computer simulation and it's potential for training wasn't an issue that was introduced at previous public hearings. I understand that the Air Force has some reservations about it. I have to point out, however, that if NASA could train and mount successful space flights without realistic training, which was obviously not achievable, then

32

why cannot the Air Force do this? The ability to change and flex a training program is infinite in computer simulation. Efficiency would be maximized, it seems to me, far in excess of the efficiencies alluded to in the alternative suggested here. From my point of view, it seems that computer simulation would offer important benefits as conflicts mount around the world. Computer simulation might offer hope for more effective outcomes in post cold war conflicts where our strategy seems to consist primarily of hitting at gnats with hugely expensive sledge hammers.

PD-5

Computer simulation might offer relief to the increasing invasiveness this high-tech equipment poses for the private lives of the populous. Perhaps some innovative thinking is called for.

I see you raised the red flag. May have one more minute to finish my last point?

THE HEARING OFFICER: As I said earlier, I'm not going to stop anybody from continuing past the three-minute point. It's just notice to you how long you're going.

MS. TERI LUDUIGSON: Okay. Thank you.

Point four is the economic impact issue. This did seem to be given very short shrift, and I certainly didn't see any analysis that satisfied me that the subject was seriously addressed. But perhaps the conclusion that the noise level

33

was inconsequential since humans, interestingly enough, in contrast to the animals, under the apparent assumption that we are not animals, which I found rather astounding -- but the conclusion that humans would habituate, perhaps this meant that the economic impact was not worthy of serious effort and, in fact, I think this was suggested in the introductory review of the EIS.

I think you've seen in your base, here, that this is a very diverse community, but we are held together by a common thread, and that is love for this land and its peaceable use. People don't stay or come here to make money. You've heard that over and over. But people do stay here for generations. They come back after being educated in the best universities the country has to offer. They move here and stay and suffer the inconvenience and expense and low incomes for that common thread.

Yes, we have something like 24 percent of our population living below the poverty level. Yes, we have unemployment that's four times the national average. And yes, we have no super highway, so all our goods and services are more expensive; that includes housing, food, clothing. So we make less money, we have fewer assets, and we pay more for what we have. The potential economic impact on a community that is special, fragile and existing on the edge should be given serious consideration. Will tourists have prehabituated to

BR-4

34

the noise levels?

On a personal note, would my husband and I have joined this community a year ago, purchased a home with the assets we were lucky enough to build elsewhere, if we had known about this threat to a place that we have loved coming to for 30 years? Huh-uh (negative). But we didn't know. Is that economic impact and are we unique?

Thank you very much.

THE HEARING OFFICER: Mary Lowe? Mary Lowe here?

Ed Slook. Ed was here earlier.

Gordon Saunders? **008301**

MR. GORDON SAUNDERS: I would like to thank the Air Force for giving us this opportunity to vent our concerns. I know that you have a lot at stake. I hope that you will return to your bases convinced that we do have a lot at stake here.

My concern stems from the two planes that are involved. I don't know if anybody has raised this issue before, but the B-52 was first flown when I was a young man in my early 20's. In three weeks I turn 60. I'm old. The B-52 is old. Commercial airlines usually get rid of their airplanes between 15 and 20 years; I think I'm right on that. And I have had short trips on some trans Atlantic flights on some planes that are about 15 to 20 years old. Some of them are

AF-51

35

pretty scary and the planes were beat up and half the age of the B-52's that are now flying.

I have read a number of times that the B-52's are kept flying by cannibalizing old planes that are in even worse condition. This is not reassuring, especially if it is anticipated that these huge craft will be put down within 300 feet of the ground at times. B-52 was conceived as a high altitude bomber. What purpose could be served by flying it at 300 feet?

AF-51

PD-1

The B-1 has a checkered history at best. It was killed as out of date and too expensive in the Carter years, then revived by the Regan administration and Bill, in spite of some levels of protest that came from high levels in the military. It did not fare well early on, going down like a winged duck on a shooting gallery because the ground avoidance system was defective and the plane plowed into objects, like the mountains in Taos, with disturbing regularity. While I assumes that the avoidance system has been corrected probably with laser technology, the bad weather can affect even laser guidance systems as has been amply demonstrated in the Gulf War and in Kosovo.

Your own officers have admitted that Alternative D is probably the most controversial option, and it is not hard to see why the ecology of the area is already fragile, population growing and the ancient adobe structures certainly

CU-1

36

stand to be damaged by vibration generated by low level flights.

CU-1

Finally, if these two craft were to be phased out, I assume that they're old enough that they must be facing phase out, I shudder to think of the noise levels and speed factors that will accompany any replacement craft. They will be faster, more maneuverable, louder, and because of these attributes, more dangerous to those on the ground, whether they be friend or enemy.

The Air Force has a reputation of being one of the most rational and responsive branches of the military service. Here is a golden opportunity to reinforce that public assessment. If Alternative D is chosen, you will generate permanent animosity in this region. That is hardly an objective worthy of consideration by the Air Force.

I'm almost done. Regardless of how much money is saved, hate to think what the taxpayers would be footing in the way of costs for 2600 flights a year. Why not cut back on the number of flights and affect the savings that way?

PD-1

Those are my concerns. Please add those to those that have already been expressed. Thank you.

THE HEARING OFFICER: Tony Trujillo.

MR. TONY TRUJILLO: Good morning, Colonel Burd.

THE HEARING OFFICER: Good morning.

37

008302

TY MR. TONY TRUJILLO: I'm from Questa. I'm here to speak for my nephews and nieces, two of which are -- have been living there for the last six months tending their grandparents, right underneath the proposed flight plan over the general area near Amalia. All my nephews and nieces have attended the Rio Costilla Ski Area. That's a recreation area.

I'm not here to speak for the adobes, I've moved an -- enough of them all my life that a little more work won't hurt, but it's all been at that poverty line, too. It helps to add more work and with more people coming in, it's -- it's better. Living around here is better. But if they're going to be turned away by this, that's being proposed by Air Force, that the -- the -- the smallest parts that I'm concerned about.

I'm standing up here because under the constitution there is -- there is this part that says that we are guaranteed to a republican form of government, that's where any ill is addressed. And that's what NEPA and all these things have to do with, if I'm right. You being the judge, you probably have a little better idea. As far as having that right, I've sat here because a lot of my kinsmen and family members have been decorated, both posthumously and in person, for what they did for the armed services in world struggles.

38

The -- the fact that I am here should be enough, in protest of this, for it not to happen if the constitution is read right as we shall not have to surrender our homes to the military for -- for housing or any other thing. And the intrusion of the noise is a trespass, and there is -- any sharp lawyer I think can argue it out. You have enough room. You have the technology, you have the ways and means to get around it.

All this is, usually, in government, first problems that are things that -- that the Colonel -- I forget what this Colonel's name is -- mentioned the first thing is that they have to get rid of their budget or allow for their budget. That's what I've seen in government mostly.

But all that aside, there is a stronger sense that you should not do this than you should, and I just hope it works out that way.

THE HEARING OFFICER: Punya Upadhyaya? And excuse me if I mispronounced your name.

008303

MR. PUNYA UPADHYAYA: That's fine. It's always fun to figure out how to say it. Punya Upadhyaya, P-U-N-Y-A U-P-A-D-H-Y-A-Y-A.

Good morning, Colonel, ladies, gentlemen. Thank you for this opportunity to share our feelings and thoughts. As you've heard already, people do very irrational things to come to Taos; all right. We give up jobs, we give up money,

39

we give up opportunity so that we can come here. And there is what is -- I heard your presentation, I'm sorry I didn't get your name. I realized that the military is making similar irrational efforts to come to Taos. Can't blame them. It's a lovely place and there are many ways in which we would welcome your presence here.

But as I look at it, my focus here, it shifts on the comparison in terms of B and C versus Alternative D, and I'm really struck by the incredible dispropensity that I see here for Example D: 30 special use land management areas that are affected. Under Alternatives B and C two will be affected. The number of endangered species that will be affected are quite -- you mentioned three, your document out there mentions seven to nine. There is one mentioned in Alternative B and C.

In terms of reduction based flight time or not knowing how you're framing it, but the flight time that it takes the bomber as you get to the place where they're actually doing the training. You only save 45 percent of that as against 70 percent influences, or 89 percent more option. I mean, that seems to be the most technologically or economically compelling reason to actually create alternatives, and I'm struck by how we even got in the ballpark with that kind of savings. I mean, statistically speaking, that is significantly irrational.

40

BR-1 In terms of the data you supply us, I am again very struck by the average data you're using about DNA levels. Averages are not the point, the point is the event, so the use of statistical averages seems unfair. What are the differences there? And again, I'm struck by how, in terms of our public use areas are affected significantly, about public use areas and other areas. Again, our average levels are significantly higher than the DNA changes that are going to take place in other areas.

And when you said -- I was struck by how you dismissed the environmental justice issue when you said that the noise levels did not have necessarily much of an issue. There is pollution, there is vibration, there is residues, there are particulates and so on that are -- which will significantly **AO-1** affect us. For two reasons we're trying one significant effort: One is to develop an economic alternative focused on organic agriculture, not big in our numbers but it's big in our heart, and that will get affected.

And thirdly, a lot of people come here because they're **AO-1** chemically sensitive and so on, and it would help them, and you would destroy part of the reason they've come here.

Lastly, concerned about the safety record. Last, safety **AO-61** risk. And in terms of the pollution and -- a large plane falling down on you would have a significant impact.

So we do have concerns and hope that you will take them

41

into account and make a rational choice. Thank you.

THE HEARING OFFICER: Stephen Kelley. 008304

MR. STEPHEN KELLEY: I've got a written statement I'd like to present. It doesn't take an Environmental Impact Statement to understand the damage that will be done by low-flying bombers to Taos. The idea of desecrating the peace of northern New Mexico with low-flying jet practice, land which is laying virtually undisturbed in its natural state for eons, is out of the question. BR-7

Those of us who live in Taos are given the rare opportunity to exist in creation as God created it before it was screwed up by the greed and bungling of man. As was eloquently pointed out at last year's hearing by our mayor, Taos is a global peace zone and, as such, is certainly as important to keeping of the peace as preparation for war. To violate this peace with low-flying jet bomber practice is to destroy our very peace that our Air Force exists to protect.

Many people who have traveled extensively on the earth consider this among the most beautiful and unspoiled locations on the planet. It has been suggested that the Air Force should stick to areas that have already been ruined by their flights. To suddenly invade this area which has lain for centuries undisturbed merely because the terrain is appropriate, because the Air Force wants to save a few bucks on gas, and two hours' flight time that are required to fly

42

to other areas is no good reason for being here.

Already they are flying here. Many reports come in of low-flying jets well below the 300-foot ceiling. Pilots, contrary to what they might feel, are not Gods in the sky, and unlike Gods, they are subject to errors in judgment, as was evidenced by the training flight shenanigans in Italy for which the Air Force took no responsibility. This sort of impunity in taking responsibility for one's own actions does not bode well for anywhere that the Air Force might fly.

Low-flying jet practice is not just a question of preserving old adobes and the cracks that might damage them. What needs protecting here is peace, peace for the people, peace for the animals and peace for the land, itself. CU-1

There is only one winner in this situation, peace or its disruption by war. As Lieutenant Curry suggested not long ago in the February 11th edition of the Taos News, hoping that we might buy this, "It's a win-win situation," he says, "because we'll keep the integrity of our training requirements while taking into consideration the needs of the Taos Pueblo," totally ignoring the resounding no that greeted him last spring from all the citizens of Taos.

His other statement was, "Without sacrificing our own training purposes, we were able to mitigate the route a bit to make both parties happy." Mitigating the route a bit will not satisfy the people of Taos.

43

Thank you.

THE HEARING OFFICER: Chris Pieper? 008305

MR. CHRIS PIEPER: I thank you for this opportunity to speak, and I appreciate that it must be difficult for you to come here.

I grew up under Moffat Field in the Bay Area where there is a lot of over flights. And you do become habituated to the noise because you live in an industrial area, and so the impact of the flight is not that significant. I've also spent a lot of time in eastern California in the desert, and in the mountainous terrain of the Sierra Nevada where I have backpacked, and you become habituated to the level of quiet and then when a bomber comes over it is very disruptive. Much more disruptive than it is in an area where there already is a lot of white noise, a lot of noise generated by an industrial area.

This area that you're talking about flying over is known for its silence, the darkness of the night sky, and a peacefulness of the surroundings. The Valle Vidal has been called the Yellowstone of the southwest. And there is no question in my mind that these flights will have a profoundly negative impact on this area. Lot of people do come here because this area is clean, there is less noise than other areas. BR-7

And so to cause the least disruption, I would highly

44

recommend that you choose another area. And I hope that when you come to make this decision, that you use -- you use your rational faculties and determine that this is an inappropriate area to come.

I teach at Taos High and enjoy it very much. Teach science there, and I know that my students -- thank you -- resoundingly oppose this initiative. So I -- I am here partly representing them, myself and my family and this whole community.

So thank you for this opportunity to speak, and good luck. 008306

THE HEARING OFFICER: Helen Visarraga.

MS. HELEN VISARRAGA: Good morning. Thank you for this opportunity to talk to you this morning. I am -- my family is originally from this region for 300 years. The culture here has suffered enough oppression, this is just another form. I'm a social worker in the community. I serve as the out-patient clinical director for Taos-Colfax counties in serving the families and children, and I am here today representing the families and children of this community. TY

The B-52 bomber is a symbol of violence. It's a symbol of destruction. We do not need any more symbols of violence and destruction here. We are in the midst of high racial tensions in this community and in the surrounding areas. We have had a lot of violence here. We have had a lot of racial

NORTHERN COURT REPORTING

45

tension. This impact of having B-52 bombers here would only escalate that social tension.

It's important for the Air Force to recognize that you have other alternatives, we don't. The families and children here do not have other alternatives. They can't just move, move away, and find another place to live.

Many writers, myself included -- I'm a writer and a poet -- we come here, they come here to -- to take advantage of the consciousness of the peaceful setting, the quiet environments and the cultural diversity. And we, as a community -- many of the agencies involved here in -- the agencies against violence include the judicial, the legislative, the social factors, agencies that represent families and children, the police department, the state department, many other factors are involved here in representing to you the need for you to encourage the federal government to find another alternative to having B-52 bombers influence and impact our peaceful community.

So it is from my heart, and as a representative of (Spanish spoken).

Let me interpret that. I want you to record this. And make sure that you are aware of the consciousness of the people that is being impacted here in the elements of violence, of destruction and abuse that you will be enhancing, should this project be allowed to continue.

46

008307

Thank you.

THE HEARING OFFICER: Annegret Pollard?

MS. ANNEGRET POLLARD: Good morning. Thank you for this opportunity to address the issue.

First off, I would like to ask each of you who is on this hearing panel -- madam, you also -- the two officers, then -- have either one of you ever been living as civilians in an area where these kinds of flights take place, and have you ever been bombed or strafed yourselves? Which is, after all, the end result of what this training is supposed to achieve. Sir, would you please answer me this question?

THE HEARING OFFICER: I believe you came in late. And one of the things I indicated is that this public hearing is not a question and answer session, so if you have questions that you wish to state as a part of your comments that's perfectly acceptable, but we will not be answering any of these questions in this forum.

MS. ANNEGRET POLLARD: Thank you. I would assume then that you have not, and I would like to suggest that the experience of these overflights, which I have had in other places in this world, in Europe and in other places in this country, are extremely dangerous to people, even when they get used to them. They're especially damaging to children who incorporate this kind of perception. And we never really quite get over that for the rest of their lives.

AF-18

47

I have been bombed. I have been strafed. And it is an experience I probably share with other people who live in this community, and I can tell you that it is something unforgettable.

The second issue I have is that I think the military, the Air Force in this case, is being quite wasteful. And I don't think that the military services are really ever called to account to be economical in their thinking because everything you want is provided, and then more.

Thank you.

Wastefulness in simply picking up on another area which already has low over flights. I have seen these machines myself, daytime and nighttime, helicopter formations were coming through here, is rather disturbing for all of the reasons the other people have already mentioned.

And the last thing, I thought it is curious that the Air Force has not yet found a way, with all the brains working for it in this high technology game, to establish a virtual reality. Walt Disney might be helpful with this, too, to establish training grounds on white sands or wherever and use your very best computer programing to enable these pilots to learn what can be marked even to differentiate between a pig and a person, to -- to do this in areas already destroyed by these exercises, rather than picking on areas such as Taos or northern New Mexico or any new area which would be destroyed

PD-5

48

by this in their character as they are.

Things are difficult here for people, and I don't think the Air Force should even consider adding this area to waste.

Thank you very much.

008308

THE HEARING OFFICER: Todd Thompson?

MR. TODD THOMPSON: Good morning, gentlemen. I just wanted to make my comments brief, but I'm basically opposed to the choice of this particular -- this particular location for the RBTI. I think both of your other alternatives present less of a hazard and impact to people on the ground, as well as the overall environment, not that I am for this particular activity at all, in general. But if it has to be done somewhere, I think the other two alternatives are much better locations.

I would just like to say I have been living in Taos County area for 20 years. And during that time, I have had experience with military over flights in a number of different conditions. When I lived north of Questa there is evidently a fighter plane route that flies through there, and a number of times we had sonic booms and broken windows, this kind of thing. It would be very difficult for the home owners to recover their damages, even though they did try and pursue that line. So that has been ongoing for at least 20 years that I know of in Taos County.

We are also subjected to training routes evidently from

AF-15

49

a National Guard unit out of Curtland Air Force base in which I have personally experienced C-130's flying anywhere from looks like 50 to 200 feet above the ground north of the Taos airport area, what's known as Hondo Mesa. I've woken up with one of these C-130's right there in front of my front windows and my kids screaming, you know, "Daddy, we're going to be bombed," or whatever. And this happens on a regular basis every few months.

I've also been down in the Rio Grande Gorge near Arroyo Hondo when two or three Blackhawk helicopters will be coming up through the gorge at a very low altitude, terrorizing the wildlife, the human life, the people down there using the river, terrorizing my children in this case. And as recently as last September I've seen training exercises over the Rio Grande Gorge, again in the Taos airport landing zone. And I've talked to people at the Taos airport. This is in violation of requests they've made to these National Guard training units in which two -- in which three or four C-130's fly in a figure eight pattern varying their location.

And all of this is to say that Taos County is already subjected to a very high level -- an amount of training missions by other air units, whether out of New Mexico or Oklahoma or wherever. We don't need to be subjected to any more; okay? What we have is enough. It's terrorizing to the people, to the wildlife.

50

And if you take into account in your environmental assessment all of the other impacts that are affecting Taos County in terms of the military air flights, then for sure yours doesn't need to be added to all of that. So, appreciate it.

Thank you.

008309

MS. JANE RING: Jane Ring. I bought a house in Taos six months ago, and I came here to heal from a death in my family, as well as my own healing process from a recent illness, and the bombers would substantially destroy that peace and the healing that's happening. **BR-7**

A lot of houses that are built here incorporate solar energy. The entire side of my house is all glass, so -- I know that you can't answer questions, but my question is how will these flights affect the glass in my house? **AO-12**

Also, a lot of people that live here are artists. I'm a photographer, and substantial source of my income is from photographing the landscape and the wildlife. And I'm concerned not only for the welfare of the wildlife, but the fact that B-1 bombers would affect them when I'm trying photograph them. **BI-3**

I do acknowledge the importance of your mission, and I'd like to encourage you to find a location to do this that is far away from people and wildlife.

Thank you.

51

008310

THE HEARING OFFICER: Shirley Shepherd?

MS. SHIRLEY SHEPHERD: I came rather late, and my remarks will be brief, but I do believe that this is a -- not a terribly necessary operation. And as a person living in a so-called democracy, I believe that all of us should have a voice, rather than just having military tell us what to do.

Now, I also have had teenagers and they have taken driving lessons, not at any risk to their lives, which I think young bomber pilots might have in a training mission of this kind. I think that the driving lessons are given in a simulator situation in which the young driver is inside a pretend car and they can tell when they're doing something wrong or something that is going to cause their death. I do not want young bomber people trained in my backyard to crash and die in a mission that I think is futile at any cost. **PD-5** **AO-61**

Thank you.

THE HEARING OFFICER: That exhausts all the cards that have been filled out by people indicating a desire to speak. I'd like to know now if there is anyone who has not spoken that would like to? Yes?

008311

MS. KATIE WOLFMAN: Thank you. My name is Katie Wolfman. I live in San Cristobal, five miles south of -- of Questa where your airplanes will be flying and that, just to let you know, I'm totally opposed to having you come

52

here.

The issue I want to raise this afternoon is fire. In my village two years ago someone was burning their trash, put it out, went to church, but the trash can was very hot. It started a fire that caused 200,000 forest acres to be burned. Only one little, teensy trash can. We were there, me and my vecinos, within 20 minutes, but we have no water. We only had shovels. There is no fire fighting equipment in this entire county, except in this little town. Any plane that crashes would start a humongous fire. We are very dry here.

This was a terrifying event, maybe as traumatic as war. Within an hour, the fire was 3,000 feet above our little heads with our shovels. It took ten days for them to be able to contain the fire, because to get in the mountains, even with helicopters -- thank God they came, one time I certainly was glad to see them come, even though certainly they were noisy, had to come and lay their slurry.

This is not a safe environment. We have no emergency care. We have no fire care. This is not a good place to train. You are putting your pilots in places that are very risky, with the ground flows of air, everything else that comes from each valley, our information, our sense knows. This is a foolish place to train, this puts your people who are my relatives in your service at risk. It puts us who live here on the ground at risk. **AO-16**

53

We ask you not to come here. Thank you.

THE HEARING OFFICER: Is there anyone else who has not made comments who would like to come forward now and make comments? Is there any -- yes? 008312

MR. GEORGE SHEPHERD: Yeah. My name is George Shepherd. My wife just spoke a moment ago. We both have lived here for five, six years. I just want to make a point that I'm sure has been made many times before, that is, if you are in a home, by the news that we've been reading, that tragic crash and loss of life in Italy -- and sure that the Air Force knows that this is a heavily skied area with many ski tows, and that apparently accidents happen from this kind of low flight that you plan to make over this area. AO-61

And that not only taking into account, but I can assure you gentlemen that if anything like that should happen in this area that happened in Italy, it will not be as easy a sentence in terms of those who were responsible. Politically, democratically, we will hold those responsible for any kind of accident of that type.

Thank you.

THE HEARING OFFICER: Is there anyone else who has not made comments who would like to make comments?

Mr. Williams?

MR. DANIEL WILLIAMS: Sorry I had not turned in a card, so --

54

THE HEARING OFFICER: Thank you.

MR. DANIEL WILLIAMS: Thank you. 008313

My name is Daniel Williams. The -- certainly the gentlemen at the front know me. I've made comments in Angel Fire, I spoke four times that night, and once at the Taos meeting the other evening. There -- as far as my background, as I've said previously, I retired from the Air National Guard as a major. I was a director of operations for one unit and operations change officer for two units.

The normal RBTI, if I can say that -- anyway, it really does makes sense from an Air Force training prospective, if we're going to send our young men and young women to war, it is important to provide the kind of training they need. And so my personal position is not in opposition to the military and military training, and it's not even to RBTI. It is, however, a very strong opposition to Alternative D, because I'm convinced that while the training would be realistic and would be very beneficial training, it doesn't justify the devastation that would occur to northern New Mexico as a result of this route.

Something I would like to point out is that while I do not want to wish the low level overhead bomber flights on the good people of Texas, the other alternatives do make more sense than does Alternative D. And one of the key things there is that there are already bombers there. In looking at

55

the numbers, it appears that because of the number of flights that are in existence on the other routes, it would be approximately a 66 percent increase versus if this were to happen in northern New Mexico. For us it would be approximately an 1800 percent increase.

While there are flights on the existing routes, it's a few flights per week, where we would now be talking about 10 to 12 flights per day on average of six days a week.

In addition, Kenamen Air Force base, which owns IR-109 which much of the proposed IR-153 covers, has established their 84 noise sensitive areas in northern New Mexico. I do not have the data in front of me to know exactly where those are, but I would ask that you contact Kenamen Air Force base to find out where they are and ensure that those are examined for the EIS. PD-38

They're -- in the final thing, sir, I'd like to ask, that the public comment period be extended from 90 days to 120 days. As you know, it takes roughly a year for the Draft EIS to come out after all the comments are done, another six months or so for the Final EIS to come out. And yet, originally the public comment period was going to be only 45 days. In my opinion, the -- that -- rather than simply being to streamline the process, what that would be designed to do is to limit public comment. AF-50

So we appreciate the fact that it was extended to the 90

56

days but, sir, we will ask that you extend it to 120 days as Senator Bingaman and others have asked. And the reason is to allow people to go through a very thick document. Most people are not familiar with the technical aspects, and it gives them a chance to go through and really see what kind of impact it might have. And as we -- as I did point out previously, there were two areas that it showed no impact, whatsoever: One being the socioeconomics, and because of the tourism this would have an incredible impact. The other had to do with -- with the cultural resources. And again, that does not reflect or honor the -- the culture of the people of Taos Pueblo, their areas they hold sacred and so on. BR-4

So from my position, I'm not opposed to RBTI to do military training, but simply to Alternative D. And the thing that does make sense about this is that the routes or the flights are already taking place. What we're really talking about is simply bringing them closer, save maybe about three flight hours per mission, and in so doing at $10,000 per flight our saving $30,000 per flight and millions of dollars, and millions of tax dollars which, in fact, are our tax dollars.

So, I'm not asking to you do away with RBTI, simply to choose an alternative that has a lesser impact and realizing that this alternative, by your own, is -- through your own study you can see that it clearly has the highest impact, and

57

we believe a far greater impact than what the study shows.

Thank you.

THE HEARING OFFICER: Is there anyone else who has not spoken that would like to come forward and make comments? Now, of those -- and I'd like to remind you that in less than an hour we're going to start our second public hearing, and you'll be given an opportunity during the comment period in that hearing to make comments if you have additional comments. But if anybody has a burning desire to make additional comments and you've already made comments, I will permit you to do so now before we take our lunch break.

MR. RON GERSTEN: I just wanted to --

THE HEARING OFFICER: Could you restate your name again? **008314**

MR. RON GERSTEN: I'm Ron Gersten. I just wanted to briefly address the fact that it seems so important to the proposal that this is a place that already has all these existing flights. I'd like to also point out that we're not asking for questions, here, but that I think the overwhelming majority of the people here would love to see those routes diminished rather than increased. So I think that takes away from a little bit of the "Well, this is existing stuff going on." We don't like it going on, for the most part is what I've heard.

And I also wanted to point out or ask without an answer,

58

that as a ski instructor I teach children up on the mountain. And I had one incident this year while I was up on the mountain where a fighter, and I don't know what kind, came flying very low right up a trail called Bamby, wung up around the ridge, looked like it was going to hit it. But one of my kids, one of the group of four, was crying and wanted to go back inside because he was scared.

AF-6

I'd ask, was that one of the existing flight paths or would we admit that people who are flying these planes, just like myself who sometimes blows off a stop sign, sometimes do things they're not supposed to do and, therefore, go off these routes into some of the more sensitive areas like the Pueblo lands that you carefully avoided going around them this time. So last -- I guess you changed the route from last year. So, it could happen, and I just wanted to point that out.

Also, that allowed the people that are in the age I believe that would be flying these jets insurance companies consider the highest risks for autos because -- not because they're not coordinated and can't handle it, because at that age a lot of people sometimes do things that they shouldn't, like to show off, and perhaps end up cutting the wire. I just wanted to point that out.

And then as far as the economic impact, I just wanted to state, I did mention I own land in El Rito up north of here.

59

It boarders the Latir Wilderness. I believe I paid a little extra because it bordered the Latir Wilderness, which you are now wanting to fly over. So, I believe you all have access to my address, but I just wanted to state that if, in fact, you do pick Alternative D, please contact me. I have a cabin with five acres that I would be very willing to sell to anyone, you know, probably at a lot less than I paid. So keep that in mind when you say there is no economic impact possible here.

BR-4

Thanks.

THE HEARING OFFICER: Would anyone else like to make any additional comments?

Ladies and gentlemen, that concludes this public hearing. Thank you for your participation and input --

MR. GREGORIO VICINTE: Wait just a minute, please.

THE HEARING OFFICER: I have one person who would like to make comments. **008315**

MR. GREGORIO VICINTE: My name is Gregorio Vicinte. And last time I mentioned to you about this flight patterns that you have established for this area, and these buildings, all the buildings in the surroundings areas, mountains and cliffs, that would be effectively disturbed by the sounds of the jets. And like I said before, you -- you have no guarantee for any citizen of this area that there

AO-61

60

AO-61

will not be no accidents.

You cannot guarantee us, but you can prevent this. And prevention is the key of this thing. Prevent the accidents. Who knows how far we're going to go on to this war that is going on right now, so you do need to have a place. You do -- you need to have a good understanding of what are you doing in this area. And by us coming here to listen and to talk and to testify whatever our feelings are is not going to be enough. You have to do the rest. You have to provide us protection.

THE HEARING OFFICER: Is there anyone else that would like to make comments? Mr. Williams?

MR. DANIEL WILLIAMS: Thank you very much, sir. If I may, I didn't address the comments regarding the EIS, but if it's all right to you, I would like to give some information to the crowd just for a moment regarding the EIS. Would that be all right?

THE HEARING OFFICER: Would you like to make comments?

MR. DANIEL WILLIAMS: Yes, your Honor. Thank you.

THE HEARING OFFICER: If you would like to make comments, you may make comments. **008316**

TY

MR. DANIEL WILLIAMS: There's somebody who mentioned they were not here to ask questions, and certainly

61

that is true in terms of the Air Force responding to many comments today. However, what we can do is we ask -- ask questions, and part -- as part of the EIS, the Air Force is required to answer every one of our questions. And so the questions are very important, not necessarily just for the meeting here and verbally, but write them down. If you've got five questions, you don't have to know the answers to those, ask the questions. And that would be included in the Final EIS.

So, I've got a list that I will be submitting that has 75 different questions on it, and those I can -- I can reasonably expect to be included. So, anything you've got questions, pose it as a question and write it down. But what's most important is -- is the written comments. Those are what -- that's what's going to be available to the decision maker.

Writing letters is -- is incredibly important. Make sure whatever you write goes to the EIS, but in addition to that, make sure that you send a copy to our legislators. We've got the addresses out at the table. And there is a route, if you want to see where this -- or a map which shows where this will be on the route in relation to your homes and areas that you care a lot about.

But in addition to writing your legislators and the -- submitting comments to the EIS, another thing that would be

62

very valuable is send your comments to the Secretary of the Air Force, Mr. F. Whitten Peters. The Acting Secretary of the Air Force will be the ultimate decision maker. He'll be getting a briefing and a recommendation, but what you submit to him -- he doesn't normally get the letters from the individuals. You can send them to him so that he will know how you feel and he will, therefore, not be insulated from the feelings of the people here, so --

Sir, thank you very much. I appreciate it.

THE HEARING OFFICER: Is there anyone else that would like to make any comments? **008317**

TY MS. HELEN VISARRAGA: I have just one last one. My name is Helen Visarraga. I would like you, as you go into your deliberations, and in promoting your mission, which I think the military wants to keep peace for our Citizens -- but please also keep in mind that -- do not -- in the process of keeping the peace for the nation, that we don't wage war on its own citizens; okay? **008318**

MR. PAT LAWRENCE: Good morning. My name is Pat Lawrence and I live in Questa. I'm not real good at speaking in front of people and I almost didn't want to come up here, but I can't let this opportunity go by.

It's a wonderful presentation you folks have made out there, and took a lot of work. I met some nice folks that work for you out there. I'm not here to talk about whether

63

we need to teach these kids how to fly planes and go over -- and the politics involved in -- in any of the reasons why you need to train.

PD-4 I'm here to say that I think there are other places you can train, and obviously environmental impact statements are often skewed. They're very ambiguous. They can be twisted and test cases from Nevada and Arizona. You can color it any way you'd like. The problem is you can't -- can't take an area and put down its essence of what it is. If you were to make an Environmental Impact Statement, I would suggest that some of the men that designed this route -- Secretary of the Air Force, perhaps -- could put on civilian clothes, hike with my daughter and me down into the gorge one day and note that there is no planes flying overhead, a rare occasional meeting with another person, perhaps. It's a quiet, beautiful, pristine area that's already been set aside for us by our government for this pleasure. You can't -- you can't define the essence of this place unless you've experienced it.

I brought my daughter and son today. I want them to see that the Air Force, maybe you're willing to listen to this, maybe you're willing to listen to the intangible spirit of this place, if you will. And I want her to see if you listen. She's a witness, eight years old today, to whether you will listen. She's asking me if we're going to move if

64

this happens. We will, of course. We may have to. Once you destroy this place by flying over it, you can tell me that the deer wouldn't be scared, that the herds will stay and anything you want. But when you take away the essence you'll take away the spirit and the soul of this place, and it will be dead. And you won't care because you've never been there, and you'll be -- you'll be happy to know that you've trained a few more kids to kill people. And you'll destroy one of the most beautiful places in the country.

And if you decide to take this route, my daughter is my witness that we tried, and you didn't listen.

Thank you.

THE HEARING OFFICER: Is there anyone else who would like to make any comments?

Ladies and gentlemen, that concludes this public hearing. Thank you for your participation and input.

Please remember the public comment period will extend through June 16, 1999.

This public hearing is adjourned. Thank you again.

(NOTE: A recess was taken from 12:19 p.m. until 1:26 p.m.)

THE HEARING OFFICER: Ladies and gentlemen, we'd like to get started now so any of you who are out there who can hear me and would like to come in and attend the public hearing, please come on in and take your seats.

I'm Colonel Mike Burd and I will be the presiding

81

recorded accurately.

Finally, I'd like to remind you to limit your comments to the Draft EIS; that is the purpose of this public comment period. If you have written comments that you'd like to turn in, there is a box in the outer room that you can place them in.

UNIDENTIFIED VOICE: Sir? This lady has to go back to work, she's just off for lunch, and she wants to know if she could please speak, Renee Hardy. She didn't sign up because she didn't think she had time.

THE HEARING OFFICER: Well, I assume no one objects to that, so --

MS. RENEE HARDY: I've got to go back to work, yeah. Okay. Well, I just want to say --

THE HEARING OFFICER: Could you state your name, please? 008319

MS. RENEE HARDY: Yeah, my name is Renee Hardy. I'd just like to say I really appreciate you guys holding this, and I guess one of the first things I was wondering about is, like, the third Bill of Rights -- yeah, Bonnie just brought this. Yeah. I was wondering, this -- it says, "No soldier shall at any time of peace be quartered in any house without the consent of the owner, nor in time of war but in a manner to be prescribed by law." So I just wondered how that would fit into, you know, bombers flying in

BR-5

82

our airspace, which I kind of consider our home.

BR-5

And I guess the other thing which comes up a lot is about, you know, you guys setting up the Environmental Impact Statement. That just seems like a conflict of interest. So I just wanted to bring up those two things. And then, I'm really opposed to the bombers flying over northern New Mexico. You know, I'd like you to consider another site or just make use of what you're doing now.

GE-39

So, at any rate, thank you very much. Yeah.

THE HEARING OFFICER: I'd like to now turn to the cards that have been handed in. And we have -- I have 15 cards right now, so we have plenty of time for everone to say what they'd like.

I'd like to first call on C. L. Anderson-Whiteaker.

MS. CHERON ANDERSON-WHITEAKER: Good afternoon, sir. 008320 My name is Cheron Anderson-Whiteaker, C-H-E-R-O-N, last name W-H-I-T-E-A-K-E-R. My father is Lieutenant Colonel Andrew Anderson, U.S.A.F. retired. I guess that would make me an Air Force brat, so I'm not unsympathetic to what you would want to do, but I do have some very strong concerns.

I live in Amalia, New Mexico, in a 50-year-old hunting cabin. When the route of the training flights was changed last fall, in early winter, it resulted in over flights of the Valle Vidal Unit at Carson National Forest and the

83

communities -- impoverished communities of Amalia and Costilla.

The statements that I have read reported in our little paper say that there will be up to 2600 flights a year, 15 percent of which will be nighttime flights between 10:00 and 4:00 in the morning. We're a rural ranching/farming community. We're up with the sun and we go to bed with the sun. And 15 percent of the flights occur at night, it means we'll get 52 nights a year of corrupted sleep.

AO-26

Another thing that concerns me is the effect that these flights that occurred in November, December and January had on my show dogs, my racing dogs. And from what I experienced, I can understand what would happen to the livestock and the game in the area that the residents depend on for their livelihoods because there is no reliable employment in the area.

BR-3

And finally, having come to New Mexico from Nevada, I am well aware that there is suitable terrain and bases available that would accommodate this type of training without disturbing socially and economically depressed areas.

PD-4

Thank you.

THE HEARING OFFICER: I would like to now call on Jane Tate. 008321

MS. JANE TATE: Air Force personnel and fellow Taosenos, in World War II my three brothers served in the

84

armed forces. My name is Jane Tate, T-A-T-E. Four people in my immediate family built World War II aircraft for years. Two of my cousins died in World War II bomber flights, so I deeply respect being so well defended by the U.S. Air Force.

I do see some current issues to address. About ten years ago the first Environmental Impact Statement for Taos Airport expansion was rejected by the Santa Fe court since one of the prospective builders created his own EIS. This type of conflict of interest it seems is now repeated via the Air Force's contracted drafting of the EIS for RBTI. The current EIS for Realistic Bomber Training Initiative was designed to fit Air Force desires, obviously side-stepping and understating the vast, well documented potential hazards to humans, animals and plants.

Our Taos mayor, Fred Peralta, has cited fear of forest fires being generated by Plan D flights. These hazards would undoubtedly be compounded by significant economic depression in an already impoverished area.

BR-4

In the June, '98 Air Force newsletter I read that public hearings in January and February of 1998 regarding RBTI conducted in four states, including New Mexico, drew only 535 citizens, grand total. Captain Kangaroo taught me how to count, so I noticed that in this time period Taos meetings alone were attended by 800 people, virtually all opposed to Plan D. Too bad that some outside monitoring of RBTI protest

GE-3

GE-3

letters can't be done. The FDA last year stopped an evasive organic food labeling plan after receiving thousands of protest letters.

Five years ago I began an informal study of sanctuary trauma. This was to isolate symptoms of a person who felt safe until some quick and unexpected invasion happened to him, sometimes repeatedly. Rapists and gunshots were some typical invaders. Some dominant post trauma symptoms are: Number one, a quick retreat when similar sounds occur; number two, dangerous isolation for self-protection since a trust was broken; number three, fear of a close relationship, including sex and parenting; number four, in extreme traumas, violence and destruction when a victim is approached in the same or similar manner to where the original invasion occurred.

My son-in-law suffers a serious hearing loss after two-week summer artillery practices in the Washington desert east of the Cascade Mountains. The National Guard issued earplugs to him which he neglected to wear. Under Plan D which calls for 2600 flights per year, would all of us have to wear earplugs 24 hours a day? Since 15 percent of these flights would occur between 10:00 p.m. and 6:00 a.m. very little silence could be assured.

My pediatrician in Houston said that my children wouldn't be prone to ear infections when they were older,

that the ear drum would grow stronger. How are we to protect infants and young children from flights as lows a 200 feet with sounds hitting 130 decibels?

AO-47

Rather than increase overflights in northern New Mexico, I think current flights should be reviewed and reduced by the Air Force.

Considering the sad prospects of the aforementioned, I would call Plan D of RBTI a potential rage to the ear drums with permanent damage so serious, some as serious as bullet wounds.

Loss of sleep is another large factor in this impossible, unworkable, inhumane battery of offenses offered to us in Alternative D. I say scrap it.

AO-26

THE HEARING OFFICER: Like to now -- I'd like to now call on Giovanna Paponetti.

008322

MS. GIOVANNA PAPONETTI: Thank you for the opportunity to say a few words to people.

I believe strongly that the possibility of this Realistic Bomber Training Initiative program proposal would be disastrous in northeastern New Mexico. The primary CULTURE, Native American, has been here since the beginning of time. The Hispanic culture, of which there are 65 percent in Taos alone, of Taos residence, has been here 400 years. This is home to these people. They have no where else to go. They depend on the tourist economy to make their meager

living. They get by.

People other than the Native Americans and Hispanics come here by choice. The lifestyle is healthy. People learn to live on a shoestring budget and accept it because the meaning of life has more value. In the Taos area one learns to live simply. Tourists love to come here because it is one of the few places left to get away from noise and the lifestyle they are used to. Many retired here because it is a place of their dreams to spend their final years.

BR-4

I am also concerned with our native wildlife, many of which have dwindling numbers already, the devastating effect noise will have on them. Part of our economy depends on them, as well. Hunters come from out of state, as well as the cultural aspects of the local people who hunt. This project will negatively affect us in every way, the lifestyle of the very old community.

Come to New Mexico as a visitor, enjoy our resources and our people, and then say to yourselves, "Is this a place we want to destroy?" There is no other place in the United States like New Mexico, and I hope it stays that way.

Thank you.

008323

THE HEARING OFFICER: Bonnie Banneau?

MS. BONNIE BANNEAU: It's Bonnie Banneau, and I think I have more than three minutes so I hope that you will indulge me.

UNIDENTIFIED VOICE: I'll cede her my time. I'm on there to speak.

MS. BONNIE BANNEAU: Well, you know, I just -- instead of coming and speaking four different times, because I was in attendance Wednesday night and I was in attendance this morning, but I didn't try to sign up for four different three-minute periods, I'm just going to carry on and try to do it all in one fell swoop, here.

And just -- the last lady was discussing the hunters and hunting season. Now, there is so many impacts and, you know, you can't really write them down in a book because every person is going to be impacted differently in their own life. And, you know, some people probably just won't even notice, but a lot of people are really going to care. And say, like, these hunters they go out once a year with their guns and their -- frequently -- alcohol to shoot at little critters and big critters running around.

And I've been in those forests when there is low flying planes, and any herd of critters is going to fly away. And, you know, irritated hunters, they shoot at helpless little birdies. I mean, I would not exactly recommend hunting season as a good time for doing your -- I mean, it could be even increased danger of people just getting totally irrational and people do get totally irrational when they're traumatized. People's good senses just fall apart, you know.

89

My father was in the Air Force, too, during World War II, and we lived near a base when I was small. And it's probably the most violent years of my life, both of my parents in separate incidents almost killed me and I almost committed suicide all within, like, the border of an Air Force base. It was an -- it was just the anger, the sense of there being hostility in the air, that people are training to kill, you know, that there -- their weapons on many -- on many of these planes, it -- it creates anger and fear and -- and just the aura that comes with it.

And many people talk to you about emotions and feelings, and this is definitely an environmental impact. This is an environmental impact in a state with a very high rate of -- of domestic violence. Just April 8th and 9th we were here in this very room at a conference on the effects of family violence on children. And New Mexico has a the most poor children per capita in the nation. 70 to 85 percent of incarcerated violent offenders grew up in violent homes or were abused as children. Only five states have higher teen violent death rates than New Mexico. New Mexico's infant homicide rate is twice the national average.

Only two states rank lower than New Mexico in school testing scores. 40 to 70 percent of children who live in homes where domestic violence occurs are physically abused themselves. These are just a few of the issues we discussed

90

here, and the effects of violence on children.

As I -- a year ago on April 22nd, there was a low flying bomber that came over the school in Arroyo Hondo. Fortunately, it was lunch time and it was not testing time, but this is going to effect children's ability to be tested. Tests you know that's going to disrupt, especially -- there is a lot of what they call ADD where kids have a hard time paying attention and doing their homework.

And as Renee said about quartering the military in our homes, this is like having the military flying through our attic at loud volumes any time. This is going to affect people's ability just to concentrate and do their work. And the first thing right in the bill of rights has to do with the congress shall make no law representing or establishing a religion or prohibiting the free exercise thereof.

The abridging of freedom of speech or of the press or the rights of the people to peaceably assemble and petition the government for redress of grievances, and you're hearing a lot of grievances here and we're petitioning you for redress on the -- especially the freedom of religion, because if you say you're going to fly over six days a week, and people who worship on Sunday are not going to have jet fighters flying over when they're doing their weekly prayer services, because the meditators meditate every day of the week.

AO-18

91

People at the pueblos, Native Americans, believe that every day is sacred, that ever moment is sacred, that our whole lives are sacred and every living creature is sacred.

I was very upset by the "no adverse impact because of the noise" philosophy. I mean, that's totally ridiculous, you know. That doesn't respect people's feelings at all. Everybody is ready to say we think there is adverse impacts to having low flying loud noises coming over our heads, and just to pretend that this is not part of what your -- your realm is, we can just throw it out under the -- this is not an environmental justice issue. And I understand that environmental justice is more of a pie in the sky idea than it is something that -- it's not really possible to implement it, from what I could figure out.

I spent a long time talking to a lady there in Texas yesterday morning. I almost cried because it was, like, it's a policy guidance document, but meanwhile we have a siege on New Mexico. The federal government is moving all the nuclear weapons production facilities from contaminated places like Rocky Flats and Hanford and Savannah River and Frenal and Oak Ridge and they're moving all the nuclear weapons production facilities to Los Alamos and Sandia, which means we have an increased buildup of pollution from that, and also an increased number of trucks. We have at this point about three vehicles a week with radioactive stuff cruising around

92

our highways, and if they -- when they get WIPP in full swing it's going to go up to like at least ten vehicles a week.

And many of these highways with radioactive waste and bombs and bomb components are going to be crossed by your proposed Flight D and possibly the other Flight A patterns, and I suggest that you pay attention to where radioactive waste trucks and student pilots are crossing.

My impression was that if your airplane gets in trouble you can try and land it on a highway. And, I mean, I don't know what kind of training there is regarding the question of do -- are any of these people told they can land on highways and do you designate the highways with nuclear bombs and nuclear waste and let them know exactly what's going on or, you know, just don't tell them and it won't hurt them.

But as the government, you have the duty and responsibility to those who you govern, you know. The government it's elected, and even though the Air Force obviously was never elected and is sort of paid for by our elected officials, they have the duty and responsibility to us to take care of our planet, and it just seems like the weapons industry is going totally wild in New Mexico, between the -- the bombs and the radioactive waste, and this in the north.

And you are really endangering our land of enchantment and we hope that you will kindly back off. And I think that

AO-94

93

it would be good to learn to practice peace. I think that the practice of peace is a very important part of having a peaceful world, and that your not going to make any friends if you have enemies and you kill them and you're just making more enemies. And the only way to end war is by making friends and showing compassion. And I think that all these issues you shouldn't just pigeon hole and say, "This fits our program and we have to relate to it," and this is out there and we can't relate to it because everything that people say has to do with how it impacts the lives, which is the environment of our existence here on this planet.

Gracias. **008324**

THE HEARING OFFICER: Justin Reid?

MR. JUSTIN REID: My name is Justin Reid. I'm a resident of Colorado and not of this area, but I have been attending all the meetings that I can to express myself about what is happening or what I'm afraid will be happening if this plan is developed.

I don't really think that it makes much sense to argue about whether or not you should train for this kind of work. It makes a lot more sense just to say, "well, as long as you have to do that, please do it in a way that is the least expensive in terms of damaging the human spirit." And I say to you that consideration is the most important consideration you have to consider.

94

I would take your aircraft to where it does not affect any human beings if you could. To -- sorry. To define that place, all you have to do is look at the map of the United States and see who owns what property. United States owns, as one of the speakers mentioned, something like 80, 85 percent of the land in Nevada. Hey, go do it there. That's the place to do it. It may cost you a little more money, but the Air Force has never worried too much about that kind of thing. Go where it really makes some sense to go, and where you don't impact the human creature.

PD-4

Thank you.

THE HEARING OFFICER: Mary Jo Carey? Cliff Bain? **008325**

TY MR. CLIFF BAIN: My name is Cliff Bain. I live in Arroyo Hondo. Everybody who has spoken in the last week that I have been present for has given you a lot of really good reasons not to do this thing here. I'd like to talk about something that is perhaps outside of the narrowest scope of this EIS study process, and it has to do with needs assessment.

Now, you did address needs assessment in there, basically saying that we have airplanes, pilots need to know how to fly them so that they can return from their mission safely. But I'd like to push it a little further and put into the record a broader context for that need.

95

Right now the United States is at war in Yugoslavia and Iraq using a technique of air power and using these similar aircraft, and a lot of other kinds of aircraft, to basically project U.S. military power wherever we seem to -- our leaders seem to feel like it needs to be demonstrated. Of course, it's not demonstrated, it's -- this isn't the threat of it, these are bombs falling and killing people.

And I would just like -- I don't feel more secure. I don't think there are very many people in Iraq that feel more secure, and I sure as -- don't think there are very many people in Kosovo who feel more secure because NATO, largely made up of U.S. aircraft and armaments are dropping bombs. I think that there is a need for the U.S. to be involved in the world, dare say that, intervene, but it's too easy for us to do this with bombers. It costs us very little, except by way of tax money. It is actually costing us our -- the -- the means that we could be using to rebuild our country and taking care of our -- educating our people and feeding our people. All that money is going down a rat hole, as far as I'm concerned.

But just looking at the narrow, the aims of the use of military force, national defense and security, I don't think it's doing the job. And I'd just like to finish by saying that I sincerely hope that we can draw the line here in northern New Mexico, and be successful in deterring you from

96

appropriating one more chunk of United States airspace for this activity.

But I hope that if we are successful there, or even if we're not, that we continue to find ways to draw the line and to rethink how we can take care of these ostensible humanitarian objectives in a way that is successful and less harmful to ourselves, to the people who happen to be at the receiving end of these bombs. **008326**

THE HEARING OFFICER: Gloria LaRiva?

TY MS. GLORIA LARIVA: My name is Gloria LaRiva. I'm born and raised in Albuquerque, New Mexico, and I'm here representing the International Action Center which is a national organization committed to opposing U.S. intervention abroad, which we see as strictly for geopolitical and profit making interests of the 70,000 military contractors, each of whom is not willing to give up their stake in the profits that they make, regardless of how many people are killed.

I am very much in support of the statements that people have made here from the Taos region for the environmental and human concerns, the impact on them. I think they know best what is needed here, and that is the elimination of these flights to make sure they don't take place.

I would like to address the immediate environmental concern that I have, and that is in agreement with the previous speaker, that people are dying in Yugoslavia, and

people are dying in Iraq from these bombings. I just returned from Iraq, from Yugoslavia. I was in Yugoslavia from the fifth to the ninth day of the damages. I was in Belgrade, in Novi Sad. I was in the villages that have been hit by cruise missiles and I saw people dead in the hospitals, young people, older people, in comas from the blast of the bombs. Factories which were targeted.

And when you think about this, the whole tactic of bombing is against civilian infrastructure, and the military never admits the first reason why they're doing this. They have to cover it up because the people remember Vietnam. But as war progresses, the military has come out with the truth about what this war is really for and who the targets are. And every day they keep saying, "We're going to widen the array of targets," when, in fact, civilians have been killed from the first day.

The bombs that hit Novi Sad on the 24th of March within hours of the bombing, within three hours of the bombing by the United States, killed people. And I saw them in the hospitals.

I would like to say that you have four alternative plans in the bombing patterns. I don't believe that any state, any people, should be subject to these flights. They're terrorizing. I live right now in San Francisco where the Blue Angels fly over on Fleet Week to show their prowess, and

there is nothing more terrifying than to have these flights over. They may be for show purposes, and it can't make -- you cannot help but think about those flights that come over to show off how they can fly, and what it means for a people to live in other countries and know that those flights mean death.

That -- the sad thing about this is that most of the bombs that have hit Yugoslavia, they apparently don't even hear the planes, it's just a blast from the sky. There is a piece of literature that you put out here that says bombers played an essential role in the gulf war destroying Iraqi airfields and communication facilities, as well as neutralizing enemy ground troops. This is a tiny part of what you hit. And I went to Iraq twice. My video is showing here at the film festival, "Genocide By Sanctions." Within eight hours the U.S. Air Force destroyed 95 percent of the water facilities for the whole civilian population of Iraq. Within 24 hours all electricity, all water, all sewage was wiped out. Those targets were planned way ahead of time.

And this new war is the same. After their people are bombed and obliterated, we'll see then sanctions imposed on them, enforced by the United States military under the reaches of NATO.

So I would like to just end by saying that the International Action Center today is having demonstrations

throughout the United States. There are several thousand people in San Francisco, I just called them. There are over 10,000 people in New York City. There are people demonstrating in over 150 cities and towns, as well as here in northern New Mexico, and I want to express our support for the people of Taos, and New Mexico, in what I know will be a growing anti-war movement. And I just urge us all to join together, to join hands, and to say that these trillions of dollars being planned to spend for more jet fighters we need at home.

Ten percent of the fourth graders in the Native population of New Mexico, only ten percent, have reading literacy ability; only 26 percent of other children of color in New Mexico. And we are one of the most militarized states in the country. Why is it that there is no trickle down in this state? Why is it that the army picks or the military picks the least populated, the most disenfranchised states as New Mexico? But I'll tell you what: We have a lot more consciousness in this state than you realized, and we're going to put up a fight. 008327

THE HEARING OFFICER: Ted Strowhal?

MR. TED STROWHAL: Hi. I don't have any prepared statement. I'm going to restrict my comments to whether we should have this bombing training area in northern New Mexico.

I grew up on Air Force bases, mostly SAC bases, and they were some of the best years of my life. However, I know that B-52's rock your world when they fly by. I was up on a lake, Sanchez Lake in southern Colorado, sleeping on a boat about a year ago and heard a rumbling that sounded like a freight train coming. And I looked up and I couldn't see the sky, all I saw was the bottom of an airplane. In the morning, everything on that boat was covered with a black, oily soot.

This isn't as wide ranging as the war in Kosovo, but this is where I live. This is a bad place to be having a bomber training mission. They're not going to be able to stay in the corridors that you guys have outlined. I don't know what the Environmental Impact Statement reads, I haven't looked at it. But it's going to make a mess out of this place.

I work construction. Most of the houses that we're working on, most of the new construction are retired people moving in here. Right now we're living off tourism. This BR-4 place has potential as a retirement destination. Everything that this county depends upon is -- is tied to the mountains, to the quiet, to the environment. And I've been to west Texas, and there is just not a whole heck of a lot down there. It's hard to find a tree down there. And I haven't looked at the demographics, I don't believe there is that many people.

101

I think you guys need this. I think you've got good reasons for setting up another training range. I think this is the worst possible place to do it. You guys are flying over Cimarron Canyon, Heron Lake, Canjilon Lake.

One thing I agree with that everybody has said is that the State of New Mexico has given its pound of flesh, as far as military installations, and I think it's time for somebody else to buck up.

Thank you. **008328**

THE HEARING OFFICER: Alex Carpenter?

TY MR. ALEX CARPENTER: Hello, relatives. Thank you for being here to hear what we have to say today.

How many more people have to die? This country, here -- founded on murder. Right now there is people dying all over the world. How many more people do we have to kill before we wake up to see what we're doing? I mean, people are dying in Iraq right now. People are dying overseas right now. These planes will be practicing to kill more people. Why? Why? Why do we want to practice killing more people? You want to practice, why don't you just practice on me now, I mean.

Mother Earth keeps us alive. Without Mother Earth we're all dead. So why -- why put bombs on what keeps us alive? Sad part is the tax dollars that we pay, it goes to this war machine, so we can't just go like this, "It's your fault." We can't do that, it's our personal responsibility. And

102

that's the sad thing to think about, that if we're confirming that this government -- that we're helping kill people, I don't want to think about that. But do we have to?

I think we have to think about that in this age. Right now so many people are dying. We know what we're doing, this is genocide. Genocide is happening now. So why? Why would we agree to conform to genocide? I mean, why? Why do we want to kill more people? I mean, we've already seen so many people die. How many more do we have to see until we want peace, you know?

What do these planes do for us? They're not helping us. I mean, I was in the Mojave Desert and I saw a plane fly buzz right over my head, baroooooom; right? Buzz right over my head, and it scared me. I was defending the valley because we didn't want nuclear waste put in that valley, in a sacred valley of the indigenous people. And we stopped, but the planes, they flew over us and it made me hit the ground, covered my ears. It scared me from my life. Should have seen it.

So, these planes are flying around practicing to bomb people. Practicing to bomb people? You know, why? Why practice to bomb people, you know? We're killing each other. We're killing ourselves. It doesn't make any sense. Nobody -- nobody wins a war. For bombing these people overseas, for what? For oil, for money? This country is founded on

103

murder. This country wants to continue with murder.

The creator is watching us all and knows what's happening, sees what's going on. We can't continue to kill each other because we're killing ourselves. We're all a family, you know. We're all a family. We're bombing the people overseas. They'll -- we're bombing innocent people and families. You have an -- a family. You have a mother, fathers, we're all daughters and sons of somebody, you know. Same type of people we're killing overseas. Doesn't make sense.

Please, please find peace in your heart. Please. Thank you. **008329**

THE HEARING OFFICER: Allen Ferguson?

MR. ALLEN FERGUSON: Good afternoon. I am a writer of novels and an attorney. I want to focus on the specific aspect of the Draft Environmental Impact Statement that had to do with the effects, the potential effects of low level bomber flights on the Taos County economy. And it sounded to me from what Lieutenant Colonel Mason said, as if **BR-4** the statement ignored some of the real potential negative effects; specifically, the effects on the artistic community and on the tourist industry.

The artistic community in Taos, unlike in many anywhere else in the country, I think more than anywhere else in the country Taos has a very high proportion of artists: Writers,

104

painters, sculptors, film makers and so forth. I know from my own art, which is writing, that I need long periods of silence in order to create a novel, in order to write a chapter, and rewrite a chapter and make sure that it's correct. I know that whenever there are loud noises, even a car going by on the street if its muffler is bad or something, it interrupts my thought process and my creative process. If there were bombers flying overhead it would do that to a much greater extent, I think. And that's true, I think, of many, many artists in this community.

A large proportion of the tourist dollars, as well as other dollars that come into this community, come in because of the art, here. I believe that the Air Force needs seriously to look at the artistic aspect of the economy in Taos County, and gauge in ways that I don't think you've looked at yet, the potential effect on artists, not only writers, but also painters, sculptors, film makers and other artists, of the noise levels and the frequency of noise that would happen if these bomber flights were -- were regular in this area.

There is also a direct impact on the tourist industry. As somebody else pointed out, tourists come here from New York, Houston, L.A., San Francisco, all over the country and all over the world, for that matter, to escape the noise and commotion and hubbub of the cities. If they come here and,

105

instead, incur noise levels that exceed those that they find in New York or L.A., they're much less likely to come, I think. And I don't get the sense that the Air Force has seriously considered that impact.

BR-6

Finally, I would like to say that I was a Boy Scout in the early '60's and came to Philmont Scout Ranch in Cimarron from a big city and hugely enjoyed the wilderness experience. There are lots of Boy Scouts from all over the country who come here to Philmont for that purpose. There are also many other groups and organizations and individuals who come to New Mexico for wilderness experience. Wilderness experience would not be the same. As a 14 or 15-year-old Boy Scout, I would not have had the wilderness experience I had if there had been bombers flying overhead while we were out camping in the high mountains and by the high lakes.

Thank you.

THE HEARING OFFICER: Shirley Girard? Shirley Girard? Toni Boersig? Toni Boersig? Lumina Greenwall?

008330

MS. LUMINA GREENWALL: Hi. My name is Lumina Greenwall, and I am highly opposed to the RBTI in this area, or actually in any area, but especially in this area. I have lived here now for over seven years. I came here for the reasons of the peace, the quiet, the wilderness. I'm a photographer, and a Reiki master and practitioner, and

106

bombers blasting overhead would absolutely destroy my -- my peace of mind, my reason for being here.

BR-7

And, you know, people who move here do not move here to make their fortune. We very often give up jobs that are highly paid in order to live here in a place that is pristine and beautiful.

And I was an Air Force wife, I lived on a base, I know what those planes sound like when they come overhead, and they are just an assault. They're an assault on your hearing, on your soul and on your mind. And I beg you, please, this area does not need your bombers. Please take them elsewhere. To Nevada where you already are doing training exercises, where it is wide open. Not here, please.

Thank you.

008331

THE HEARING OFFICER: Gretchen McGregor?

MS. GRETCHEN MCGREGOR: My name is Gretchen McGregor and I've been a resident of Taos since 1982. I have a degree in environmental science from the University of California, Berkeley, and I've spoken twice before, but I feel that I haven't been specific enough for addressing what I would like to see in the final draft, or the Final Environmental Impact Statement.

I find the draft to be woefully inadequate. In the presentation you said that all appropriate environmental factors have been considered. We have been hearing for hours

107

about different factors that have not been considered, so I would like to be very specific in what -- what I anticipate seeing in the final draft: Provision for crossing over the alternative route, bringing in nuclear waste from the other facilities, nuclear facilities. The route is Route 285, New Mexico Route 285. The flight corridor crosses directly over that. I mentioned this a year ago, and we were promised that whatever we mentioned would be included in the draft, which it wasn't. And I think careful consideration should be made in the final that you are, in fact, crossing that.

AO-94

That's been news to some of the military officers who I've spoken with, and that makes me very nervous that you are not even aware that you are, in fact, crossing the WIPP route, which brings in the nuclear waste.

Second, I'd like to have entered in the public record that New Mexico is the second most fatal state in the United States. I'm also an EMT and what "second most fatal state" means is that any accident or health crisis that can arise, in any state you're going to be in better shape than you are in New Mexico, unless you're in Alaska. And the reason for this is not that we don't have great EMT's and physicians here, but that we are in the category -- not rural, but frontier. And I'd like that to be in the record.

Thank you. I'd like that to be in the record, as well. And I can't imagine coming up with a Final Environmental

108

Impact Statement without addressing the lack of health care facilities that we have at stake. I'd also like to enter into the record that we have one Level One hospital in the entire state. A Level One hospital is a hospital that has a designated operating room and trauma unit for any type of accident that could occur.

Specifically, I'd love to see in the final draft an assessment of, if there were an accident, a crash of one of these B-52's, let's take just for example over the Philmont Boy Scout Ranch where we have the highest concentration of population which will be exposed to these low level flights. I'd like to see an example that addresses how we would provide for emergency medical services, not only for the children, but for the pilot, as well. I can't imagine a final impact statement not addressing the lack of health facilities in this state as one of the environmental factors.

AO-16

I know I've run out of time. I'd like to just quickly also ask for fighting of fires. In other words, if a B-52 or B-1 bomber did crash, how much fuel would be on board, and how big of an explosion could we anticipate and how much, if it were over a wilderness area, of a fire would be ignited. Again, I think it needs to be included.

AO-7

The last thing I would like to ask for is we know, we've seen your DNL model of sound which gets the sound down to below 60 decibels which is the legal limit. In speaking with

BR-1

109

BR-1

the military officers we know that the decibels, in fact, the actual real noise is 120 decibels, which if humans are exposed to that we -- we will suffer instantaneous loss, permanent damage of hearing. And so, in addition to the DNL model which we've been seeing is very low or acceptably low, which we know it isn't, I'd also like to see the final conclusion of the assessment of the actual noise, the real noise, along the flight corridor, because I think that you need to include both of those models, even though the DNL model is the more accepted modeling for sound.

And finally, just -- I know this isn't possible, but we've already experienced fly overs since the 1940's and we all know that they fly outside of their corridor. They fly over the Taos Pueblo. They fly over the ski valley, and that's why a lot of the residents here are very -- we don't trust that there is any accountability for staying within the flight corridor. And if there is any way that that could be assessed within the final draft, I think that would be appreciated by everybody.

Thank you. **008332**

THE HEARING OFFICER: Shane West.

MR. SHANE WEST: Good afternoon, gentlemen. How many minutes do I have? Three?

THE HEARING OFFICER: Well, that's just a guideline.

110

MR. SHANE WEST: Guideline? Good.

Man, I didn't think I had anything to say, you know, just like last time. It was like -- last time all I talked about pretty much was the -- you have a -- videotaping, I should turn it over.

UNIDENTIFIED VOICE: Music, music major.

MR. SHANE WEST: I'm a music major, so I'm kind of familiar with some of the effects of sound, and jeez, where to start. The heart program, the global changes, Freedom of Information Act? You know, Ralph Nader was addressing Stanford University at a commencement address a couple of years ago for the Green Party and said, "What's the difference between ignorance and apathy? I don't know, and I don't care." You know, so maybe that's the whole point, no one knows anything and no one really cares, you know.

And each person here must represent at least 100 people, you know, I figure, because your average citizen doesn't give a -- doesn't care. You know, doesn't show up, doesn't bother to take the time to do something like this, you know. And I mean, I feel kind of silly. I mean, what do I know? I always wanted to be a pilot in the Air Force but, I don't know, I guess I went crazy and played music instead. And now look at me.

But anyway, Mayor Ted Peralta -- I really like that there has been a lot of really educated and well informed

111

BR-4

BI-2

things, and I'm not real good at things like that, but sometimes I take notes.

Economic depression. Over 800 people were opposed to that, I suppose, and the FDA and the food -- labeling impoverished over 100 areas that -- that we live in, you know.

The migratory patterns, I put a star by that one. I think that's a pretty important thing to consider is the migratory patterns of the elk and the other four-leggeds and the winged ones that we have around here. What was the -- the experiment, I believe it was 1944 they found a drawing in the pyramids of Egypt and they reproduced this drawing with an experiment with sound. And here we go back to the study, it's an experiment with sound. And with this experiment, they -- they put musical instruments around a 50-ton block and levitated this 50-ton block. And some 15 to 20 yards that they moved this 50-ton block with sound.

Yeah, Freedom of Information Act. Yeah. Universe was spoken into existence. This is the east gate of the prophecies of more than one culture. I'm a stutter -- I'm a stutter -- I stutter a lot. I'm a studier of existential drama -- is many -- and in all I have underlined eight times in all Aboriginal cultures this is prophesied. Sound is very important, universe was spoken into existence. It's the essence of all magic. Hopi Land, Hope Villa, the Black

112

Hills, Mount Rushmore. There is nothing sacred, praise God, nothing is sacred. Therefore, everything is sacred. And I do believe the great spirit is going to take care of all this, no matter if anyone cares to show up at any of these meetings and really has anything truthful or insightful to say or not.

It is rumored that the FBI stole the White Buffalo from the Cotanish, but it was returned on the morning of the third day. The government does believe in psychics, that's why they hired them in the last war to figure things out. And that's how they figured a lot of things out was by consulting your local psychic. In fact, they have vested thousands upon thousands of dollars in training people on what they call far seeing training.

My time is complete, so I'll finish up with Antone -- I think it's Antoine Girl Red Tea invented the transporter beam. He's the same fellow that invented the laser beam. He's also figured out how to program crystals, little crystals we all carry around in our pockets, and use them as -- because the -- they're binary thinkers, they can now be used by computers by inscribing letters of the Caballa on its surfaces. Inappropriate.

Oh, yeah, you can buy a clone for $200,000. This is now a fact, you can buy a clone for $200,000. Why don't they clone their soldiers? Because this is an attempt at slavery?

113

I think so. Inappropriate addresses environmental factors, guys.

LU-9 She talked about Route 285. The lady here the other day was talking about several areas in national parks that you didn't even address in your -- in your flight path. And I like the part where she said this is a -- this is categorized as a frontier, and no hospitalization. What about it? What about the emergency medical services?

I guess that's all I have to say. Inhale to the chief; right? God bless Bill Clinton. 008333

THE HEARING OFFICER: Elizabeth Cunningham?

MS. ELIZABETH CUNNINGHAM: My name is Elizabeth Cunningham. I'd like to talk of things of intrinsic worth, things that you can't put a value on, a monetary value on. I would like to speak about the creative process as one of those.

People come here to escape the noise of the city, to have the quiet to think and to read. It's sort of a negative space compared to the positive space of being very hectic in many places. There are artists, writers, academicians, people from corporations and from cultural institutions that come here for the peace and quiet that we offer here.

At present I think there is one in seven people in Taos that are artists, and they come from people who have been here for generations, from the Pueblo people, Hispanic

114

people, from Anglo people as the others are called, and who have been here for a long time, and those that are continuing to move here and be drawn here for the same reasons that artists have always been drawn here, for the beauty, the nature, the tranquility and the quiet.

Taos hosts over 30 artists a year at the Wurlitzer Foundation who come here for the quiet in order to create and bring that creativity back and their products of those creativity books, scores of music, compositions, orchestras, back to the United States as part of our cultural fabric. I have been a member and on the board of the Taos County Historical Society. My husband is the co-director and curator of the Kit Carson Historic Museums. These are two institutions that are dedicated to preserving the history and culture of Taos, and through this presentation to help educate the people of this community and make it continue to be the viable community that we know.

Bombers have not been a part of this, historically. We appreciate them not coming. Another entity that I speak for is the silence. I think this is one of the most rapidly disappearing valuable assets that is never talked about and never defended that we have here. It's part of the wilderness and wilderness connotes an undisturbed environment that includes the human race.

I think there is one other thing to speak to is the

115

environment. William duVries, a very respected naturalist who has written a wonderful book called, "Enchantment and Exploitation," said that studies that are done on the environment only give us the minimum impact it might have. If you think about the rain forest disappearing in one percent a year it doesn't seem like much, but in 100 years there will be no rain forests left.

PD-4 You do have Nevada. You do have in the Air Force other corridors that have been, but will not be as impacted as some of your own statistics have shown this area would be impacted. And we would appreciate it if perhaps you would expand on those. It would be more cost effective and it would leave us the peace here that does tie into both our economics and our aesthetics.

Thank you very much.

THE HEARING OFFICER: I'm sorry, but I can't make out the last name of the next individual. But it's Gunther, and it's N-A-C-H-T-A-B. 008334

TY MR. GUNTHER NACHTAB: I guess there is only one Gunther here. Gunther Nachtab.

THE HEARING OFFICER: Could you spell that, please?

MR. GUNTHER NACHTAB: Yes. My name is Nachtab Nachtab. Nachtab doesn't sound real Irish, does it? It's Birish, that's where it came from. Birish means Bavarian.

116

Well, ladies and gentlemen, thank you for the opportunity to talk here. I -- I think a lot has been said that I can only repeat, and I will only repeat it for my -- from my own experience. I became a resident of Taos County in '91, moving here from Washington D.C., a very populated area with lots of air traffic over your heads. And one of the reasons I'm here is because I couldn't stand the air traffic any more.

I don't know if your impact studies have ever investigated what it does to people, really. I would say I'm probably a victim of air traffic over my head. It's been a -- years -- many years ago, during the war, when realistic bomber training was done over my head in Germany and the bombs dropped on me and I had to run for cover. Today I'm here, and the realistic bomber training is coming back to me? You want to kill me now because you couldn't kill me then? A lot of people run away because that noise affects you. And even if I could probably run away today again, lots of little kids couldn't run away when you have the training here. And they will be affected, maybe the way I was affected.

As an artist and nature lover I'm here and I like really to have this area being protected rather than being destroyed, as realistic bomber training probably would do it. And it couldn't be realistic enough because you, I hope, won't drop bombs. That would be true realistic. And how

117

unrealistic the training is that you have today, I understand, because the bombs that are dropped in Yugoslavia do not hit the targets only, they hit the innocent people. And you can never be truly realistic unless you stop it, and find other ways of supporting a government to prevent any other war.

Thank you very much.

THE HEARING OFFICER: Ed Slook? **008335**

TY MR. ED SLOOK: Jeez, I -- I want to say, I don't know you people that are here. I love all you people that are here. I love you Air Force guys, too. There is a few things in your environmental impact study that really amazed me.

The flight operations would not be expected to preclude existing land uses or continued use or occupation of an area, prevent recreational uses, threaten public health and safety or be inconsistent with and applicable regulations. Flight operations could, however, be perceived by the affected public as negatively affecting their quality of life. Perceived as negative? Could be? Could be perceived as negative?

You know, I don't have a whole lot to say because there is -- so many beautiful people here have said so many beautiful things, it's beyond my comprehension, my learning, my knowledge and my wisdom to even add to anything that's

118

been said to you people, to the Air Force, to our government. I think they get the picture. I think the picture will eventually be a shrinking picture of the military that we now see.

I think that some of the military people, themselves, that I have spoken to here are ready for new work in a new age, in a new millennium, in a new world, where the focus of war and muscle and power is diminishing, in which we spiritually grow, where there is energy and light in this specific area where we got them now, to tell them in your beautiful words that you are beautiful personas, and in a beautiful way.

Ahoy, Great Spirit. Here are all these prayers. Nomas De. **008336**

THE HEARING OFFICER: Three Toads?

MR. THREE TOADS: Hello. How are you today?

THE HEARING OFFICER: Good. Welcome back, Mr. Toads.

MR. THREE TOADS: Yes.

LIEUTENANT COLONEL MASON: Good to see you.

MR. THREE TOADS: And who is this lady?

THE HEARING OFFICER: That's the court reporter.

MR. THREE TOADS: She's the court reporter? Okay. And this gentleman, you got center stage.

119

UNIDENTIFIED VOICE: Appreciate it.

MR. THREE TOADS: You got center stage.

Who are you? What's this -- sound man, huh? Oh, the video camera? God, maybe I could share this with you, I -- you know, pan the whole audience, and for everybody here, pretty exciting video, hey? You know, you have a camera thing going on in town right now, the movie picture show. You guys got to make sure to spend some nights there. Get on the roster to see the latest, and -- and -- from -- Hollywood has brought us.

But, anyway, I get to stand now. I get this microphone, huh? Does it disconnect? Hey? God, what beautiful people out here, for sure. You're right, Dog Man. Good people. Taosenos. It's so beautiful to be part of Taos and share Taos County, view of the wilderness and view of the land. And the land -- so big out here, and keep that big landscape, you know. This is -- this is so filled already with, you know, jet trails 17 in the morning or 18, coming from the west and going to the east and going to Texas. To Texas. God, we're on the major route to Texas. Flying with the Air Force and just all these trails going every which way, man. All those airplanes are flying high. I can't imagine if they were flying low.

And flapping along in my raven wings, I mean -- I'm actually a raven and not a toad. But anyway, I'm flapping

120

along my raven wings and a hang glider, and here comes a jet flying underneath the gorge bridge and cooks my balloon and my hang glider. I mean, that's what this is on the wake of.

Last year at this time somebody knocks a tram out of the sky in Italy. I mean, that's what you guys are -- here last year when you showed up, that's what had happened just before or just after you came here, you know. Major disaster for 21 people in a gondola in Italy, you know. I think the governments are capable of accidents and they're capable of big accidents. Not just little ones, big ones.

And WIPP coming to the state. And, you know, there I am in my fighter plane and I want to hit the WIPP, that's my target, you know simulator target, because I'm playing a game, a war game. So who knows what my -- disaster might come out of this one, huh?

BR-7 From New Mexico we have a pristine wilderness area here, we have a lot of people involved in agriculture, a territory, maybe that's the way you're treated, you know, it's expendable or something. It's a frontier, and it is truly a frontier, and a beautiful frontier. And the people here really like it here that way. There is no train coming through town, you know, no train tracks. You don't have to hear the train couplings and uncoupling all night long. The noise level is down. You can see the stars all night, you know, they're clear.

121

And so you guys come here from Texas for vacation; okay? You're invited to New Mexico for vacation, and when you leave Texas, you know, you come over here to New Mexico. You enjoy where it's quiet, you know, I hope. This isn't Nevada, this isn't the saline desert of California where the jets fly over at 100 -- you know, 100 feet, 50 feet sometimes, you know. I've been there, seen those jets flying over real close.

And life acts like a game sometimes, but hopefully it's a game of life, not a game of death. With that I'll shut up. And I hope you guys make a good decision and make it right, because we don't need to be a subdivision off of Texas, you know, Langly Air Force Base. 008337

THE HEARING OFFICER: Stacey Huddleston?

MS. STACEY HUDDLESTON: I've noted that I need more than three minutes.

THE HEARING OFFICER: I don't remember if you were here at the beginning of this when I talked about the three minutes and what the NCO next to me is doing with the card?

MS. STACEY HUDDLESTON: Right, that you give the time up and --

THE HEARING OFFICER: I previously said that I'm not going to stop anybody when they go past three minutes.

MS. STACEY HUDDLESTON: Okay. I request that

122

the Final EIS include the possible impacts that had been proven over and over to be true and realistic over a minimal of the past 15 years. Other areas that were pristine have suffered immense damage since the '60s. To my knowledge, you have documented each, and perhaps civilian comments on those areas. This information should be included as the realistic impact.

I have listed a number of things to be included. They are as follows: A public record of all Air Force, military, Air National Guard jet, helicopter, B-52 and B-1 crashes in the past 15 years from California, Texas, Kansas, New Mexico, Colorado, Utah; and the record of how many died, civilian and military. The damages should be realistic, should be listed in a realistic full spectrum of impact with compensation costs of people who survived, their medical records, land damage, building damage, psychological damages, environmental, et cetera. This would have to include air shows, low military training, planes colliding mid-air, refueling and other maneuvers in the air and on the ground.

AO-61

Crashes due to migratory birds, alarmed reaction of one bird causing the others to fly up, getting caught in their engines, crashes due to negligence. Also, the casualties resulting from little losses, incidents where fighter jets lose parts of their equipment like bombs, external flight recorders, fuel fill tanks and the likes.

AO-61

123

Included with this, the impact of such an accident in or near residential areas, watersheds, wildlife sanctuaries, nuclear plants, and how these disasters would be dealt with; a full cost evaluation of each disaster and the possibilities of forest fire, contamination, cleanup of the land and water disasters. Plan of emergency compensations for residents.

AO-49

Also, the medical availability of emergency care and/or the cost of creating medical facilities that would more than humanly accommodate such an accident. A record of the last 15 years to be included of complaints from citizens about the violations of the trainings, and what solutions were offered to the citizens complaining; include the research and the cost of keeping track of low level flights and reports on violations, and what was the outcome within the deciding military jurisdictions regarding these violations?

BR-5

The EIS, without a doubt, should include possible damages caused by air blasts. A scenario including the devastation in other cities and towns where the U.S. has practiced low level flights; how many roofs have been torn off, how many cathedrals have caved in or sustained damage from flights coming too close? How many families, how many were compensated? How many dead?

AO-2

This scenario should also include avalanches. Cost and compensation of possible damages to the population and land and air should be included. The EIS should include a report

124

on the lowest level flight zones, time schedules, expected expenses, fuel capacities, expense and loss, all chemicals carried and used for general functions of the planes, and descriptions of storage vessels and their capacities concerning accidents.

Along with the chemical breakdown, liquids, vapors, et cetera, should be a list of toxic effects on human, animal, plant and other living, life giving forces. The amount of oxygen burned up over the duration of flights, in a timely fashion, for example, how many millions of gallons of air per second is used during take off, during the first five minutes, the next five minutes, et cetera. This should have a comparative chart along with it as concerns the amount of oxygen produced in a day by the surrounding force.

AO-66

And air report of fuel drizzle or rain should have details of what chemicals would be thrown out during every hour of flight for each flight intended. The percentages of chemicals and concentration, percentages of chemicals blown out at low level flight training, as well as high level training needs to be examined. This report should be inclusive of mid-air refueling over unpopulated land and residential areas.

It should include how much fuel is lost, what kind of storage tanks are used, leaks, damage on ground and off, estimated millions of gallons that will leak into the ground.

125

A 15-year report of comparisons from other areas already experienced in low level training should be included with the contamination report on the soil and water. This should also include fuel that would be dumped through exhaust, fall during emergencies when a training has more than the minimal amount of fuel and needs to prepare to land. Any such dumping of fuels needs a full spectrum report on hazards, costs, damage possibilities, long term effects on living forces. It needs to be inclusive of possible toxic liquids and reports on ricocheting explosives similar to the F-16's hydrazone that may be used on the bombers, and their harmful effects to humans and natural life.

AO-5

AO-95

The environmental destruction costs can be quite devastating to forests, lakes and field. The human exposure reports should include ray burns, skin contact, organ damage, central nervous system damage, what the lethal dose is and how much will be carried on each bomber and what each container is made of, et cetera.

A report should include an area survey of heart patients and doctors as concerns increase rates of heart circulation diseases and areas with low level sounds that cause problems with not only heart sensitivities, but disturbances in intestinal tract and other organs. Other problems to be included would be premature contractions of pregnant women leading to spontaneous abortions. Low level sound is

126

characterized by extremely high levels of noise, very steep increases and decreases, and energy concentration, and highly sensitive areas of the air. Because the noise burst is coming fast and without warning, the body has no way to prepare, medical and psychological concerns need to be addressed.

AO-20

A report on the psychological stress and physical alterations or disturbances that pilots experience should also be included. What effects, what the effects of an accident due to human failure; what speeds do they travel; what if they lose consciousness; how many quit or die?

Children have been the most affected in other areas where low level training has gone on. Studies should be included from Europe, Canada and America as to the mental and emotional damages inflicted on children to be included from previous reports; how many children have been found with threshold hearing levels impaired by 30 percent or more; how many children won't go outside on clear days because they're perfect days to fly? How many can't sleep or wake up screaming? How many have thrown themselves on the ground when they've seen a bird fly by? How has this affected their behavior at home and at school?

AO-18

The impact on children must be addressed. This should include the toxic effects in the air, sound, emotional, physical, behavioral, environmental, social and agricultural.

127

Migrating birds who are disturbed have a hard time eating generally, eventually will not be able to migrate or even survive the migration. The loss of my birds due to the low level flights and the increased amounts of deaths that occur when high speed low level flights should be estimated and the impact of this should be evaluated. The loss of a flock of birds' lives in this case may indicate a crash or -- and loss of other lives. This should be a complete picture in the environmental evaluation.

BI-2

A Freedom of Information report should be included to reveal details of military realistic training practices in keeping with the Air Force's goal to balance itself with the environment and traditional land uses. A review of all communities, city councils and private organizations that have filed lawsuits, their cost and results should be included; the cost effectiveness of tax dollars going towards creating public resistance, and the cost of the communities organizing in opposition; evaluating the time of public spent going to meetings, emotional stress, physical stress, expenses of contacting the people, following advertising, TV fliers, writing complaints, forming demonstrations when necessary, et cetera.

They're not free to be living their lives. They're spending time and money to fight the system that is sacrificing us to protect us in the future, while

128

realistically training to kill others in other places. This is not the life we strive for.

What is the report on creating public resistance and what is the impact? We deserve the right of physical security, the free development of our personalities and the undisturbed use of property. Silence in the sky and peace on earth. This is the irrevocable decision that should be made. Dismiss all the alternatives and redirect your services to humanity. Low level flights frighten, sicken and kill. This is the Realistic Environmental Impact Statement that has been proven. Keeping the communities informed and involved is not the decision process that the public is looking for. A clear no has been given by this area and many owners again and again.

Every ten years or so you come up with a new way to get our airspace. I suggest that you add the alternative to do nothing, to decrease the airspace you have available and then to make an irrevocable decision to never try this again. The location doesn't matter. It could be Canada, Turkey, Germany or in the American southwest. For wherever fighter jets play, for wherever fighter jets play the impacts on human health, wildlife and wilderness can be environmentally devastating and all too frequently deadly. Do not proceed.

Where is Major Brent Adams and where is the representative of the NEPA, the Draft EIR is a failure.

129

008338

THE HEARING OFFICER: Josh Lazoroff?

MR. JOSH LAZOROFF: I do not give permission for my image to be filmed. Okay, can you move the --

UNIDENTIFIED VOICE: Stop the film?

THE HEARING OFFICER: No, don't stop the tape, but point it somewhere else.

MR. JOSH LAZOROFF: That's fine, you can point it somewhere else.

Thank you for allowing us to have some measure of choice in regards to military procedure. However, the choice you offer is very narrow. Saying, "We want your input in deciding where to conduct these training missions," doesn't allow us to say that we don't want these training missions, whatsoever. Given what the United States is responsible for, historically and presently, should this discussion even be taking place? **GE-3**

The U.S. demonizes those people in countries that are not in line with our national interests. And I venture to say that our natural interests do not include me. Yet, if our government would apply the same set of standards to ourselves in regards to atrocities and war crimes, terms such as "murderers" and "Nazis" would be applicable. Let us first address what we are responsible for before we even discuss future action towards any aggression, any form of aggression.

Thank you.

130

008339

THE HEARING OFFICER: Tim Cudahy?

TY

MR. TIM CUDAHY: I'm a particularly bad public speaker. I've been to -- I think this is about the fourth or fifth meeting, now, and I've pretty much chickened out every time, this being my last chance. I don't think I'll be able to live with myself, because I live directly under the path of the proposed RBTI, Proposal D, I believe it is. I know a lot of people have claimed to live directly under the path, and they probably believe that without knowing exactly where that path goes. But I do know where that path goes, and I live just a few short miles from the Colorado border on Highway 522, and that is directly under the path that you're proposing.

I have a million things I'd like to say, and I probably won't remember even half of them. I'm particularly grateful to the last woman who spoke, who covers all the technical details of the inadequacies of the Environmental Impact Statement, because I'm not prepared to do so. And I've been advised to not speak from my emotions, but to speak on technical terms so that you have to address those in your final report and all that, but I'm going to -- I'm going to try and speak from my heart anyway.

I noticed in speaking with some of you and some others in the armed forces that many times you believe from the very bottom of your heart that you are doing a dirty job that

131

somebody has to do. I know that sometimes the response is, "I also wish I lived in a perfect world where these things didn't have to happen, and where my job wasn't necessary." And I know that often times you believe all these things. But I know that if you are really being honest, and in the bottom of your heart you also must know that the power that this country is exercising around the world is not always just. It is often evil. And I believe that if you look down in your heart, I don't think you have to look that deep to know that that's true.

And I think it must be very difficult for you to be in an institution that carries out some of the atrocities around the world that are being carried out, not to protect democracy, but to -- to protect the assets of the people who form foreign policies and pull the strings. You must know that that's true.

So I would suggest from the bottom of my heart, to your heart, that you look at -- in yourselves, and if you see that even a fraction of what I'm saying is true, that you redirect what you are doing with your lives, and that you encourage whoever is about to step in your place, because somebody will step in your place obviously, that they do the same. The armed forces of the United States and other countries are doing a horrible -- horrible things to innocent people.

And yeah, a lot of times there is someone like the

132

current Milosevic or the current Hussein or whoever who are very bad and terrible people, but this is not -- this is not countries with just one person in them. They have hundreds of thousands and often millions of people, and they're the ones who are under your bombs. This is completely unacceptable and I would just encourage you to please redirect your lives, use the knowledge that you gain from the positions that you do have and make this world a truly better place. It has to happen sooner or later.

I think that's all I have to say. And I think -- I think you must know that -- that the -- that the game is getting late, as -- as pilots.

I do remember one other thing I wanted to say. As pilots who fly all around the world, either you or your superiors must see that the global patterns, the weather patterns, are getting fierce and intense. And that the -- and that the system, the -- the economy, the way the economy has been set-up in an unsustainable way, largely based on creating waste and using up all the natural resources -- and whether or not the natural resources ever will actually be used up or not I think is questionable. I think actually that the sink capacity of the earth, that is, the ability of the earth to actually absorb the amount of waste that's being created by this unsustainable system is what's going to choke us all in the end.

133

And I don't think that the end is that far away. I'm not one of these apocalyptic people who think that the Y2K is going to end our life as we know it in a few short months, but I do think that we are in the final years, and that things will change. So I want to encourage you to please go back to the people, and -- and tell them that, you know, we're just too embarrassed to come in front of these people and tell them that the effects on our bodies and their lives are going to be negligible and that they'll habituate to it. That we're just too embarrassed to go to them and -- and say that, that the -- that the environmental impact is acceptable and that they're going to learn to live with it. And that -- and that we're just too embarrassed to go to them and say that we -- that the Air Force actually needs to do this to keep the world safe for democracy.

That's all I wanted to say. Thank you.

THE HEARING OFFICER: Joe Rael? 008340

TY MR. JOE RAEL: Good afternoon. My name is Joe Rael, native of Taos, New Mexico. I've got a few thoughts too, but some of them may not make perfect sense. But they're in my heart, also.

Welcome, U.S. Military. Welcome to my skies. Welcome to my home. I live in the greatest country in the world. Who do I thank for this? My God, my creator. I kneel down and give thanks each morning. Yet who guarantees these

134

freedoms I enjoy? The brave, proud women of -- men and women of the U.S. Military. I salute you. You risk your very lives so that I may live my life each and every day. I am the kid you see on the ground with his eyes wide, his heart pumping life in each movement, his thumbs up in a salute to the most patriotic people in this country.

You risk your very being to protect our rights and liberties as we know them. I am grateful and appreciative of your sacrifice. To the veterans and active duty personnel of the armed forces of the U.S., I thank you and am grateful of your great contributions.

Taos and northern New Mexico have a long and honorable tradition of serving our country from World War II. Maybe a lot of you have heard of the Bataan Death March. The second world war my father served proudly, and Korea, Vietnam, Persian Gulf and now the present conflict in the Balkans. There are people who are willing to fight for peace, justice and freedom, which we as a people generally take for granted. The very fact that we are able to assemble here today and speak our mind is a very special and rare opportunity. I take this time to honor and offer my gratitude to you men and women.

We live in the very special and unique place here on earth. I was born and raised here and am willing to share my skills, my land, my life with you so that you may be better

135

prepared to do your job. There are some places here that are sacred to my brothers, although there are others. The two that come to mind are Blue Lake and Taos Pueblo that I may ask you to honor and reserve these. The land in which we live is so vast and wide that surely we can accommodate your needs and insure ours.

I love to see you in the skies, and ask you to always be there. Though the general sentiment of this community seems to be of a negative nature, rest assured that there is a huge, though mostly quiet segment of our community that stand behind you in every aspect. The people who have fought for this country know more than the detractors in this audience can ever hope to know. There is a simple difference between right and wrong, proper and improper, and moral. You work for justice, and I thank you for that.

To the people who seem to be anti everything, you need to stop and think about what you have, and who is responsible for it. It was not given to you, it was earned. I am quite ashamed of our civic leaders, and you do not seem to realize that we have a need to share our resources with the very people who are allowing us to enjoy and prosper in this great land. The price we pay is minuscule compared to the benefits which we receive. The risks we face from these operations are absolutely tiny when compared to the everyday challenges we face.

136

I demand that the mayor of Taos, the governor of New Mexico, the president of the U.S. allow and grant the U.S. military the right opportunity to train to be the best they can be. They represent us, you and me. This day and age is more and more in need of people who respect and honor God, the flag, and the U.S. Constitution. The minority of people who are actually insuring our way of life is small, but they're among the greatest people on earth. Though I, as you, wish this world was a loving, peaceful and caring place, history has shown that the world is in a constant state of turmoil. We can strive for the -- a better world, but the fact of the matter is that right now we need to be strong to survive.

I firmly believe that the surest way to avoid conflict is to be constantly prepared for it. We owe it to the many, many people who have died -- yes, died -- to insure our freedom. Would you give your life so that others may live? That, my friends, is a huge sacrifice, yet there are many men and women doing this very thing 24 hours a day, seven days a week, 365 a year right now. I enjoy -- enjoy all that we have, yet be aware that we must give in order to receive.

So, I declare that my skies are open to all friendly craft, may you soar to great heights, keep us free, and always remember that there are people here who love, honor and respect what you do and what you represent. May God

137

bless you and always keep you safe. You're welcome in my home.

Thank you. **008341**

THE HEARING OFFICER: Carol Miller.

MS. CAROL MILLER: Does this come off? I want to sit down because I feel like and equal to you, and this way -- thanks.

I wear many hats. I am a public health care worker, and I just spent two days in the microbiology workshops where we looked very carefully at social ecology from the global level to the cellular level. And what I learned is that there is no way for the Air Force, for any of us to predict the unintended consequences that might result from this tremendous change in our communities.

On the health plan of the Picuris Pueblo, the tribal council submitted testimony and resolution opposing the flights. I'm a health planner for a clinic in Tierra Amarilla which provides a lot of trauma care. And when we submitted our testimony from the clinic, the Air Force told us they didn't know that there was a health facility very close to the flight path. That shows the kind of work that was not put in on the front end.

I think you should know that there are trauma centers with helicopter flights in and out with critically ill patients. And we were told that we could not be prenotified

AO-24

138

AO-24

of what the flight path would be when there could possibly be an emergency helicopter on the way in.

I am opposed to this because I think that the military has enough airspace already. At a hearing in December of '97 we were told that there were scheduling conflicts of migrant services and that that was why the Air Force is looking for some of its own airspace closer to where the planes are now located. And I feel that that's a Pentagon issue to work out how to best share the existing airspace, that already exists, rather than moving and expanding into other communities.

I think that we have documentation about problems with miscarriages and stillbirths among animals, and there is some of us in the public health community that believe that that would also happen in human births. And I think that that is reason enough to not extend low level flights over communities where there are a lot of people living, giving birth, and enjoying what we have here.

I just want to say that the amount of money that this will cost to extend these flights -- I work in public health so I'm very sensitized to the sacrifices that we're making so that a greater proportion of our government and our so-called booming economy can go into the military while it's cutting programs everywhere for people here: Education, health care. Many people do not know that rural health care in New Mexico is very threatened this year, and that some of the clinics we

139

rely on may, in fact, be closing.

I urge you not to put these flights anywhere, but to use existing airspace that you already have. Thank you.

THE HEARING OFFICER: Fritz Davis? **008342**

MR. FRITZ DAVIS: Good afternoon. If I could, first, I would like to know who I'm addressing here. Would you identify yourself, sir, please?

THE HEARING OFFICER: You came in late.

MR. FRITZ DAVIS: I did, I'm sorry.

THE HEARING OFFICER: My name is Colonel Mike Burd. I'm a full-time military judge. I've had no involvement in the development of the RBTI initially, the proposal, or the Draft EIS. I'm here merely to act as a moderator or a hearing officer.

Sitting to my left is Lieutenant Colonel Greg Mason, who is a B-1 instructor pilot at Dyess Air Force Base. And he gave a briefing earlier, at the beginning of the hearing, about the RBTI.

MR. FRITZ DAVIS: Thank you. Appreciate it. I want to commend the Air Force, first of all, in their decision to eliminate the Blue Lake and Taos Pueblo area from consideration. Having said that, I also must say that I support Senator Bingaman's opposition to these flights for several reasons.

Now, one, from a natural standpoint, from an

140

environmental standpoint, I believe that to say that the impact is going to be negligible is a vast understatement of the situation. I have requested a copy of this proposal, and I want to read it in full, myself. I've only been -- found pieces and parts here and there. But I would urge reconsideration or more careful study of the environmental situation.

BI-20

I also have concerns from an economic standpoint. I think sucking an eagle into the jet engine is not going to be good for the engines. And I think that's a very good possibility. I don't know if that's been considered or not. Eagles, buzzards, large birds that do great damage can cause great havoc, as I'm sure you're aware.

BR-4

Also have considerations at this point about the economic impact of these flights. Currently in Taos County the unemployment rate is 11.3 percent. That is as of February of this year. That's down slightly from this same point last year when it was 11.5 percent. Colfax County, the economic impact, the unemployment rate, 7.5 percent. I think that in an area where tourism is a large consideration, where people come to mountains to get away from noise, I think the impact is going to be a lot greater than it has originally been considered.

And I grew up in Wichita, Kansas so I know the sound of a B-52. I also know the sound of a B-1. They're magnificent

141

airplanes, I must confess. I still have to go outside when I hear one going over to see what I'm looking at.

I do believe that there needs to be closer considerations, more realistic considerations of what impact upon wildlife and what impact economically on an already pressed economic area, as I believe the national unemployment level -- for Taos County is approximately what, a third of what the unemployment level is here. And in Colfax County it's about three-and-a-half points less. So I think damage, damage needs to be considered much more carefully than it has been currently.

I thank you gentlemen for your time. Appreciate it. And I also must say that I understand the needs for these flights, in that preparedness is a part of our modern world, whether we want to admit it or not. However, I would urge you to look again, very carefully, at what the ultimate injury to our area will be.

Thank you.

THE HEARING OFFICER: Cory Boyd. **008343**

MR. CORY BOYD: Good afternoon. I've lived here and seen many things. I've seen some bald eagles, I've seen some golden eagles. I've seen many rare and endangered birds in this area. And I think that this is a consideration that needs to be considered in the impact statement, because I feel that there is a real hazard of a bird getting sucked

BI-5

142

in an engine.

I live under the flight route D-84, which is a low level training route right now currently in the state. A few times in the past we've been woken up around 9:30 at night, between 9:30 and 10:00, by a bomber coming over our house. This has happened a couple of times at night and a couple of times in the day. In the past time that -- the daytime, when they pass by I saw the crew, the fly crew in the cockpit passing by at eye level. They weren't 200 feet in the sky, they were approximately 150 feet off the deck. That is not -- not a safe level to be flying. That is not a safe level. With a 160-foot wing span on a plane, if it banks, if it makes a hard turn it's going to eat it.

We live in an area where there is no electricity, there is no well, there is no water supply. If there was a crash, it would be entirely devastating to our community, to our houses, to our lifestyle. I urge you to take that into -- into account in your decision that we're going to make.

AO-16

I hear things about protecting our freedom and protecting our national interest, but what does this really mean to me? Protecting other people's freedoms; what about them when you're dropping your bombs on them, you know, the bombs that we pay for with our tax dollars? What happens to them? You know, most of those people have nothing to do with what's going on. Most of those people don't even know the

143

big wig that's getting the money from our military, protecting our national interest.

What about the people in Panama, Honduras, Nicaragua, Guatemala, El Salvador that have been killed, destroyed by our military? What about the hungry and homeless in our own country when -- at a time when 12 billion more dollars is being allocated for our military spending, when most people in the United States can't even get welfare to receive food stamps for more that about three months? 120 dollars. At one point I heard a comment on the radio about Kuwait and how bad the situation is. People there from their government receive $120 a month for food, at a cost one-half of our costs for food. And yet they say that that is enough. They say that that is unjust.

Well, in a free country where people are starving, 25,000 people every year are dying from hunger in our country, where do you find your justification to take $12,000,000 and put it into a military which is killing, raping and destroying people? Is insuring the freedom of a few privileged people, notably the five percent that make the rules and control our congress and our law decisions, are they worth slaughtering millions of people?

I, myself, received no benefit from the national interest of protecting of the military. I'm sorry, but I feel that without the military it would be no different than

144

what it is today, except people would be fed.

Thank you.

THE HEARING OFFICER: Billie Bolton? **008344**

MS. BILLIE BOLTON: Hi. Thank you for being here today. I read in the EIS that it said that we should -- that the people of Taos County would habituate to the noise that these bombers would make flying 200 or 500 feet over our towns, and I just want to say that to me we shouldn't have to habituate to this sort of thing. That level of noise and that kind of disturbance to me is psychological terrorism, and for us to have to make this sacrifice in order for the military to have the added convenience of not having to travel as far to do its testing I think is -- is not acceptable. This -- this is our land, this is our communities, and I don't think that you should be allowed to expand the military flights that we already have. Ten flights a day is just way too much.

AO-13

And the constitution guarantees us the life, liberty and the pursuit of happiness. And the pursuit of happiness to me includes peace of mind. Now, we were not responsible for the building of these bombers and I don't think it should be our responsibility and our sacrifice to provide a place for the testing, that the military already has plenty of test grounds. And I don't believe that this expansion should be made at all, so I would ask military to stay with the

145

no-action alternative, and to consider the -- this is a -- this is a land that people will fight to their last breath to protect the quality of life. And I think that -- that you know we won't stop here.

So, thank you.

008345

THE HEARING OFFICER: Alva Morrison.

TY ALVA MORRISON: Thanks for being here, fellas. I know you have had to listen to an awful lot. Just want to add my two cents, because I'm here to support the no-action alternative. And I'm aware of how much military flights from the U.S. Air Force and other air forces have been expanding all around the western part of the country recently, and it's a deep, deep concern for me. I don't think it's necessary for us to have to bear the increased burden. I don't mind seeing the occasional jet flying over, you know, up in the -- way up in the sky. It's all a different thing when you're coming in at 200 feet.

And I'm aware that it's not just the U.S. Air Force, that the reason for -- I know the previous speaker mentioned the conflicts between the different services, and that it's not just the U.S. Air Force, that we've got all kinds of other countries coming in here, depending on what the latest -- you know, whatever the current administration happens to be, what their foreign policy is.

I'm a ski instructor up here in the north, and we had

146

the Singapore Air Force coming in here to go skiing this winter. Well, I think it's fine if they want to go skiing, but I don't think that my health and my -- and my peace of mind should have to suffer for whatever bloody -- blood thirsty dictatorship happens to be in good with whatever the current administration is.

And I think, for that reason, if there is conflicts in the use of military airspace right now, we should thin out some of the use of the current airspace to get rid of those conflicts. I don't think we need to add to anybody's suffering that's going on all over the western part of this country.

And as far as this business of people habituating to the noise of these jets, that's a joke. And that's a big ol' hole in that EIS and it's going to get taken into the courtroom and torn up to shreds because we're not going to habituate to that kind of noise. It's going to cause extreme health and psychological damage. And I for one am never, ever going to habituate to the noise of the Singapore Air Force flying at 200 feet over my head.

Thanks a lot.

THE HEARING OFFICER: I've now gone through all of the cards that have been turned in, and what I'd like to do is take a break, short break, and then when we come back, probably no more than ten minutes for the break, then

147

I'll ask if there is anyone who has not made comments that would like to come forward and make comments.

After that I will ask if there is anyone who has made comments that would like to make additional comments. And we will do that until everyone has said everything they want to say. But I would like to take a ten-minute recess.

(NOTE: A recess was taken from 3:47 p.m. until 4:01 p.m.)

THE HEARING OFFICER: I'd like to call the hearing back to order. And we have a public official who has indicated a desire to speak, so I would like to now call on Erlinda Gonzales, who is Town of Taos Council Member.

008346

TY MS. ERLINDA GONZALES: Good afternoon. My name is Erlinda Gonzales and I'm here as an individual, but also as a council member, the Town of Taos Council. As a government body we have opposed the flights, the proposed flights, and I would just like to speak on -- on that note, because I feel that this would endanger what we enjoy today, the tranquility that we have in the community. And for myself, I can say that we have a beautiful, unique town, a beautiful city, a beautiful county, and I think the noise, in itself, would be an issue.

But also what it would do to our wildlife, to our few farms that we have left, few ranchers. But also just what it stands to take away from us in the way of tranquil community. So I just stand here before you and ask that you not bring

148

these flights over our community.

008347

Thank you.

THE HEARING OFFICER: Sylvia Rennie?

MS. SYLVIA RENNIE: My name is Sylvia Rennie. I'm also the secretary of the Latir Neighborhood Association. That means we live right under this flight path that you're proposing. I also was at the meeting at the Sagebrush in -- on Wednesday evening, and I was struck how many stories were almost identical. And it became very repetitive and I found that it was, in fact, very moving that so many people should repeat the same story.

I had a tremendous job in a big city. I made good money, I had a good position, and I couldn't stand the commotion, the noise, the hectic life. They particularly did not habituate. They did not get closer -- you're saying we will -- to this noise. One doesn't. One loses hearing, one has lost it. If one is getting stress syndromes, one's got them.

There was a psychotherapist on Wednesday evening also, also said this thing is cumulative, getting stress, getting distress over and over again makes matters worse and worse, one doesn't get used to it. I also am not a refugee from the cities, but relatively late in life I found that I could make my own decisions. I found a very quiet place to live, and I am now in my last third of my life, more or less, and I'd

149

really like to spend it in peace and quiet. And I find it appalling that I should suddenly have to come to meetings in beautiful weekend afternoons like this to fight bomber noise.

I very much hope that after all these meetings, after all the letters people have written and e-mailed and phone calls people have made, you do grasp and understand and sympathize that we cannot stand the thought of you doing this to us.

We've also been told that it's the pattern of the flights and the flying time which is expensive. Well, as somebody pointed out the other night, if that isn't a consideration, why don't you move your bases up towards Utah instead of having all of these flights suddenly thundering through our valleys?

PD-2

So, I just wanted to add my voice to all the other people who said, "We've had the noise, we couldn't stand it. We have found a place without the noise." Please, let us live in peace and quiet.

Thank you. **008348**

THE HEARING OFFICER: Lorenna Shalev.

MS. LORENNA SHALEV: Hi. I wanted to address the issue of the fact that bombing is against international law and, therefore, the training of bombers in our area cannot be therefore justified according -- so I wanted -- I don't know, do you give any answers to these questions or is

150

this just a public comment time?

THE HEARING OFFICER: The latter.

MS. LORENNA SHALEV: Okay. The other -- I don't remember all of the things I wanted to say. So there was that question. The other thing is also whether or not it really makes any difference that all the people are opposed or the animals are opposed whose voices you cannot actually hear? Does it actually change anything that you have this amount of opposition in an area, and what -- is there truly a democracy here and do we have a void.

GE-3

Blessings.

THE HEARING OFFICER: Ladies and gentlemen, that goes through the cards that were provided to me. I'd now like to ask is there anyone who has not made comments that would like to come forward now and make comments? Yes? And if you do chose to come forward, if you'd please state your name? **008349**

MR. GENOA BLIVEN: My name is Genoa Bliven. I may be one of the few people here who live closest to your proposed route through Sunshine Valley. Federal government went through a lot of expense to create the Wild and Scenic River designation north of Questa, invested over a million dollars in creating the Wild and Scenic River park there. That stretch of the Rio Grande is one of the only truly pristine wildlife areas left in this area.

151

There are nesting areas for Golden Eagle where the nests themselves are over 300 years old, and they are probably the size of your house, because every year the eagles add more to their nest. Those particular eagles, those golden eagles, as well as bald eagles nest there and they will rise to meet and challenge a B-1, a B-1 bomber. You're proposing that you're going to fly 800 feet over there nesting area, and they will challenge a B-52 or a B-1. They weigh around 35 or 40 pounds.

BI-5

And that event would occur about two-and-a-half miles from my house. You'd be coming my way. I don't particularly appreciate your lack of foresight in even thinking about doing something like that. I don't like it at all. First of all, it seems like a very confused priority to -- for the federal government on the one hand to create a wildlife sanctuary to spend taxpayer dollars and reserving an area for peace and quiet -- thanks -- and then to turn around and to completely propose a completely contradictory use for the same peace of land. I don't get it.

That's all.

THE HEARING OFFICER: The court reporter has asked if you would spell your name?

MR. GENOA BLIVEN: First, G-E-N-O-A is the first name, and B-L-I-V-E-N.

THE HEARING OFFICER: Is there anyone else

152

that has not made comments that would like to come forward and make comments? **008350**

MR. JOSH ALLEN: Hi. I haven't really read through all of your information. My name is Josh Allen.

THE HEARING OFFICER: Could you state your name please?

TY

MR. JOSH ALLEN: Josh Allen. But I have a general sense of what's your plan, and I'm absolutely opposed to it. And I feel incredibly angry and frustrated that this proposal is going through, and I feel an urge to kind of pin my anger on you, but I don't want to do that. I want to just acknowledge that you are all very good human beings, like all of us, but I feel like you don't have some important information or you're not acting with full integrity.

And not only do I not support this proposed route, I don't support any route in this country, and I think it's important to kind of -- for all of us to really look at this issue, and think about human life and to do the right thing, and I don't believe that it's the right thing to kill other human beings, and I don't believe it's a good thing for the military to go actively recruit working class people, especially working class men and people of color. And I see a very kind of racist and classist component to the military system, and I would just appeal to all people to really think clearly about this issue, and not support the military's

153

involvement in New Mexico, and throughout the world.

Thank you.

THE HEARING OFFICER: Is there anyone else who has not made comments that would like to come forward and make comments? Mr. Williams? **008351**

TY MR. DANIEL WILLIAMS: Good afternoon. My name is Daniel Williams. Many of those -- many -- certainly the gentlemen up front all have heard me speak because I've made comments four times: In Angel Fire, in Taos previously, and then earlier today.

What I'd like to add to my previous comments, if I may, is to emphasize, and this is for the benefit also of those of you in the audience, that in the EIS on page 263 what it does point out is -- a chart here says expected operational outcomes of implementing Alternatives B, C or D, and it does compare each of the alternatives. And the real key is if we look down into the third column, actually the third road, it says for Alternative B that it would be a 26 percent increase from the proportion of combat training time as opposed -- let's talk about as opposed to time that is spent flying to the areas where the training will be conducted.

Alternative C, a 26 to 29 percent increase in proportion to combat training time. And then finally for Alternative D an 18 to 26 percent increase in proportion of combat training time, so much -- what that really means is of the three

154

alternatives, the one that would benefit the Air Force the least operationally is Alternative B, this particular alternative.

And there are two key parts, understand, to the decision or two key things to look at. One is the operational benefit. The other is the environmental impact. Other parts of the EIS have already shown in the executive summary that, in fact, this alternative does have the highest impact and it does show it as being significantly higher than the other two alternatives. But, in addition, this shows that the benefit to the Air Force also is higher on the other two alternatives.

The chart on the executive summary -- for the benefit of anyone wanting to look at that EIS, this chart is on page ES-3, and it shows diamonds to reflect the effect. And for Alternative D it's showing two diamonds under "Airspace," and air -- two diamonds under "Land Management Use," and one diamond under "Biological Resources," versus the other two alternatives which show one diamond each in each airspace aircraft operates, one diamond in a land management use and negligent impact in all other areas.

So while many of us do feel that the EIS -- it does show a significantly lower impact than we're convinced it would have. Again, the EIS itself does show a higher environmental impact for this area, but it also shows a higher operational

155

benefit to the other two alternatives. So, based on that, two of the very basic reasons for making a decision, two of the key things to look at, the other alternatives, do make more sense. And I don't say this to wish this on the people of Texas by any means, but again to stress that this particular alternative, the northern New Mexico alternative is -- would be the least effective and the least beneficial for the Air Force.

Thank you.

THE HEARING OFFICER: Is there anyone else who has not made comments who would like to come forward and make comments? Yes?

MS. JASMINE SANDERS: You need my name?

THE HEARING OFFICER: Yes. **008352**

MS. JASMINE SANDERS: Jasmine Sanders. I just wanted to say that I was just over the -- at the pow wow celebration, and some of the women from the Pueblo who couldn't be here asked me to say that they grew up with these bomber jets flying over the Pueblo, and that the huge enormity of the sound had a negative impact on their ears, AO-12 and also on the structure of the historical homes on the Pueblo. And they're absolutely opposed to having this initiative go further, and so am I.

THE HEARING OFFICER: Anyone else that has not made comments that would like to make comments? Is there

156

anyone -- yes?

MS. LORENNA SHALEV: Can I add --

THE HEARING OFFICER: I was just going to call on individuals who have already made comments, if they'd like to make additional comments, so please. **008353**

MS. LORENNA SHALEV: Hi. I did go to Angel Fire at the previous time, before you produced the EIS in -- in order to speak. And on my way home I met a whole herd of elk on the road. And afterwards when I tell people about that they said, "Well, maybe you're meant to be a spokesperson for them because they cannot speak."

And it is really important that in areas where the wildlife are to be protected, and have specific areas like the Valle Vidal, and that -- that breeding grounds where people aren't even allowed, no cars were allowed. And yet BI-1 these bombers were going to come over and interfere with these specially protected breeding grounds.

And so on behalf of the animals, again, I'd like to make and another plea.

THE HEARING OFFICER: Ma'am, what was your name again?

MS. LORENNA SHALEV: Lorenna Shalev.

THE HEARING OFFICER: Could you spell your --

MS. LORENNA SHALEV: L-O-R-E-N-N-A S-H-A-L-E-V.

157

THE HEARING OFFICER: Thank you. Is there anyone else who would like to make additional comments? Anyone at all? Would anyone like to make any additional comments? Mr. Williams? **008354**

TY MR. DANIEL WILLIAMS: Daniel Williams. Sir, I understand -- I know that we're getting close to the end of the day, here, and I know that 5:00 o'clock is a scheduled time, and may I just make a request as a citizen that if we take a break and we could reconvene so that anybody else that does come in later would have that opportunity? We'd appreciate that.

THE HEARING OFFICER: That's reasonable. Colonel, was there anyone out there?

UNIDENTIFIED VOICE: No one in the outside room or hallway, Judge.

THE HEARING OFFICER: Mr. Williams has asked that we take a break in case someone shows up, and I think that's a reasonable request. So let's take a break, and what I'd like to do is just stand in recess until we get one or two additional individuals. So, I won't adjourn this hearing until 5:00 o'clock. So, we are in recess.

(NOTE: A recess was taken from 4:20 p.m. until 4:58 p.m.)

THE HEARING OFFICER: Ladies and gentlemen, I would like to resume our hearing, so I'm calling the hearing to order.

158

I'd like to know if there is anyone else who would like to make any comments? Yes? **008355**

MR. DAVID KRUSELL: Try to do this better than the last time.

GE-7 Hi. Name is David Krusell, K-R-U-S-E-L-L, and I'd like to say that, to me, if you come into an area and propose to do a study with your rules, and you write your own environmental study on it, which is, you know, obviously subjective because the Air Force obviously would like to be in one of these three areas, that I think it entails an obligation to really be impeccable in what you are doing. And I-- I don't think that's the case, here.

ED-2 I think that's the omission of, you know, half dozen wilderness areas, vast wilderness areas, Latir, Valle Vidal, it's an -- even a -- omit those from your study, I think is -- is certainly not impeccability.

BI-5 I think to mention that you are going to be impacting a few -- at least a few species of rare or endangered birds, and then you just say, "Well, we're going to do that," but at the end, you know, your final decision is that's okay, and not even saying anything about it, I don't think that is in good faith. I think to come into an area and not even go down and talk with the people, you know, to -- to find out the area with your dog, to talk with those people, I don't know where you are going to do it. And investigate and just

159

do studies with secondary work on computers or reports is -- is not in good faith.

And I think that in a situation like this it would be obvious that you would want to fly these planes over the area, and certainly the people of Taos County would be more than willing for you to run five or ten jets over so that we could come out and see what it's about so that we would know what we're talking about, and I think that would be -- make things much clearer for everybody because then everybody would know exactly what we were talking about.

So I don't think that -- I don't think that there has been good faith there. I think that you'd kind of like to slip in here as easy as possible, and I don't think that's right.

PD-2 And I think that in terms of, you know, travel all that distance, you know, being separated from your training grounds up north and having to go all that distance, I think there should have been some foresight on this years ago, and that could have been taken care of. If I own a -- you know, let's say a fishing industry, and I don't do it in Utah and then expect, you know, to get mail across California and get to the ocean. I use some good business sense. And I think that could have been done easily back in the good old days. And I hope that the statement looks on.

So thank you.

160

THE HEARING OFFICER: Would anyone else like to make comments? Please? **008356**

MR. RICHARD ARTHURS: My name is Richard Arthure of Ranchos de Taos. And after speaking with some of your officers next door I understand that what they're proposing is to have flights of bombers at 400 feet, and to increase the number of flights to up to ten flights a day where they now have, if I understood correctly, something like 50 flights a year, or less than one a week.

This is an extraordinary increase. And to have these flights at such a low altitude, 400 feet, I know that the noise level would be really intense and that it would be a very serious disruption of not only wildlife, but human life. And that's really something that should not be done.

I know, after discussing it with my friends in this area, that people that I've spoken with are very strongly

BR-7 opposed to these flights. They effect the quality of our life here in Taos County. And the impact on wildlife cannot be understated -- is being understated and should not be. Cannot be overstated, perhaps I should say.

So, for these reasons, and also it's come to my attention that something like 75 percent of the land mass of this country is already covered by different flight

PD-1 corridors. There is absolutely no justification for having these low level flights of only 400 feet, which would be, I

161

know, an almost deafening noise. There have already been a great many flights in this area, and the area of Southern Colorado, around the Herfano Valley that I personally have witnessed, and here over New Mexico. And there is much too much of this military over flights already. To ask for more of them, and to increase it up to a level of ten flights a day, this very low altitude, would be an intolerable invasion of this county, and a way that would be completely unacceptable.

So I urge you to -- not to go through with this project. And I urge you to consider the needs and the rights of those who live in this county, in this area, both humans and animals and birds. Please. There are many, many air corridors right now that are controlled by the military, the Air Force, more than enough. To intrude further, and to this beautiful land, and to destroy the peace of this land in the way it is proposed would be completely unacceptable.

Thank you for your attention.

THE HEARING OFFICER: Spell your name, please.

MR. RICHARD ARTHURE: Yeah, it's Richard Arthure, A-R-T-H-U-R-E.

THE HEARING OFFICER: Would anyone else like to come forward and make comments? **008357**

MS. TAMMA SIPES: My name is Tamma Sipes, and I just want to speak for my own personal experience recently

162

in El Salto, which is outside Arroyo Seco. It was an early morning and it was quiet, beautiful morning. And suddenly there was a jet flying very low, probably around 300 feet, over where I live. And it was extremely disturbing. I can't imagine what a bomber would do. I can't imagine the impact of a large plane.

This was a fighter, a small fighter. He didn't belong there and you had no control over him. He was flying out of your control. And how do you account for that? How can that -- what happens if one of these guys, this -- the bomber who is 22 years old and decides he wants to play? What happens to the people below, to the land, to the animals? I just think it's outrageous that you've chosen a place of peace as this is, to do this.

AF-8

Would you -- I'm going to ask you a personal question. Would you, if you were retiring from the service, choose to live in a place where bombers were practicing? I want you to think about that. I know what your answer would be because nobody in their right mind would want to live there.

Thank you.

THE HEARING OFFICER: Would anyone else like to come forward and make comments? Yes? **008358**

TY

MR. ELLIOTT LIBMAN: Yes. I got out for about three hours, but you guys didn't. And I was here before, and I was the one that -- I said the government doesn't have ears

163

when you wouldn't say anything, and you said that this was not a dialog.

And what I -- I have been kind of walking around and seeing people, and in the other room. All I can say to people was I don't trust the government because that was the only way -- that was the only way to be honest, to start a conversation. And then I felt sort of funny, you know, because it's not that personal, but yet it is.

I was out in the lobby and there is a woman who works for the -- you know, for the Air Force. And I said to her, "It's not, like, a personal thing."

And she said, "It's not, like, a personal thing," but people tend to take it out on you guys personally and it's not your policies. But we, the people, never get to talk to the people who make the decisions, and they talk to the people who pay for the politicians' elections, campaigns, and that's where our policies are coming from, the corporations, and you know it.

And -- and the woman -- the woman outside, we talked a little bit and, you know, there was like a connection that we had. And I -- there was a guy there that she worked with and I felt like that, you know, she was going to get in trouble, you know, because she was, like, talking about her feelings, that it's a difficult job, because it is. And so -- you know, so I left. And when I came back I said to her, you

164

know, "We all -- we need to get jobs that we really feel in our hearts."

And she said, "I did, and I am." And I think that what happened was there is a denial that happens. There is a -- there is like a -- right now the people do not trust the government. This is terrible.

I was born in 1949, before the '50s. But I was -- I was -- came of age in the late '60s. And you're, like, "I want to get out of here, and I don't want to hear this," but how are we going to heal and change our values? We have to learn to live together, multiculturalism, multiethnicity. But right now the interests of the money have -- they've always been that way.

I'm Jewish, you're black, you know that. I mean, yeah, you're in a tough place right now. Hell, you -- I mean, I don't know.

I'm really -- I got to my house, and then I came back, and I -- I felt like I just wanted to talk about that because I think that's what's real. It's going on in this county, with the county government, and -- and right across town, Howard Zen. This is like the Howard Zen RBTI day. You know, the real -- we -- are we going to change our priorities so, instead of making decisions -- I'm sorry, I'm going to go on. Not too much longer, though -- not make decisions based on economic expediency. That's what runs western civilization.

165

It's called reason and logic, and it's tied to technology, but it really benefits a few people who are really rich, and they own the media and they own the military.

And I'm done.

THE HEARING OFFICER: Sir, the court reporter has asked for your name.

MR. ELLIOTT LIBMAN: Oh, I'm sorry. My name is Elliott Libman. I've been a psychotherapist for Taos Mental Health for six years. I work with people who are traumatized, and I'm not sure if that meant to you that, "Oh, this guy can be discounted." But I don't believe you. I -- I look -- I mean, I want to believe you, you know. You're a good guy. But you would not want to put it in your backyard. RBTI, I mean, NIMBY, NIMBY, not in my backyard. Everybody who makes these decisions, and not you maybe, live in places where they don't put the nuclear waste, where they don't put the sledge.

And the rich people live in these palaces with gates. And western civilization has been about freeing people. The American Revolution was about it. But now we invade and kill indigenous people and -- and take their land. And we need to change it and we need to change it with love and real heart. Our heart gets tied with deceit, and our self-interest takes over.

MR. DAMON SHYMANSKI: Good afternoon. My name

008359

166

is Damon Shymanski. I work with the local youth organization, and I just wanted to share something that really kind of brought my attention to this and really solidified my opposition to the proposed training route.

I went about three weeks ago on a float trip down the Chama, which is just below the Abiquiu Dam where the flights begin. And I was with five local youth on a trip where we went down and planted cottonwoods down the Chama River, which is a native species that has been taken over by the tamarisk. And on that trip -- it was three days long -- we saw two bald eagles, the likes of which I have never seen in all my days. And the crew, who was mostly local young men, grew up here, also had never seen anything like that.

BI-5

And so it really got me to thinking about the habitat of that area, and not just that area, but all over the training region that is proposed. I think that any time you have that many flights -- it's a massive increase. And if you have that many flights going through an area, species are going to be disturbed, people that live there are going to be disturbed.

And you'll find, I think, throughout this community, that we're united in our opposition to this. And I would hope that as an organization, as any business would do, they would consider the public's opinion of their practices and how that's going to effect not only what kind of people join

167

that organization, but also the public's view of that organization. You know, if people vote for how politicians are going to spend dollars, it might influence in the future what kind of funding the Air Force gets.

And I think that you really need to think about the impact that ten flights at 400 feet are going to have, not only on the people of the area, but the habitats of the region, and the future of the Air Force, for that matter.

Thank you.

THE HEARING OFFICER: Would anyone else like to come forward and make comments?

MS. CYNTHIA AGNEW: I have a really --

THE HEARING OFFICER: Could you tell us your name?

008360

MS. CYNTHIA AGNEW: Cynthia Agnew. Just a comment on what he said is that northern New Mexico, I think, in comparison to the other areas, makes the large majority of their income from the natural assets that are here. And that -- that is the one thing that we really have. And tourism, the attraction of, you know, growth of -- socially is reliant on those habitats and natural beauty that we have.

BR-4

THE HEARING OFFICER: Yes?

MR. GALEN GOLDSMITH: How long do I have to speak? You have a timer.

THE HEARING OFFICER: Well, we use as a

168

guidelines three minutes, and -- but --

MR. GALEN GOLDSMITH: Okay.

THE HEARING OFFICER: -- I haven't cut anybody off, so --

008361

MR. GALEN GOLDSMITH: My name is Galen Goldsmith. I live in Albuquerque. In this particular incidence of the new training routes, I was told it was going to be being done Monday through Fridays. And there are families that have to get up to go to school in the morning, people have to get up and go to work. And I kept getting told that is sounds about as loud as a chainsaw, but from your own environmental impact, 117 decibels from a B-1 at 300 feet, that's more -- close to the 123 decibels of a rock band.

Now, when I turned 21 I had a criminal citation for having a rock band play at my 21st birthday party and it was only 10:00 o'clock at night. And these are going to be happening at 1:00 in the morning and over populated areas, and it just seems ridiculous that this is not going to have an impact on a community. I mean, people need their sleep. And these are -- these are -- that's really loud.

AO-26

And then, more in general, in general towards the need for Air Force. A few years ago I met the last person to drop a bomb on U.S. soil, a Japanese man, and he was about 60 years old. The Japanese during World War II thought that

169

they could start major forest fires in the Pacific northwest. They didn't know it was a rain forest, so it didn't work. That was sometime in the mid '40s, I suppose. That was the last time we had a bomb dropped on our soil. And before that I guess it would be under the Polk administration, and that was questionable whether that was U.S. soil or Mexican soil.

And it is a question of need for this. I mean, the military grew tremendously during the cold war, but -- the cold war is over, but during that time when the military was a major industry, lots and lots of monied interests got into it. I mean, it's a major industry in the United States, and so now the cold war is over and so now we have terrorists, which I suppose weren't there before, but now they're just as big of a threat as the U.S.S.R. was. And we have ethnic cleansing that we need to protect.

So, in regards to ethnic cleansing, if I could mention I'm very much against the idea of ethnic cleansing, very much against how in 1974 the U.S. support the -- and support Jimmy Carter gave them. More records when they began a campaign of genocide that ultimately killed 200,000 Israelis, which was done with U.S. weapons, with U.S. military equipment. I'd like to say that I -- I'm very much against the ethnic cleansing that goes on in Israel, although at a much lower grade. U.S. entirely supports everything that the Israeli government does, it seems, regardless of the effect on the

170

Palestinians.

When Benjamin Netanyahu came to power and announced that since the newly elected government, all of the previous peace agreements of the Palestinians were null and void, they don't matter because it's a new government. That is ethnic cleansing in itself.

And so I'd just like to wrap it up by saying that I question the fact that we're in Kosovo because of trying to stop ethnic cleansing and the -- question the regimes that we've supported in the past, and I really strongly question the need for such a tremendous war machine when the U.S.S.R. is no longer really a threat to us any more, and making up new enemies just to justify the people that don't want to lose the business and the industries of creating all these weaponry.

THE HEARING OFFICER: Would anyone else like to come forward and make comments?

UNIDENTIFIED VOICE: Would you? Do you have anything you want to say?

UNIDENTIFIED VOICE: Are you allowed to speak to us about -- we're people. We're both Americans; right? Why are we on the other side of the fence? **008362**

TY MR. SAMMY SWENSON: Okay. Hello. Good to see you guys here today again. I was here Wednesday. We have the meeting, there was a lot of people here Wednesday, and it

171

was real nice to see. And I hear --

THE HEARING OFFICER: Could you tell us your name?

MR. SAMMY SWENSON: Oh, nice to meet you. My name is Sammy Swenson. I'm from Maine, in the East Coast. And, yeah, I'm coming here to Taos to do a global peace walk where I just happened to be having this coming up April 22nd, but I'm going to talk a little about my understanding of maybe why I'm here talking.

And I guess if you look at, like, people and, you know, we're all people living on the earth. And the earth has some resources. And we're trying to live in harmony with the earth, so I'd like to start out with that and my own humanity must live a peaceful way of life and we can make things work.

So, starting off with that note, maybe from a long time ago, you know, people have wars and fighting amongst themselves. You know, we've evolved, you know, as creatures maybe, from whatever your belief is. And we've come together, but wars have continued.

And now here in 1999 is the war still happening because we're -- we're still fighting over resources. It's a general, basic understanding. But when is it going to end and what's going to stop it or what's -- what are we trying to come to? What's the point?

You know, we have this -- we have the bombing routes

172

that we want to do, or the training routine, and that's -- that's another part of the whole puzzle that's happening. But ultimately we know what we have to do and we have to do it soon or else we're going to, you know, be in more trouble than we already are because, you know, the -- the Endangered Species Act, you know, and all the pollution that's happening, and the lot of this stuff that's happening. You know, we all know what's happening, and the time is running out.

UNIDENTIFIED VOICE: They don't believe it because they're insulated from it. They don't get any of that.

MR. SAMMY SWENSON: We're all trying to believe it, but it's not real to them. It's like a general feeling, you know, the general feeling if we could get together and channel, like, a general feeling of "Okay, we know a direction that we're going to move in." People, in general, you know, all as one.

We're going to declare a global peace zone, United States. Maybe this year. We're going to walk to Washington. We're going to tell them about this. We're going to get people to come together, and -- "Global peace zone 2,000," how does that sound? We could declare the earth to be global peace zone 2,000 and, you know, continue that prayer and just -- hey, who knows. It could happen, you know. It's,

173

like, a good idea.

So instead of complaining about, you know, the war that's happening, I want to offer some positive solutions and I'd like to thank these guys for taking so much, you know, of the heat that you've put yourselves in, you know. And in the way of -- but I'd like to just say, you know, thank these guys. Shake their hands, pass the peace, and -- all right.

Thank you very much.

THE HEARING OFFICER: Would anyone else like to come forward and make comments? Yes? **008363**

MR. CLIFF BAIN: I'm Cliff Bain. Thank you for a further opportunity. I just wanted to relate a conversation I had with a Mr. John Schuler out in the lobby about an hour ago. He is a -- works at Cannon Air Force Base, civilian employee in charge of airspace management, something like that. And he pointed out a couple of things that we here in Taos have needed to know.

AO-65

And one of them is that if a -- if an air -- a military aircraft is outside of a designated Military Training Route, they are not permitted to fly fast -- faster than 250 -- what do you guys go by, not miles but the other one? In any event, about 280 miles per hour. So what that tells me is that what all of us who have lived here in Taos have experienced, which are jet fighters flying really fast and really low -- there doesn't happen to be any military

174

training routes in this -- to the east of Ojo Caliente.

UNIDENTIFIED VOICE: This is how we get rid of it all.

MR. CLIFF BAIN: No, I'm talking about accountability, first step. Because we're talking about a military training initiative that has some rules, it has some parameters. And people here in Taos feel like that things are being violated, but we don't know what the actual rules are. So he's going to send me, you know, a -- the FAA's publication that lists all the routes. And this is an FAA law. And he says that -- I mean, a regulation.

AF-43

And he says that a pilot that flies faster in an area that -- that's not a Military Training Route, even if they are under visual flight regulations, are not permitted to fly faster than 250 nautical miles per hour, so they're breaking the law. So this is useful to know. And I hope that we can all get informed and know the right places to begin to take the first steps towards accountability.

And the other thing that's interesting, that relates specifically to this RBTI program, is he says that there is a memorandum of understanding, an agreement between the New Mexico Fish and Wildlife Service, perhaps the federal. He's going to send me this, I don't have it yet. But that if there is a nesting site identified for a bald eagle, a peregrine falcon or any other threatened or endangered

175

species.

A specific location is mapped by GPS, and it's marked on the charts. And the agreement is that an aircraft will avoid that, will rise to 200 -- 2,000 feet to avoid this.

Now, we haven't heard in all the explanations of this RBTI that if, in fact, there are nesting sites identified along this quite long route that we can be assured that the aircraft will cease to fly at 400 or 200 or 500 feet above ground level and rise to 2,000. And I just wanted to get this into the record so that in your Final EIS you can assure me that this, in fact, will happen.

Thank you.

THE HEARING OFFICER: Would anyone else like to come forward and make a statement?

UNIDENTIFIED VOICE: I have a question. Does anyone answer questions?

THE HEARING OFFICER: What I informed everyone of at the beginning of the hearing is that this hearing is not a debate, nor is it a question and answer session. I've also previously added that questions are certainly appropriate, to the extent that you think they are, as a part of your comments. So if you have a question that you would like to pose as a part of your comments, that's certainly appropriate to raise any question that you have. We will not be answering any questions.

176

008364

GE-30

MS. TAMMA SIPES: My name is Tamma Sipes. Has there been a dialog about this, or has it always been just comments? Can that be answered? No, I guess. The answer is no.

One thing I would just like to comment on, and actually my comments are not for you, but they are, too, also for you. It's been amazing to me to sit in this room. I'm a psychotherapist. It's been amazing for me to sit in this room and feel the level of depression, both on this side and on this side. It's like the powerlessness of both sides, appears to me incredibly sad. We seem to be locked in a spiral that none of us can get out of, and I -- I really believe that it's pathetic. And it -- it touches my heart.

It's very hard for me to sit here and feel that energy. It's -- we all feel like there is nothing we can do. I mean, they're going ahead in their usual way, and we are, too. But, it seems so useless. And it seems so sad. The fact that people can name what it is that is our malady means that we're starting to maybe see how to get through it, so the fact that there is this depression, that's the beginning, the recognition of it. Each person that has that feeling, how to -- how to heal. **008365**

TY

MR. ELLIOTT LIBMAN: We -- we're -- we've been -- the civilization has been taken over by western capitalism. Indigenous cultures have been wiped out. There

177

is a sustainable waste. It has been wiped out, the multinational corporations often enacted by the military. And we need to create a world that's based on trust. And dominator society -- there is a book by Rita Eisner called "The Challis And The Blade." Before the patriarchy there was a matriarchy, and it was a partnership because when women are in control they don't have to prove anything, it's a partnership. When men are in control -- because it's -- because women control the sexual encounter. Men are -- the man is young and healthy, he's always ready. A woman controls it and she's more in her heart.

It's funny because we don't know how to deal with sexuality. That's what stopped me. I wasn't going to say it, but it's the truth. And we need to heal. From the theaters that indigenous people get lured into our -- into the economic system by all the gadgetry and then the fear that we live by goes into their hearts, and we need to -- we need to create in our hearts the purity and the sacredness that has all -- this all of our -- all of our ethnicities go back to and know. And it's real.

MR. SHANE WEST: Well, I guess it's the closing comments. I came in at just the right time. I figured you'd have been long gone by now.

THE HEARING OFFICER: Mr. Shane, could you state your name again?

178

008366

TY

MR. SHANE WEST: Yes. My name is Shane West. And I hope you gentlemen have a safe journey back to whereever you head. And man, I like the guy that was just up. The ethnicity and the roots and everything, that's where it's at; right?

And I guess one thing that I wish I had harped on a little more while I was up here, pardon the pun, is a harp program, you know, the effects of sound waves and the -- are very, very real. It's what holds the universe together, and the harp program is designed to -- so they can see all these aircraft everywhere; is that right, gentlemen, something like that? But it's also the -- the same system can be used to what they call stealth fighters, and it is a -- what do they call it? It's a -- basically, it's an engineered bias. It's computerized, but it's bioengineering. So we can catch computer viruses now in our system that can be controlled by radar, okay. And this may sound like a bunch of crap, but you know what, it's the truth. Isn't that weird?

Isn't that amazing how far technology has come? We can now transport from here. They have a transporter beam just like on Star Trek. The same guy who designed it has -- has had figured out how to program crystals by inscribing letters of the Hebrew alphabet, the Caballa, on the surfaces, the sides of it.

It's amazing how far our technology has come. I mean,

179

we've known about the pyramids on Mars for 30 years, but no one talks about them. We're all -- and we need to respect this planet. And main thing being the noise from the planes, and the middle of the heart chakra of this planet which is the Four Corners area, might not be a good thing. It's kind of like if you got a pacemaker, stay away from a microwave.

Now, all these bombs that they're dropping, you know, as a person who gets up and prays a lot, when those bombs went off in India I felt it, you know. The earth kind of went into shock for a few weeks, and I had a dream about a turtle who's shell was cracked. And I think together, if we all try to start getting some confidence and some thought towards -- every thought, every thought we think manifests itself in reality, that we are images of God, that we're co-creators with Christ, whatever you want to call it. The power of our manifestation, it matters what we think. It matters what we do to the earth. It matters that we care about its chakras and things like that.

Look at all the changes we've gone through in 150 years on this one continent alone. That's got to effect the electromagnetic grid, whatever you want to call it, got lots of scientific explanations for it in a lot of different books. But the point is this is the heart chakra of the earth and I just wanted to reiterate that point.

And God bless you gentlemen. Have a good one.

180

THE HEARING OFFICER: Yes?

MS. JASMINE SANDERS: Hi. I spoke before at -- I had --

THE HEARING OFFICER: Your name? 008367

MS. JASMINE SANDERS: Jasmine Sanders. I just -- I work with young people in this community, and I also moved here from Philadelphia. And I'm -- now that I got a little more information about the level and the noise and all this stuff that's going to go on here, I just -- and I want to write -- write this down because I heard this is the most effective way to do, but I'll just say for now that I think that we all need to think about the impact that this kind of level of noise is going to have on the young people in this community.

AO-18

And this whole concept of habituation to noise and any level of trauma or invasiveness that -- that any of us experience, but particularly young people that are at a sensitive point in their lives, that habituating to any level of trauma means shutting off a part of yourself to deal with it. And that impacts on young people's ability to think clearly about what's going on, which is what happened to all of us, that we all got a lot of misinformation and got shut off from our ability to think clearly about what's going on in this country, and in the world.

And that's what we're all trying to do now, get clear

181

information about what is really going on and what we can do to make changes. And I had and interesting talk with Major Petteway out there which for me confirmed how confused, in particular, I think young men that are brought into the military at all different levels and given -- I've heard the same exact words from most of the young men that I've met in the Air Force and different sections of the military, which to me says when I really try to have a conversation and hear someone's individual thinking, that people are very cut off from their ability to think clearly about what their true thoughts are about the information that's in front of them. And I think that as people that need to think about this next generation, and -- one minute? Thank you -- that we need to think about this noise level thing, and the effect it's going to have on young people.

But even beyond that, we need to think about what kind of information and what kind of -- what kind of situation that the young people in this part of the world, and all over the world are being given with the state of affairs right now, and how we're explaining things, and the level of hopelessness we're introducing into the lives of young people are at a younger and younger age, and particularly boys. And I think that's something we all need to not only think about, but commit our lives to building relationships with young people where we're really listening to them and giving them a

182

chance to have this space to stay really open in their hearts to experiencing life with the full information that they deserve to have.

Thank you.

008368

TY MR. STEVE LAMAR: Hello. My name is Steve Lamar. 1986 I was in the army. I was a tanker, combat arms, under Regan. I was in the National Training Center in Fort Irwin. And during that month I went through a lot of hell, and jets flying very close to the tank, got gassed, sleep deprivation, the whole, you know, war simulation. And I'd like to know when the war is going to end? The war -- there is a war on the people right now, that I see.

And, you know, people come here to live in peace and harmony, to be in tune with the Great Spirit, and we don't need jets flying over our houses. We don't want you here. It's just plain and simple. People in this community do not want the Air Force here.

008369

TY MS. HOPE: My name is Hope, and I just wanted to continue Steve's thought. Was -- I was talking to the Major outside and he was saying how, really, in all the areas that you all have been looking at to have your training, that there has been about 80 percent of the population that didn't want it there. And that struck me as, you know, kind of expected. That is, you know, people don't want it.

And I just think it's a difficult situation, because you

183

have these things and you need to train with them, but people don't want it in their homes. And it seems like that's a really tough situation for everybody because, you know, ideally, in my -- in my world I don't think I'd want these at all. I don't think I'd want the military and I don't think anybody would want to have to have the military. I don't think anybody would want to be at war and nobody would want to fight and nobody would want to kill and nobody would want their family killed.

And so now we've gotten to the point where we have these weapons and we have this military and so you can't have weapons and so -- not know how to use them, so you want to train, train people to know how to use them. And where to do that?

But I think I just wanted to express the part of the matter for me is just that it seems like nobody really wants -- wants this to happen, and that to look at that a little more often and to pray for that, and I'm sure you all do as many -- much as we do, is pray for there to not be war so that our children can grow up happy and free, and their children and their children and their children. And this world needs to be a better place.

And, you know, it seems like there is consistently new wars popping up here and there around the world, like it's always happening. One ends and another one starts,

184

supposedly. But I think if we just keep in our heart that we're just praying for the end of this, and if we keep our focus on that, that these issues, that these issues, you know, can bring us together, and having forums to talk and share, share what we believe in at this time. And that we can work together and keep praying together.

And that there is going to be global peace walk here on the 23rd to the 26th. We're going to walk from Taos to Santa Fe, where Taos is a global peace zone. And I think that's something to be honored. We were looking at where to have these jets flying. Is that -- this is an established global peace zone and Santa Fe is establishing themselves as one also this year, so we'd like to see, you know, more peace and less, you know, jets and more peace for our children, and more a possibility for us to envision that kind of world with less military.

So, thank you. And there is also going to be an Earth Day. In the morning there is going to be a planting tree ceremony with a -- peace -- at 7:30 in the morning and a peace parade that day at noon hiking from the Kit Carson center to the bypass.

UNIDENTIFIED VOICE: Date?

MS. HOPE: And so the walk will start at the -- the -- oh, the date? Earth Day, which is Thursday. And the peace walk starts on Friday and goes to Monday and

185

goes from Taos to Santa Fe connecting the two global peace zones. So, thanks. **008370**

MR. JOSH ALLEN: Hi. This is Josh Allen again. And I also work with young people, and I would like to speak on behalf of this oppressed group of people that aren't represented here today.

And I would -- I'm curious, like, how do you expect young people to habituate to this kind of activity going around in the air? And I just -- it brings to mind of a newborn baby and what that -- I've seen newborn babies and how they react to sudden sounds, and it's absolute terror. And you are -- I do not support anybody having to habituate to terror and to war. I think it's -- it's inhuman.

AO-18 And I also know that there are people in this world that realize that war is not the last resort and that are organizing for peace, and that are figuring out how to listen to each other and use our own human resources of sharing our hearts with each other and working towards peace, and that -- we've all been denied this as young people, and denied the exploring and claiming all of this ability to negotiate and to share and be vulnerable and to share ourselves, and that we can reclaim this. And that war is never the last resort.

And also, on the behalf of the young people, and boys -- I also work a lot with boys -- is that we are training, conditioning boys for the military and -- and I -- I think

186

that's absolutely inhumane, and that has got to stop.

Thank you. **008371**

THE HEARING OFFICER: Name again, sir?

TY MR. RICHARD ARTHURE: My name is Richard Arthure. You're going on about how terrifying those sounds can be. I was born two months after the beginning of World War II, in England, about 60 miles north of London. And some of the very first sounds that I heard as a young child were the sounds of bombers flying over. German bombers. And it is a very terrifying sound, one that I never forget. It's very traumatic for anybody, young or old; certainly for a young person it's very, very terrifying. We must not allow this to happen, to destroy the quality of our life in this community. We must find every means possible to prevent this from happening and destroying the peace of our lives in this community.

I don't wish upon anybody here, any living being, what I went through as a young child hearing those bombers flying low over London and -- and the area where it was, it was a mission site. Stress, of course; it was a target. And there were military aircraft flying low and they would cause great terror.

Don't allow this to happen, I beg of you, all of you, and you gentlemen. Please, don't do this to us. There is enough disturbance, enough warfare in the world. There are

187

enough bombers already. More than enough.

Thank you. **008372**

TY MR. DAVID KRUSELL: My name is David Krusell. I'd like to say one last thing. This experience has been kind of a wake up call for me. I was in the military very young, and pretty unconscious about what's going on. But I've never had really a lot of interaction with it or paid that much attention to it. I'm not -- I accept violence in -- in -- a certain amount of war as a reality that we still have in our life at our present development, so I'm not even expecting it to go away, or it just seems like a reality that we're going to be with for quite a while and have been with for a long time.

The wake up call was about I just realized, you know, I kind of unconsciously knew it, but now that we're the only super power and there is really no contenders for I don't think a long time, it's like -- it's a really serious situation, because we really have no -- nothing on the other side to push against. And it's a -- I remember Eisenhower said that, "Watch out for the American military. You know, keep your eye out." But I think this is a time when you have to worry about that because there is no limit and people that go into the military to spend their lives often times really are excited about war and things happening. I believe that's a reality, and things can get out of hand. That's -- in that

188

way.

I think, you know, technology where it is is really scary in that sense, in -- in the particular field that you gentlemen are in, because you're up there in the sky thousands of feet, and you never meet those people. You know, I mean, what, in Iraq were tens of thousands of people, you know, atomized and the people that were -- did that didn't see those people or know anything about them. They were just like little -- like little figures on an electronic game, you know.

And, you know, I'm not saying that this needs to be done or whatever, I'm just saying that the very distance of -- the people can be at when they're killing each other now is a serious situation. And I think it's really in this time when -- when the -- the power over the rest of the world is so much that we can demonstrate what we can do to people, I think it's really a challenge to the citizens and to the military to be able to limit themselves and to be able to see clearly what they're doing.

And I think this is a small instance of that, of -- you know, when we get up here and we're talking about -- are we over the level where we're, you know, losing our hearing or not losing our hearing? It's just like we're already at a really bizarre level to be even talking about that, when we're talking -- when we're at that level.

189

So, thank you. 008373

MS. LORENNA SHALEV: Another little comment. As a mother I felt very strongly for those people who also work with children, that the impact of panic upon a young child is devastating. And all -- is the military proposing to compensate our children, us, for the psychological -- physiological effects of this? Is there any recourse for compensation for those people who feel they cannot any longer live in this area if it becomes a Military Training Route, and have to move? BR-5

My father was in the Air Force, and he's the one who actually said to me, "Ask them for compensation."

THE HEARING OFFICER: And, ma'am, could you state your name again?

MS. LORENNA SHALEV: Lorenna Shalev. 008374

MR. ALEX CARPENTER: Okay. I'm Alex Carpenter from earlier. I just wanted to say that for us to be at war with anybody, we're probably at war within ourselves first, because if we have peace in ourselves then we don't have to fight with anybody else, you know, because everybody helps each other along in this life. And the only way we fight with anybody, anybody, would have to be like something wrong in me, you know, to make me want to act that way. TY

So, you know, it's like I just ask that we recognize, you know, the struggle in ourselves, you know, and search for

190

that peace within ourselves so we can feel a little bit better about, you know, what we do and then, you know, take it from there.

So thanks.

THE HEARING OFFICER: Would anyone else like to make comments? 008375

MR. THREE TOADS: Yeah, these are my closing comments. Close it down. Let's close. How you doing? Good.

THE HEARING OFFICER: And Mr. -- you're Mr. Three Toads; right?

MR. THREE TOADS: No, it's Two Ravens. Two Ravens. Yeah, I fly into jets. Some of my brothers have and they've died from it, you know, other ravens, you know. And out here at the landfill, we can't have the landfill where it is because they fly into the jet, when the jets come, whenever that is. Hopefully it's not too soon. TY

But at this point Taos doesn't have an -- a train station and nor does it have the airport, real big, you know. Big hangar's being built out there, though. Is that you guys' or somebody else's hangar? Wonder whose hangar that is. There is a lost hangar out at the airport, great big one.

But anyway, what I have to say is a prayer for the -- for the next generation to come. They may have -- evolve to

191

their higher selves and we here today evolve to a higher status, if -- there is a higher status available to us if we reach for them. I look forward to -- to, you know, your children surviving well, and your children. And they're not hybrid, they're not clones, that they're people, as we experience today.

And as much as we tout technology, as much as Westinghouse and General Electric would build nuclear radiation plants all around us when we know it's not healthy, and that's a very sick thing to do is to move into a nonsurvival situation, you know, and be in a zone or an area where you don't survive well. And, you know, being on the corner of the Harbor Freeway and the Santa Monica Freeway and all the cars are roaring by day in and day out, airplanes are flying over, people are landing at LAX Airport, and it's kind of a crazy world. And the craziest part of it is that we're the co-creators of that world.

And so I really do want to say a prayer today to the people of Taos Valley, and of Taos, for -- that their children and their children and their children may survive and may survive well with -- children of all of the people of earth have a right to evolve to their higher places.

And this is a prayer for the children, and we're the children, too. We get older. May we know more, and come from a wiser place. And so I'm just going to shut up for a

192

minute and just say a prayer, silent prayer.

May all of us focus, you know, within ourselves and find our spot as our center and it will come from there, and realize that this is an evolutionary path we're on, so as our children to come.

Thank you very much for this space and this floor. Thank you for all the kids on earth, may they survive well. And it's a trying time. Price of freedom is constant vigilance. It's vigilance on the people's part to keep track of. The people who we supposedly pay, here, we pay their salaries, and they run all over, do crazy wars, killing Yugoslavians right and left. Seems unfair. With children and mothers, refugees from the land, they're bombed along with the train that they were on. So, a special prayer for those today. Those are refugees.

And hopefully the military doesn't chase us out of Taos Valley because it's a beautiful valley. It's our valley. And yeah, we're all just kids. We've got them buzzing around, you know, playing war games between us. But now we're adults and we can be wiser than that and maybe --

Thank you today for your time.

THE HEARING OFFICER: Would anyone else like to make any comments? 008376

MS. MARY SIMONINI: My name is Mary Simonini, and I spoke the other night regarding habituation, that we TY

193

humans habituate. I'm a psychotherapist and in private practice and also at Taos Mental Health. So, once again, as I said the other night, I work with people daily that are dealing with stress.

I would just like to share, there is a woman whose name is Barbara Brennan, and she is a physicist and she worked for NASA. And she went on and left NASA and went on to, first of all became a psychotherapist, and eventually moved into the area of healing on many different levels, both physically, mentally emotionally and spiritually. She's at a very famous school back east, a four-year school. And she has two books out called "Hands Of Healing," and "Emerging Light." And she works with the energetic level of we humans and just of life, of everything, in terms of animals, humans.

And in her book she talks about -- I've actually met her, and she's done some healing on me, and she's incredible. She's just incredible. But in one of her books, she talks about people living in cities versus living in rural areas. And she -- she talks about how the stress level -- you know, certainly cities are fun and exciting and there is a lot we get from cities, you know, and we all -- even those of us in rural areas like to go to cities and -- and get what we get there.

However, she -- she talks about how people don't live as long -- generally, people do not live as long in cities

194

because of the stress level, because of the noise level. And people in rural areas generally -- of course, you know, nothing is absolute -- but generally live longer because there isn't the stress and the noise level. We've -- we either -- there are people that are here, have been here, have been born here or people have moved here because we want this rural area. We want less stress, we want less noise level. And your bringing the bombers in does effect us, would effect us, cellularly, you know, all the way: Emotionally, physically, mentally and spiritually. So I just wanted to state that.

THE HEARING OFFICER: Would anyone else like to make any comments?

UNIDENTIFIED VOICE: We love you. Daniel Williams stepped out to the men's room and he asked me to tell you that he would like to comment again. So, he should be back momentarily.

THE HEARING OFFICER: Would anyone like to make any comments while we're waiting for Mr. Williams? 008377

MS. LORENNA SHALEV: Lorenna Shalev, again. I'm on the board of the Latir neighborhood association. We are situated about five miles south of the corridor that goes across the Rio Grande and then below the Colorado border. And we're about 40 miles from the hospital, so that if there is any casualties from a crash it would be very difficult for

AO-16

195

people to get adequate treatment in time, so that's another consideration. I think there is nobody in that area that I know who is in support of the military over flights.

AO-16

Thank you.

THE HEARING OFFICER: Mr. Williams? 008378

MR. DANIEL WILLIAMS: Sir, thank you for the opportunity to speak again. As I have said many times before, my name is Daniel Williams.

Colonel Burd, Colonel Wheelis, Lieutenant Colonel Mason, Major Adams, I want you to know that we truly do appreciate you being here. I appreciate the fact that you've come and helped professionally, courteous everybody on the team has been and it has been inspiring and I mean that sincerely, regarding the impact that the Draft EIS shows in Alternative D.

There are a couple of birds in particular, the bald eagles and the peregrine falcons have been at Philmont it's been at times transitory, sometimes migratory, sometimes nesting, but that has been a concern.

BI-5

Regarding the noise studies, I've taken a close look and I've noticed that for Alternative D, there are a number of areas that show less than 45 DB. My understanding is that is not based on actual measurements, but based on nationwide -- nationwide model. And what I'd like to suggest is that it may be very -- way under 45 DB, and I'd like to use an

196

example.

In the northwestern part of the state near the Four Corners area there is a place called Shiprock, which looks like a sailing ship, and it's held sacred by the Navajo people. But it's -- to get there I had to drive probably seven or eight miles on dirt roads, and once I finally got there, there -- nobody else was around except for just my wife and I, but it's the quietest I've ever experienced.

It's the first time I've ever been anywhere that when I held my breath I could hear nothing. There was no wind and no insects, no rustling of grass. And so -- and we've got a number of areas that by virtue of the fact that it is a high desert environment, that it's much quieter because of being dry than areas that are wetlands, for example, where you've got frogs and a lot more insects and so on.

So I would like to suggest that we're well below the 45 DB mark. In comparing the three alternatives, Alternative B shows three different areas that are less than 45 DBs; Alternative C shows one area that is less than 45 DB; Alternative D shows 28 areas that are less than 45 DB. So I'd like to suggest that there is a tremendous difference in the impact that RBTI would have here versus elsewhere.

If I may, I'd like to compliment those of you who have come out that have spoken, that have written your comments. I'm very, very proud to be a part of the Taos community, and

the sincerity that has been shown very eloquently indicates this.

I would like to encourage people, please do write. Not just writing your comments here which is important, but write to the Secretary of the Air Force, the ultimate decision maker, and a man that in my opinion is -- tends to be sheltered or insulated from the voice of the people. Not on purpose, but by the fact that he has a lot of other things to do.

UNIDENTIFIED VOICE: Who is he?

MR. DANIEL WILLIAMS: It's Mr. F. Quentin Peters, and we've got his address on the mail out sheet there. Also, please write to our legislators. We're proud that Senator Bingaman has opposed this from the beginning. Congressman Udall has opposed it since he came into office. And Senator Dominici, who initially did not take a stand, is now beginning to ask questions and it appears that he may, in fact, take a stand against this, as well.

And finally, what I would like to say to those of you on the Air Force team, and I mean this very sincerely and I know that this has been echoed by many people, while it's true we don't want the bombers over our skies as a general rule, you as individuals are very welcome. We'd love for you to come back. And there is an area in particular called the Valle Vidal which is directly under this route that is a catch and

release trout fishing area that is -- that is such good fishing it's not unusual for people to catch 50 trout in a single day, and there are not a lot of places that can claim that. If the bombers don't come, you come and I'll take you fly fishing, and that's a promise.

Thank you.

THE HEARING OFFICER: Would anyone else like to come forward and make comments? This is your last chance, so if anyone would like to make additional comments, please come forward now.

Ladies and gentlemen, that concludes this public hearing. Thank you for your participation and input. Please remember the public comment period will extend through June 16, 1999.

This public hearing is adjourned. Thank you.

(NOTE: Hearing was concluded at 6:09 p.m.)

it in so that any names, places, references to scientific terms, et cetera, can be recorded accurately.

Finally, I'd like to remind you to limit your comments to the Draft EIS; that is the purpose of this public comment period. Also, if you would like to turn in written comments, there is a box over in the back corner of the room where you can place your written comments.

I would like to call on the first public official, Dan Noller, the City Manager of La Junta.

MR. NOLLER: You want us to come forward there?

THE HEARING OFFICER: Yes.

008379

MR. NOLLER: Okay. Thank you. I appreciate the opportunity that you have given us to let us comment on the Environmental Impact Statement. Looking at the Environmental Impact Statement I think there are some serious errors that have been made in the socioeconomic impact that that would have on the city of La Junta.

And from that standpoint I would like to go back and briefly explain what has taken place over the past twelve years, and I'll start back further than that, 1960. The Air Force located their Bomb Plot, as we have always called it here locally in La Junta, and it was operated as a temporary facility for the better part of 30 years. I think it was 1988 when they built the permanent facility.

They expended somewhere in the neighborhood

of 10 million dollars worth of funds to do this, and whenever the Air Force tells me they need some money and they spent money like that, it makes me wonder if they have gotten their ducks in order.

Anyway we had 120 employees out there at one time. And that's probably been the better part of ten years ago, and I think those figures could be verified. Now when we look at the environmental impact that has on the city, the economic impact on the city, it only analyzes the employees that are currently out there.

SE-3

We have already lost 90 employees and many of those employees are the type of employees that got involved, and we were very appreciative of that, with the operation of the city and the county. They were on the Sheriff's posse, on the police reserves, and also served in like volunteer firemen, things like that, which is very helpful to the community. So we think that the economic impact on the community is going to be more than just negligible; we think it would be a severe impact. And we think that that ought to be looked at.

We would also encourage that the Air Force think about selecting Alternate A. You have already got the investment made here in the community, and it would be -- make the most sense to us that this be the alternate that would be pursued.

20

It is my understanding that you are getting somewhat a lot of resistance in other areas that do not wanted flyovers in those areas, and I don't think -- it would be my opinion that La Junta is not an area that has given a lot of problems about that. We have been very supportive of the military here in the past and would like to continue to be supportive.

So we would like to have consideration given that you use Alternate A, don't change that, don't go to a new site. And if not, if that is not possible, that you consider the idea of using this for an inclement weather course, where you run through La Junta and have backup when you can't run other sites.

I think that pretty much covers the points I would like to make. And with that, I thank you.

THE HEARING OFFICER: Thank you. I now call on Robert Freidenberger, who is a member of the La Junta City Council. 008380

TY MR. FREIDENBERGER: Yes, sir. You did very well on the name; most people butcher that one up. I'm speaking as an individual and a member of the city counsel, and Mr. Noller echoed a lot of my comments or I will echo his.

I think that the Alternative A should be looked at a little closer. I think that the Environmental Impact Statement in regards to the social and economical

21

findings may be a little bit in error. And I also feel that possibly Alternative A should be looked at with some modification.

When you do an Environmental Impact study, it wasn't required back in the days when the first bomb plot was set up here in La Junta. And I think that consideration should be given to an impact statement on a modified Plan A. It's my understanding that you need 240 miles of varied terrain. And I'm wondering if looking at Alternative A, Subchapter 1, if you will, a modification of our site. And I don't think that was looked at. And I think that if the routes around the existing site with the existing infrastructure and expenses that are already here might be looked at.

I think that Mr. Noller spoke well. I can remember in the early days that the Air Force bought a lot of turkeys in Cheraw, but I think that the routes have changed and there is very little feedback that I have heard coming back against the Air Force flying their low level runs and so forth. And so I would encourage you to look at Alternative A, and I know it's a little bit out of line in regards to the current Environmental Impact Statement as it currently exists, but I would encourage you to look at modifying your Alternative A to address those issues. And I thank you for your time.

22

THE HEARING OFFICER: I would like to now call Rick Klein, who is the Assistant City Manager for La Junta.

MR. KLEIN: Thank you. I, too, have the same comments as far as what Mr. Noller did and Mr. 008381 Freidenberger did. I think one of the reasons why currently you do not have anybody within the audience is

GE-22 when I was looking through the paper, I didn't see it advertised. The only reason I knew is because I did get a draft Environmental Impact Statement.

I don't know if the community really knows that they have this opportunity, so I don't know if you are getting a real true representation of how this community feels because I'd hate for you to feel that nobody cares because everybody I know in this community does care. They were saddened when the military pulled out. They were definitely saddened about Lockheed, all that, just like Mr. Noller when the military pulled out.

I mean, we had people on police and fire reserve and they were the highly trained ones. They were the people that came in that had the background, that had first aid, C.P.R., and they were vital to our community. The income levels of the people, even with Lockheed, they are -- with the pending site when it talks about less than one percent -- when you look at the median area income of this area, and you look at the income of the military

23

personnel and the Lockheed personnel, they are a lot

SE-3 higher. They have spendable cash for a community. So is it less than one percent? I bet it's a lot higher, and so I would love to see you look at the Appendix A a little bit harder.

When they talk about this, when they talked about realistic bomber position, realistic bomber training, well, if you look at Kosovo, and you look at Iraq, look at the distances from the bases to when they -- before they drop the bombs. These people have been in the air for a long time before they drop the bomb. So you want it to be more realistic. This is realistic, what you have. Look at maybe a modification like Mr. Freidenberger stated. There is training where you could come and fly and get the variety pack that you are looking for, and it will be realistic. Thank you very much.

THE HEARING OFFICER: I would like to call on Doyle Davidson. 008382

TY MR. DAVIDSON: Thank you very much, Colonel. My name is Doyle L. Davidson. I'm retired here in the community. I am chairman of the military affairs committee for this community. And we are very much interested in what is going on here today.

I can remember back in 1960 when a Captain Smith from Lowery Air Force Base came down here looking for

a site to put in just like we have out here and that was the very start of that.

The community has always been behind the military. The community has -- when the blue suiters were out there in the facility, we always had a picnic for them every year. We took care of them if they had some problems military affairs in the city would help them out with those problems. And we loved the military and we loved them flying over here.

Now, I know you have gotten a few complaints from ranchers around here. And, yes, I know those ranchers. I was born on a ranch myself. Most of them I don't think are real serious, and I don't think you have got a lot of them. And I think they have been a minimum right here in this community.

I notice on your charts that you put up there you have displayed on most of those routes a creation of 48 jobs will be created with these shifts that you are going to make. We've got the jobs right here in La Junta, and we would like to take keep those jobs as long as we can.

And I would just like to make a statement in closing. We have got the best pilots in the world right now in those B-52 bombers that are over in Kosovo. Where did they train? Right out of here. Thank you very much.

THE HEARING OFFICER: That exhausts all the cards

that I have been provided, so I would like to know now is there anyone who has not made comments that would like to come forward now and make comments?

Is there anyone who has made comments that would like to come forward and make additional comments?

Very well, ladies and gentlemen, that concludes this public hearing. Thank you for your participation and input. Please remember the public comment period will extend through June 16, 1999. This public hearing is adjourned. Thank you again.

[Hearing was adjourned at 6:27 p.m.]

box. If you have written comments, you can place those at any time in that box back there.

If we don't have any public officials present, I'd like to call on the first individual, David Smith.

TY 008383 MR. DAVID M. SMITH: My name is David M. Smith and I'm representing both myself as well as members of Saint Paul United Methodist Church. I would like to thank Colonel Burd and Lt. Colonel for this opportunity to address issues for the record with DIS, and to maybe call on some intangibles to which you may not be aware that may have a bearing on the decision making process. I'm speaking in favor of Alternative A, which is no change in the current Bomber Training Initiative status.

We live in fairly unique community, a very small community, and if you were to take and pluck individuals out of a larger community like Dallas, Kansas City, St. Louis, Denver, probably those individuals would scarcely be missed in the leadership of those communities, particularly in the organizations into which they had become entrenched. Our culture here is one of which is primarily an agrarian way of life. Recently we have been blessed in having a certain measure of success in manufacturing products. But, even those, with the

loss of Levi Strauss Company moving out, it means that this small community has lots of blue collar employment, both at home on the farm as well as in manufacturing. When you take people out of our community who are largely salaried employees who are largely in leadership capacities within the community and in their local churches and in several charitable organizations that can have a debilitating impact on a smaller community. In our case I know of situations that would have an impact on other publicly held organizations, such as the Boone County Shelter for Battered and Abused Women, the local Share and Care, where people who work for this particular process, if they were removed from our community, would be extremely difficult to replace. And, I can speak for our little church in which one of our members, if outplaced and taken from this community, would leave us in a very difficult situation. He serves on five commissions within the church. Those situations are one thing when you have large churches in large communities where you can find lots of people. In this community finding leaders isn't a happening thing. And so, consequently, I ask you to seriously consider Alternative A for this community, for our particular congregation it is extremely important that

we retain the leadership in the community and no change would be a blessing to us.

Thank you again for this opportunity to address you.

HEARING OFFICER: I would like to call on Rick Waldon.

008384 RICK WALDON: My name is Rick Waldon. I work at the radar site. I'm for Alternative A. From what I've seen and from the previous meeting this evening the only people we serve are B-52s from Barksdale, B-1's from Dyess Air Force Base. No one takes into consideration the fact that we serve Little Rock Air Force Base, several C-130's. As a matter of fact, we're here tomorrow if you ever want to come by. We serve Tinker Air Force Base. We get some E-3's from Tinker. We serve (inaudible) Air Force. We're not strictly a B-52 Barksdale, Dyess Air Force Base type of site as some of the other sites are. So, I think you should take into consideration that we are centrally located where we are right now. (inaudible) I also heard that the Air Force wants to fly low, get down into the mountains and stuff. I understand that. From what I've seen in Kosovo it looks like the stress is on high level bombing. We're more than capable for 15 hours a day to take all the high level bombing you

AF-52

can get. You can't get enough high level bombing people. (Inaudible)

But, what I can say is we're more than willing to take all the activity we can give you. We don't serve only Barksdale and Dyess, we service several bases. I'd like that to be taken into consideration for Alterative A. Because I live here in this community, I want to stay in this community. Whether the site moves or not is really not an issue with me, but there are people here that are here because of this job. And, like the pastor said, there are people who here who don't want to have to leave this community. That's basically all I've got to say. I'm for Alternative A and I'd like for you to at least look into the basis that we've operated on. (Inaudible) That's all I have to say. Thanks.

HEARING OFFICER: Ladies and gentlemen, that exhausts the list of cards. What I'd like to know now is if anyone else would like to make comments. Please come on up if you have any comments you would like to make.

TY 008385 DENTON YORNES: Thank you, Colonel. I appreciate your concern about our community.

HEARING OFFICER: Tell us your name.

DENTON YORNES: My name is Denton Yornes and I

live down at Western Grove. My wife and I own the land where the tracking station is located, so we've enjoyed the military and the civilian population since the day the start of the program about six years ago. We've thoroughly enjoyed the Air Force and the concern that you have displayed to us. We appreciate that very much. I am of antiquity as far as airplanes are concerned because I was a Navy pilot in World War II getting my commission in Pensacola. I stayed there for a year and a half as a flight instructor. And then, I went to Honolulu and (inaudible) Bay and I flew air/sea rescue units. That's my background as far I'm concerned. But what I'd like to emphasize on my report is that we have had a marvelous relationship with the military and the dignity with which they have recognized the environmental impact, the concerns, the economics involved. And we certainly appreciate these two gentlemen that have made their presentation. But, I would just like to emphasize the fact that we have enjoyed a relationship with the military and with the contractor that was just something to be really proud of. And, I just wanted to emphasize the fact, as the leasor to the Air Force. They have been a marvelous implement in providing this, not only the technical side of it from the standpoint of having a part in the

community. And, I appreciate what the pastor had to say. He certainly is more eloquent than I am as far as speaking, but I just wanted you to know we've had a marvelous relationship and we'd like to support Plan A. Thank you, sir.

HEARING OFFICER: Would anyone else like to come forward and make comments?

Would anyone that has already made comments like to come forward and make additional comments. Last chance for comments.

Ladies and gentlemen, this concludes our public hearing. Thank you for your participating and input. Please remember the public commentary will extend through June 16, 1999.

This public hearing is adjourned. Thank you.

Dear Major Adams:

On May 24, 1999, the Kent County Commissioners Court passed a resolution opposing the establishment of the Lance Military Operations Area as proposed by the United States Air Force.

BR-3 The resolution identifies the fact that aircrafts (B-52,B-1) are extremely noisy and will present a startle effect on livestock, wildlife and people. Also noted in the resolution are the concerns of air pollution and a decrease in hunting and tourism in the eight county area.

BR-4 The negative effects on agricultural production and recreational uses will cause a severe loss in property value. Kent County and the seven other counties in the proposed MOA will not benefit by the addition of jobs being created and in fact, could well have a loss of economic stability.

Please consider this passage of the fore-mentioned resolution by the Kent County Commissioners Court when determining the location of the Military Operations Area for the United States Air Force.

Thank you very much.

Sincerely,

Tommy Stanaland
Kent County Judge

REALISTIC BOMBER TRAINING INTITIATIVE

Public Hearing Comment Sheet

Location: La Junta, Colorado
Date: May 19, 1999

Thank you for providing your comments on the Realistic Bomber Training Initiative Proposal.

A serious error has been made in the environmental review that shows no significant effect on the social/economic environment of our community with the potential closing of the local Lockheed Martin facility. At one time this facility employed about 120 people. At the time it was turned over to Lockheed in 1996, the employment was 67. Lockheed employs about 30. In addition to a major loss of payroll dollars to an area that is already economically distressed, other considerations were not addressed. Previously employees had been very active in local volunteer organizations such as the Chamber of Commerce, Police Reserves, Volunteer Firemen, Sheriff's Posse, local church and civic organizations. The loss of these volunteers has been a severe hardship on the social structure of the community. The local school system has also suffered a severe hardship with the substantial loss in

SE-3 funding associated with the loss of the children in the schools. The review process was grossly negligent in addressing these impacts. I am sending a copy of this to our congressional representatives to make them aware of how poorly this environmental assessment was conducted. I am assuming we paid to have this review completed and should expect to get a thorough report.

RE: TX-R-19990406-0001-50-00 / REALISTIC BOMBER TRAINING INITIATIVE DEIS

Dear Major Adams:

TY Your environmental impact statement for the project referenced above has been reviewed. The comments received are summarized below and are attached.

TxDot-Aviation Division, Texas State Soil and Water Conservation Board, had no comments as well as Rio Grande Council of Governments, sent in an article from a local newspaper in Alpine, Texas where area residents and ranchers told the U.S. Air Force in no uncertain terms that they don't want low flying bombers added to an established flight training route that snakes through the Far West Texas sky. TNRCC reviewed the draft Supplemental Programmatic Environmental Impact Statement prepared by the Air Force related to a proposal to establish realistic bomber training near Barksdale Air Force Base in Louisiana and Dyess Air Force Base in Texas, have no comments to offer on this document.

We appreciate the opportunity afforded to review this document. Please let me know if we can be of further assistance.

Sincerely,

T. C. Adams, State Single Point of Contact

Dear Major Adams,

RE: RBTI-Realistic Bomber Training Initiative

It has come to my attention, through a constituent of mine in Northeast Ohio, that the Air Force is currently considering routes for training missions in New Mexico. My constituents have informed me that one of the routes under consideration would take low flying planes over Philmount Boy Scout Ranch in Cimmaron, New Mexico. They are very concerned about the potential dangers to scouts should this route be chosen.

BR-6 On their behalf, I am writing you to inquire about the safety considerations you are looking into in regards to this route over the Boy Scout Ranch. It is my understanding that Senator Bingaman of New Mexico is actively involved in this issue. Please keep me up to date with developments concerning this issue.

Thank you for your time and consideration. If you have any questions, please call my District Director, Chris Hess, at 1-800-447-0529. I remain

Very truly yours,

Steven C. LaTourette

The Honorable Charles Stenholm
U. S. House of Representatives
Room 1211, Longworth House Office Bldg.
Washington, D. C. 20515

Dear Congressman Stenholm,

It was a pleasure seeing you at the Air Force hearing last evening. Thank you very much for coming.

BR-4 The purpose of this letter is to put into writing some of my concerns about the realistic bomber training initiative (RBTI). As I stated last night, the economic impact on the value of the ag land concerns me very much. I made reference to a real estate broker in the Big Bend area telling me that more than once he has had people lose interest in buying property after witnessing low flying aircraft in the area.

AF-36 Another concern is the fact that people tell me that the Air force is unresponsive to complaints and resorts to even more low flights over their homes after they complain. I would be glad to discuss this in more detail if you would like.

Lastly, to summarize last nights meeting, I heard 13 elected officials make comments and not one was favorable to the RBTI. I heard over 40 citizens make comments on the record and not one of those were in favor of the RBTI. I am confident that you will see to it that the people of West Texas are treated fairly by the Air Force.

Thank you again for coming.

Sincerely,

David Holt

RESOLUTION IGC 99-2

TY **A RESOLUTION OF THE INTERGOVERNMENTAL COUNCIL OPPOSING THE LOW LEVEL UNITED STATES DEPARTMENT OF DEFENSE MILITARY TRAINING FLIGHTS OVER THE ENVIRONS OF THIS POLITICAL JURISDICTION.**

WHEREAS, the United States Department of Defense has proposed that a military training route through Taos County be expanded for the purpose of military training exercises; and

WHEREAS, the proposed route would go through the Taos Pueblo Wilderness area and in the vicinity of the historic Taos Pueblo which is a world heritage site; and

WHEREAS, Taos County is recognized nationally as a tourist destination and resort community due to its tranquil environment; and

WHEREAS, the noise levels that would be created from such low flying aircraft would result in a nuisance to the citizens of Taos County and have a significant environment impact on the designated wilderness areas.

NOW THEREFORE, be it resolved by the Intergovernmental Council that in order to preserve the cultural heritage and values of this, our unique and diverse community, do hereby declare that low level United States Department of Defense military training flights over the environs of this political jurisdiction are unacceptable to the citizens herein.

BE IT FURTHER resolved that copies of this resolution be submitted to the members of the New Mexico Congressional delegation and the Governor of the State of New Mexico requesting their immediate assistance and support in requesting that the United States Air Force eliminate further consideration of this proposed military training route.

Resolved, this 14th day of April, 1999 at the regular meeting of the Intergovernmental Council.

To: United States Air Force
RE: Realistic Bomber Training Initiative (RBTI)
Public Hearing - Snyder, Texas - April 7, 1999

Gentlemen:

BR-4 My schedule in Austin would not allow me to be here this evening to express my opposition to the use of the eight counties, seven of which I represent, for low level training. This training would diminish property values, increase noise and discourage economic development in an already economic disadvantaged area.

While I am very much for a strong, well trained military, I feel that there are already enough well situated areas to provide adequate training sites.

Your consideration of the wishes of the people of the 70th District is greatly appreciated.

Sincerely,

David Counts

STATEMENT FOR THE RECORD

My name is Gustavo Cordova, I am the Town Manager of the Town of Taos. I have been asked by the Mayor and Council to present their views on this proposal by the United States Air Force, and how it will affect our community.

As governmental officials and leaders of our community, it is our responsibility to ensure that the quality of life for our citizens is not adversely affected by the actions of our federal, state, and local governments. We have a duty to evaluate proposals from our state and federal partners and determine if they serve the interest of the taxpayers of our state.

This community has long been a strong supporter of our military and the need for a well trained national defense force. A great majority of our citizens have served in the armed forces of the United States, and many serve today. We recognize that military training is critical towards preserving a force that is capable of winning in today's battlefield.

As a field grade officer with the military reserves, I too recognize the importance of training our uniformed forces. I had the misfortune of serving in combat during the Vietnam war, and witnessing first hand the value of military overflights over the forward edge of the battlefield.

PD-39 The United States Air Force proposes to select our community along with others in Northern New Mexico as a training ground to be used for preparation for combat in the battlefield. They also propose to expand current overflights over our community, and do this at all hours of the day.

PD-40 Worst of all, the Air Force proposes to conduct this training at altitudes just a few hundred feet above the ground. This would be a scary thought even using a small airplane. But the proposal goes much further than that. It

4/14/99 A.M.
EXHIBIT
CASE #

009008

proposes that B-52 and B-1 bombers amongst other aircraft, fly at such a low altitude over our community.

Perhaps the United States Air Force is not aware that Taos New Mexico is one of the foremost tourist destination communities in the United States. Taos is well known across the country as the soul of the southwest.

Taos is place where tourism is the number one industry and the number one employer. A place where arts and the creation of art is a haven for some of the country's foremost artists. A place where people come from all over the country to ski, to white-water raft, to vacation, and to enjoy the natural quiet of our beautiful environment.

Perhaps the United States Air Force is not aware that over 80% of the gross receipts of our community come from tourism, and tourism related services. Our fragile tourism base can easily become fragmented through the introduction of high speed bombers flying over the environment we have worked so hard to protect.

BR-4 I do not see anywhere in the draft environmental impact statement where the Air Force proposes to make up the loss of tourism revenue, or the significant economic loss that this bomber route will bring to our community.

SE-4 The proposal by the air force will not create new jobs. It will not result in any economic benefit for our region. It will not protect or enhance the fragile environment we have known all our lives.

BR-7 However, it will take away the natural quiet of our wilderness areas, it will be destructive to our tourism base, and it will change the quality of life in our community.

This morning, the Taos County Intergovernmental Council met in a open session at the Kachina Lodge here in Taos. The Council consists of the elected and appointed officials of Taos, Taos County, Taos Ski Valley, Red River, Angel Fire, Eagle Nest, Questa, the school districts, and the tribal governments of Taos Pueblo and Picuris Pueblo.

By unanimous vote of all the communities, a formal resolution was passed condemning the proposal before you from the United States Air Force. The

009008

resolution will be mailed to each of our members of the United States congressional delegation.

Our elected officials all agree that this proposal is very bad for Northern New Mexico. It is very bad for our tourism economy. It is very bad for the quality of life of our citizens.

Make no mistake about it. Our elected officials are prepared to fight this proposal. We sincerely hope that our proud members of the United States Air Force see fit to abandon any of the proposed overflight routes over Northern New Mexico. Thank you.

Comment #9009 was misnumbered and is not part of the official document.

Re: Draft Environmental Impact Statement (DEIS), Realistic Bomber Training Initiative (RBTI)

Dear Major Adams:

The document referenced above has been reviewed by Texas Parks and Wildlife staff and the following comments are provided.

The Department appreciates the incorporation of the location of state facilities within Special Land Use Management Area Maps for use in evaluating the various alternatives.

Flight operations associated with Alternative B, IR-178/Lancer Military Operations Area (MOA) and Alternative C, IR-178/Texon MOA, will occur over portions of Department land. This land was acquired to allow public recreation for an increasing number of people who are seeking quiet solitude within an atmosphere of esthetic landscape beauty, and for wildlife management purposes. Since low level flight operations by high performance jet aircraft have been documented to have definite adverse effects on esthetic recreational pursuits, the Department cannot support these alternatives, unless and until adjustments are made to avoid these areas.

BR-2 As we have stated in previous correspondence, please be aware of flight operation parameters conducted by pilots of this Department. This information is provided to identify potential for midair collisions between Air Force and Department aircraft. Department wildlife surveys and law enforcement flights are conducted under VFR flight rules with single and multiengine STOL type aircraft at altitudes of 100'-300' AGL. These flights typically operate from sunrise to 11:00 a.m. and from 6:00 p.m. to dark at airspeeds below 100 knots

009010

and on routes which follow lines of longitude and latitude by dead reckoning, loran, or GPS over an entire county. The wildlife survey flights occur primarily during the months of August, September, and October. Department aircraft are also used for night law enforcement surveillance during November, December, and January under VFR flight rules at altitudes of 3000'-4000' and at airspeeds below 150 knots. Dissimilarity of aircraft and operational mission dictates caution for aircrews of our organizations.

The Department appreciates the opportunity to comment on the DEIS.

Sincerely,

Andrew Sansom
Executive Director

Dear Major Adams:

RE: REALISTIC BOMBER TRAINING INITIATIVE: DRAFT ENVIRONMENTAL IMPACT STATEMENT; DEPARTMENT OF THE AIR FORCE, IN COOPERATION WITH THE FEDERAL AVIATION ADMINISTRATION; MARCH 1999

This transmits New Mexico Environment Department (NMED) staff comments concerning the above-referenced Draft Environmental Impact Statement (DEIS).

AIR QUALITY

The areas of the proposed training in New Mexico are currently in attainment for all National Ambient Air Quality Standards (NAAQS). The DEIS, however, does not adequately address impacts to air quality for the reasons stated below.

AO-96 Even though military aircraft operations are not regulated by the State of New Mexico, the proposed Realistic Bomber Training Initiative (RBTI) program apparently significantly increases emissions, especially of NOx, in the air quality control regions over which the flights are proposed. New Mexico will likely be required, by the Regional Haze Rule, to restrict activities in order to protect mandatory Class I areas during the best 20 percent and worst 20 percent of days. Potential for the proposed Regional Haze Rule to affect proposed training operations should be addressed.

AO-97 NOx is a major contributor to regional haze. Potential impacts to two nearby mandatory Class I areas (Pecos Wilderness Area and the Wheeler Peak Wilderness) are not addressed in the DEIS. Both of these areas could be impacted under Alternative D. Under Alternatives B and C, potential impacts to Carlsbad National Park, also a mandatory Class I area, should be addressed. Prevailing wind direction for different times of the year should be included and show where the emissions are being blown.

009011

AO-98 Maps of the alternatives show baseline and proposed concentrations of air pollutants (Figures 4.1-11, 4.1-13, 4.1-15, and 4.1.17). It is unclear from where the baseline concentrations of pollutants are derived. The source of these data should be identified.

Maps of the proposed Alternative D should include the towns of Mora and Las Vegas, which are both very close to the proposed training route. Class I areas should also be shown on maps of the aircraft emissions for all alternatives where appropriate. For example, Figure 4.1-11 should show the Salt Creek Wilderness and the Carlsbad Caverns National Park. The towns of Carlsbad, Artesia, Clovis, Hobbs and Lovington should also be shown on this figure.

OTHER IMPACTS

The proposed action for which the DEIS was prepared to address is the construction and/or expansion (depending on the alternative) of the ground based Electronic Scoring System (ESS) used by the US Air Force as Part of the RBTI.

The proposed action is the construction of manned and unmanned fenced enclosures, sites and pads for the deployment of mobile ESS "emitters" (electromagnetic "radar" type antennas) used during test and training flights to simulate threats, and assess pilot and systems responses accordingly.

Project areas in New Mexico include SE NM from Roswell to Jal, and/or NE NM from Taos to Clayton to Santa Rosa.

The immediate hazard associated with these emitters is possible human exposure to high-energy radio waves during operation. This potential hazard has been addressed in the design of the sites which establish a 400-ft exclusionary perimeter within a chain link fenced compound from the emitter (measured from the center of an 800ft by 800ft footprint).

The other immediate potential hazard associated with the RBTI is increased exposure to aircraft noise, which is meticulously addressed in the document.

Finally, an identifiable long-term environmental impact that may be of regulatory concern is possible surface water erosion due to construction activities associated with site development.

We appreciate the opportunity to comment on this document. Please let us know if you have any questions.

Sincerely,

Gedi Cibas, Ph.D.
Environmental Impact Review Coordinator

Texas Department of Agriculture Comments
on the Draft Environmental Impact Statement
produced by the United States Airforce
for the Realistic Bomber Training Initiative

Introduction
and
Statement of the Department's Interest

The Texas Department of Agriculture is the Texas agency charged with promoting and furthering the State's agricultural interests. The Texas Department of Agriculture joins in the comments of McCoy Land & Cattle Company, et al., and of Professor William J. Weida regarding the Air Force Draft Environmental Impact Statement (DEIS) for its Realistic Bomber Training Initiative (RBTI), and offers additional considerations on behalf of the agricultural interests of the State. While the Texas Department of Agriculture recognizes the importance of a well-equipped, well-trained military, and fully supports the necessity of bomber training, TDA nevertheless requests the consideration of alternatives that would be less destructive to agricultural interests.

Comments

I. The department concurs with the comments by McCoy Land & Cattle Company, et al., and Professor William J. Weida concerning a lack of citations to and analysis regarding certain noise data and studies. Professor Weida's comments appear to demonstrate that the DEIS evaluation of noise may have been based upon incomplete analysis and out-of-date or unsuitable methodology in order to justify a predetermined decision. According to those comments, the USAF has selectively used noise-modeling methods and data to support a predetermined outcome, rather than employing the type of objective analysis that would lead to the fully-informed, "hard look" decision required by the National Environmental Policy Act (NEPA). In order to ensure that a fully-informed, environmentally responsible decision will be made on the basis of objective criteria, we agree that the USAF should address the issues, data, and studies described in Professor Weida's comments and demonstrate why this information is not relevant or material to the environmental noise issues addressed within the DEIS.

BR-1

II. Recognizing the critical need for adequate training of the USAF's bomber crews, we believe that existing facilities and airspace over public lands could be expanded to accommodate the USAF's training objectives without the significant impact that RBTI would impose on the citizens and private property of West Texas. We note that the DEIS contains only a perfunctory and conclusory discussion regarding Federal Aviation Administration (FAA) approval of additional military airspace in connection with existing facilities at Harrison (Arkansas), La Junta (Colorado), Belle Forche (South Dakota), and Granite Peak (Utah) and the use of airspace over public lands. Because the reasons for rejecting expansion of Harrison, La Junta, Belle Forche, and Granite Peak and for discounting FAA approval of additional airspace are not fully articulated in the DEIS, the department believes that the DEIS does not meet the requirements of NEPA and the regulations of the Council on Environmental Quality (CEQ). With the preceding observations in mind, the department

PD-41

009012

requests that the USAF consider more fully the possibility of obtaining FAA approval for additional air space in connection with the aforementioned facilities and restructuring RBTI MOAs and MTRs for airspace over public lands. If after such consideration the USAF maintains its conclusion that expansion of those facilities is not feasible, we ask that the DEIS include a detailed and thorough explanation of that decision as required by NEPA and the CEQ.

III. As an alternative, the department suggests that the USAF consider other reasonable alternatives that would shift a significant portion of the planned RBTI sortie-operations away from West Texas. A careful review of the DEIS clearly shows that it does not address all reasonable alternatives. The only alternatives fully explored by the USAF are the no action alternative and several permutations of a single alternative involving the expansion of certain existing West Texas MOAs and MTRs, while entirely decommissioning the current MOAs and MTRs in Harrison and La Junta, described as having "less varied terrain," and making little or no use of the Belle Forche and Granite Peak facilities. By considering only the alternatives of no action or the complete transfer of all training activities to the West Texas region, the USAF has failed to evaluate alternatives that would provide significant training opportunities while mitigating the impact of RBTI on West Texas.

PD-42

PD-4

PD-43

No alternatives have been considered that settle for something less than the perceived maximization of the proposed training program over varied terrain. For example, alternatives could be developed that provide for continued use of the existing MOAs and MTRs at Harrison and La Junta, having the less varied terrain, and moving only a small portion of the sortie-operations to the West Texas areas with the more varied terrain. This would reduce the impact on West Texas citizens while still providing a significant amount of sortie-operations over areas with the more desirable land features. The DEIS does not explain why existing MOAs and MTRs in Harrison and La Junta must be entirely decommissioned. Reasoned analysis indicates that bomber crews will, from time to time, be required to conduct sortie-operations and combat missions over terrain that is not varied. Conducting some training sortie-operations over the less-varied terrain associated with the Harrison and La Junta facilities would still meet most or all of the training objectives described in the DEIS, while providing additional realistic training opportunities and reducing the negative impacts of RBTI on the West Texas natural and human environments. The failure to consider such alternatives, that incorporate some training over non-variable terrain, would appear to contradict the USAF's stated objective to provide mission realism in bomber crew training.

Additionally, the DEIS describes no alternatives that provide for continued sortie-operations over the longer routes to Granite Peak and Belle Forche. The USAF has itself opined that "bomber crews . . . [have flown] halfway around the world to launch cruise missiles and other ordnance at facilities for weapons of mass destruction in Iraq." Since the justification for the training initiative is to provide mission realism, it would seem reasonable to incorporate such long-range mission training into RBTI objectives, rather than relying entirely on the shorter, varied-terrain missions planned for the proposed modified MOAs and MTRs in West Texas. The necessary realism for such long-range missions (where bomber crews must endure long, relatively inactive and uneventful transit times before fully active combat situations) can only be accomplished by providing for sortie-operations to remote

PD-44

009012

locations such as the Granite Peak and Belle Forche areas. Making use of those areas would meet seemingly necessary and vital training objectives. Moreover, by diverting some of the newly proposed short-range, varied-terrain sortie-operations to long-range mission training, the negative impacts of RBTI on West Texas residents could be moderated.

PD-12

In short, the DEIS should, at minimum, be amended to consider alternatives that incorporate additional mission realism objectives while mitigating negative impacts on the West Texas environment. The lack of such alternatives may indicate that the environmental impact statement was prepared with a predetermined outcome in mind, rather than for the purpose of taking a fully informed, "hard look" at the matter as contemplated by NEPA and the CEQ. The department believes that a detailed and thorough evaluation of additional alternatives, based upon the considerations outlined above, will ensure a more complete and sensible decision regarding the implementation of RBTI.

BR-4

IV. The DEIS does not address certain economic and implementation factors which are crucial to a thorough analysis of the potential environmental impacts of RBTI on the West Texas environment. Of considerable importance are the potential impacts of RBTI on property values, recreational activities, and land use. Yet, the DEIS contains no analysis regarding the potential effects on the environment from possible drops in area property values as a result of RBTI.

As known to the department, in its capacity as a state agency involved in the development and implementation of land use policy, and as described by McCoy Land & Cattle Company, et al., many of the affected properties are currently used for traditional farming and ranching activities as well as recreational activities such as hunting, bird watching, wildlife observation, hiking, camping, and other outdoor activities. Decreases in property values as a result of the RBTI could adversely affect the preceding activities by discouraging property owners from continuing to use or make their lands available for these traditional area activities.

Given the USAF admission, in the DEIS, that overflights can produce a high level of annoyance, a reduction of interest in use of these lands for such traditional activities is likely as a result of the proposed increase in sortie-operations. As a result of lost income from such reduced interest, property owners could abandon traditional land uses in favor of commercial ventures designed to overcome lost property value. Thus, area land owners may be forced, by economic considerations, to develop their properties in a manner incompatible with maintaining wildland and wilderness sanctuaries for the birds, wildlife, and plants of the region. In other words, the impact on property values from RBTI could negatively affect the biological diversity and wilderness/wildland resources of the affected West Texas region as property owners are forced away from traditional land use. The department is of the opinion that NEPA and the CEQ regulations require inclusion and evaluation of this potentially significant impact.

Finally, the DEIS does not expressly address the potential problems associated with concentrating an increased number of flights into a smaller area and the possible environmental consequences of such concentration. Under all three alternatives to the no action plan, the airspace to be used would decrease substantially while the number of

009012

overflights would increase. For example, under Alternative B affected airspace would be reduced by 2674 square nautical miles—a nearly 20% decrease. Even without an increase in the number of overflights, the affected area would experience a concentration of negative impacts. Since an increase of overflights would occur under the proposed RBTI program, the effect of concentration is a highly significant factor that should be expressly and thoroughly evaluated and described. The increase in the number of overflights experienced on average by a person or animal within the affected areas should be expressly stated in a manner that is straightforward and understandable. The DEIS does not provide such analysis and, as a result, prevents meaningful evaluation of RBTI's impact by members of the public.

AO-99

For all of the above reasons, the department is of the opinion that the DEIS shows insufficient consideration of all significantly relevant factors related to the decision to implement RBTI in West Texas. Absent such analysis, we believe the DEIS should be withdrawn and a new DEIS prepared that addresses the issues raised in these comments.

Major Brent Adams
HQ ACFC/CEVPP
Realistic Bombing Training Initiative
129 Andrews St.
Suite 102
Langley Air Force Base, VA 23665-2769

Dear Major Adams:

In accordance with our responsibilities under Section 309 of the Clean Air Act, the National Environmental Policy Act (NEPA), and the Council on Environmental Quality (CEQ) Regulations for Implementing NEPA, the U.S. Environmental Protection Agency (EPA) Region 6 office in Dallas, Texas, has completed its review of the review of the U.S. Air Force Realistic Bomber Training Initiative (RBTI) Draft Environmental Impact Statement (DEIS), for proposed activities in western Texas and southeastern New Mexico.

Overall we found the DEIS to be a clear, concise document that is reader-friendly and reasonably complete. Our specific comments focus on the need for the Air Force to provide more complete analysis of noise impacts and airspace management issues, and to provide references and citations to support the DEIS analysis.

EPA rates this proposed action as "EC-2," i.e., EPA has "Environmental Concerns and Requests Additional Information in the Final EIS." We have identified several environmental concerns that need to be included in the FEIS to complement and to more fully insure compliance with the requirements of NEPA and the CEQ regulations. Our classification will be published in the Federal Register according to our responsibility under Section 309 of the Clean Air Act, to inform the public of our views on proposed Federal actions.

Detailed comments are enclosed with this letter which more clearly identify our concerns and the informational needs requested for incorporation into the FEIS. If you have any questions, please contact Mike Jansky of my staff at 214-665-7451 for assistance.

EPA appreciates the opportunity to review the DEIS. We request that you send our office five copies of the FEIS at the same time that it is sent to the Office of Federal Activities, EPA, 401 M Street S.W., Washington, D.C. 20460.

Sincerely yours,

Robert D. Lawrence, Chief
Office of Planning and Coordination
Compliance Assurance and Enforcement Division

009013

DETAILED COMMENTS
DRAFT ENVIRONMENTAL IMPACT STATEMENT (DEIS)
REALISTIC BOMBER TRAINING INITIATIVE

Background

The purpose of the Realistic Bomber Training Initiative (RBTI) Draft Environmental Impact Statement (DEIS) is to satisfy requirements of the National Environmental Policy Act (NEPA) to evaluate the environmental effects associated with a proposal to establish bomber training assets. The U.S. Department of the Air Force (Air Force) is the responsible federal agency; cooperating agencies include the Federal Aviation Administration (FAA) Southwest Region, Fort Worth Air Route Traffic Control Center (ARTCC), and the Albuquerque ARTCC.

The DEIS describes the environmental effects of establishing assets for the bomber RBTI within approximately 600 nautical miles (nm) of Barksdale Air Force Base (AFB) in Louisiana and Dyess AFB in Texas. The RBTI seeks to improve realistic training opportunities for B-52 and B-1 bomber aircrews while maximizing effective combat training time. Currently, long flight times required to reach existing training assets result in inefficient use of available limited flying hours.

The RBTI is a proposal to develop an Electronic Scoring Site (ESS) system consisting of airspace and ground-based assets that provide a sequence of training activities resembling combat. Specifically, the Air Force proposes to establish and modify airspace and ground-based facilities in either southwestern Texas or northeastern New Mexico to support realistic integrated bomber training.

The proposed project's fundamental purpose and need is to develop and modify the airspace and ground-based assets to provide B-52 and B-1 bombers with training that simulates combat situations to the greatest degree possible. It is the responsiveness, range, and combat capability that make the bomber force a key asset to national defense. Bombers are an integral part of the Air Expeditionary Force mission concept which seeks to provide rapid, responsive, and reliable air power through a bomber's speed, mass, and long-range reach.

Fundamental bomber combat missions involve a range of activities, including air refueling, flying at high-altitudes to the combat theater, avoiding enemy threats by penetrating enemy air defense systems, delivering ordnance from the proper position, maintaining the aircraft's geographic position and timing to stay in formation with other aircraft, and returning safely to base. To accomplish those tasks, bomber aircrews must be constantly prepared. Integrated realistic training requires a combination of airspace and ground-based assets that are linked and arranged to provide a sequence of events resembling actual combat. The RBTI would ensure that bomber aircrews possess the skills and readiness for combat that: (1) mirrors combat events; (2) links a realistic sequence of training activities into a cohesive mission; and (3) hones aircrew teamwork.

Currently, the Military Training Routes (MTR), Military Operations Areas (MOA), and

009013

associated Air Traffic Control Assigned Airspaces (ATCAA) that are most frequently used for bomber training are in southwestern Texas and northeastern New Mexico; ESS systems in Arkansas and Colorado as well as remote ranges and ESS systems in other parts of the western United States are also part of the existing training network.

Detailed Comments

GENERAL

Alternatives

PD-45 The Purpose and Need of the proposed action and alternatives may support the consideration of other alternatives. Specifically, (1) expansion and/or upgrading of the Smoky Hill Range in Kansas; (2) expansion and/or upgrading of existing emitter and ESS sites in use by adding improved MTR linkages and MOAs; (3) increased use of mobile emitters than can be repositioned as required to optimize training. We suggest that the Final EIS add discussion on why these potential alternatives were not considered or do not meet the stated purpose and need.

Executive Summary

GE-14 On p. ES-3, the table summarizing environmental effects is vague in its use of symbols to identify the "magnitude" of effects. It is particularly unclear as to what "magnitude of potential adverse effects" means. There is no reference provided with this table for the reader to determine the level of "significance" of effects, such as that provided for some resource impacts in Table 2.6-1.

BI-21 Also, based on comments provided by the US Fish and Wildlife Service (FWS) (January 27, 1998) on potential effects to threatened and endangered species (see Table 4.3-1 and Appendix H), it would seem that Alternative D should show a more serious level of adverse effect than is currently reflected in the table. This assumes a double black "diamond" represents a higher level of adverse effect than one black "diamond."

Scope of Study

PD-46 The DEIS does not address the environmental effects of increased flight times from Barksdale and Dyess AFBs to the proposed realistic training areas. The potential impacts on airspace management, air quality, and safety should be discussed in the Final EIS.

Definition of Resource Analysis

GE-15 On pp. 2-58 to 2-59, Sec. 2.5.2 of the DEIS, the justification for the dismissal from further analysis of hazardous materials and waste, transportation, and ground safety requires a more thorough justification, including citations or references to support the decision. For example, the

009013

3

document states that "Environmental baseline surveys were conducted at each of the proposed emitter sites..." but does not provide citations for those studies. Such studies should be cited in the FEIS.

NOISE

Noise (Tiering Documents)

AO-100 On pp. 4-2 to 4-14, Sec. 4.1.1, Appendix G, there is no mention in the DEIS of other EISs that have been prepared to address the noise effects resulting from B-52 and B-1 operations. Reference to such reviews should be included in the EIS. For example, reviews of the decision to base those aircraft at Barksdale and Dyess AFBs.

Noise Measurement Metrics and Analysis

AO-101 On p. ES-3, 4th paragraph; pp. 4-5 to 4-14, Sec. 4.1.1; pp. 4-19 to 4-26, Sec. 4.1.2, and pp. 4-29 to 4-34, Sec. 4.1.3, pp. 4-38 to 4-42, Sec. 4.1.4, pp. 4-46 to 4-50, Sec. 4.1.5, and Appendix G, the term DNL should be defined in the Executive Summary as it is used, as well as the rationale for using this metric. The use of DNL and Onset-Rate Adjusted Day-Night Average Sound Level metrics appear to downplay the effects of short duration noise spikes that would

BR-1 occur with low level flights of heavy bombers. Averaging tends to mask the effects of single noise events and of intermittent spikes. The FEIS needs to provide more substantial analysis of single event noise spikes and their effects on humans, livestock, and wildlife, with specifics by sites for the alternatives. Onset rates of up to 150 dB per second, and overflight noise levels of up to 117 dB indicate potentially severe noise events. The FEIS should specifically address effects on

AO-102 residences, farms, ranches, and other assets that lie within the MTRs, MOAs, and IR routes contained within the proposed action and measures to be taken to avoid, minimize, and mitigate any adverse effects.

Noise Thresholds

SE-5 On p. ES-4, 5th paragraph, the FEIS should indicate the statutes and analysis that support the conclusion that there are no adverse impacts at 65 DNL, and that indicate no need for further analysis given maximum expected noise levels of 65 DNL.

Representative Aircraft Noise Levels

AO-103 In reference to p. 4-6, Table 4.1-1 and p. 4-8, Figure 4.1-3, Table 4.1-1 lists L_{max} levels for selected aircraft at various altitudes. Figure 4.1-3 lists sound exposure limits for aircraft at various altitudes. The source(s) for these values should be indicated, as well as whether the B-1 and B-52 aircraft models listed in this table are identical to those that are expected to use the proposed MOAs and MTRs. Please address in the FEIS.

009013

4

Noise Operating Procedures

AO-104 On p. 4-60, Sec. 4.2.2, the document states that "the Air Force has established special operating procedures to avoid overflight of specific locations considered to be sensitive to aircraft noise." The FEIS should describe those procedures, identify those locations, and reference the specific guidance or procedure.

BIOLOGICAL RESOURCES

Threatened and Endangered Species

BI-22 In reference to p. ES-4, 2nd paragraph, this paragraph states that "field surveys...did not identify any threatened, endangered, or sensitive plant or animal species; therefore construction and ground operations would not impact these species." This conclusion should be supported by current field surveys that indicate the lack of presence of threatened and endangered species. The conclusions drawn in the DEIS must also be based on an assessment of habitat quality (i.e. whether the habitat is considered to be critical habitat by USFWS and/or state fish and game agencies). A copy of the Biological Assessment prepared for the FEIS should be included to assist the reader in reviewing the Air Force's analytical conclusions. A concurrence letter from the USFWS should also be included.

BI-22 On p. 4-89, the fifth sentence of the first paragraph of this section states that "Surveys of the candidate emitter sites and Electronic Scoring Sites demonstrate that none of these species or their habitat would be affected by RBTI." A reference for the document should be included in the FEIS describing the methodologies used for these surveys. It should also state whether USFWS concurs with such findings.

Wetlands

BI-22 In reference to pp. 4-1 and 4-84, the conclusion that there are no wetlands in the project area that would be effected by the proposed action should be supported with a letter of concurrence from the U.S. Army Corps of Engineers or a wetlands delineation map. Please provide this information in the FEIS.

Biological Resources

BI-23 On pp. 4-89, 4-95 and 4-106, the discussions of environmental consequences of airspace and flight operations do not provide sufficient detail to establish the precise impacts on each of the endangered species within the impact areas of each alternative. This discussion should be revised such that the ranges of each of these species in relation to the affected airspace are shown clearly on maps. Such depictions would allow determination of the total area of each species range that may be affected by the overflights, particularly the areas that may be newly overflown under each alternative. In each case where the range of a threatened or endangered species intersects an

009013

5

overflight area, especially new overflight areas, please provide detailed information on the number of overflights, the noise associated with each overflights, and the expected effect on the affected species, based on past studies (e.g., no affect or abandonment of the area). Again, these issues may have been addressed in the Biological Assessment, and it would assist the reader to have the Biological Assessment (and the subsequent USFWS Biological Opinion) for the proposed action. Please address in the FEIS.

Electromagnetic Effects on Wildlife

BI-24 In reference to Sec. 4.0 of the DEIS, the statement does not address the potential effects of the proposed new emitters and of conducting electronic combat operations on wildlife. In particular, the FEIS should address potential radiation hazards to birds.

Biological Resources - Migration Flyways

BI-25 On pp. 4-17, 4-36, 4-44, and 4-50, Sec. 4.1; pp. 4-84 to 4-108, Sec. 4.3, and in Sec. 4.1; Alternatives B, C, and D are noted as not overlying or intersecting "any major migration flyways or water bodies where birds congregate." In Section 4.3, reference is made several times to migratory bird species (e.g., waterfowl, whooping cranes, and bald eagles) occurring within the proposed bomber training areas. If migratory bird routes for this region are well documented, such as those used in developing the Bird Avoidance Model (pp. 4-17), then they should be overlapped with bomber training routes and shown on a map. This would be particularly useful in better understanding the potential impacts on such species and also the potential for bird-aircraft strikes, as described in Section 4.1.

CULTURAL RESOURCES

Number of Identified Sites

CU-9 On page ES-5, 1st paragraph, the DEIS lists the number of National Register-listed properties, but does not address whether there are other sites that may be eligible for listing that require additional investigation. Please clarify in the FEIS.

Mitigation of Impacts on Cultural Resource Sites

CU-10 On p. ES-5, 1st paragraph, the DEIS states that effects on cultural resource sites under Alternatives B, C, and D "could be avoided in most cases or mitigated to insignificant levels" but does not list any mitigation measures that will be taken, or how those measures will reduce or avoid potential impacts on cultural resources. Mitigation measures should be identified in the FEIS.

009013

6

Consultation with the Texas and New Mexico State Historic Preservation Offficers (SHPOs)

CU-11 In reference to p. 4-120, Sec. 4.5.1, the DEIS states that the results of field investigations have not yet been submitted to the Texas and New Mexico SHPOs for evaluation and that Section 106 consultations have not been completed. This process should be completed prior to the issuance of a Final EIS so that the public has complete information on the proposed action. If the SHPO consultations are not expected to be done in time for completion of the FEIS, a statement should be added to Section 4.5 identifying that the proposed action will not be undertaken until consultations are completed and that specific measures are taken, as appropriate, to reduce, avoid, or mitigate any adverse effects the proposed action might have on historic properties.

CUMULATIVE EFFECTS

Cumulative Airspace Impacts

On p. ES-5, 3rd paragraph and pp. 2-16 to 2-17, the FEIS should address current and anticipated future civil aviation activities in the affected area to ascertain whether there will be cumulative effects on airspace. For example, an analysis of existing and proposed civil aviation jet routes and instrument flight rules (IFR) and visual flight rules (VFR) routes should be included. The cumulative uses of proposed and nearby airspace identified on pp. 2-16 to 2-17 should be assessed for impact.

AIRCRAFT OPERATIONS

Ordnance Usage

PD-47 In reference to p. 1-2, Sec. 1.2.1,"1st side bar", the FEIS should clarify whether any inert ordnance is expected to be employed under the proposed action. If so, these actions must be assessed for impacts.

Optimum vs. Current Sorties

PD-48 In reference to p. 1-10, Sec. 1.4, Figure 1.3-3 and p. 1-15, Sec. 1.6, Figure 1.6-1, the figures comparing optimum vs. current sorties (and later, optimum vs. current vs. proposed) do not indicate the sources for how an "optimum" sortie was determined, the sources for the characteristics of current sorties, and the sources for the characteristics of proposed sorties. The FEIS should indicate, at a minimum, the year(s), source document(s), aircraft type(s), base origin(s), and training area(s) that were analyzed to produce these figures. Additionally, Figure 1.6-1 should indicate which alternative (B, C, or D) was assumed.

009013

7

Low Altitude Flights

PD-49 In reference to p. 1-12, Sec. 1.4.1, Figure 1.4-1 and 1st "side bar," this reference is the first time that the DEIS mentions that aircraft in MTRs may fly as low as 300 feet AGL. This key fact should be disclosed in the Executive Summary.

Required Airspace and Ground-Based Assets

On pp. 2-3 to 2-8, Sec. 2.1.1, the DEIS should indicates sources of the operational requirements that generated the specific needs for airspace and ground-based assets. For example, Operational Requirements Documents (ORD), training manuals, or other such Air Force AF-53 documents that define B-52 and B-1 training requirements. These references are important to establish the lineage of the training requirements stated in the FEIS.

Required Airspace Assets

On p. 2-4, Sec. 2.1.1, the description of the minimum required airspace assets for MTRs, MOAs, and ATCAAs should include a reference to Appendix A which provides a detailed study GE-16 of how these criteria were established. Please clarify in the FEIS.

Aircraft Safety

In reference to p. 4-44, Sec. 4.1.4 and Table 4.1-17, the FEIS should explain the following statement made in the 4th paragraph, "The estimated years equate to 0.02 percent probability of a B-52 Class A mishap per year and a 0.07 probability for B-1s." This conclusion is not clearly supported by the figures for IR-178 in Table 4.1-17 that the estimated years between mishaps for the B-52 and B-1 are 45 years and 15 years, respectively. The probability for B-52 is AO-105 given in terms of a percent and the probability for the B-1 is not given in terms of a percent. It is suggested converting both to a percentage figure of 7 percent and 2 percent, respectively.

Impacts on Civil Aviation

In reference to pp. 4-28 to 4-29, Sec. 4.1.3, pp. 4-37 to 4-38, Sec. 4.1.4, pp. 4-45 to 4-46, Sec. 4.1.5, the DEIS does not provide analysis of the impacts of the proposed action on civil aviation. The referenced section describes proposed changes to the airspace structure in the region but does not address potential impacts caused by the proposed substantial increases in airspace usage. For example, p. 2-35 states that under Alternative B (Lancer MOA), a total of 2,350 annual sortie-operations would occur, as compared to the current usage of 206 annual AO-106 sortie-operations. The FEIS should consider the potential impacts of this increased usage for all alternatives.

009013

8

Sortie-Operations

PD-50 In reference to p. 2-21, Table 2.3-2, Appendix B, the figures listed in the referenced table and Appendix B for sortie-operations are not cited for source and dates. The FEIS should indicate the year and time period for the baseline (Alternative A) sortie-operations, the assumed projection year for Alternatives B, C, and D, and provide a comparable projection under PD-51 Alternative A, for all aircraft types. In addition, the Appendix B tables should indicate the number of hours of usage for each area.

Airspace Management, Noise, Aircraft Emissions and Air Quality, Air Safety for Alternative A: No-Action

In reference to pp. 4-19 to 4-27, Sec. 4.1.2, the description of the affected environment and the baseline conditions do not include the areas outside of the primary MTR, IR-178. For example, there is no discussion of the ESSs in Colorado and Arkansas. Analysis of the No-Action GE-17 Alternative should include a full analysis of these areas.

OTHER

Emitter Safe Distance

In reference to p. 2-30, Sec. 2.4.1, the third paragraph under the heading of "Ground Operations" states that: "...For the proposed emitters, the safe distance has been established at 350 feet." A reference for this figure should be added that explains the rationale for this distance, and provides a thorough discussion of any health and safety concerns that are associated with the proposed emitters. Any relevant data on the safety records associated with past uses of the proposed emitter types should be included in the FEIS..

PD-52

Electromagnetic Spectrum Effects

In reference to Sec. 4.0, the DEIS does not address the potential effects of the proposed new emitters and conducting electronic combat operations on the electromagnetic spectrum. In particular, the FEIS should analyze potential impacts on frequency management and frequency allocation, and assess interference issues.

Land Management and Use; Alternative A, No-Action

LU-10 On pp. 4-56 to 4-61, Sec. 4.2.2, the DEIS describes primary land use but does not include population figures or population density statistics under the MOAs, MTRs, and ATCAAs. These figures are important for determining the number of human receptors in the vicinity of the flight path. Please include in the FEIS.

United States Department of the Interior

OFFICE OF THE SECRETARY
Office of Environmental Policy and Compliance
Post Office Box 649
Albuquerque, New Mexico 87103

IN REPLY REFER TO:

April 30, 1999

ER 99/260

Major Brent Adams
RBTI EIS Project Manager
HQ ACC/CEVP
129 Andrews Street, Suite 102
Langley AFB, Virginia 23665-2769

Dear Major Adams:

The U.S. Department of the Interior has reviewed the Department of the Air Force, Realistic Bomber Training Initiative (RBTI), Draft Environmental Impact Statement (DEIS) of March 1999. In this regard, the following comments are provided for your consideration.

It is our understanding that the RBTI, designed to increase training opportunities for aircrews flying B-1 and B-52 aircraft from Dyess Air Force Base, Texas, and Barksdale Air Force Base, Louisiana, consists, briefly, of the following proposed elements:

Modifications and additions to existing Military Training Route (MTR) airspace in Texas and New Mexico used generally for low-altitude navigation training activities;

Modifications and additions to existing Military Operations Area (MOA) airspace in Texas and New Mexico used for medium to high altitude training and maneuvering;

Increased flights by B-1 and B-52 aircraft in the identified airspace;

Acquisition of several 15-acre parcels under MTR and MOA airspace for construction and operation of an Electronic Scoring Site system; and

Closure of existing Electronic Scoring Site systems in Arkansas and Colorado.

We support the training mission of the Air Force and the expressed purpose of the subject initiative to provide realistic training scenarios to prepare flight crews for real combat. However, our mission and legal mandates cause us to be concerned about the effect of the RBTI on lands and trust resources managed by several Bureaus within the Department of the Interior. These concerns are discussed below.

009014

2

Endangered Species

BI-11 We request that the discussion about threatened and endangered species be clarified and corrected. The references to an ongoing consultation with the U.S. Fish and Wildlife Service (FWS) are in error. FWS records indicate that species information was requested from and provided by the FWS Ecological Services Field Offices in New Mexico and Texas more than 1 year ago. The latest, March 25, 1998, communication received by the FWS from Ogden Environmental and Energy Services clearly stated that no determination regarding the need for consultation under the Endangered Species Act had been made. Thus, the statements that the Air Force is currently in consultation with the FWS (page 4-85) should be corrected. It is recommended that a more recent list of threatened and endangered species be used in your analysis; species have been proposed for listing and listed since the original December 1997 request for information. We also recommend that the consultative process required by the Endangered Species Act be completed prior to final decision so that potential options will not be precluded. In this regard, please contact Regional Director (ES-TE), U.S. Fish and Wildlife Service, PO Box 1306, Albuquerque, New Mexico 87103-1306.

Subsequent environmental documentation should also contain data relevant to the northern aplomado falcon. Portions of the proposed action within southeastern New Mexico and west BI-26 Texas overlay historic habitat for the falcon. Without an opportunity to review the field data documenting the surveys conducted for this species in this area, we cannot support the characterization of the species' use of the region as a rare migrant or visitor (page 4-90). The BI-27 same rationale applies to such designated sensitive species as the ferruginous hawk, loggerhead shrike, burrowing owl, white face ibis, swift fox, and Texas horned lizard. The document presents no data concerning the stability of populations of these species, specifically their distribution and abundance within that habitat. We cannot concur with the conclusions presented in the document without reviewing the data upon which the impacts of the proposed action have been assessed.

Identification of Land Units

Land units Congressionally designated and managed by a number of Bureaus of the Department of the Interior should be clearly identified. Maps outlining specific units of National wildlife refuges, National parks and monuments, etc., do not appear in the DEIS. LU-11 Various units, administered by the National Park Service (NPS), that were omitted may be impacted by the proposed action, including Capulin Volcano National Monument, Fort Union National Monument, Big Bend National Park, Santa Fe National Historic Trail, Lake Meredith National Recreation Area and Alibates Flint Quarries National Monument.

009014

3

LU-12 Specific references to impacts on units of the National park system are lacking. Neither a negative declaration nor a description of impacts for any unit (except for acknowledging an impact from Alternative A on Big Bend National Park) can be found in the document. For example, Capulin Volcano National Monument appears to be on the edge of the Mt. Dora MOA. Currently, there are few military aircraft operations visible or audible at the National Monument. The National Monument was established in 1916 to protect Capulin Volcano and to provide the public with the opportunity to learn about this classic volcanic feature. Capulin Volcano is the focus of a volcanic field that extends almost 85 miles from Raton to Clayton, New Mexico. The Mt. Dora MOA overlies a large portion of the Raton-Clayton Volcanic Field. Almost 70,000 people visit Capulin Volcano annually. In addition to geology, other important elements of the Monument's significance include air quality, night sky, and the scenic vistas. The panoramic view from the top of Capulin Volcano is a significant part of the visitor experience. Portions of three other states (Texas, Oklahoma, and Colorado) as well as the Sangre de Cristo range of the southern Rocky Mountains, over 50 miles to the west, can be seen from the volcano's summit. The potential effect on the scenic vista and visitor experience at Capulin Volcano from 2,668 annual sortie-operations in the Mt. Dora MOA cannot be evaluated with the information provided in the DEIS, primarily because the exact location of the MOA compared to the National Monument is not clearly presented.

Pages 3-9 to 3-10 acknowledge that people seeking isolation and natural beauty in recreation and tourism in the study areas in New Mexico and Texas may find noise from non-natural sources "unpleasant intrusions." This statement may be true for the effects on units of the National park system. In addition it may be that such noise also adversely impacts the legislated purposes of parks and monuments.

The discussion of Aircraft Noise Assessment Methods (pages 4-5 to 4-14 and pages 4-23 to 4-24) has limited relevance to assessing impacts on federal lands or resources, such as natural quiet (i.e., the natural soundscape unaffected by human noise sources), or on a park visitor's experience, which may range from a few hours to a few days at most and may occur mostly out of doors seeking such things as solitude, tranquility, and the natural environment (including natural sounds). This limited relevance is probably also true for other outdoor recreation and natural areas. While the NPS is still evaluating the utility of noise metrics to

AO-55 assess impacts in the very wide variety of park units, some matters are becoming clear. We support the use of L_{max} and SEL metrics in combination with Percent Time Audible and one-hour L_{eq} metrics which have proven to be important for assessing noise impacts on most National park resources and visitors. The cumulative metric Average Day-Night Sound Level (DNL), which is an annualized 24-hour average relevant to residents of an area, has no relevance at all to impacts on a visitor's experience or federal resources. For example, if a visitor's once-in-a-lifetime visit to a NPS area includes a 100+ dB aircraft event of even a few seconds, it may be one of the most memorable parts of the visit, regardless of the event's effect on the DNL. Whether that memory is positive or negative, it will not be part of the purpose of any of the parks or monuments in the study area, so it will detract from the intended visitor experience.

009014

4

PD-53 We are concerned about the cumulative effects of all the military airspace changes being considered in New Mexico and Texas. It is also unclear how aircraft may move from one set of MTR's and MOA's to another and how aircraft may transit into and out of the set of MTR's and MOA's being considered in this DEIS.

In addition, the following specific comments, questions, and concerns relate to Alternative "D" unless otherwise specified:

Military Overflights

The incidents of military aircraft overflights of Capulin Volcano National Monument have been significantly reduced in recent years. We appreciate the willingness of the Department of the Air Force, especially Cannon Air Force Base, to work with the NPS and would count on continued cooperative efforts on the issue of military overflights.

PD-54 We are concerned, however, about an increase in military aircraft overflights at Lake Meredith National Recreation Area by the addition of Instrument Route (IR)-153 section WAWB. The impacts from increased numbers of aircraft following the Canadian River drainage should also be analyzed in subsequent environmental documentation.

Airspace and Aircraft Operations

PD-55 We recommend the elimination of the MOA airspace over Capulin Volcano National Monument by the reconfiguration of the Mt. Dora MOA. It is unclear whether secondary MTR IR107/VR108 and Visual Route (VR)1175/1176 would still continue within former MOA airspace over or near Capulin Volcano, New Mexico. The significant increase in the level of use within the Mt. Dora MOA is not sufficiently considered. Substantial discussion of

PD-56 the increased aircraft activity within the MOA was lacking. For example, how long will aircraft typically operate within the MOA? How many planes and how many sortie-operations would be occupying the MOA at the same time? Annual sortie-operation is projected to increase from 379 to 2,668, almost exclusively by bomber aircraft (2250). There are almost no bomber aircraft currently using the Mt. Dora MOA. Without knowing the distance of the

PD-57 MOA from Capulin Volcano, New Mexico, it is difficult to evaluate concerns about noise and visual impacts resulting from an increase in annual sortie-operations from 379 to 2,668.

PD-58 Aircraft use is concentrated in segment AB-JK of the proposed IR-153. We are concerned about the projected total sortie operations and resulting noise and visual impacts for segments HI/IJ located near Fort Union National Monument. A total of 3,100 operations are projected from a baseline of 440 operations. The effects of this increase should be analyzed in future environmental documentation.

009014

5

AO-107 Further discussion of how the DNL ratings were achieved is necessary. Part of the calculations included factoring the annual sortie-operations divided by 12 for a monthly average (p.4-9); yet there will be approximately 260 fly-days (much less than 365 days) per year (p.4-21). Would a daily average rather than monthly average provide a more accurate factor for determining noise effect? Further discussion should also be provided describing how the DNL ratings were determined for sections of IR-153 that are estimated to receive more than 2,668 sortie-operations per year, such as sections HI/IL with 3100 projected sortie-operations.

Land Management and Use

As stated above, it was difficult to identify the affected environment from the maps provided. We were unable to identify federal land units on the map of Special Use Land Management Areas in Figure 4.2-8. Knowing the distance of Capulin Volcano National Monument from the proposed adjustment of the Mt. Dora MOA, the distance of Fort Union National Monument from sections HI/IL, and the distance of Lake Meredith National Recreation Area from section WAWB of the proposed IR-153/Mt. Dora MOA would assist in evaluating impacts and effects in subsequent environmental documentation. It appears that a greater number of special land management use areas (13) will be affected in Alternative D than in the other alternatives, and these areas will experience significant increases of 10 -16 DNL in noise.

Socioeconomic and Environmental Justice

SE-5 We question the analysis and conclusion that adverse impact would not occur because none of the proposed airspace exceeds a noise level of 65 DNL (p. ES-4). There are problems using the DNL standard in a largely rural setting. The changes in noise level affecting some communities or in some cases isolated residents are significant. While there are fewer communities affected in this alternative, the change in noise levels is greater. The rural communities within the affected area are generally composed of low income and minority populations. There has been little involvement of citizens in the rural communities of Union

GE-22 County or the gateway community of Clayton, New Mexico, in the development of this DEIS. Public meetings were held in Angel Fire, New Mexico, which is a 3-hour drive from Clayton, of which at least an hour is on mountainous roads.

Cultural Resources

CU-12 Again, without knowing the proximity of Fort Union National Monument to IR-153 sections HI/IL, it is not possible to properly evaluate the consequences of the alternatives to this National park unit. The assessment focuses on the impact of noise levels and possible physical

009014

6

damage to properties listed on the National Register. Some Register-listed structures will be subjected to an 18 DNL increase and some noise levels would reach 62 DNL. This is a significant change. Even though the noise may not physically damage the historic properties, there may be a negative effect on the historic setting and visitor experience of those historic resources.

Within the DEIS, there is insufficient consideration of the noise and visual intrusions to the Santa Fe Trail, a National Historic Trail. Significant segments of the Cimmaron Route and

CU-13 Mountain Route lie within the affected area. Also, there is no mention of the consideration of National Historic Landmark sites, such as the Clayton Complex, which includes McNee Crossing, Rabbit Ears, Turkey Creek Camp, and Mt. Dora. Subsequent environmental documentation should analyze the effects of the alternatives under consideration on the historic setting and visitor experience of these sites.

Thank you for the opportunity to comment on this DEIS. We trust these comments will be of use during subsequent environmental documentation.

Sincerely,

Glenn B. Sekavec
Regional Environmental Officer

Re: Realistic Bomber Training Initiative Draft Environmental Impact Statement.

Dear Major Adams:

The New Mexico Department of Game and Fish (Department) has reviewed the Draft Environmental Impact Statement (DEIS) for the Realistic Bomber Training Initiative (RBTI). Clint Hensen and Mark Watson, Department wildlife specialists, attended public meetings for this project. The RBTI proposes to establish an Electronic Scoring Site System consisting of linked military airspace and ground-based components for B-1 and B-52 bomber training within approximately 600 nautical miles of Barksdale Air Force Base (AFB) in Louisiana and Dyess AFB in Texas. The Air Force proposes to use existing and new military airspace and ground-based components in either west Texas or northern and northeastern New Mexico, depending on which alternative is selected.

Three action alternatives were identified. Proposed locations for Alternative B: IR-178/Lancer MOA and Alternative C: IR-178/Texon MOA are almost entirely in west Texas, with only a small portion of airspace extending into New Mexico. Alternative D: IR-153/Mt. Dora MOA is proposed in northern and northeastern New Mexico, with eastern portions of the Military Training Route (MTR) extending into west Texas.

Should Alternative D be selected, the Air Force anticipates an average of ten B-1 and B-52 bomber flights per day, 260 training days per year, at a minimum of 300 feet above

009015

ground level (AGL) through the northern New Mexico MTR. Currently, approximately one jet fighter overflight per day at 100 feet AGL or above occurs in the existing MTR.

The Department has three major concerns with Alternative D (primarily with the establishment of the new Instrument Route (IR) 153 within this MTR): 1) the large number of ecological sensitive Special Land Use Management Areas in the flight path and adverse impacts on sportsmen and recreationists; 2) potential direct, indirect and cumulative adverse impacts on wildlife, including big game and threatened, endangered and sensitive species; and 3) a deficient cumulative impacts analysis and the safety of our personnel conducting seasonal aerial wildlife surveys.

1) **SPECIAL USE LAND MANAGEMENT AREAS AND IMPACTS ON SPORTSMEN AND RECREATIONISTS:**

Page 4-81 of the DEIS states: "Flight operations would not likely affect land use, recreation resources, or visual settings under the airspace." Page 4-83 states: "None of the alternatives would have more than minimal effects on land use, recreation resources, or visual settings." The Department strongly disagrees with both statements as explained in the following section.

LU-13 Alternatives B and C would overfly two Special Use Land Management Areas (e.g. state parks and wildlife areas, Wild and Scenic Rivers, etc.), whereas Alternative D would overfly thirteen (or seventeen; the DEIS is contradictory with regard to this issue; see page 4-76). Ecologically sensitive Special Use Land Management Areas in New Mexico in the flight path for Alternative D include: 1) the Urraca, Colin Neblett and Elliot Barker Wildlife Areas owned by the Department and managed for wildlife habitat and hunting opportunities; 2) Villanueva, Cimarron Canyon, Sumner Lake, Chicosa Lake and Clayton Lake State Parks; 3) the Rio Grande Wild and Scenic River; 4) Kiowa National Grasslands; and 5) portions of the Carson and Santa Fe National Forests. Ute and Conchas Lakes State Parks are close to the proposed flight paths, but are not analyzed in the DEIS.

Should Alternative D be chosen, the frequency of overflight disturbance throughout most of the New Mexico MTR and the intensity of overflight noise disturbance will increase substantially. Increased low-altitude overflights of ecologically sensitive Special Use Land Management Areas will subject hunters, fishermen, non-consumptive wildlife users and wildlife to noise levels 10 DNL above current baseline levels (DNL is the Day-Night Average Sound Level, which sums individual noise events and averages noise levels over a 24 hour period). Federal agencies have adopted guidelines for noise analyses, and most consider noise levels at or above 65 DNL unacceptable to residential, recreational, cultural and other human use areas. At 65 DNL, approximately 12% of the exposed population would be highly annoyed. Humans may perceive changes of 3 DNL or more,

009015

even below 65 DNL, as degrading their environment and/or negatively affecting their quality of life (DEIS p.4-56). For proposed IR153, which contains 38 segments and most of the airspace outside of the higher altitude Military Operations Area (MOA), over half of the segments will have a noise level of 60 DNL or above. Noise levels will increase by more than 10 DNL in 22 segments. The highest noise levels and greatest change would occur in segments AB-GH of the route (northern New Mexico), the most ecologically sensitive segments that include our wildlife areas. In the western half of the MTR, 4 to 10 percent more people could be highly annoyed (DEIS p.4-46).

The Elliot S. Barker, Colin-Neblett and Urraca Wildlife Areas are owned and managed by the Department for wildlife habitat and hunting opportunities. These areas provide habitat for mule deer, elk, turkey, bighorn sheep and numerous other wildlife species. Critical winter habitat areas occur on the Colin-Neblett, which receive concentrated wildlife use during winter months (Colin-Neblett Wildlife Area Management Plan; August 24, 1984). The Elliot S. Barker Wildlife Area is located within the Valle Vidal Management Unit, and contains both summer and winter habitat for big game species. This area provides important winter habitat for a substantial number of residential and migratory elk, which generally occupy the area in December and stay until April (Elliot S. Barker Wildlife Area Management Plan; August 24, 1984).

LU-14 The Valle Vidal Management Unit was not identified within the DEIS as a Special Use Land Management Area. The Valle Vidal is managed by the Department in cooperation with the Carson National Forest as critical elk calving and wintering habitat. The Valle Vidal is designated as a once-in-a-lifetime opportunity elk hunting area, and closures are in effect from January 1 to July 1 in a portion of the unit to prohibit human disturbance. The Valle Vidal falls under segments BC to CD of proposed IR-153, which are only 4

LU-15 nautical miles wide, and would experience 2,660 sortie-operations per year. This increased frequency and intensity of low-level overflights will adversely affect the hunting, fishing and nonconsumptive wildlife experiences for New Mexico sportsmen

BI-28 and recreationists in this area, and possibly adversely affect elk migration and reproduction.

LU-16 The DEIS also fails to identify the Latir Peaks Wilderness Area as a Special Use Land Management Area, which also falls under segments BC-CD. The Latir Peaks Wilderness Area has been identified as suitable Rocky Mountain bighorn sheep habitat and is currently being considered for reintroduction bighorn in 2000. The DEIS should analyze potential impacts to the Valle Vidal and Latir Peaks Wilderness Area and incorporate these areas into the Special Use Land Management Areas tables.

009015

2) **IMPACTS ON WILDLIFE:**

The Department is concerned with the potential adverse impacts of low-level overflights on big game, waterfowl, and threatened, endangered and sensitive species.

With regard to this issue, page 4-106 of the DEIS states:

> "Potential sources of impacts to wildlife from aircraft overflights are the visual effect of the approaching aircraft and the associated subsonic noise. Any visual impacts would be most likely to occur along those portions of IR-153 that are below 1,000 feet AGL (e.g., segments AB-IJ), the altitude accounting for most reactions to visual stimuli by wildlife (Lamp 1989; Bowles 1995).
>
> "IR-153 would experience an increase of approximately 1 to 10 sortie operations per day, depending upon the segments flown. The potential for impacts to wildlife and birds would be greatest where the segments permit flight altitudes below 1,000 feet AGL but above 200 feet AGL. Of the 38 segments on proposed IR-153, 30 would permit overflights below 1,000 feet AGL (Appendix C, Table C-3). It is estimated that approximately 80 percent of the flight activity along these segments would occur below 1,000 feet AGL. None of the flight activity in the proposed Mt. Dora MOA/ATCAA would be below 3,000 feet AGL and it should not affect wildlife. As a result of the program of consultation, the USFWS has raised concerns regarding the effects of low-altitude overflights on threatened or endangered bird species.
>
> "Studies of subsonic aircraft disturbances on ungulates, in both laboratory and field conditions, have shown that effects are transient and of short duration, and suggest that the animals habituate to the sounds (Workman *et al.* 1992; Krausman *et al.* 1993, 1998; Weisenberger *et al.* 1996). Similarly, the impacts to raptors and other birds from aircraft low-level flights were found to be brief, insignificant, and not detrimental to reproductive success (Smith *et al.* 1988; Lamp 1989; Ellis *et al.* 1991; Grubb and Bowerman 1997).
> Based on these studies, the evidence would suggest that Alternative D flight operations would not result in significant, adverse impacts to wildlife or threatened, endangered or sensitive species. Historically, and at present, most (about 90%) of the area and wildlife under proposed IR-153 has been subject to low-altitude military overflights."

Other literature sources suggest that low-level aircraft overflights can negatively impact wildlife populations. Concerning possible adverse effects of low-level overflights on wildlife, the National Park Service (1994 p.10.2) states:

> "In general, wild animals respond to low-altitude overflights, although the manner in which they do so depends on life-history characteristics of the species, characteristics of the aircraft, flight activities, and a variety of factors such as habitat type and previous exposure to aircraft...The primary concern stemming from these low-level overflights related to wildlife is that the flights may cause physiological and/or behavioral responses that in turn reduce the wildlife's fitness or ability to survive. Overflights may cause excessive arousal and alertness or stress. If chronic, stress can compromise the general health of animals. Overflights may interfere with raising young, habitat use, and physiological energy budgets. Indirect effects on wildlife such as accidental injury, energy losses, habitat avoidance and abandonment are very difficult to detect, but some experts suspect they occur."

009015

Major Brent Adams 5 June 16, 1999

Concerning the effects of low-altitude overflights on wildlife, the National Ecology Research Center (1988 p.13-15) states:

> "Differences in noise from low-altitude subsonic overflight and high-altitude supersonic overflight include the increased duration of noise from a low-altitude overflight, the greater probability that noise from low-altitude overflights will be accompanied by visual perception of the aircraft, and the broad-band frequency distribution of jet engine noise (about 200-20,000 Hz) versus the low-frequency noise of sonic booms (with most of the sound energy between 15-50 Hz).
>
> "Animal species differ greatly in their response to noise of various characteristics and duration. Individual animal response to a given noise event or series of events also can vary widely, due to a variety of factors, including time of day and year, physical condition of the animal, physical environment (such as whether the animal is restrained or unrestrained), the experience of the individual animal, and whether or not other physical stressors (e.g. drought) are present."

BI-29 A substantial body of literature documents impacts to domestic animals and wildlife in laboratory and field settings of simulated and actual aircraft noise and overflights. Borg (1981) found that in general, animals appear to be more sensitive to noise disturbance than humans. Effects to wildlife from low-level overflights and sonic booms may include: 1) direct physical auditory changes such as eardrum rupture and temporary and permanent hearing shifts (Beagley 1965; Majeau-Chargois et al. 1970; Reinis 1976); 2) lowered reproductive rates (Calef 1974; Gunn and Livingston 1974; Harrington and Veitch 1992; and others); and 3) behavioral changes such as decreased ability to obtain food, interference with mating, and habitat avoidance (Stockwell et al. 1991; McCourt et al. 1974a; Schweinsburg 1974a and 1974b; Gollop et al. 1974b). See Table 1 for a partial list of studies of effects of simulated and real aircraft noise and sonic booms on wildlife and domestic animals.

The conflicting research findings on the effect of noise and low-altitude overflights on wildlife populations suggest that extreme levels of noise can have serious adverse effects, but that below a certain threshold no or minimal disturbance is detectable. The Department believes that the intensity, frequency, duration and timing of the proposed low-level overflights may have substantial negative impacts on wildlife populations, should Alternative D be chosen.

009015

Major Brent Adams 6 June 16, 1999

PARTIAL LIST OF STUDIES OF EFFECTS OF SIMULATED AND REAL AIRCRAFT NOISE AND SONIC BOOMS ON WILDLIFE AND DOMESTIC ANIMALS

STUDY	TYPE OF NOISE	SPECIES	EFFECT
Beagley 1965	General noise	Guinea pig	Anatomical hearing damage; hearing loss
Majeau-Chargois et al. 1970	Simulated sonic booms	Guinea pig	Anatomical hearing damage; hearing loss
Reinis 1976	Simulated sonic booms	Mouse	Auditory damage, inner ear bleeding
Calef 1974	General noise	Caribou	Increased incidence of miscarriages; lower birth rates
Gunn and Livingston 1974	Low-altitude helicopters	Lapland longspur	Lower hatching and fledgling success; higher nest abandonment; premature disappearance of nestlings
Harrington and Veitch 1992	Military jets	Caribou	Calves died
Burger 1981	Low-level supersonic transports	Herring gull	More fighting; lower clutch size due to broken eggs during fighting bouts
Shaw 1970	Blasting, drilling, sonic boom, low-altitude aircraft	California condor	Adults flush from nest; some nests abandoned
Wilbur 1978	Blasting, drilling, sonic boom, low-altitude aircraft	California condor	Adults flush from nest; some nests abandoned
Bunnell et al. 1981	Commercial jet aircraft	White pelican	Stampede, panic; eggs lost, abandoned, eaten
Stockwell et al. 1991	Helicopters	Bighorn sheep	Decreased food intake while feeding (interruption)
McCourt et al. 1974a	Fixed-wing aircraft	Grizzly bear	Interrupt activity; leave area
Schweinsburg 1974a and 1974b	Fixed-wing aircraft	Ducks and geese	Abandoned some lakes for more than 4 days
Gollop et al. 1974b	Helicopter	Glaucous gull	Disrupt nesting behavior

009015

Major Brent Adams 7 June 16, 1999

BI-17 Page 4-50 of the DEIS states: "Neither the existing nor proposed airspace in Alternative D would overlie or intersect any major migration flyways or water bodies where birds congregate." This statement is inaccurate, represents a poor understanding of the area under analysis, and is contradicted by information contained in the DEIS. Page 4-103 of the DEIS recognizes the importance of the Rio Grande flyway to migrating whooping cranes. This flyway also supports thousands of sandhill cranes, snow and Canadian geese, waterfowl and other birds in annual spring and fall migrations to Bosque del Apache National Wildlife Refuge and points further south. The DEIS fails to acknowledge the use of Sumner, Conchas, Ute and Clayton Lakes State Parks, and Rio Grande, Pecos and Canadian Rivers as significant wintering areas for migratory waterfowl and eagles. These areas will all be in or near the flight paths for Alternative D if selected. These facts undermine the DEIS assertion (p.4-50) that even with increased sortie-operations, the potential for bird-aircraft strikes in IR-153 and Mt. Dora MOA would be negligible.

BI-14 Section 4.3.5, page 4-101 states: "Most of the wildlife occurring under Alternative D airspace consist of those species associated with mixed grasslands. As described previously under Alternative A: No-Action, many of these wildlife species are habitat generalists able to adapt to a range of habitats…Due to the arid nature of the region, the abundance and diversity of resident and migratory wildlife are greatest around riparian areas, lakes, reservoirs, and ephemeral playas." These statements are inherently contradictory. Many different habitat types will be impacted by the selection of Alternative D, including montane, lacustrine, riverine and riparian habitats. Because most vertebrate wildlife species in New Mexico are reliant on riparian and aquatic habitats for food, water and cover, these species are not able to adapt to a wide range of habitats. Of the 867 species of vertebrates known to occur in New Mexico, 479 (55%) rely wholly or in part on aquatic, wetland or riparian habitat for their survival. Fifty-one of the 96 species that are listed by the state as threatened or endangered are associated with these habitats (NMGF 1997). The reliance of much of the state's wildlife on aquatic and riparian habitats within Special Land Use Management Areas in the proposed MTR emphasizes the potential adverse impacts on wildlife.

THREATENED, ENDANGERED AND SENSITIVE SPECIES

The DEIS cover sheet states: "Alternative D would result in continued and increased low-altitude overflights of known or suspected habitat for federally-listed threatened and endangered bird species: peregrine falcons, Mexican spotted owls, and bald eagles. No cumulative impacts are expected." Table 2.6.1 on page 2-61 of the DEIS states that for Alternative D, the project will increase by 10 low-altitude overflights over three peregrine falcon nest areas, wintering bald eagle areas, and Mexican spotted owl habitat. The table states that the U.S. Fish and Wildlife Service considers low-altitude overflights as potentially significant to these species. The Department is also concerned about the

009015

Major Brent Adams 8 June 16, 1999

potential direct, indirect and cumulative impacts to these species. Several recent reports have suggested that spotted owls may be susceptible to disturbance-induced stress, which could be contributing to population declines (Wasser et al. 1997; Malakoff 1997). Although the literature is again divided concerning the impacts of low-altitude overflight disturbance on certain raptor species, testing for similar intensity, frequency, duration and timing of overflight disturbance is difficult. We believe that extrapolating study results to situations with more intensive low-level overflight conditions would not be valid.

3) **CUMULATIVE EFFECTS AND DEPARTMENT AERIAL SURVEYS**

Due to the incremental increase in low-altitude overflights of northern New Mexico by various branches of the military, the Department has previously requested that cumulative impact analyses be conducted to adequately analyze past, present and reasonably foreseeable future projects. To our knowledge, none have been done. It is our understanding that Sections 1502.16 and 1508.7 of the National Environmental Policy Act (NEPA) regulations require federal entities to consider direct, indirect, and cumulative impacts of the proposed project on the affected environment. CEQ regulation 40 CFR1508.7 states: " 'Cumulative impact' is the impact on the environment which results from the incremental impact of the action when added to other past, present, and reasonably foreseeable future actions regardless of what agency (Federal or non-Federal) or person undertakes such other actions. Cumulative impacts can result from individually minor but collectively significant actions taking place over a period of time."

PD-59 Page 5-2 of "Chapter 5-Cumulative Effects" states: "Known past and present actions that might result in cumulative effects are all Air Force activities." We disagree with this statement, since the Air National Guard proposed to establish a low-level training route over northcentral New Mexico, which the Department commented on in a letter dated 24 June 1990. To our knowledge, these flights still occur. The Department also routinely conducts aerial big game population surveys that overlap much of the areas to be overflown by proposed IR-153. These survey flights were not analyzed as part of the

BR-2 cumulative analysis for this project. The Department is concerned that the increased number of low-level flights will pose a hazard to Department personnel conducting routine aerial big-game surveys if Alternative D is selected.

GE-18 Page 5-2 of the DEIS also states: "The flight operations of each of these actions [USAF] have been incorporated into the analysis in this EIS as part of the baseline conditions in the affected airspace environment for the No-Action Alternative and the action alternatives, then incorporated into the analysis for each of the alternatives." It is our understanding that this approach does not fulfill the intent of NEPA cumulative analysis requirements. By considering all existing activities as baseline conditions, past and present activities are not analyzed. If this method were valid, each new project would essentially start with a "clean slate", and have no previous impacts to consider, since any

009015

previous impacts would now be considered existing baseline conditions. In support of this apparent position, page 5-1 states: "The time frame for cumulative effects starts in early 2000 when airspace changes proposed under RBTI would most likely be implemented and would continue into the foreseeable future."

The Department believes that a more rigorous analysis is needed to determine possible long-term cumulative effects of past, present and future Air Force and other aerial operations in northern New Mexico on sportsmen, recreationists and wildlife. NEPA (40 CFR 1508.27.7) states that: "Significance cannot be avoided by terming an action temporary or by breaking it down into small component parts."

In closing, the Department's primary concerns are the intensity, frequency, duration and timing of proposed low-altitude overflights, primarily in the proposed IR-153 of Alternative D, and the project's potential adverse impacts on recreationists and wildlife, including big game, water fowl, raptors, and other sensitive species. Alternative D will have the most adverse impact on wildlife resources and recreational users of Special Use Land Management Areas and would result in the most change from baseline conditions (page 4-52).

We appreciate the opportunity to comment on this DEIS. Should you have any further questions regarding our comments, please contact Mark Watson, Habitat Specialist of my staff at (505) 827-1210.

Sincerely,

Tod W. Stevenson

Major Brent Adams
HQ ACC/CEVPP
RBTI Project Manager
129 Andrews Street, Suite 102
Langley Air Force Base, Virginia 23665-2769

Dear Major Adams:

This responds to Mr. Alton Chavis's March 12, 1998, transmittal of the Realistic Bomber Training Initiative (RBTI) Draft Environmental Impact Statement (DEIS). The RBTI, designed to increase training opportunities for aircrews flying B-1 and B-52 aircraft from Dyess Air Force Base, Texas, and Barksdale Air Force Base, Louisiana, consists of the following proposed elements:

Modifications and additions to existing military training route (MTR) airspace in Texas and New Mexico used generally for low-altitude navigation training activities;

Modifications and additions to existing military operations area (MOA) airspace in Texas and New Mexico used for medium to high altitude training and maneuvering;

Increased flights by B-1 and B-52 aircraft in the identified airspace;

Acquisition of several 15-acre parcels under MTR and MOA airspace for construction and operation of an Electronic Scoring Site system; and

Closure of existing Electronic Scoring Site systems in Arkansas and Colorado.

Our comments deal solely with the discussion of threatened and endangered species within the document, a narrative that is greatly in need of clarification and correction. The references to an ongoing consultation are in error and should be corrected. Our records indicate that species information was requested from and provided by the Fish and Wildlife Service Ecological Services Field Offices in New Mexico and Texas more than one year ago. Indeed, the latest (March 25, 1998) communication received by the Fish and Wildlife Service from Ogden Environmental and Energy Services clearly stated that no determination regarding the need for consultation under the Endangered Species Act had been made. Thus, the statements that the Air Force is currently in consultation with the Fish and Wildlife Service (Page 4-85) should be corrected. We also recommend that a more recent list of species be

BI-11
BI-30

009016

utilized in your analysis; species have been proposed for listing or are under review for determining if a proposal to list is warranted since the original December 1997 request for information. We have enclosed a current list of species for the following counties: Colfax, Eddy, Guadalupe, Harding, Lea, Mora, Quay, Rio Arriba, San Miguel, Taos, and Union.

BI-26 The Fish and Wildlife Service also requests an opportunity to review the data upon which the statements concerning the northern aplomado falcon in the draft document are based. The portions of the proposed action within southeastern New Mexico and west Texas overlay significant historic habitat for the falcon. Without an opportunity to review the field data documenting the surveys conducted for this species in this area, we believe that the characterization of the species' use of the region as a rare migrant or visitor is biologically unsupported. Without reviewing those data, we also cannot agree with such blanket statements as those in the last paragraph of Page 4-90, concerning such designated sensitive species as the ferruginous hawk, loggerhead snake (we assume this is loggerhead shrike), burrowing owl, white face ibis, swift fox, and Texas horned lizard. The document presents no data concerning the stability of populations of these species, specifically, their distribution and abundance within that habitat. Without reviewing the data upon which the impacts of the proposed action have been assessed, and based on our own records, the Fish and Wildlife Service cannot concur with the conclusions presented in the document.

Should you have any questions concerning these comments, please contact this office at your earliest opportunity.

Sincerely,

Jennifer Fowler-Propst
Field Supervisor

Dear Major Adams:

BR-6 I have personally reviewed the Air Force's proposed Realistic Bomber Training Initiative (RBTI) and the Draft Environmental Impact Statement, with appendices, regarding Alternative D in northern New Mexico. As you know, I have been a firm, consistent supporter of the armed forces in the United States, and I believe strongly in the need to further improve training and support for our military personnel. Programs like RBTI are essential to such training, and I support them vigorously.

I could not, however, be more strenuously opposed to the selection of Alternative *D* – and I urge you in the strongest possible terms to consider some other alternative.

I have been a volunteer in the programs of the Boy Scouts of America for my entire adult life. For more than fifteen years, I have been a volunteer at Philmont Scout Ranch in Colfax County, New Mexico – the largest and most famous Scouting facility in the world. I spend several weeks every year in the Sangre de Christo Mountains of Philmont; have hiked, camped and fished there, and know its terrain as well as I know my own back yard.

Philmont lies directly in the path of Alternative D. Low-level overflights by B-1s and B-52s would destroy its usefulness for the wilderness camping and hiking experience that has made it world famous, and from which more than a half million young people have left with a greater appreciation for our natural environment and their own resourcefulness. Though Colfax County is sparsely populated, there are more than 5000 young people in the mountains of Philmont on any given day – some on horseback, some rappelling or mountain climbing, some engaged in spar pole climbing. Their safety would be compromised, and their wilderness experience destroyed should these flights be approved. For all practical purposes, the single largest asset of the Boy Scouts of America would be rendered useless for the purpose it was acquired more than sixty years ago should Alternative D be selected.

Thank you for your consideration of my views. Please contact me personally if you would like to discuss the matter further.

Sincerely yours,

Edward A. Pease
Member of Congress

RE: Draft Environmental Impact Statement

Dear Major Adams:

Please enter Brewster County's objection, in the strongest possible terms, to the Draft Environmental Impact Statement ("DEIS") for the Realistic Bomber Training Initiative ("RBTI"). Although the Air Force may have complied with the technical requirements of the National Environmental Policy Act ("NEPA"), you have clearly not complied with the spirit or intent of the Act. The intent of the Act is that all proposed governmental actions should be considered in light of their impact on people and the environment; that is the only reason NEPA was passed and continues to have relevance. Both the people of our County and all aspects of our environment will be significantly impacted by the cumulative effect of the RBTI and the activities in Instrument Routes 102, 141, and 178. We urge you to follow the "No-Action Alternative" (Alternative A) and leave the people, livestock, wildlife, values, and quality of life intact in Brewster County.

Although some initially doubted the rationale and justification of low-level bomber training, which was claimed to be critically-needed, the recent conflict in Kosovo has proven the Air Force's logic to be both hollow and false. It is very clear that our military commanders do not consider it an appropriate tactic or risk of war to expose our pilots, our personnel, and our equipment to the hostile responses that low-level flight in combat entails. If, in an actual war or other conflict, our bombers will operate only at 15,000 to 40,000 feet or above, why is it **AF-54** appropriate to terrorize our citizens at an altitude of 300 feet? Why is that training necessary? Aside from the reasons for the conflict in Kosovo, which are unclear, the lessons the conflict taught are crystal clear: The bombers of the United States Air Force are not going to be flying low in war. Why do we therefore need to train them in peacetime to use tactics that they will not be called upon to use in war? Perhaps, rather than acquiring new property rights by utilizing **BR-5** private property for a public purpose, the Air Force should consider rewriting its training manual and revising its tactics.

Since NEPA requires an evaluation of the environmental consequences of proposed action, environmentally it is inane dissembling to claim that a sound level of 117 decibels will have minimal effect on livestock, wildlife, or the quality of life. Too many personal and commercial anecdotes, as well as scientific studies, belie this. The DEIS has taken average noise levels over

Brewster County does not discriminate on the basis of race, color, national origin, sex, religion, age and handicapped status in employment or the provision of services.

009018

Major Brent Adams, RBTI EIS Project Manager
June 16, 1999
Page 2 of 3

a prolonged period and within a large area to ameliorate the impact effect by claiming that the build-up and the dying-down of the maximum sound level moderates its effect, as does the fact that there will be lateral variance within the route. This approach may sound logical, but it is not real life. Neither a deer nor a human reacts to the sound of an aircraft approaching or leaving or flying somewhat to the side as detracting from the impact of its flying directly overhead at 300 feet and 550 knots. There are no "averages" in time and space in real life experience that lessen the maximum impact of the noise.

BR-1 The DEIS spends ten pages explaining "the cumulative energy average noise metric" and the "Day-Night Average Sound Level". Your explanations are hard to follow, to say the least. The reason they are hard to follow is that they make no sense to real people in a real life situation. What counts is the maximum sound level. To honestly measure the impact, the DEIS should measure the maximum sound level. You have not done so, as a result of which all of your explanations are irrelevant.

Much of the DEIS ignores the real concerns and real reactions to your proposal by real people. To compare the sound of a B-1 at 500 feet with the sound of a chain saw defies common sense; yet Figure G-1 blithely makes that comparison. Similarly, to claim that an F-16 at 5,000 is like a garbage disposal means to a normal person that the Air Force is merely justifying its preconceived results. The DEIS is a finely crafted document that could just as easily been written before you began the process. Perhaps it was.

Your cavalier dismissal of any problems with aircraft emissions and air quality with the statement that "[b]ecause military aircraft are mobile and cover very long distances over many different areas, they commonly contribute little to the total emissions in a region." This, too, is the explanation of averages, exactly like your amelioration of the sound impact. The fact that

AO-70 emissions will dissipate does not mean much to the family that is forced to smell the emissions emanating directly over their house. Nor does it impress the eco-tourist who thought he was going to one of the last pristine places in Texas.

Also disturbing is the claim that safety is not a realistic concern because "[f]light safety is of paramount concern to the Air Force." Undoubtedly that is true, just as it is true that "[your] aircraft accidents have steadily declined." Nevertheless, you do acknowledge that what you euphemistically call "Class A Mishaps" do occur and, in fact, will continue to occur. Since a Class A Mishap involves "loss of life, permanent total disability, [or] total cost of more than $1 million", the fact that they are rare is of small comfort to the people living under the RBTI route.

It is also revealing that the Air Force presents reams of data to justify its denigrating of any safety concerns and then recites that "[t]hese data are only statistically predictive and actual

AO-61 mishaps result from may factors." Why is it acceptable to inflict the danger of any Class A mishap — any whatsoever — on private citizens?

009018

Major Brent Adams, RBTI EIS Project Manager
June 16, 1999
Page 3 of 3

Typical of the circular logic repeatedly employed by the DEIS is the statement that "[m]ilitary flights have taken place over Texas...for almost 90 years. During this long time, the pilots, their crews, and their aircraft have successfully coexisted with the people and the environment." Yet this misses the point entirely. The point is that during times of national crisis, such as a world war, people will happily make sacrifices; yet this is not a time of national crisis, and the Air Force has, as is admitted in the DEIS, cut back bases and personnel in West Texas drastically. Now you are asking us to increase our sacrifices because we have done it in the past. Sir, if we find ourselves as a nation at war and at risk, I am quite sure everyone in Brewster County will make as large a sacrifice as necessary. But in peacetime we should be allowed to live in peace.

Quite frankly, it is difficult for me to write this objection because of the futility of doing so, which is quite obvious to all citizens of Brewster County. Just as was the case with the series of proposed modifications to Instrument Routes 102 and 141, it is clear that no amount of public concern will deter the Air Force from doing in West Texas what it wants to do anyway. All of the citizens of Brewster County support a well-trained military and the cause of military preparedness. It becomes increasingly difficult to do so, however, when the Air Force forces private citizens to bear the cost of its actions by devaluing their property, their businesses, and their quality of life.

Since it is the environmental impacts of your proposed actions that we are supposed to be considering and that the DEIS is supposed to be evaluating, the actual impact on the environment and on the people who exits in it should be considered. The DEIS does not do that. It rationalizes the impacts and justifies the ensuing moderated impact, which is a fiction not a fact.

AO-109 The only argument presented in the DEIS against conducting realistic, low-level bomber training over federal lands instead of private lands is that it is inconvenient and inefficient for the Air Force. Convenience to private citizens should also be a factor. As should their quality of life. As should the success and prosperity of their businesses. Please choose Alternative A.

Respectfully yours,

VAL BEARD

THE STATE OF TEXAS

HOUSE OF REPRESENTATIVES
AUSTIN

MEMBER:
STATE AFFAIRS
WAYS AND MEANS

June 14, 1999

Honorable F. Whitten Peters
Acting Secretary of the Air Force
1670 Air Force Pentagon
Washington, DC 20330-1670

Dear Secretary Peters:

BR-6 It is my understanding that the U.S. Air Force is proposing a new training route for low level B-1 and B-52 bomber flights from bases in Texas and Louisiana under your Realistic Bomber Training Initiative (RBTI). One of the proposed routes, Alternative D, traverses Philmont Scout Ranch in northeastern New Mexico.

I am an advocate of the Boy Scouts of America and their programs. Philmont Scout Ranch provides a great natural resource for Scouts to learn, explore and experience wildlife in its native habitat. The adverse effect of low level flights in this wilderness area could be great. Specifically, I am concerned about the impact the proposal will have on the health and safety of thousands of Scouts attending Philmont each year (summer) and damage to the wildlife and environment. The sudden roar of jet engines could cause a horse to bolt and injure a Scout or distract a Scout while rock climbing.

I urge you to help preserve this national treasure by selecting an alternate training route. Thank you.

Sincerely,

Tom Craddick
State Representative
District 82

Major Brent Adams
RBTI EIS Project Manager
HQ ACC/CEVPP
129 Andrews Street, Suite 102
Langley AFB, VA 23665-2769

Dear Major Adams:

Having reviewed the RBTI draft EIS, I have comments in four areas:

1. Current DEIS analysis results,
2. DEIS analysis deficiencies,
3. Limitations in integrated governmental decision making,
4. The impact of existing lawsuits.

Current DEIS Analysis Results

The DEIS analysis, as it currently stands, indicates that RBTI alternative D is the poorest of the action alternatives presented by the Air Force. DEIS data shows that:

The change from baseline sortie operations will be significantly greater for alternative D than for alternatives B and C.

Alternative D presents increased potential for conflicts from intersections with existing jet routes and federal airways, and with civil aviation, thereby requiring increased airspace management to ensure existing levels of airspace safety. (Questions: Is increased management reflected adequately in costs associated with alternative D? Is this increased complexity taken into affect when determining relative safety or cost conclusions?)

A larger number of communities and Special Use Land Management Areas underlying alternative D will be subjected to substantially larger increases in noise levels.

Alternative D will generate a substantial increase in annoyance generated by noise level increases of 15 DNL above baseline (more than a doubling).

Flight segments where increased noise levels occur are over such areas of special concern to those of us living in Northern New Mexico as Philmont Scout Ranch, falcon nesting areas and major wildlife breeding and calving grounds.

Some of these flight segments are relatively narrow, thus limiting the ability for overflight dispersion.

000951
009020

There is a larger impact on issues of concern to the USFWS, e.g., existing falcon, eagle and owl habitats.

There will be considerably higher impact on National Register listed properties in terms of both noise levels and sortie rates.

There will be generally lower benefit to the operational outcomes sought by the Air Force should they choose alternative D.

DEIS Analysis Deficiencies

While I believe the DEIS analysis already indicates that alternative D is the least viable choice, I also find the DEIS analysis deficient in other areas when analyzing the impacts of RBTI flights on the area underlying RBTI alternative D.

BR-7

1. Discussions of quality of life (page 3-8) are so benign as to be a cop out. The perspective of native peoples living in Northern NM deserve more specific treatment. So does that of the Hispanic peoples having traditional connections to this area, and of the anglos that have elected to live in this area for other quality of life criteria than the prevailing American "upward mobility" ethic. The comments of a great number of people at the scoping meetings (Sprint '98) and public hearings (Spring '99) in Taos and Angel Fire are minimally reflected in the relatively generic discussion at the beginning of DEIS section 3.3. Further, when discussing Native Americans on page 3-9, no specific reference is made to the Jicarilla Apache (reference the Jicarilla Apache inputs in Taos during the April '98 scoping meetings) and Taos Pueblo sites (e.g., Blue Lake) in Northern NM underlying or adjacent to RBTI alternative D. By making reference only to Mescalero Apache sacred mountain tops and other historic Apache and Comanche displacements, the analysis completely misses the point and avoids the EIS analyst's responsibility to provide a context sufficient for accurate judgements about such criteria as Land Management and Use, Socioeconomics and Environmental Justice, or Cultural Resources.

2. Regarding the DEIS treatment of the Land Management and Use criterion, Northern NM should be considered prime, and increasingly rare, recreation area that is in increasing demand by a significant segment of the American population -- the baby boomers. Failure to recognize this feature of America's current demand for second homes and recreational space and the linkage of this demand to the unique characteristics of the area underlying RBTI alternative D is a substantial omission. This failure limits the DEIS analyst's ability to recognize economic development and regional planning challenges to which RBTI alternative D adds, or to fully address the impact of RBTI alternative D on Socioeconomics criteria.

3. If the Air Force is serious about adhering to FAA avoidance rules (see page 4-5 and reference FARs, Title 14, Code of Federal Regulations, Sec. 91.119,

000951
009020

PD-60

Minimum Safe Altitudes: General, subparagraphs (b) and (c)), then the ability of RBTI alternative D to satisfy stated Air Force requirements is further limited. These rules will require flights through segments over Philmont Scout Ranch (and other areas like the Colin Neblitt Wilderness and some segments of the CS and Vermejo Ranches) at altitudes considerably above those appropriate to the "threat-avoidance" altitudes associated with the realistic training sought in these areas. This is because of the open-air assembly of persons that are part of normal activities in these regions. The exact locations and frequencies of these assemblies will be unknown to the Air Force, thereby requiring flights through segments over these regions at substantially higher altitudes than are being proposed by the Air Force.

PD-38

4. Added to the above is the USFWS position that overflights should be as much as 1600 to 2000 feet above the bird populations of concern, an operational deviation that would limit Air Force ability to achieve its objectives even more. Not only that, it is a flight deviation that, while potentially promised by the Air Force, could not and would not be monitored for compliance and would be easy to deviate from by accident or on purpose.

5. The impact of aircraft operations in the Northern NM region entails noise impacts equal to the noise made by rock bands, chain saws and diesel trains. These are apt to be more-than-normally annoying because of the higher incidence of people using the region under RBTI alternative D for purely aesthetic reasons to whom such noise events will be unacceptable. The potential for such annoyance cannot be minimized by converting it to a cumulative metric (DNL) that satisfies some general analysis purpose appropriate to "communities" of homes rather than recreational groups. Moreover, the cumulative metric minimizes the hazards associated with the startle impact on individual or group activities going on in the open areas of the area affected by alternative D (horseback riding, rock climbing, hiking in potentially hazardous regimes, youth training, wildlife photography, etc.). This is one of several examples of a relatively persistent tendency in the DEIS to generalize rather than treat the specific characteristics of Northern NM that were amply communicated to the Air Force in both scoping meetings (Spring '98) and public hearings (Spring '99). [NOTE: Although the Air Force did not record any information at the Spring '98 scoping meetings, media footage of the Taos meeting is available, as is a full video of the Angel Fire scoping meeting.]

BR-1

GE-19

6. The comment on page 4-81: "Flight operations could, however, be perceived by the public as negatively affecting their quality of life" is in error. If you review the comments made in Taos and Angel Fire during the Spring 1998 scoping meetings and more recently in public comment meetings, you will note that the term "could" should clearly be revised to "will!" Even people who were not residents, but regularly come to our area for its recreational and aesthetic appeal, indicated such opinions. Are you listening? Are you using the available data and public comment accurately, or are you downplaying their impact by resorting to use of generalizations and the "softest" of available qualifiers?

000951
009020

AO-110

7. A similar criticism of your analysis can be levied on the data on page 4-82. There you indicate that noise levels of 65 DNL are a guide above which negative impacts may occur in residential areas, a statement that assumes 20dB attenuation because of residential construction. Yet, your analysis indicates significant noise level increases up to 65 DNL in areas that involve uses having human importance that are not occurring in residential areas. Isn't this fact relevant?

8. Many of those impacted by alternative D will be those for whom the discussion on noise-related awakenings (see pages 4-13/4-14) are totally irrelevant. Scouts at Philmont and backpackers in the Colin Neblett Wilderness are not in "the field (in the sleeping quarters of homes)" for which the DNL metric was evaluated, nor are they in the region long enought to get habituated! Thus, the statement on page 4-14 assuming a 20-dB noise insulation level is irrelevant. This kind of analysis is misleading because it uses credible research which is irrelevant to the arena and population being impacted. For example, the comment on page 4-11 that "findings substantiate that community annoyance to aircraft noise is represented quite reliably using DNL" is a wonderful statement that overlooks the fact that in the area underlying RBTI alternative D, a "community" with will not be the only area of concern. As an ancillary comment, Philmont Scout Ranch, with it's unique character and mission, must be considered a "community" underlying IR-153 (added to Table 4.2-11) which will be significantly and adversely impacted by the increase in sortie rates and the increase in noise metrics, whichever metric is used. And the Philmont "community" does not have the advantage of a 20dB attenuation due to housing construction!

> Philmont contributes uniquely to young peoples' development by offering foundation experiences unavailable elsewhere. Having led a group through Philmont on horseback and along steep mountain trails, I can attest first hand to the benefits of the Philmont experience on the character of young people, and concur with the Philmont management's real concern for safety impacts of low-level RBTI flights.

BI-31

9. The comment on p 4-106 that: "Historically, and at present, most (about 90 percent) of the area and wildlife under proposed IR-153 has been subject to low-altitude military overflights" is misleading. Those flights have been much lower in both frequency (historically one/day; proposed over 10/day) and noise impact (historically up to 17 DNL lower) than what is proposed for alternative D. This difference is so great as to make the fact of historical overflight irrelevant.

10. Section 4.4 addresses the impacts of RBTI on Socioeconomics and Environmental Justice factors only in the immediate vicinity of ESS and emitter site constructions/operations. This is overly limiting. The statement that: "given the rural nature of the region and the history of military use of the associated airspace, changes in numbers or types of overflights are not expected to produce measurable impacts on the economic value of the underlying land" is self serving considering the dramatic increases in both overflight frequency and noise levels. So is the statement that: "It is possible, however, that a recreationalist or rancher

BR-4

000951
009020

could be startled if an overflight took place at a specific point of time, but such an event is difficult to predict." It's lack of predictability does not lessen the Air Force's responsibility to consider the impact of such events, given the high incidence of demand for recreational use of lands underlying IR-153, and the fact that this startle effect will often occur when the affected individual or group is engaged in potentially hazardous activity. The fact that the authors of the DEIS assert that only construction/operational sites are relevant of consideration does not make it so, particularly when the public comments provided the Air Force about the fragility of the Northern New Mexico economy at scoping meetings and public hearings dictate otherwise.

CU-15

11. Regarding the analysis of affected cultural resources, the data indicates that several sites within the confines of the Philmont Scout Ranch were ignored. I also question whether DNL is the appropriate noise metric to use for noise impacts on some of those resources rather than Lmax or SEL. Again, the note that the area has been previously overflown is misleading or inaccurate. An increase from 1 to 11 per day suggests that the historical frequency is irrelevant. Further, Philmont Scout Ranch and its ignored cultural and archeological sites have not been regularly overflown.

Limitations In Integrated Governmental Decision Making

On page 2-11 of the DEIS, reference is made to public suggestions that the bombers be moved. While this is not an option available to the Air Force as part of this EIS, the DEIS response that eliminates this option because of the Base Realignment and Closure (BRAC) process suggests the need to improve governmental decision processes.

The BRAC process defines and recommends realignment and closure options based on military needs and economic impacts. Given the added costs associated with the BRAC decision to move added bombers to Barksdale and Dyess AFBS that are identified by the RBTI, clearly the BRAC process did not consider all the associated costs of the move. The Air Force should have (and I hope will in the future) pointed out the added costs of ensuring crew readiness associated with this decision to the BRAC committee.

Further, the DEIS states (page 2-8) that sorties must be completed using allocated flying hours based on funding from Congress. If Congress approved the move of bombers to a location requiring more flying hours to existing training routes, they can also approve the funding associated with increased flying hour requirements generated by their approval of the BRAC decision. The Air Force should request these funds and point out to Congressional leaders these adverse economic linkages to Congressional and Presidential decisions. These kinds of downstream connections between what are presented by government agencies, Congress and the President are the kinds of things that reduce the taxpayers' view of governmental credibility.

I suggest there is also another kind of connectivity that needs consideration by Air Force and Congressional leaders. It is the potential connectivity between the RBTI and other

~~000951~~ cm
009020

training routes. Based on BRAC, are there other RBTI-like "adjustments" in training routes being proposed by other than the Barksdale/Dyess contingent that might be synergistic with the Barksdale/Dyess requirements? We don't know the answer to that, although we do know that the US, and especially the Western US, has many training routes, and many major test and training installations encompassing the terrain and threat systems required for military training (e.g., Utah Test and Training Range, the training arenas north of Nellis AFB, Fort Irwin, the Naval Weapons Center). Perhaps it is time to insist on a Programmatic EIS for such training routes and ranges, and, as part of that, require the FAA take a more integrated look at all the requirements that constitute the public interest than just military requirements. While this would be a complex and difficult undertaking, the likelihood of savings from eliminating duplication of capability and the associated costs is potentially in the billions of dollars.

Oh by the way, this was implied by General Colin Powell (then Chief of Staff of the JCS) in his February 1993 report, Roles, Missions and Functions of the Armed Forces of the United States, when he asserted that, "An integrated test and evaluation range structure linking existing ranges across six western states and supersonic areas off the California coast would provide a land, airspace, sea area to accommodate a large portion of our joint training, test and evaluation needs well into the next century." (For those that don't know the history of the national ranges, this notion has it's genesis in the Continental Operating Range concept that surfaced in the mid-1960s.)

GE-20 Isn't it time to prepare a Programmatic EIS that combines the full intent of NEPA with an integrated assessment of military needs and an opportunity to save taxpayer dollars, or will the public continue to be forced to react to piecemeal actions for which the full range of impacts and benefits is unclear?

The Impact Of Existing Lawsuits

GE-21 I understand that the Air Force is engaged in a lawsuit filed against them by West Texas ranchers concerned with RBTI action alternatives B and C. Any settlement that precludes low level training over alternatives B and C followed by a decision to select alternative D would violate NEPA and the purposes of the EIS process, and would add a decision criterion (the power of the legal war chest) that is not addressed in the DEIS. If a lawsuit prior to conclusion of the EIS process sways the Air Force's decision or subverts the conclusion justified by EIS analysis processes, then NEPA and the EIS process is a hoax and a waste of taxpayer dollars.

Respectfully,

Eugene A. Erb
Mayor Pro Tem,

REALISTIC BOMBER TRAINING INTITIATIVE

Public Hearing Comment Sheet

Location: LA JUNTA
Date: 4/19/00

Thank you for providing your comments on the Realistic Bomber Training Initiative Proposal.

GE-22 1) WHY WASN'T THE MEETING ADVERTISED?
2) THE INFORMATION IN THE EIS WAS BASED IN APPENDIX J, SOCIOECONOMICS ON THE IMPACT TO LA JUNTA AFTER THE MILITARY WAS DECOMMISSIONED. THE FACILITY IS FUN BY LOCKHEED WITH MORE OF THE JOBS THAN WHEN RUN BY THE AIR FORCE.

PD-62 3) THERE WAS NO NEGATIVE NTR'S FOR THE LA JUNTA AREA.

PD-63 4) IF YOU WANT REALISTIC BOMBER TRAINING LOOK AT THE FLYING TIME ABOUT BOMBERS LIKE IN VIETNAM AND KOREA.

SE-2 5) ECONOMICS I DOES NOT TAKE IN THE BUSINESS IN THE AREA AS THE SAVINGS OF PERSONNEL AT SITE. (UNEMPLOYMENT INCOME)
6) ECONOMICS DOES NOT TAKE INTO ACCOUNT THE COMMUNITY INVOLVEMENT & SUPPORT (EDUCATION) IN YOUTH GROUPS LIKE FFA & POLICE POSITIVES.

RESOLUTION

TY **WHEREAS,** Lynn County is a community of almost 7,000 people. The economy of Lynn County has always been primarily agriculture and ranching.

WHEREAS, the **City of Tahoka** is one of four incorporated cities located in Lynn County. The population of Tahoka is approximately 3,000 people. The city's economy is affected by the agriculture and ranching in our community.

WHEREAS, the city's economy has been adversely affected in the past several years because of drought conditions.

WHEREAS, the city council has the responsibility for the safety and welfare of its citizens. The city council feels that allowing the United States Air Force to use the air space over Lynn County would negatively impact the economy to such an enormous degree that the city's economy might never recover. And, there are concerns over the safety of such use of the community's air space.

WHEREAS, there are other areas of the country that can be utilized by the United States Air Force for training purposes. At these other locations no one's safety or economy would be affected.

NOW THEREFORE BE IT RESOLVED, that the city council of the **City of Tahoka** actively supports the Heritage Environmental Preservation Association in opposition to the United States Air Force Lancer Realistic Bomber Training Initiative.

PASSED AND APPROVED by the City Council on this 6th day of April 1999.

APPROVED:

Mayor, City of Tahoka

ATTEST:

City Administrator, City of Tahoka

009023

000148 CN

April 12, 1999

The Honorable Whitten F. Peters
Secretary
United States Air Force
The Pentagon
Washington, D.C.

Dear Secretary Peters,

Let me first underscore that as an avid proponent of a strong U.S. defense and as Senate Budget Committee Chairman, I understand the Air Force's need to achieve realistic training under existing fiscal constraints. I strongly support the Realistic Bomber Training Initiative's (RBTI) ultimate objective. However, I also believe this objective is attainable without undue negative impact to wilderness areas and New Mexican communities.

I would also like to recognize the fact that the Air Force has taken significant strides to accommodate Native American concerns in Northern New Mexico and has formally extended the comment period. I interpret both of these actions as demonstrative of a good faith effort on the Air Force's behalf to accommodate and compensate for different public interests.

I have previously voiced my concerns to the Air Force about the proposed "Alternative D" for the RBTI. At the same time, I believed it was important to allow the process to proceed in order for any decisions to be based on an accurate and justifiable analysis of the available alternatives. Having now reviewed the Draft Environmental Impact Statement for the Realistic Bomber Training Initiative, I have several questions and concerns regarding the Air Force's analysis and conclusions.

First, the Draft EIS concludes that all three alternatives (B, C, and D) have "no measurable impacts to socioeconomics." Second, I note that for Alternative D the Draft EIS mentions that specific segments of the training route would be over areas that support a number of threatened and endangered species; it also notes that the U.S. Fish and Wildlife Service considers low-altitude overflights as potentially significant to these species. Lastly, the summary chart under the heading "Environmental Consequences" offered on page ES-3 clearly indicates greater adverse effects in three categories for Alternative D than any other alternative, and, again, suggests "negligible" socioeconomic impact for all alternatives.

Given the increased noise levels to areas that the Draft EIS and the different economic base of Northern New Mexico as compared to the impacted communities in West Texas and Southern New Mexico, I would appreciate better understanding how the "negligible socioeconomic impact" conclusion for Alternative D was reached. Is there any quantitative analysis utilized to

009023 000148 CN

BR-4 determine, for example, that land values, tourism, and recreational activities in this area will not be negatively impacted by the proposed training?

I would also like to know precisely how to interpret the Air Force's Draft EIS in light of the findings offered in the Draft regarding negative environmental consequences. My constituents will no doubt attend your hearings in New Mexico and ask you similar questions, but in order to clarify for my own purposes the Air Force's most recent views on RBTI options, I would appreciate hearing your response to these concerns.

Again, I would like to reiterate my full support for a trained and ready Air Force. Recent operations in Kosovo make the need for realistic training in diverse terrains all the more evident. Simultaneous, as a representative all New Mexicans I believe it is important to remain vigilant as this process moves forward.

Sincerely,

Pete V. Domenici
U.S. Senator

DOMENICI QUESTIONS AIR FORCE'S DRAFT ENVIRONMENTAL PLAN ON PROPOSED NORTHERN N.M. TRAINING FLIGHTS

WASHINGTON -- Senator Pete Domenici today questioned findings in the Air Force's draft environmental impact statement for proposed bomber training missions in northern New Mexico, asking the Air Force to explain several conclusions.

Domenici today wrote Whitten F. Peters, acting Secretary of the Air Force, with his concerns on the Air Force's proposal to begin a Realistic Bomber Training Initiative (RBTI) in northern New Mexico.

"Let me first underscore that as an avid proponent of a strong U.S. defense and as Senate Budget Committee chairman, I understand the Air Force's need to achieve realistic training under existing fiscal constraints. I strongly support the ultimate objective of the Realistic Bomber Training Initiative. However, I also believe this objective is attainable without undue negative impact to wilderness areas and New Mexican communities," Domenici said.

Domenici issued the letter as the Air Force this week embarks on additional public comment hearings on the RBTI in New Mexico, particularly Alternative D which will most affect northern New Mexico.

Having thoroughly reviewed the draft environmental impact statement (EIS) for the RBTI, Domenici questioned some of the Air Force's analysis and conclusions. He sought answers to some apparent inconsistencies, including the fact that:

- All three alternatives (B, C, and D) have "no measurable impacts to socioeconomics,"
- For Alternative D, the draft EIS mentions that specific segments of the training route would be over areas that support a number of threatened and endangered species, in addition to noting that the U.S. Fish and Wildlife Service considers low-altitude overflights as potentially significant to these species; and,
- A summary chart under the heading "Environmental Consequences" clearly indicates greater adverse effects in three categories for Alternative D than any other alternative, and, again, suggests "negligible" socioeconomic impact for all alternatives.

--MORE--

 000148 CN 009023

"I have previously voiced my concerns to the Air Force about the proposed Alternative D for the RBTI. At the same time, I believed it was important to allow the process to proceed in order for any decisions to be based on an accurate and justifiable analysis of the available alternatives," Domenici wrote Peters.

"Given the possible impact of noise levels to the different economic bases of northern New Mexico as compared to the impacted communities in West Texas and southern New Mexico, I would appreciate better understanding how the *negligible socioeconomic impact* conclusion for Alternative D was reached. Is there any quantitative analysis utilized to determine, for example, that land values, tourism, and recreational activities in this area will not be negatively impacted by the proposed training?"

Domenici said he would also like to know precisely how to interpret the Air Force's draft EIS in light of the findings regarding negative environmental consequences.

"Again, I would like to reiterate my full support for a trained and ready Air Force. Recent operations in Kosovo make the need for realistic training in diverse terrains all the more evident. Simultaneous, as a representative for all New Mexicans, I believe it is important to remain vigilant as this process moves forward," Domenici concluded.

The B-1 and B-52 bomber training routes being considered by the Air Force include the northeast part of New Mexico, as well as southeast New Mexico and southwest Texas. Information from the public meetings in New Mexico will be taken into account as the Air Force prepares its final EIS by October 1999. A final Record of Decision on the bomber training routes is expected in November 1999.

REALISTIC BOMBER TRAINING INTITIATIVE

Public Hearing Comment Sheet

Location: Reagan County
Date: 6-1-99

Thank you for providing your comments on the Realistic Bomber Training Initiative Proposal.

TY In my 20 plus years in local politics I cannot remember a more controversial topic than the RBTI.
People of the land out here are extremely sensitive to any environmental concern that might impact their area. This coupled with the availability of information and the tremendous amount of time they are willing to dedicate will be interesting to the future of your involvement here.

TEXAS HISTORICAL COMMISSION
The State Agency for Historic Preservation

GEORGE W. BUSH, GOVERNOR
JOHN L. NAU, III, CHAIRMAN
F. LAWERENCE OAKS, EXECUTIVE DIRECTOR

April 26, 1999

Mr. Alton Chavis, Chief
Environmental Impact Analysis Branch
Department of the Air Force
Headquarters, Air Combat Command
HQ ACC/CEVP
129 Andrews Street, Suite 102
Langley AFB, Virginia 23665-2769

Re: Project review under Section 106 of the National Historic Preservation Act of 1966
Draft Environmental Impact Statement, proposed Realistic Bomber Training Initiative,
Multiple Counties, Texas (Air Force)

Dear Mr. Chavis:

Thank you for your correspondence describing the above referenced project. This letter serves as comment on the proposed undertaking from the State Historic Preservation Officer, the Executive Director of the Texas Historical Commission.

The review staff led by Myles Miller has completed its review. We support the selection of an alternative that would result in the least amount of direct and indirect impacts to cultural resources, and therefore recommend the selection of Alternative A (No Action). However, should this alternative prove to be infeasible, we agree with the recommendations for mitigation of effects to cultural resources proposed in Section 4.5 of the draft EIS. On page 4-120 of the draft EIS it is stated that the 22 potential Electron Scoring Sites (ESS) within the State of Texas have been surveyed for cultural resources, although the report of field investigations has not yet been submitted to the SHPO. We will provide our comments and eligibility recommendations upon receipt of this report.

CU-15 We do wish to note that in a previous letter dated January 5, 1998 we requested that your environmental consultant submit copies of the 7.5 minute USGS quadrangle maps showing the locations of the proposed ESS facilities, projected construction impacts, and land ownership status. In this manner we could have provided input on the archeological survey methods, expected resources, site definition criteria, and whether a Texas Antiquities Permit was required for investigations conducted on lands owned by the State of Texas. For example, it is stated on page 4-120 that the archeological survey of the proposed ESS facilities utilized transect intervals of no more than 25 meters. Our state guidelines for West Texas recommend transect interval spacing of 15 meters for archeological surveys.

Mr. Alton Chavis, cont.
P. 2

We look forward to further consultation with your office and hope to maintain a partnership that will foster effective historic preservation. Thank you for your cooperation in this federal review process, and for your efforts to preserve the irreplaceable heritage of Texas. **If you have any questions concerning our review or if we can be of further assistance, please contact Myles Miller at 512/463-5864.**

Sincerely,

for F. Lawerence Oaks, State Historic Preservation Officer

RESPONSE SECTION

Broad Issue: Noise Analysis Methodology (BR-1)

Letter #	Response

0013 0027 0045 0072 0105 0136 0145 0149 0158 0191 0202 Noise is an issue of concern not only for the U.S. Air Force and the Department of Defense, but other Federal agencies such the Federal Aviation Administration (FAA), National Aeronautics and Space Administration (NASA), U.S. Environmental Protection Agency (EPA), Occupational, Safety and Health Administration (OSHA) and the Housing and Urban Development (HUD), among others. These agencies have both independently and collectively studied various sources of noise, including aircraft noise. Particularly since the introduction of jet aircraft, more research has been devoted to aircraft noise than to any other environmental noise problem. Concern over potential effects has prompted many studies on humans, animals and structures. Research focus has included health effects, interruption of activities (e.g., speech interference, sleep disturbance, recreation), wildlife and livestock and property values. Recent concerns over quality of life issues and impacts to solitude and wilderness experiences have emerged in the last few years.

0217 0223 0288 0318 0323 0329 0365 0416 0417 0452 0507 0531 Noise is typically one of the primary concerns voiced when an action involving military aircraft is involved. It is unquestionable that military aircraft generate high noise levels. The levels experienced by an individual or a receptor on the ground vary according to several factors such as location of the receiver (such as a person or sensitive receptor), the distance of the aircraft from the receiver (such as altitude or lateral/slant distance) and how the aircraft is operating at the time (i.e., what is the speed and power setting). In other words, where an individual is in relation to the aircraft and how the aircraft is operating, determines what the noise "dose" will be. The noise levels generated by fixed wing aircraft in the U.S. Air Force inventory, have been measured by noise specialists from Armstrong Laboratories (Wright-Patterson AFB, OH), with sound recording equipment arrays while flying at a variety of speeds and power settings. These measurements are contained within the acoustical data set known as NOISEFILE used in computer modeling.

0634 0674 0713 0784 0827 0828 0877 0906 Predictive computer modeling is standard practice not only in noise analysis, but also in areas such as weather and air quality, transportation, bird avoidance modeling (BAM), personal finance, economic forecasting and urban planning, among others. Computer models utilize a set of known data or information, such as measured noise levels, then make predictions based on the modeled situation (airspeed, power setting, altitude). To determine the correct situational factors for military aircraft noise modeling, information is gathered from aircrews, airspace managers, training requirement syllabi and flying hour allocations. This data collection is performed for each new proposal to ensure the planned training operations are characterized according to the current and future requirements.

0957 0983 01129 01130 01131 08057 08082 08085 08146 08202 08221 08239 08246 08250 08253 The technology used by the Air Force to model aircraft noise is based on the best available technology at the time. Currently, the Air Force uses a computer program known as MR_NMAP (MOA Range NOISEMAP) to model aircraft noise in training areas away from the installation. Over the years as technology has increased, the programs have been refined and updated to reflect the latest information and data. For example, as additional aircraft have been added to the inventory, the acoustical database has changed. Likewise, as our research studies have provided additional information on effects such as annoyance, the modeling programs have been updated to include the additional penalties for intrusiveness above those determined in the previous studies. As technology increases, the programs will continue to evolve as well. The Air Force is often criticized for our efforts in this area, particularly as it relates to the identification of noise related technology needs. It is inappropriate to assume the mere identification of a new research need is an admonition that current technology and modeling procedures are inadequate or inaccurate. The Air Force's continued involvement in the research arena, along with that of other Federal agencies and the scientific community, has brought the understanding of noise exposure, computer modeling and noise effects to its current the level of sophistication.

08255 08279 08303 08331 09012 09013 In light of this ongoing process, we will continue to submit research needs to the USAF Office of Environment, Safety and Occupational Health (ESOH) Technical Planning Integrated Product Team (TPIPT) at Brooks AFB which serves as the central repository for research ideas and needs. ACC and other major commands utilize the Technology Needs Survey program to compile, rank and prioritize the Air Force research needs in order to compete for limited research funding. Additional information on this program can be accessed on the internet at: http://xre22.brooks.af.mil/98 99TNS/TNSintro.htm.

09018 This program, along with locally funded research, helps the Air Force continue to improve our
09020 methodologies and analyze potential impacts in compliance with the National Environmental Policy Act (NEPA).

In accordance with NEPA, each time an action involving military aircraft is proposed, whether it be a realignment or establishment of an aircraft squadron, creation or modification of airspace or a change in the way aircraft operate and utilize training areas, an environmental analysis is accomplished to determine the potential impacts. The noise analysis is a very important part of the overall analysis. The objective of the noise analysis is to present what the current or baseline noise environment is today and to estimate what the change would result if one of the proposed alternatives were selected and implemented. The RBTI EIS noise analysis was prepared with the computer program, MR_NMAP (MOA Range NOISEMAP, 1994), which represents the best available technology for modeling military aircraft training operations. MR_NMAP calculates noise levels under Military Operations Areas (MOAs), Military Training Routes (MTRs) and on air-to-ground ranges. The RBTI proposal only involves a MOAs and MTRs, so a range analysis is not included.

To account for all military activity currently occurring in the affected airspace, each sortie operation in the existing parcels of airspace, including those beginning in the near future, were included in the baseline. In addition, sortie-operations on coincident routes that overlay the primary route and sortie-operations at locations where other routes cross or intersect the primary RBTI route were included. The coincident or intersecting airspace, identified as secondary airspace in the EIS, is important to the overall noise environment. By including each sortie-operation occurring in the affected primary or secondary airspace, all of the contributing noise or the noise "dose" was accounted for. The process was then repeated for each alternative to include the proposed sortie-operations from the various alternatives of RBTI. The results provided not only the new noise levels in the affected airspace, but also provided the change or "delta" to the baseline noise level or how much the noise increased or decreased.

The noise levels in the RBTI EIS are A-weighted which approximates the hearing of the average human ear. Individuals interested in the what the noise exposure may be from a single flyover event should refer to both the maximum noise level (L_{max}), the highest sound level occurring during a single aircraft flyover, and the sound exposure level (SEL) which combines the maximum level of a single event with its duration based on distance. To present the cumulative noise exposure or to account for all the aircraft activity occurring in an area, the Day-Night Average Sound Level or DNL is used. DNL (also known as L_{dnmr}) has been proven applicable to infrequent events and to rural populations exposed to sporadic military aircraft noise. Contrary to the myth that this metric dilutes or diminishes the noise over a 24-hour period, the DNL in fact accounts for all the relevant factors associated with aircraft operations. It accounts for the total number of events occurring, the duration of the events and the maximum noise levels associated with the events.

In addition, the DNL metric includes penalties for operations occurring after 10:00 PM and before 7:00 AM (to account for the added intrusiveness of nighttime operations) and a penalty of up to 11 dB for the startle or "surprise" effect from the rapid onset of aircraft noise (resulting in an onset-rate adjusted DNL, also know as L_{dnmr}). Therefore, the total "noise dose", including penalties, was calculated for each piece of affected airspace. DNL is the principal metric for describing long-term noise exposure of military aircraft and is sanctioned by the Federal Interagency Committee on Noise (FICON). During the most recent federal review of noise methodologies agencies including EPA, Department of Transportation (with FAA participation), Department of Defense (represented by the Air Force, Army and Navy), HUD, the Department of Veteran Affairs, the Department of Justice, the Council on Environmental Quality and the Council on Historic Preservation, concluded in its final report, "[t]here are no new descriptors or metrics of sufficient scientific standing to substitute for the present DNL cumulative noise exposure metric" (FICON 1992). Collectively, the three metrics used in the RBTI EIS provide adequate analysis of both the existing environment as it occurs today and the future noise environment should one of the action alternatives be implemented.

FICON. 1992. Federal Agency Review of Selected Airport Noise Analysis Issues. Federal Interagency Committee on Noise. August.

Throughout the areas potentially affected by RBTI, many commentors raised concerns regarding conflicts between civil aviation and the proposed increase in flight activity by the B-52s and B-1s. These concerns ranged from inhibiting civil aviation conducting commercial and agency management activities to a belief that air traffic safety would degrade to the perception that civil aviation pilots would lose the freedom with which they currently operate. Civil aviation activities that have been noted in the areas potentially affected by RBTI include: weather modification (cloud seeding), pest (e.g., boll weevils) eradication, crop spraying, range distribution and water assessments for livestock, emergency medical flights, pipeline surveillance, predator control, wildlife management, drug smuggling interdiction, and pleasure flights.

As described in the EIS (Section 4.1), the FAA manages the entire national airspace system for the collective benefit of all users, general, commercial, military, and other agencies. To accomplish this goal, the FAA has established rules, regulations, and procedures designed to promote safe and effective operations by all types of aircraft. These rules, regulations, and procedures help promote awareness of all pilots' operations and, thereby, promote safety.

One primary way the FAA promotes the beneficial use of the national airspace system for all types of users is by defining different types of airspace for different purposes. The FAA also dictates how aircraft must operate and interact within these different types. Under the RBTI alternatives, two types of military training airspace, MTRs and MOAs, are the focus. As detailed in Section 4.1.1 of the EIS, MTRs and MOAs are designated by the FAA for military aircraft training activities. But this airspace is not exclusive to the military. FAA procedures allow for other aircraft (civilian and non-participating military) to transit in MTRs and MOAs. There is a broad misperception that MOAs and MTRs function like restricted airspace and non-military pilots must fly around these airspace units. No pilot is prevented from flying in an MTR or MOA as long as they follow the rules applicable to the particular situation (i.e., VFR or IFR). This applies to the full range of general and agency aviation activities occurring in the area affected by RBTI.

FAA procedures provide for non-military users to fly safely through MTR and MOA airspace. This is accomplished in three ways. First, scheduling serves as a means to help avoid conflicts between military users of the airspace and others needing to fly through it. As presented in Section 4.1.1 of the EIS, the FAA requires the responsible military organization to publish the hours of operations for each MTR and MOA; these publications are available to anyone and updated every two months. The FAA's Aeronautical Information Manual urges pilots planning to fly in or near a MTR or MOA to consult these publications. The Air Force recognizes that civil aviation pilots do not believe this is a convenient or effective means to get current information on when and where military aircraft would be operating in an MTR or MOA. For that reason, the Air Force proposes to set-up an 800 telephone number that would provide the planned weekly schedule of use for the MTR and MOA used under RBTI (see Mitigations, Section 2.6.2).

Second, FAA procedures for planning to fly in an MTR or MOA provide means to avoid conflicts between civil and military aviation. Military aircrews, in planning training flights, identify airfields under and near an MTR and MOA. By applying FAA order 7610.4, the aircrews then avoid charted and uncontrolled airfields by 3 NM laterally and 1,500 feet vertically. For civil aviation pilots planning to fly through an MTR or MOA, the Aeronautical Information Manual recommends they contact the nearest flight service station for detailed information on the use of military training airspace at that time.

Third, the FAA prescribes procedures during flights to avoid conflicts between aircraft. VFR flights by non-participating aircraft through an MTR or MOA must employ see and avoid techniques. This means that VFR conditions must apply and all pilots, whether civilian or military, must use extreme vigilance to look for and avoid other aircraft. Many commentors expressed a lack of faith that see and avoid techniques would suffice to prevent potential

conflicts between fast moving, large military bombers and small, slower civilian aircraft. However, this technique has been used successfully and safely throughout the country where civil and military aviation interact. Military aircrews flying IFR consistently communicate with air traffic control to ensure avoidance of other aircraft. Similarly, civil aviation pilots flying IFR need to communicate with air traffic control; they must also receive air traffic control clearance to enter and active MOA. Aircraft responding to emergencies, like rescue or medical flights, are given priority by air traffic control.

Broad Issue: Overflight Effects on Livestock (BR-3)

Letter #			Response
00017	00642	00984	Analysis on the effects of noise on livestock have been modified in section 4.3.3 and Appendix G in the EIS. It is possible that aircraft flying below 2,000 feet could startle domestic animals. However, animals have been shown through numerous studies to adapt and habituate to various sound sources, including jet aircraft noise. Under some circumstances aircraft flying at low altitudes may result in incidental livestock startle that could lead to injury if these animals are confined or have not been exposed to aircraft overflights. Overflights could stress cattle, although it is a small portion of the aspects that contribute to the overall stress to cattle and horses. Livestock stress is more likely to occur because of extremes in weather, illness, or predators. A 1956 study found that the reactions of dairy and beef cattle to noise from low-altitude, subsonic aircraft were similar to those caused by flying paper, strange persons, other moving objects (USAF 1993), or even to the sound of a tractor engine (97 dB) (Gladwin *et al*. 1988). Overall, the U.S. Forest Service has concluded (USFS 1992) that "evidence both from field studies of wild ungulates and laboratory studies of domestic stock indicate that the risks of damage are small [from aircraft approaches of 50 to 100 meters], as animals take care not to damage themselves. If animals are simply overflown by aircraft at altitudes of 50 to 100 meters, there is no evidence that mothers and young are separated, that animals collide with obstructions (unless confined) or that they traverse dangerous ground at too high a rate." A study in 1972 by Frazier observed that bison "appeared oblivious" to the aircraft noise and continued grazing throughout all aircraft passes (Gladwin *et al*. 1988). Bowles (1995) cites Kruger and Erath as observing pregnant mares (horses) exhibiting intensive flight reactions, random movements, and biting/kicking behavior. However, no injuries or abortions occurred, and there was evidence that the mares adapted somewhat to the flyovers over a month's time (USAF 1993). Espmark *et al*. (1974) also reported that stock occasionally jumped backwards when startled, but that they ceased responding within a few days. The potential effects of low-altitude flights on horses and cattle could result in short-term behavioral changes, ranging from simply looking at the aircraft or vocalizing to scattering over short distances (up to about 50 yards) and jumping. These reactions may occasionally result in damage to fences or injury to animals. If damage or injury occurs, citizens may lodge a complaint with the Public Affairs Office at Dyess Air Force Base at (800) 699-5169. The Air Force also had established procedures to handle claims, see Broad Issue: Overflight Effects on the Economy and Land Use (BR-4). No evidence was found to justify claims associated with the direct loss of productivity (feed intake, weight, or growth rates) or loss of marketability from overflights, since overflights are sporadic. No effects due to startling would occur under the MOA, where military flights associated with RBTI would occur above 3,000 feet AGL.

Broad Issue: Overflight Effects on the Economy and Land Use (BR-4)

Letter #			Response
00012	00441	01030	The public hearings raised the concern that military overflights would affect the economies of underlying communities. Many commentors mentioned that noise would negatively affect the economic viability of ranching, hunting, tourist-related, and retirement-related businesses, as well as property values. The issue of noise impacts on various economic resources such as those mentioned above is not new to the Air Force. Studies have been conducted in areas of special use airspace (training airspace away from an installation) to examine the influence of noise. An extensive economic impact study was performed by the Air Force in the early 1980s in association with establishment of the Valentine and Morenci Military (USAF 1980) Operations Areas (MOAs). These MOAs (or certain portions) were proposed for the purpose of conducting supersonic operations, in addition to subsonic training activity. (*Note*: RBTI does not include supersonic operations.) The Valentine MOA is located above portions of Jeff Davis, Culberson, Hudspeth, and Presidio counties in the Trans Pecos region of southwest Texas and the Morenci MOA lies above southwestern Arizona and the southeastern portion of New Mexico (the supersonic area lies entirely within Catron County, New Mexico, and later became Reserve MOA). An analysis of the economic conditions was performed for the two proposed MOAs, as well as for four other existing MOAs authorized for supersonic operations, with focus on the following areas: population, assessed property valuations, real estate development, employment, personal income, retail trade, tourism, ranching, farming, mining, and forestry. Public concerns related to this action were very similar to those expressed by the public during the comment period for RBTI. The Valentine and Morenci (USAF 1980) analysis results showed general net gains in economic health both before and after initiation of the sonic boom activity (and hence, the increased subsonic activity). Overall, there is no evidence to suggest military aircraft training, with or without supersonic operations, significantly or adversely affects the economic health of an area with respect to ranching, tourism, and recreation (including hunting), property value, development potential, or enjoyment of the land. ***Ranching***. As discussed in Section 4.3 (Biological Resources) and Appendix G (Noise) of the EIS, studies have shown that there is no evidence that military overflights increase death rates, reduce productivity rates, or otherwise have long-term negative effects on domestic animal and wildlife populations. Individual animals, especially those unaccustomed to the aircraft noise, or those that may be under stressful situations (i.e., being worked by cowboys or bad weather conditions) may startle when surprised by a low-altitude flying aircraft. However, studies have shown that populations habituate to these overflights and display no long-term, negative effects. In fact, there has been free-ranging livestock grazing at Air Force ranges like Avon Park Range in Florida, Melrose Training Range in New Mexico, and Saylor Creek Range in Idaho for over 30 years. These livestock (cattle and sheep) have been overflown by the full range of fighter and bomber aircraft in the Air Force inventory at altitudes as low as 100 feet AGL and have not shown any negative impacts, nor have ranchers experienced decreases in their operations due to these low-altitude overflights. Please refer to Broad Issue Response 3, *Overflight Effects on Livestock* for further discussion. ***Hunting***. Section 4.2 (Land Management and Use) of the EIS has been modified to include discussion of hunting leases in Texas. While individual game animals may be startled by aircraft noise, especially those unaccustomed to the overflights, the data suggest that populations of animals would not be significantly affected.

The behavior of game animals would not be expected to change such that hunting would be affected (personal communication, Rollins and Trail 1990). Also see Section 4.3, Biological Resources.

As discussed in Section 4.1 (Airspace and Aircraft Operations), general patterns concerning the perception and effect of aircraft noise on people have been identified, but attitudes of individual people toward noise is subjective and depends on their situation when exposed to noise. Also, as discussed in Section 4.2 (Land Management and Use), the likelihood of any one location being repeatedly overflown is low. The dispersed military overflights would not be expected to negatively affect hunting in the overflown areas such that the value of land leased for hunting would be significantly affected. While individual hunters may be startled and annoyed by intermittent aircraft overflights, there is little to suggest that hunters as a group would modify or cease their hunting activities as a result of the proposed alternatives.

For example, a MOA and several MTRs overfly Sutton County. Laughlin MOA had over 9,500 sortie-operations in 1997 and over 4,000 sortie-operations in 1998. The MTR s include portions of IR-123, VR-143, and SR-282 and account for 1,002 sortie operations in 1997 and 2,226 sortie-operations in 1998. The MOA and MTRs overlie most of Sutton County; a county that has historically received revenues from hunting leases (Ward 1985). Hunting, therefore, has existed at the same time as thousands of sortie-operations have occurred and these operations have not frightened wildlife away, nor dissuaded hunters from visiting the area.

Tourism and Recreation. Studies of areas where military aircraft training occurs have not shown a decrease in tourism or recreational opportunities due to the occurrence of military overflights. This applies not only to areas where subsonic flights occur, as proposed with RBTI, but also in areas where supersonic operations occur as well. In addition to the Air Force study discussed above, the U.S. Forest Service and National Park Service prepared Reports to Congress pursuant to Public Law 100-91, the *National Parks Overflights Act of 1987.* As discussed in the EIS Section 4.2, research supporting these reports found that wilderness area visitors did not generally notice aircraft noise intrusions. However, if noticed, low-altitude, high-speed aircraft were reported as the most annoying types of aircraft to hear or see due to the startle effect. In general, noise from aircraft can affect the solitude expected by recreationists in wilderness areas and can cause both humans and animals to startle.

There are a number of factors other than aircraft operations that may affect tourism and the use of recreational areas. These could include weather, proximity to other attractions in the area, lack of snow, airport access, and service amenities. While it is possible that a tourist visiting an area may find an aircraft overflight to be annoying, no significant change to the tourist industry would be expected. In addition, the sorties proposed for RBTI (10 or less per weekday) would not result in a continuous noise source and would not typically be scheduled on weekends. The majority of RBTI airspace has existed for many years and the relevant influences from military aircraft operations are not significantly changing in a majority of the study area.

Property Values. As discussed in Section 4.4 of the EIS, studies have been conducted to assess the change in property values near airports with increasing noise levels. However, these studies (such as the Noise Depreciation Sensitivity Index, NDIC) are specific to the near-airport environment, and are not applicable to the dispersed, higher altitude, episodic noise experienced under an MTR or MOA. In general, there is little evidence to support the estimation of loss in property values due to low-level military overflights in an MTR or MOA. Again, other variables such as drought, market prices, community amenities, and proximity to urban areas are more likely to affect property values than military overflights. Please also refer to response AO-56.

00421 01026
00423

Conclusion. As discussed in Section 4.1 of the EIS, annoyance, which is based on perception, is the primary effect associated with aircraft noise. Given the subjectivity of how noise is experienced, it is difficult to translate overflight-noise-generated annoyance into changes in human behavior, especially for noise events that do not equally or consistently affect groups of people. As discussed in Section 4.2, the likelihood of any one location or person being directly and repeatedly overflown is low. Certain commentors have stated they may become highly annoyed and decide to stop visiting a certain hunting location or tourist attraction, or change their minds about purchasing property because of military overflights. However, other less-annoyed people may not change their behavior and still return to hunting locations, visit a tourist attraction, or buy a home. Military aircraft overflights occur across the United States and overfly public and private lands, including recreational areas. There is little data to suggest these overflights have significantly affected the economies of these underlying communities (Fidell *et al.* 1996 and USAF 1980).

The Air Force has specific procedures that they follow when claims for damages are made against the Air Force. Real property and economic losses are determined by reviewing the circumstances of each individual case and cannot be generalized into an overall impact. Noise and other aircraft operational complaints can be reported by the public by calling the Public Affairs Office at Dyess AFB (800-699-5169). When reporting an incident, the time and place of the incident should be provided. In many cases this information is all that would be necessary to identify the source of the incident. Information such as type of aircraft, tail-numbers, and insignia are often helpful in identifying the cause of a specific incident, but are not necessarily essential.

Airspace Ownership. Several commentors on the draft RBTI EIS stated that airspace over their private lands was part of their private property. The commentors stated that as private property, any flights crossing through that airspace would be "trespassing," and the landowner should be compensated for that use. Law and regulation, however, demonstrate the federal government's control of all airspace within the United States. According to 49 U.S. Code 49.40103(a), the United States Government has exclusive sovereignty of the airspace of the United States. This sovereignty supersedes all prior claims through mechanisms like Spanish Land Grants.

Federal government sovereignty over all airspace began with the Air Commerce Act of 1926 and the Civil Aeronautics Act of 1938. The Federal Aviation Administration (FAA) originated with the Federal Aviation Act of 1958. This law gave the FAA the authority and responsibility to control airspace in the United States and to operate an air traffic control system. In 1994, this act was replaced without substantive change by Public Law 103-272 and further codified under Title 49, U.S. Code.

Under FAA Regulation Part 71.71(a), the airspace of the U.S. extends from ground level to above 60,000 feet MSL. No upper limit to the extent of the airspace above 60,000 feet MSL has been established. The FAA has established different kinds of airspace for different uses like the MOAs and MTRs to those proposed for use under RBTI. The FAA also established rules and regulations for aircraft operating in the airspace in order to ensure safety and effective operations. For example, the FAA defines and operates airspace under certain circumstances to separate civil aviation from military training activities.

The FAA and each military service have very strict rules to ensure pilots stay within defined training airspace. The rules govern minimum altitudes, maximum speed, and type maneuvers that can be performed inside and outside designated training airspace. Military commanders have the authority to suspend pilots who willfully violate flight rules, such as flying outside designated training airspace. The military closely manages the airspace they use to ensure they do not exceed planned parameters.

In addition, the FAA sets rules about the altitude that any aircraft can fly over certain areas. As noted in Section 4.1 of the EIS, FAA rules direct aircraft to avoid congested areas of a city, town, settlement, or open-air assembly by 1,000 feet above the highest obstacle and within a horizontal radius of 2,000 feet of the aircraft. Outside of congested areas, aircraft must avoid visible people, vessels, vehicles, and structures by 500 feet (either horizontally or vertically) (FAA Sec. 91.119(b)). Even though the FAA imposes such restrictions, it does not mean that private citizens "own" the airspace within 500 feet of their house or barn. Rather, the federal government has sovereignty over the airspace and controls its use through the FAA. The imposition of such restrictions by the FAA does not grant private citizens "ownership" of airspace outside of those restricted areas, nor do such restrictions limit federal sovereignty of airspace.

Compensation. Commentors during the public comment period also raised issues concerning compensation for the effects of overflights on underlying private property. These ranged from concerns about property damage to potential impacts to livestock to the concept that property could lose value. Additionally, commentors asked whether the Air Force could pay compensation for the "nuisance of noise." The Air Force can only make payments to members of the public if authorized to do so by law, such as the Federal Tort Claims Act (FTCA). The Air Force considers each damage claim on a case by case basis. Air Force regulations provide an established process through which damage claims can be submitted, investigated, and resolved.

The impact of noise on private property may also be addressed under "takings" law. The seminal case in this area is the Supreme Court *United States v. Causby* case. Briefly, *Causby* established that landowners are entitled to compensation only when overflights are so low and so frequent as to directly and immediately interfere with the use and enjoyment of the land. Subsequent cases have elaborated on this concept so that today, the general rule is that a successful plaintiff must prove: 1) the flights take place directly over plaintiff's property, *and* 2) the overflights are of such a frequency that, 3) plaintiff's use and enjoyment of the land is substantially interfered with, *and* 4) the flights are below navigable airspace (500 feet AGL for uncongested areas and 1,000 feet AGL for congested areas). Our review of the RBTI airspace indicates that flight paths would not impact landowners to this degree.

Broad Issue: Effects on Philmont Scout Ranch (BR-6)

Letter #				Response
00007	00520	00685	00939	Many people, including past and present Boy Scouts, have raised concerns regarding the potential effects of proposed overflights on Philmont Scout Ranch that could occur if RBTI Alternative D were chosen. All of these individuals have expressed their pride in the experience they or members of their family gained when they attended the Ranch or the opportunities future generations would attain when they visit the Philmont Scout Ranch in northeastern New Mexico. ***Safety***. Flight safety is of paramount importance to the Air Force. Safe flying procedures, adherence to flight rules, and knowledge of emergency procedures form consistent and repeated aspects of training for all aircrews, including those at Barksdale and Dyess AFBs. B-52s have one of the best safety records of all aircraft in the Air Force inventory and the B-1s have an excellent safety record as well. B-52s have had 97 Class A mishaps in over 44 years of operation (1955-1999) and over 2 billion flight miles. The B-1 has also flown for 15 years (1984-1999), more than 160 million miles, and has had 11 Class A mishaps. Given these excellent safety records, the probability of future accidents is extremely low. ***Noise***. In Section 4.1.5, Aircraft Noise, the EIS describes the noise resulting from aircraft overflights in Alternative D. While military aircraft have overflown the area for years, noise levels would increase from less than 45 DNL to between 59 and 62 DNL. Over the Philmont area, flight altitudes would range from 400 feet AGL to over 12,000 feet AGL. But, in accordance with FAA regulations, aircraft flying over the ranch headquarters and main camp area would avoid it by 500 feet vertically or laterally. The MTR corridor over the Philmont area would be 8 to 15 nm wide, and flights would be dispersed across this area. The likelihood of one spot being repeatedly overflown on a daily basis would be very low. Staff teaching and student learning should not be impacted by overflights if RBTI Alternative D were chosen. ***Flight Activities***. When flying, aircrews are required by the FAA and Air Force rules to stay within established route boundaries and not fly above any open-air assembly of people or congested areas. These rules are established to protect the public. As they do now, the B-1 and B-52 aircrew members would continue to follow these procedures when overflying the Philmont Scout Ranch structures if Alternative D were chosen. ***Aerial Refueling and Fuel Jettison***. Under the RBTI proposal, aerial refueling would take place using established procedures and aerial refueling routes (only above 10,000 feet AGL) and would not occur on the proposed MTR. When refueling, the aircrews would normally practice the maneuvers and exchange enough fuel to simulate actual aerial refueling procedures. Any amount of fuel that might escape during these training procedures would evaporate before reaching ground level. In addition, if an emergency were to occur at low altitudes, B-52s are unable to eject fuel and the B-1s are required to climb to 10,000 feet AGL (enough height to ensure that jet fuel evaporates before it reaches the ground) before jettisoning any fuel. Therefore, the potential of increasing the probability of catastrophic fires or campfires escaping their boundaries due to aerial refueling procedures are minimal. However, the Air Force recognizes that accidents could happen and established emergency procedures would be followed if any aircraft were to crash.

Population Numbers and Recreation. The EIS has been modified to recognize the visitors Philmont Scout Ranch receives during the summer season. Section 4.2.5 narrative, discusses the importance of camping, hiking, and other outdoor activities to the area during the Spring to Fall seasons.

Land Use. In the EIS, Figure 4.2-7 depicts general land use of areas overflown under proposed Alternative D, therefore, some of Philmont Scout Ranch may appear as rangeland. This figure is not meant to show terrain elevation, however, Figure 4.3-6 provides information on vegetation found under the proposed airspace and includes montane forests and grasslands. Further, Figure 4.2-8 illustrates the special use areas, including Philmont Scout Ranch. This figure has been modified to clarify the Philmont Scout Ranch location and include the Carson National Forest Valle Vidal Unit.

Threatened, Endangered, and Sensitive Species. These species potentially found under Alternative D, and in particular the whooping crane, bald eagle, mountain plover, and Mexican spotted owl, were analyzed in the EIS in Sections 4.3.1 and 4.3.5.

Livestock. Please refer to BR-3, Overflight Effects on Livestock. In general, a broad range of studies have found that livestock, including horses, may or may not react to noise from low altitude overflights of aircraft.

Philmont Historic Structures. In Section 4.5, the National Historic Register was consulted and sites officially reported on this list were included in the EIS according to type of resource, i.e., no specific names of the structures were reported. Table 4.5-10 lists the sites found under Alternative D. None of the districts or structures was specifically named. The final EIS has been modified to include all National Historic-listed sites.

Mines. Both active and abandoned mines should not be structurally impacted by overflights proposed under Alternative D. Refer to Section 4.5 for further discussion of vibration effects.

Broad Issue: Quality of Life (BR-7)

Letter #	Response Text
00027 00039 00055 00062 00123 00153 00195 00293 00321 00327 00328 00337 00352 00383 00392 00397 00400 00403 00414 00418 00421 00426 00612 00634 00730 00763 01118 01130 08011 08025 08032 08033 08047 08125 08154 08161 08176 08184 08185 08191 08205 08244 08250 08251 08256 08266 08272 08280 08294 08295 08296 08297 08304 08305 08309 08330 08336 08356 09008 09020	Many citizens at both the public scoping meetings and the public hearings have expressed concern that their quality of life, which is based directly on the kind of lifestyle that they can enjoy in western Texas and northeastern New Mexico, will be changed by implementation of RBTI. Quality of life, traditional lifestyles, and the effect of overflights and noise on solitude, recreation, and wilderness are discussed in the EIS in Sections 3.3 and 4.2. Measuring quality of life can be very subjective. Even within a single community, notions on quality of life can vary a great deal. Each individual has a different perspective on how his or her quality of life has been affected by changes within the community. Some of the components that define quality of life include: population density, traffic, ethnic or social character, businesses, recreation, education, and crime level. The ability to maintain their traditional lifestyle may also be an important element in determining quality of life. There are many kinds of traditional lifestyles in the region, including ranching, oil exploration, Native American, and military. The Air Force has been conducting military aircraft operations in this region for over 50 years. Citizens may notice changes in military overflights in certain areas associated with RBTI, in other areas however, changes would not be discernible. The number of sorties is proposed to increase from 1 to 10 per weekday in some areas and decrease in others. An increase of overall sorties would not exceed 2,660 per year under the action alternatives. Less than 5 percent of the time, RBTI aircraft overflights could extend as low as 300 feet AGL in the MTRs in some areas, but in the MOA would not go below 3,000 feet AGL. With an average corridor width of 8 to 16 nautical miles, the likelihood of repeated overflights above a specific area is low. Many other factors, including fluctuations in the national and regional economy, population changes, land investment by urban interests, and changes in cultural amenities could affect the quality of life. External economic fluctuations in the cattle market, decreases in income, or changes in weather could affect local ranching and recreation industries to a greater degree than aircraft overflights. As under current conditions, noise from military aircraft operations may periodically disturb citizens and affect their enjoyment of solitude; however, opportunities for abundant periods of peace and quiet would continue as under present conditions. Rural lifestyle could be characterized as having shared traditions and values, emphasis on personal relationships, family orientation, and ties to the land. Increase in overflights and noise would not affect these characteristics. Additional military use of the airspace would not preclude civil use of the area or restrict access to areas for recreational or economic activities. In fact, these activities have coexisted in the area for half of this century. Most of the military airspace proposed under any of the alternatives is currently in use. Commercial aircraft overflights have also been taking place and will continue to do so. Therefore, existing quality of life should not be degraded. Nevertheless, public concern about reductions in quality of life due to the project will be considered in the decision-making process.

Thank You (TY)

Letter #							Response
00002	00126	00268	00571	00892	08004	08252	Thank you for your comment during the public comment period for the draft EIS for RBTI. Public and agency involvement is an important part of the NEPA process. You and many others can be proud that your participation and comments have become part of the record and will contribute to the decision-making process.

General (GE)

Letter #	Response #	Response
00019 01130 00983	GE-1	Under NEPA and CEQ Guidelines, a fiscal cost-benefit analysis for training or training assets is not required.
00046 08146 00954 08156 01131 08289 08013 08290 08041	GE-2	Selecting locations for public hearings was based on the affected area, where scoping meetings had occurred, and on providing sites offering reasonable access to the greatest number of people. Meetings were scheduled for evenings in many locations to accommodate people working during the day. The Air Force conducted 15 hearings in 11 locations throughout west Texas, northern New Mexico, Colorado, and Arkansas. See also response GE-22.
00080 08177 00194 08201 00232 08217 00296 08246 00447 08276 00871 08321 01130 08338 08126 08348 08168	GE-3	Through the NEPA process, the public has numerous opportunities to help shape proposals and influence decision-making for a project. While public comments under NEPA are not a "vote" on whether to proceed or not with a proposed action, substantive comments on this EIS can and do influence the decision and final outcome.
00080	GE-4	The Air Force has solicited input on the RBTI proposal since 1997 through a public involvement process detailed in Chapter 6 of the EIS.
00085	GE-5	Each public hearing included an open house where Air Force representatives were available to answer questions.
00085 08113 00976 08231 08105	GE-6	The time limit placed on comments was designed to ensure that all people who wished to speak had that opportunity. At every public hearing, the hearing officer permitted those individuals with additional or longer comments to speak again.
00110 08355	GE-7	The analysis is performed objectively, fairly, and in accordance with NEPA requirements. Proponent agencies are responsible for preparing NEPA analysis for their proposed actions. Agencies commonly seek specialized technical support in performing analyses and preparing NEPA documentation.
00245 08168	GE-8	Completion of the environmental impact analysis process involving an EIS commonly requires two or more years. In addition to the necessary analysis, consultation with agencies, and writing, this process includes several steps required by regulation and law. Each of these steps has a specified duration.
00246	GE-9	Analysis in the EIS considered the principles of biodiversity.
00283 01129 00970 08299	GE-10	This EIS has been prepared in accordance with NEPA to analyze potential environmental consequences. Detailed analyses of potential impacts are presented in Chapters 4.0 and 5.0 of the EIS. Section 2.5.4 demonstrates the conformance of the analysis to NEPA requirements.
00296 08206 00970 08254	GE-11	The Air Force reviewed each comment. Responses to comments are presented in this volume of the EIS. No decision regarding RBTI will be made until after publication of the EIS. The decisionmaker will use all the analysis in the EIS plus public and agency comments to arrive at a decision.
00334	GE-12	Federal, state, and local government officials in the affected communities were all sent newsletters announcing the time and location of public hearings.
00387 09009	GE-13	The suggestion you made will be forwarded to the decisionmaker for consideration.
09013	GE-14	The table is merely a qualitative summary intended to provide the reader with a basic understanding of the difference magnitude of impacts among the alternatives. Table 2.6-1 in the body of the EIS provides a detailed comparison of impacts.
09013	GE-15	The Air Force analyzed and considered the effects of the RBTI proposal on these resources. The Air Force believes the summary presented in the EIS is adequate to understand the lack of effects.

09013	GE-16	Appendix A is referenced in this section on page 2-5 of the draft EIS.
09013	GE-17	Analysis of all primary and secondary airspace under Alternative A is included in the referenced section. For example, Table 4.1-4 includes noise levels for all these airspace units and the preceding text describes these conditions.
09015	GE-18	Cumulative impact analyses were prepared in accordance with NEPA and CEQ guidelines. The inclusion of current and recent past activities in Alternative A (No Action) allows analysis of the cumulative effects.
08170 09020	GE-19	The Air Force attended those meetings at the invitation of Senator Bingaman. The format and recording of comments were established by the Senator's office, not by the Air Force. The Air Force did, however, have four representatives present. Comments from those meeting were considered in preparing the RBTI EIS.
09020	GE-20	The variety of Air Force activities in the region and throughout the nation are not part of a single program or policy initiative regarding training and airspace use. Separate analyses of these various activities will adequately address their combined cumulative effects. Consequently, a programmatic EIS is not needed.
09020	GE-21	The settlement in the referenced lawsuit includes no requirement to preclude assessment of Alternatives B and C.
00046 08041 00288 08082 00334 08093 00635 08103 00786 08127 00846 08146 00881 08206 00899 08215 00962 08381 00970 09014 00982 09021 01100	GE-22	The Air Force performed a comprehensive public involvement process. Chapter 6 of the EIS details this process. Advertisements for the meetings were run in local newspapers 1 to 2 weeks prior to the meetings. Over fifty newspapers in the affected areas were also sent press releases detailing the time and location of each meeting. In addition, over 900 newsletters were sent out to individuals that participated in scoping. These newsletters described the time and location for each meeting. In addition, over 900 copies of the draft EIS were sent to the public and agencies.
00486 00962 00970	GE-23	Two meetings were held at Alpine, Texas on two consecutive days. The location and starting time for each meeting was advertised well in advance (see response GE-22). At the referenced meeting, all attendees were given multiple opportunities to comment for the record. The meeting was adjourned only after no one wished to speak further.
00713 00786 00806 00846 00906 00971 00977 01131 08050	GE-24	Descriptions of the field surveys for biological resources, cultural resources, and hazardous waste for the candidate emitter and Electronic Scoring Sites are presented in Appendix E. Analysis in the EIS used the most recent, available data. Data were collected from federal, state, and local agencies and an extensive examination of available literature pertinent to the area was conducted. Pertinent studies were reviewed and used in the analysis irrespective of their implications for the project. Note the discussion of overflight effects on wildlife in Section 4.3 as an example. NEPA and CEQ Guidelines do not require original studies or research in preparation of an EIS.
00786	GE-25	The referenced officials originally told the Air Force that the cafeteria location would be adequate for the meeting. When informed later of potential limitations with the cafeteria, the Air Force acquired use of the auditorium.
00786 08041 08041 08127 08171 08278	GE-26	More than 900 copies of the draft EIS were mailed out at least two weeks in advance of the first public hearing in April 1999. Copies were express shipped to the repositories prior to that time. The repositories were located in the communities within the affected area and were ones that were reasonably accessible from other nearby communities. The Air Force also sent copies of the draft EIS to four additional repositories in the area under the proposed Lancer MOA. Those individuals receiving a draft EIS either requested one or were participants in the scoping process.
00786 01130	GE-27	This comment is inaccurate. Air Force officials informed every landowner that the sites were being evaluated as part of the RBTI proposal. The right-of-entry

		was granted by each landowner to allow survey of their land included this information. In addition, each landowner was contacted by telephone and several met with Air Force representatives.
00868 01131	GE-28	It is neither a CEQ requirement nor the standard practice of federal agencies in New Mexico to publish EISs in Spanish. Based on the extensive public participation and comments, the Air Force believes that a broad cross-section of the public had access to the EIS and expressed their concerns. The Air Force provided a Spanish-speaking representative at each public hearing.
00962 08085 00983	GE-29	Any future proposals to change the nature or amount of use of the airspace would require assessment in accordance with NEPA.
00970 08231 00976 08258 08113 08277 08124 08364 08211	GE-30	The purpose of a public hearing under NEPA is to provide the opportunity for the public to comment on the adequacy of the draft EIS. The format of the RBTI public hearings fulfilled this requirement and the open house prior to the hearing allowed for discussion.
00983	GE-31	Proposed IR-153 would be scheduled by Dyess AFB and Cannon AFB would continue to schedule the Mt. Dora MOA.
00983 08026	GE-32	All projected airspace users are documented in Section 2.4 and Appendix B.
01001	GE-33	All project records would be available at Dyess AFB, Public Affairs Office.
01129	GE-34	Mitigation measures have been added into Section 2.6.2 of the EIS.
01131 08179 08206	GE-35	Detailed maps and Geographic Information Systems analysis were used in assessing impacts. The maps presented in the EIS reflect summaries of that information, and fulfill the requirements of NEPA to inform and disclose.
08177 08232	GE-36	A court reporter recorded (verbatim) all statements made at each public hearing. The transcripts are presented in Volume II of the EIS.
08190	GE-37	The counts used in the EIS were relatively accurate estimates. See also response GE-19.
08199	GE-38	The opinion of the FWS is presented in Section 4.3.1 of the EIS.
08263 08276 08319	GE-39	Under NEPA, the agency proposing the action also makes the decision concerning the action. The Secretary of the Air Force or a designated representative will make the final decision with substantial input from other members of the Air Force staff. A decision will be made only after reviewing all the environmental analysis, comments, and other pertinent factors (e.g., training requirements).
08289	GE-40	The public had several ways to provide comments: oral comments at public hearings, written comments submitted at public hearings, or written comments mailed to the Air Force. Information on how to submit comments was provided at each hearing, in newsletters, and in the Notice of Availability for the draft EIS.
08129	GE-41	The No Action Alternative is thoroughly described in Section 2.2 of the EIS.

Editorial (ED)

Letter #	Response #	Response
00324 00326 00326	ED-1	This has been modified in the EIS in section 4.2.5.
00906 08215 08139 08355 08180	ED-2	Valle Vidal Management Unit has been added to section 4.3.5.
08139	ED-3	Clayton Lake State Park was discussed in Table 4.2-12. The discussion of migratory birds and waterways was modified in section 4.3.5.
08170	ED-4	The Air Force conducted a number of informal meetings with communities, agencies, and public organizations for RBTI. Although not discussed directly in the document, the concerns expressed during these meetings were considered during the environmental impact analysis process.
08170 08178	ED-5	Figure 4.2-7 represents general land use information from the U.S. Geological Survey. The mountainous coniferous forest of the Philmont area is presented in Figure 4.3-6.
08170	ED-6	The effects of noise on structures are discussed in section 4.5.1.
08179	ED-7	The relationship of the proposed route under Alternative D to the boundaries of the town of Angel Fire is accurate based on the best available information at the time the DEIS was produced. The exact distance of the town to the proposed route is not discussed directly in the EIS.
08188 08282	ED-8	The letter has been included in Appendix H.
08215	ED-9	These sites are incorporated into the Special Use Land Management areas in Figure 4.2-8.
08237	ED-10	Given the vast region covered by the proposed airspace, every community was not identified by name in the EIS. However, the EIS has been modified to reflect the total number of people overflown under each proposed alternative.
08254	ED-11	The impact analysis process examines project effects on the environment, resources, land management and use, and on people. There is no requirement to analyze the effects on individual private property owners.

Purpose and Need, Description of the Proposed Action and Alternatives, and Cumulative Effects (PD) and (CE)

Letter #		Response #	Response
00001	00983	PD-1	Sections 1.2 through 1.4 of the EIS detail the need for RBTI, including the specific airspace and ground assets associated with the RBTI proposal. This section provides basis for the need for low-altitude training. It also demonstrates that refueling the bombers to access distant training assets would not resolve the deficiencies prompting the RBTI proposal.

00015	01129	PD-2	Section 2.1.3 of the EIS explains that basing the additional bombers at Dyess and Barksdale AFBs was a decision of Congress and the President through the Base Realignment and Closure process. Moving the aircraft to other locations would require a similar authorization or basing decisions outside of the scope of this analysis.
00019	08083		
00085	08254		
00291	08347		
00296	08355		
00019		PD-3	As described in the EIS, a MOA meeting the realism requirements for RBTI must overlie lands suitable for the placement of electronic emitters.
00018	00721	PD-4	Chapter 1.0 and Section 2.1 define the rationale and the process defining the alternatives. As this shows, the Air Force examined over 70 MTRs located within approximately 600 nm of Barksdale and Dyess AFBs as possible candidate alternatives. All locations outside the 600 nm radius from the bases were excluded from consideration. Those presented in the EIS are the only three candidates that wholly or partially meet the purpose and need. All others, as specified in Section 2.1, failed to meet one or more of the criteria for inclusion.

00052	08300	PD-5	The EIS addresses the use of simulators, and demonstrates that they can provide a small proportion of training, however, they lack the realism necessary to fulfill the purpose of RBTI.
00409	08307		
00579	08310		
00112		PD-6	Requirements for military readiness derive from the National Command Authority with the President as its leader.
00144	00770	PD-7	The alternative identification process focused on identifying existing MTRs and MOAs meeting the needs defined for RBTI. Out of the more than 70 MTRs evaluated, only 3 met the needs. They were selected as
00257	00814		
00267	00870		

00284 00336 00359 00370 00374 00404 00484 00587 00652 00654 00668 00715	00927 00928 01052 01055 08006 08017 08028 08037 08050 08061 08116 08144		alternatives irrespective of the underlying land ownership. The alternatives overlie a mixture of federal, state, and private lands. Alternatives B and C overlie more private lands than Alternative D; Alternative D overlies more federal lands.
00215 00217	00296 00760	PD-8	Section 2.1.3 describes why simulators alone would not provide adequate realism or training. See also response PD-5.
00321		PD-9	To meet the training requirements for all aircrews and ensure readiness for combat, training needs to occur throughout the year. Training tempo may vary season to season.
00334 08229		PD-10	Section 2.1 describes the size and location requirements for emitters and electronic scoring sites. A thorough evaluation of these requirements was performed before identifying locations and alternatives. Section 2.4.1 describes emitter operations.
00342		PD-11	Section 2.3.1 of the EIS indicates that flights would occur on weekends only occasionally.
00369 09012		PD-12	The RBTI alternatives were designed to provide training realism while also reducing the potential effects of the action. A first priority in identifying alternatives was a requirement to maximize the use of existing airspace. By using more than 75% existing airspace in each of the alternatives, the Air Force sought to reduce the potential to affect lands and resources not previously under military airspace.
00370		PD-13	As described in Sections 1 and 2 of the EIS, no requirement exists for variable terrain under a MOA.
00983		PD-14	Depending upon conditions, training requirements, and airspace type, aircrews could fly IFR or VFR. Night vision goggles would normally be used during night operations.
00983		PD-15	Aircrews would include those from Formal Training Units and those from operational units conducting Continuation Training.
00983 01020 01033		PD-16	Section 2.3.1 of the EIS describes the proposed hours of use for the MTR and MOA. The B-52s and B-1s would fly 80 to 85 percent of the time during the day.
00417 00792 08081 08268		PD-17	The alternative identification process focused on identifying existing MTRs and MOAs meeting the needs defined for RBTI. Out of the more than 70 MTRs evaluated, only 3 met the needs. Selection of these alternatives used operational criteria. No particular location was defined for the alternatives other than those meeting the operational needs as described in Section 2.1 of the EIS.
00191 00194 00291 00421	00486 00899 08254	PD-18	In the draft EIS, all alternatives were evaluated equally; none received preference over another. In the final EIS (Section 2.1.5 and Appendix K), the Air Force recommended a preferred and environmentally preferred alternative. However, no decision to select or not select a particular alternative has been made at this time. Such a selection will be presented in the Record of Decision.
00494		PD-19	The RBTI proposal is designed to provide realistic training on a daily basis. Such training includes both low and high altitude training activities. Aircrews could not achieve this level of training through temporary duty assignments at other bases.

00589 00944 08295	PD-20	As detailed in Chapter 1.0 and Section 2.1 of the EIS, the training needed by the B-52 and B-1 aircrews requires terrain following and terrain avoidance. MTR airspace used for such training must overlie lands offering terrain variability. Flying over the ocean or using simulators would not fulfill this need.
00727	PD-21	Both the federal budget and past decisions related to base closures or realignments are beyond the scope of this EIS.
00962	PD-22	The FAA, under its authority to manage airspace over the United States, has charted all existing MTRs. See also response PD-1.
00970	PD-23	The No Action Alternative, as presented in Section 2.3, includes only existing airspace and would support only baseline sortie-operations.
00983	PD-24	Section 2.4 details the proposed process for obtaining the land for emitter sites and Electronic Scoring Sites.
00995	PD-25	Section 2.1.3 of the EIS explains why increasing funding to provide more flight hours is not a reasonable alternative to the RBTI proposal.
01130	PD-26	Refueling for the B-52s and B-1s is a training activity that includes set-up along a refueling track, linking to the refueling aircraft, disengagement, and flight to the next training activity. Even if no fuel or a nominal amount of fuel is delivered, the training to accomplish the refueling is essential.
01130	PD-27	Should the Air Force propose to fly at lower altitudes in an MTR or MOA than those assessed in this EIS, the proposal would be environmentally assessed under NEPA. See also Response AF-2.
01130	PD-28	Average sortie duration is derived by dividing the number of required sorties for a unit into its total annual flying hours. As stated in Section 1.3.3, average sortie durations do not always correspond directly to the time needed to achieve realistic training. To achieve such training, the aircrews from Barksdale and Dyess AFBs would need to fly slightly longer durations. These durations are hours less than current flight times that include substantial low-value transit time.
01130	PD-29	Section 1.2.3 of the EIS clearly describes the relationship between a sortie and a sortie-operation. Total sortie-operations are presented for each alternative and used in all appropriate analyses.
01130	PD-30	Additional detail on emitter operations and safety is presented in Section 2.4 of the final EIS. See also Response AO-32.
01130	PD-31	Section 2.4.2 clearly states that all existing segments of IR-178 north of proposed segment ZAA would be eliminated. This includes the segments under the proposed Lancer MOA.
01130	PD-32	All secondary MTRs intersecting or overlapping with primary airspace were analyzed in all pertinent resource categories. No part of the RBTI proposal includes changing the use of VR-1116 or IR-154. For IR-128/180, the EIS indicates that sortie-operations would decrease under Alternatives B, C, and D.
00827 01130 08133	PD-33	The baseline sortie-operations legitimately include activities resulting from analyzed and approved actions affecting the same study area as RBTI. All of these sortie-operations were accounted for in the analysis. To eliminate these sortie-operations from baseline would also necessitate eliminating them from projected flight activities for Alternatives B, C, and D. Thus, the amount of change in noise levels (from baseline to proposed action) would remain the same as that reported in the EIS. NEPA requires analysis to focus on the affected area. Section 2.2 of the EIS clearly defines the affected area and describes the primary and secondary airspace units within that area. Sortie-operations for all the airspace units are analyzed under each alternative and the synergistic effect of the interaction of those units is analyzed. In this way, the EIS accounts for the airspace use in the affected area. No programmatic treatment of additional areas is required under NEPA or CEQ Guidelines.

08032	PD-34	Very little land would be involved in RBTI. Only about 200 acres would be affected, and the Air Force would compensate private landowners through lease or purchase payments. See also response BR-4.
08103 08176	PD-35	The EIS considers the cumulative effects of both primary and secondary airspace use within the study area. It also accounts for all users of the primary and secondary airspace. Sections 2.3 and 5.1.2 describes how past, present and baseline sortie-operations were incorporated into the analysis.
08177	PD-36	Accurate, scaled maps are provided throughout the EIS to provide the reader the ability to find specific towns or locations in relation to the alternatives. Angel Fire is approximately 5 nm distant from the nearest part of the proposed IR-153.
08202	PD-37	Operational considerations defined the need for the RBTI proposal and directed the alternative identification process. In that process, environmental considerations were used. The EIS is devoted to assessing the environmental impacts of the proposal.
08313 09020	PD-38	The Air Force is familiar with the noise sensitive areas in northeastern New Mexico. Locations of these areas are included on the operations supplements at Cannon AFB who manage the majority of the airspace where the sensitive sites occur. Should Alternative D be selected, the established flight restrictions and/or operating procedures would be incorporated into the RBTI operations.
01018 08229 01027 09008 01039	PD-39	As shown in the EIS (Figure 2.4-11), no portion of the proposed MTR (IR-153) in northern New Mexico would occur over the City of Taos. The proposed MTR would lie more than 30 miles away from the City of Taos and behind mountain ranges.
08113 09008	PD-40	The EIS states that the proposed flight activities would occur between 300 feet AGL and 15,000 feet. Flights could occur anywhere within that range of altitudes, but flights would be between 300 and 500 feet AGL for only 5% of the time. For an average training flight along the MTR, this 5% would represent roughly 2 to 3 minutes within the total flight time for the route. In the portions of the MTR in the region north and east of Taos, B-52 and B-1 flight levels would be no lower than 400 feet AGL.
01130 08037 09012	PD-41	Sections 1.2, 1.3, and 1.4 in the EIS describe in detail the requirements for the airspace to meet the training needs of the B-1s and B-52s. Section 2.1 details the application of those requirements to existing airspace in order to identify potential alternatives to meet the need. Over 70 MTRs were evaluated, including those associated with La Junta and Harrison. The EIS in Section 1.3 establishes that neither La Junta nor Harrison have the integrated assets required for the training and the areas lack required terrain variability. As such, even with airspace modifications, neither would fulfill the purpose and need for RBTI. These sections of the EIS also demonstrate why use of the Belle Fourche and Granite Peak assets would not fulfill the purpose of reducing low value transit time and increasing combat training time. Both of these sites lie well outside the 600 nm area in which frequent realistic training could occur.
08132 09012	PD-42	There is more than a single alternative. The EIS includes analysis of three action alternatives, with two in west Texas and one in northern New Mexico.
09012	PD-43	NEPA and CEQ guidelines require that a proponent of a major federal action present the decision-maker with reasonable alternatives. If reasonable, these may include alternatives not meeting the full need. Use of the Harrison and La Junta facilities and associated airspace would not even fulfill part of the need for RBTI. Furthermore, all of the proposed alternatives include continued training in airspace associated with La Junta, Harrison, Belle Fourche, and Granite Peak. As such, the existing alternatives incorporate the important aspects of the alternative concept suggested in the comment.

08067 09012	PD-44	Realism in training is important, as stated in the EIS Section 1.0. However, the requirements for realism must focus on the crucial combat activities rather than transit time that yields only low-value training. Under RBTI, aircrews would continue to fly a proportion of their training with longer distance sorties to locations like Belle Fourche and Granite Peak. As such, they would receive that portion of training requiring long-range missions.
08247 09013	PD-45	Defining reasonable alternatives was a focus of RBTI, as shown in the draft EIS in Section 2.1 and in Appendix A. As this information demonstrates, over 70 MTRs were examined for operational suitability. These included MTRs associated with the Smoky Hill Range, as well as those associated with the existing ESS's at La Junta and Harrison. The systematic and rigorous process used to identify RBTI alternatives (Section 2.1) demonstrated that none of the suggested potential alternatives met the purpose and need.
09013	PD-46	As shown throughout Section 1.0, particularly in Section 1.6, the goal of RBTI would be to reduce the overall flight times from the bases to the training assets. Section 1.3 details the reasons why these assets need to be closer to the bases and how this would reduce overall flight time.
09013	PD-47	The same "side bar" discussed in the comment states that "all ordnance delivery would be electronically simulated". This clearly indicates that nothing of any type would be released from the aircraft.
09013	PD-48	The section preceding Figure 1.3-3 describes, in detail, the current situation of flying activities for the B-52s from Barksdale AFB and the B-1s from Dyess AFB. The sentences leading up to this figure "call out" state the locations to which the current sorties fly. Optimum was determined based on the Air Force syllabi and training requirements of the B-52s and B-1s.
09013	PD-49	This has been modified in the final EIS.
09013	PD-50	Section 2.2, Description of the Study Area, details each source and date for the data used to define the sortie-operations in Table 2.3-2 and in Appendix B. For Alternatives B, C, and D, the estimated timing of implementation has been added to the EIS.
09013	PD-51	Additional information on average hours of use are included in 2.3.1. Typically, 1 to 2 bomber aircraft would operate in the MOA over a 30 to 45 minute period. On average, about 5 periods would be scheduled per day. A two-aircraft formation would require 45 to 60 minutes to complete a training flight through an MTR. On average, about 5 periods would be scheduled per day.
09013	PD-52	This has been modified in the final EIS.
08086 09014	PD-53	The analysis in the EIS accounts for the primary (those used or proposed for use by the B-52s and B-1s) MTRs and MOAs affected by the alternatives as well as the secondary (not used or proposed for use, but intersected by primary airspace) MTRs and MOAs within the entire study area. Data tables in Section 2.2-2.4 and in Appendix B detail the projected sortie-operations in each airspace unit by aircraft type. Movement from one airspace unit to a separated unit will follow the same FAA regulations to which all air traffic must adhere.
09014	PD-54	Proposed segment WAWB of IR-153 does not overlie any portion of Lake Merideth National Recreation Area. The segment terminates approximately 6 nm west of the area. The Canadian River drainage is not assessed in specific in the EIS because it does not include any designated special land use management areas. Effects of Alternative D on recreation activities such as those that could occur in the river drainage are assessed for all lands underlying the affected airspace.
09014	PD-55	Their use would remain unchanged as shown in Appendix B of the EIS.
09014	PD-56	Flight activities in MOAs are detailed in Sections 1.4, 2.1.1 (including an example of a mission in Figure 2.1-1), and 2.3.1. All of these discussions

		apply to the Mt. Dora MOA as well as the other alternatives. Typically, 1 to 2 bomber aircraft would operate in the MOA over a 30 to 45 minute period. On average, about 5 periods would be scheduled per weekday.
09014	PD-57	As shown on Figure 4.2-8, this NPS unit would lie 4 to 5 nm outside the proposed Mt. Dora MOA.
09014	PD-58	As shown on Figure 4.2-8, this NPS unit would lie 2 to 3 nm outside the proposed IR-153.
09015	PD-59	As described in Section 2.2, all aircraft activities in the affected primary and secondary airspace are analyzed in the EIS.
09020	PD-60	The Air Force has and will continue to adhere to all pertinent FAA regulations. Military pilots flying over sparsely populated areas will avoid all visible persons, vessels, vehicles, and structures by 500 feet. Over congested areas, pilots will overfly no lower than 1,000 feet above the highest obstacle within 2,000 feet. Meeting these requirements would not degrade the training effectiveness of the MTR.
09021	PD-62	Sections 1.2, 1.3, and 1.4 in the EIS describe in detail the requirements for the airspace to meet the training needs of the B-1s and B-52s. Section 2.1 details the application of those requirements to existing airspace in order to identify potential alternatives to meet the need. Over 70 MTRs were evaluated, including those associated with La Junta and Harrison. The EIS in Section 1.3 establishes that neither La Junta or Harrison have the integrated assets required for the training and the areas lack required terrain variability. As such, even with airspace modifications, neither would fulfill the purpose and need for RBTI.
01124 09021	PD-63	Realism in training is important, as stated in the EIS Section 1.0. However, the requirements for realism must focus on the crucial combat activities rather than transit time that yields only low-value training. Under RBTI, aircrews would continue to fly a proportion of their training with longer distance sorties to locations like Belle Fourche and Granite Peak. As such, they would receive that portion of training requiring long-range missions.
00868	CE-1	Sections 2.4 and 2.5 of the EIS present information on the location and use of both primary and secondary airspace under each alternative. All secondary airspace that intersects or overlaps with primary airspace is included in the analyses. In this way, the cumulative effects of other, non-RBTI flight activities are addressed.
00113 00292 01129	CE-2	Cumulative impact analyses were prepared in accordance with NEPA and CEQ Guidelines. The EIS considers the cumulative effects of both primary and secondary airspace use within the study area. It also accounts for *all users* of the primary and secondary airspace. Section 5.1.2 describes how past and present actions were incorporated into the analysis.
01129	CE-3	Section 4.3 of the EIS addresses the impacts of construction, loss of habitat, and aircraft overflights. The first two factors are related. The EIS demonstrates that less than 20 acres would be affected by construction, so less than 20 acres of habitat would be affected. All of the candidate sites have been subject to previous disturbance that has degraded the habitat. Since the potential impacts to wildlife are negligible to nonexistent, they would not add to any potential impacts from aircraft overflights.

Airspace and Aircraft Operations (AO)

Letter #		Response #	Response
00001 00045 00088 00106 00119 00140 00149 00217 00297 00327 00336 00466 00846	00983 01020 01027 01034 01041 01118 01130 08086 08103 08108 08265 08292 08303	AO-1	Section 4.1 of the EIS presents the air emissions projected to result from implementation of RBTI. All emissions of criteria pollutants monitored by the EPA would be less than one tenth of one percent (0.1%) of the standards set by the EPA to protect human health, the environment, and visibility.
00005 00398 01129 08023 08035 08078	08082 08095 08128 08157 08337	AO-2	Section 4.1 of the EIS discusses the effects of wake turbulence. This analysis establishes that vortices from B-1s or B-52s flying at 300 feet AGL would produce no more than a temporary, light breeze incapable of damaging structures, livestock, or people. Wake turbulence from one aircraft can affect another aircraft that is trailing it too closely. The FAA has established guidelines for separation of aircraft in flight. Adherence to these guidelines by all pilots, military and civilian, would prevent any problems.
00005 01130		AO-3	IR-178 has been used by low-flying bomber aircraft for roughly two decades. Prior to that time, its predecessor routes, IR-144 and IR-165, covered much of the same area. Bomber aircraft used these routes since their inception. All changes to the use of IR-178 have been assessed in accordance with NEPA. Prior NEPA documentation shows that as early as the 1970s, use levels were equal to or greater than baseline sortie-operations. Established avoidance procedures for airfields would remain in force. See also response AO-2.
00013 00383 00517	00938 08005 08097	AO-4	The EIS addresses noise effects on humans (Section 4.1) wildlife and livestock (Section 4.3 and Appendix G), special use land management areas (Section 4.2), and cultural resources (Section 4.5).
00020 00042 00200 00365 00983	08108 08167 08170 08337	AO-5	B-52s are unable to eject (dump) fuel. For B-1s, if an emergency were to occur, B-1s are required to climb to 10,000 feet AGL or higher before jettisoning fuel. This provides enough altitude to ensure that jet fuel evaporates before it reaches the ground.
00042 00057 01129	08166 08247	AO-6	Air Force aircrews are the most highly trained in the world. These aircrews regularly deal with the effects of winds and turbulence both at high altitude and low altitudes without any effects on safety or navigation.
00043 00097 00113 00120 00292 00361 00393 00399 00405 00416	00448 00507 00538 00625 01011 08186 08187 08190 08193 08331	AO-7	The safety records of B-52s and B-1s are both exceptional and the probability of a mishap is extremely low. If a crash did occur, its potential to start a fire would be dependent on many factors including the season, wind, moisture, terrain, as well as the nature and density of the vegetation. No restrictions on flight activities would be expected. See also responses AO-16 and AO-49.

00044 00247 08172		AO-8	As described in Section 4.1 of the EIS, speech interference could occur. Most people when faced with an outside noise raise their voices sufficiently to be heard. The potential for overflights to "interfere" with instruction would be extremely low since the number of direct, low-altitude overflights would be less than 10 per weekday and flights would be dispersed within a broad MTR corridor. In addition, low altitude overflights currently occur over at least two areas with very difficult rock climbing routes: Joshua Tree National Monument and City of Rocks (Idaho). The Air Force is not aware of any evidence of an effect on climbing safety in either area.
00044 00247		AO-9	The EIS in Section 4.1 addresses sleep disturbance and indicates that it is a function of myriad factors, not only noise.
00044 00247		AO-10	Military aircraft communications and electronic combat equipment operate at different frequencies than other radio and communication equipment, so no effects are anticipated.
00046 00466 00625 00969 01129	08023 08084 08086 08088	AO-11	The EIS describes the emissions from the jet engines in Section 4.1. All emissions of criteria pollutant monitored by the EPA would be less than one tenth of one percent of the standards set by the EPA. These would also include water vapor, but not unburned fuel.
00053 00218 00325 00407 00694 00765 00803 00811	00835 00837 00845 08012 08165 08309 08352	AO-12	Vibrations to structures from low-altitude overflights are addressed in Section 4.5 of the EIS. The analysis in the EIS demonstrates that the proposed overflights would not cause structural damage to homes, historic structures, or other structures.
00062 00349 08218 08249 08344		AO-13	No airspace associated with the RBTI alternatives overflies Taos, Taos Pueblo, or the Taos Ski Valley. Figure 2.4-9 shows the distances of the airspace to these areas. Taos lies 30 or more miles from the nearest portion of the proposed MTR. Noise from aircraft would not be audible at that distance.
00068 00293	01108 01130	AO-14	Flight activities under RBTI would not involve supersonic speeds or produce sonic booms.
00074 08228		AO-15	Figure 2.4-11 presents the increase in sortie-operations per MTR segment for Alternative D.
00092 00105 00120 00124 00140 00144 00165 00200 00225 00227 00240 00241 00295 00308 00322 00355 00361 00370	00427 00445 00447 00458 00466 00500 00566 00760 00784 00906 00983 01019 08012 08016 08096 08218 08287 08311	AO-16	As demonstrated in the EIS (Section 4.1), the safety records of B-52s and B-1s are both exceptional and the probability of a mishap is extremely low. Should the Air Force implement one of the RBTI action alternatives, it would prepare the necessary plans and procedures to deal with responses to mishaps.

00374 00382 00391 00410	08331 08343 08377		Continued from AO-16.
00101 00441 00800		AO-17	The analysis of noise annoyance addresses community noise effects and the basic research considered people from a wide range of occupations. Additionally, the probability of repeated overflights of a single location is small.
00101 00118 00120 00125 00500 00611 00800 00826 00862 08006	08090 08223 08247 08265 08278 08307 08323 08337 08367 08370	AO-18	The effect of aircraft noise on children is a controversial area. The reactions and behaviors of children described in the comments have not been documented in any research on the effects of aircraft noise on children or supported by anecdotal evidence. Also no evidence has been reported about these kinds of reactions to military overflights that have occurred over the last 30 years. It has been proposed that children are potentially more sensitive to noise sources as compared to adults, however, studies completed to date have produced no unequivocal evidence of auditory or non-auditory impact due to aircraft operations. Further, many studies (which have occurred primarily in Europe around airports) have been plagued with serious design problems including failure to incorporate control variables and account for exposure to other loud noise or small sample sizes. Numerous studies have also concluded no likelihood of permanent hearing loss, psychological or physiological health effects on children or young people. The RBTI proposes a small increase in sortie-operations (up to 10 per day) primarily in areas where military activity has occurred for many years. Neither children nor adults exposed to noise levels associated with either the existing military aircraft operations occurring today (Alternative A) or any of the actions alternatives (Alternatives B, C, or D) are anticipated to suffer serious health effects. Mental and emotional effects, as well as hearing loss due to the low noise exposure levels associated RBTI, can generally be ruled out. The Air Force has reviewed the referenced study entitled, "Jets over Labrador and Quebec: noise effects on human health," by Jeannie Rosenberg. The paper focuses on the issue of effects of low level flights on human health (hearing loss, annoyance, startle, and physiological effects). These issues are addressed in Sections 4.1 and 4.2 of the EIS. Also, see above for a discussion of effects on children. The other unnamed German study referred to, was not specifically reviewed, however, the preponderance of scientific literature indicates no long term health effects, including "post traumatic stress syndrome," result from occasional overflights such as those associated with the RBTI.
00105 00207 00223 00245 00274	00323 00643 01131 08163	AO-19	The potential for bird-aircraft strikes is analyzed in the EIS (Section 4.1). That analysis demonstrates the very low probability of such occurrences.
00113 00124 00136 00137 00219 00292 00374	00399 01011 01104 08011 08263 08337	AO-20	Section 4.1 of the EIS addresses health effects and aircraft noise. The body of scientific evidence does not support the commentor's claim concerning the aircraft noise generated under the RBTI proposal and hearing damage, physical ailments, and pain.
00114		AO-21	The FAA has the responsibility for establishing, modifying, and eliminating airspace. The duration that such airspace continues to exists is also up to the FAA. Airspace is not permanent. For example, should the

			Air Force implement Alternative B, hundreds of miles of IR-178 would be eliminated and portions of existing MOAs would also be eliminated.
00120		AO-22	Depending upon the nature and location of the training mission, the Air Force has pre-designated alternate landing locations. Aircrews are highly trained to respond to difficult emergency situations and would plan for all possible contingencies.
00134 08085		AO-23	Analysis in the EIS accounts for all aircraft using the defined airspace units irrespective of their base of origin or service affiliation. Appendix B shows all current and projected airspace use.
00138 00412 00547	08192 08341	AO-24	Life flights and other emergency aircraft activities are always given priority over training activities when the two may be in conflict. For fires involving aerial fire fighting, the FAA transmits a Notice to Airmen to avoid the area of operations.
00156 08019		AO-25	Section 4.1 of the EIS presents the noise levels associated with all aircraft associated with the RBTI proposal. See also response BR-1.
00157 00531 01044 01045 00130	08043 08099 08320 08321 08361	AO-26	Sleep disturbance studies have used both the DNL and the SEL metric in evaluating noise-related awakenings. As such representative studies using both metrics are discussed in the EIS in Section 4.1. It has been determined that arousal from sleep is a function of a number of factors including age, gender, sleep stage, noise level, frequency of noise occurrences, noise quality and pre-sleep activity. Under the RBTI proposal, a maximum of 15% and 20% of the B-52 and B-1 sortie operations, respectively, would potentially be flown at night, i.e., after 10:00 PM. Additionally, nighttime sorties are required to land back at their home station no later than 2:00 AM during the summer and prior to 1:00 AM during the winter season, which effectively reduces the overall potential for sleep disturbance to some degree. The SEL for a single overflight varies depending on the altitude, the lateral distance from the receiver and the aircraft operating characteristics. At the lowest operating altitude band of 300 to 500 feet AGL, accounting for 5% of the proposed operations, the SEL ranges from 116 to 113 dB for a B-1 and 111 to 107 dB for the B-52. In some situations, sleep awakenings have occurred, however studies have shown noise-related awakenings are far less than spontaneous awakenings. The variability of the aircraft position within the airspace structure also reduces the probability of repeated awakenings and significant impact.
00167 00220 00387 00689	00977 08217 08255 08285	AO-27	As presented in Appendix G, the body of scientific knowledge reveals no instances of subsonic aircraft overflights causing landslides, rock slides, or avalanches.
00195 00625 00806 08067		AO-28	The potential effects of aircraft noise on people, livestock and wildlife due to current and proposed operations are discussed in the RBTI EIS Sections 4.1, 4.2 and 4.3. Additional, information on the effects of noise is found in Appendix G, pages G-9 to G-17. Although individual situations can not be predicted, overall, studies have shown that the noise levels associated with RBTI do not cause catastrophic, long-term impacts. Individual overflight events are temporary intrusions into the local environment and do not represent lasting effects. Also see responses BR-1 and AO-42.
00198 00360		AO-29	The presence and use of military airspace over wilderness areas is not in conflict with any stipulations in the Wilderness Act of 1964. Numerous wilderness areas were established under existing military airspace that is still used today.
00243 08164 08181		AO-30	As shown in the EIS, Section 2.4.4, no airspace associated with Alternative D would occur within 5 nm of the Angel Fire airport. No restrictions on the use of that airport would be expected as a result of

		RBTI.
00265 00333 08034	AO-31	Jet fuel (JP-8) does not contain ethylene dibromide.
00267	AO-32	The systems within military aircraft do not emit at frequencies that could affect automobile operations.
00267	AO-33	The aircraft would be training and would not carry nuclear weapons of any kind.
00272	AO-34	As stated in Section 2.4.2 of the EIS, the MOA airspace in the vicinity of Big Lake, Texas would have a floor (base) of 3,000 feet above ground level, not sea level.
00283	AO-35	Section 4.1 of the EIS details both baseline and potential direct and indirect impacts for noise and air quality. Section 5.0 discusses cumulative impacts.
00291	AO-36	Proposed IR-153 would overlap and intersect with numerous existing MTRs that are used for low-altitude training by a variety of aircraft, including some B-1s and B-52s. Appendix B presents the breakout of all current aircraft users of these MTRs.
00291	AO-37	The EIS does show that much of the airspace over the area including Philmont Scout Ranch would be newly established airspace. Refer to Figure 2.4-9 in the EIS.
00324 00326 01129	AO-38	The EIS cites the findings of the National Forest Service accurately. The EIS goes on to note that low-altitude, high-speed overflights were considered most annoying and that the associated startle effect can negatively affect wilderness experiences.
00324 00326	AO-39	The EIS shows the projected amount of change in noise levels as described in the comment. The EIS also defines this amount of change as an adverse impact.
00334	AO-40	In Section 2.4.1, the EIS discusses RF emissions and the safety zone to be established around the emitters. This zone provides more than sufficient separation for the RF emissions from the emitters. Additional discussion of RF emissions has been presented in the EIS.
00334 00983 08087	AO-41	The basis for the sortie-operations is presented in Section 2.2 of the EIS. Actual counts of sortie-operations flown were used based on the records of the airspace managers for the appropriate airspace units. All proposed users are accounted for in these data.
00342 00383 08046	AO-42	It is possible that aircraft noise could startle domestic animals. However, animals have been shown through numerous studies to adapt and habituate to various sound sources, including jet aircraft noise. Likewise, human response to jet aircraft noise can also include startle or "surprise" effect. While the experience may be annoying in the short-term, no long-term health effects have been shown to occur. The overflights and associated noise levels from current operations or those that would result from an RBTI alternative, are intermittent and short in duration as opposed to regularly scheduled flights, such as at an airport. Additionally, the varied altitude structure and horizontal distribution of the flights make repeated overflights of the same location infrequent.
00354	AO-43	The EIS details the potential impacts of the RBTI proposal from noise, air emissions, and safety in more than 50 pages in Section 4.1.
00361	AO-44	The low probability of mishaps as presented in the EIS reflects the number of proposed flights under RBTI.
00361 08210	AO-45	The analysis of the effects of noise on humans is presented in Section 4.1 of the EIS; analysis of the effects of noise on wildlife is presented in Section 4.3.
00365	AO-46	The use of live ordnance for training is not part of the RBTI proposal.

			Rather, aircrews would electronically simulate ordnance delivery training.
00448 00517 00636 00894	08048 08126 08321	AO-47	No part of the RBTI proposal involves flights by B-1s or B-52s at 200 feet AGL; the lowest altitude flown by these aircraft is 300 feet AGL.
00531		AO-48	The noise analysis presents information on the cumulative exposure in the form of DNL that is appropriate for community response. Noise levels for single events, i.e., single overflights, provided by the L_{MAX} and SEL metrics supplement this.
00538 01104 01130 08337		AO-49	While the probability of a mishap is extremely low, it could occur. When an aircraft crashes, it may release fuels, oils, lubricants, and other materials that could enter the ground. The potential for contamination would depend upon many factors including the nature of the accident, porosity of the soil, geologic features, and season of the year. As part of the Air Force's accident response, the presence of contamination would be investigated and, if found, the affected area would be cleaned-up according to Federal standards.
00565 08016 08100 08166 08167		AO-50	B-52s are unable to eject (dump) fuel. For B-1s, if an emergency were to occur, B-1s are required to climb to 10,000 feet AGL or higher before jettisoning fuel. This provides enough altitude to ensure that jet fuel evaporates before it reaches the ground. Jet fuel (JP-8) contains no ethylene dibromide.
00689		AO-51	The OSHA standard applies to sustained noise over a 30-minute period. As shown in Figure 4.1-2 and Table 4.1-1 of the EIS, the maximum sound levels of 117 dB (B-1) and 110 dB (B-52) would be instantaneous and not sustained. This noise level would occur for a fraction of a second. As the aircraft recedes from the receiver, the noise levels decrease with distance.
00689		AO-52	The EIS in Section 4.1 discusses studies on aircraft noise and hearing loss. These studies indicate that RBTI flight activities would neither generate noise levels nor occur with such frequency as to affect hearing.
00712		AO-53	As shown in Figure 4.1-2 and Table 4.1-1 of the EIS, the maximum sound levels of 117 dB (B-1) and 110 dB (B-52) would be instantaneous and not sustained. This noise level would occur for a fraction of a second. As the aircraft recedes from the receiver, the noise levels decrease with distance.
00727 00827 01129		AO-54	No "rural" or "wilderness"guidelines exist, however the referenced guidelines are useful in evaluating the impact of aircraft noise. Additionally, use of the DNL metric is has been recommended as the principal means for describing long-term noise exposure of civil and military aircraft operations.
00742 00744 00745 00746 00853 00856 00865 00878 00896 00950 00953 00955	00956 00970 00984 00985 00993 00994 01078 01089 08182 08237 09014	AO-55	Use of the DNL cumulative metric, as recommended by the Federal Interagency Committee on Noise (FICON), is accepted as the principle metric for describing environmental noise exposure. DNL is appropriate because it not only accounts for the total number of events occurring and the time they occur, it also accounts for the duration of the events and the maximum levels noise levels associated with the events. There are no new descriptors or metrics of sufficient scientific standing to substitute for the DNL cumulative noise exposure metric. As noted, inclusion of the L_{max} and SEL metrics is useful to further describe the noise levels attributed to an individual overflight. Collectively, these three metrics provide adequate analysis of the existing environment as it occurs today and the future noise environment should RBTI be implemented. Although DNL can be supplemented with other metrics to characterize specific effects, to date there is no consensus among various agencies on the desired metrics relative to the new field of wilderness psychoacoustics. Additionally, the RBTI action alternatives were structured to avoid NPS properties to the

		maximum extent, however public feedback on the proposal has indicated a preference for overflights to occur over Federal property verses private lands. See also response BR-1.
00827	AO-56	In the RBTI EIS, the AF has presented the noise levels of the existing environment, i.e., that occurring today, and presented the resulting changes if one of the three action alternatives were implemented. It is intuitive that if property values have not suffered due to the historical activity (which includes not only military activity, but management agency flights as well as general and commercial aviation), the addition of 10 flights per day at varied horizontal and vertical distribution will not suddenly result in drastic impacts to property values. Factors which are likely to contribute to fluctuations in property values is the economy, employment opportunities, community amenities, community and education services, as well as historical ties to the land. These factors drive property values, not sporadic military overflights.
00868 08126 08193	AO-57	As stated throughout the EIS, the analysis was based on a floor of 300 feet AGL for proposed MTRs. The floor altitudes of 200 feet AGL noted in Appendix C are structural remnants of the existing MTRs from which the proposed MTRs were developed. See also response for AO-47.
00868	AO-58	The sortie-operations presented in Tables B-1 through B-4 are yearly. As stated in the titles for Tables B-6 through B-8, the sortie-operations denote average daily use. Section 4.1 of the EIS addresses the potential effects of the RBTI alternatives on civil aviation. See also response BR-2.
00894	AO-59	It is possible that aircraft noise could startle domestic animals. Animal responses may vary but generally large, studies have failed to provide conclusive evidence of any serious effect except trauma due to panic reaction. Animals have been shown through numerous studies to adapt and habituate to various sound sources, including jet aircraft noise. In the literature review of Manci *et al.* (1988), behavior reaction observed in livestock exposed to low-altitude subsonic overflights have generally consisted of startle reactions that were considered minimal. The RBTI low-level overflights may result in incidental livestock startle that may or may not lead to livestock damage. The expectation that overexertion of cattle raised for food purposes would result in death or weight loss, is speculation.
00827 00906 08021	AO-60	The data set from which the "Schultz curve" is synthesized is not a model, but rather a dose-response relationship for noise exposure levels and the prevalence of annoyance. The original curve was derived from a body of 161 paired observations in the 1970's (T.J. Schultz, "Synthesis of Social Surveys on Noise Annoyance," *Journal of the Acoustical Society of America*, 64(2):377-405, 1978). The set of data was updated from 161 to 453 data points by Dr. Sanford Fidell and colleagues in a 1991 publication (Fidell, S., Barger, D.S., and T.J. Schultz, "Updating a Dosage-Effect Relationship for the Prevalence of Annoyance Due to General Transportation Noise," *Journal of the Acoustical Society of America*, 89:221-223, 1991). The expanded analysis revealed only minor differences in the prevalence of noise-induced annoyance as predicted by Schultz and by the newly derived relationship for all transportation noise. This research also pointed out that the prevalence of aircraft noise is somewhat greater than that attributable to surface traffic (e.g., street/highway traffic and railroad noise). This finding was acknowledged by the Air Force in the article entitled "Community Annoyance and Sleep Disturbance: Updated Criteria for Assessment of the Impacts of General Transportation Noise on People" (Finegold, L.S., C.S. Harris, and H.E. von Gierke, *Journal of the Acoustical Society of America*, 42(1):25-30, 1994). According to the 1992 Federal Interagency Committee on Noise

		(FICON), "the dose-effect relationship, as represented by DNL and 'Percent Highly Annoyed' (%HA), remains the best available approach for analyzing overall health and welfare impacts for the vast majority of transportation noise analysis situations." The RBTI EIS provides this information to assist the public and decision-makers in understanding the degree of community annoyance resulting from the noise levels associated with the alternatives. Additional single event noise metrics have been provided to fully describe the potential noise environment.
00950 08262 00955 08272 00956 08288 00984 08303 00985 08310 01078 08312 01089 08315 08020 08337 08187 09018	AO-61	No human endeavor is entirely without risk, yet the potential for aircraft mishaps (as reported in Section 4.1 of the EIS) is extremely low. The EIS describes the nature of Class A mishaps, provides the overall history of Class A mishaps for the life span of B-52s and B-1s, and presents the estimated rate of mishaps. All sources and causes of mishaps are included in the calculations used in the analysis. On average, B-52s have had a Class A mishap for every 28 million miles flown; B-1s have a record of one mishap per 14.5 million miles flown.
00970 01041 01130 08034 08076 08100 08100 08132	AO-62	Section 4.1 and Appendix F details the methods and assumptions used for the MAILS modeling. The MAILS air quality analysis used a conservative approach by assuming all aircraft would fly at 300 feet AGL for the entire duration of flight in an MTR segment. This distribution over-emphasizes the lowest altitudes whereas only 5 percent of flight activity would actually occur there. An altitude of 5,000 feet AGL was not used as a mixing height for the MAILS model. Even using this conservative approach, the criteria pollutant concentrations would be less than one tenth of one percent of the human health standards set by the EPA.
00983	AO-63	Section 2.4.4 and Appendix C (Table C-2) present information on the length, corridor width, and altitude structure of the airspace associated with Alternative D.
00983	AO-64	Section 2.4.4 and Appendix D present data on the number and location of emitter sites. Section 2.4.1 indicates that all emitter sites would be located on leased or purchased private land and that the emitters would be unmanned.
00983 08363	AO-65	On average, the B-52s would fly at 360 knots and B-1s at 420-550 nm/hour. No supersonic speeds would be employed.
00983 08337 01130 08100	AO-66	The fuel used by B-52s and B-1s is JP-8. JP-8 is basically low-grade kerosene with other additives totaling less than 1 percent. The Air Force switched to JP-8 a few years ago, in part, to reduce jet fuel's potential effects on the environment and to standardize with NATO forces.
00983	AO-67	Table 2.3-2 in the EIS presents information on current sortie-operations on existing MTRs associated with the RBTI proposal. Tables 2.4-5, 2.4-9, and 2.4-13 present the proposed use of the MTRs under each alternative in comparison to current usage. Appendix B provides additional data on sortie-operations within the airspace.
00983	AO-68	As shown in Section 4.1 of the EIS, the analysis of noise emphasizes the differences in noise levels under existing and projected conditions.
01033	AO-69	No landings would occur in northern New Mexico. Landings would occur at Barksdale AFB, Louisiana, and Dyess AFB, Texas.
01044 01130 09018	AO-70	In section 4.1, the EIS details the emissions from the proposed aircraft activities and compares them to standards established by the EPA for human health. As the analysis demonstrates, the aircraft emissions would represent less than 1% of the threshold for 15 of 16 categories, and about 2.5 percent of the threshold for the other category. These emissions would not affect human health and would not be "smelled" by people on the ground.

01128	AO-71	Establishment of a MOA would not limit civil or agency VFR air traffic. FAA regulations permit non-participating VFR traffic to transit a MOA. See also Response BR-2.
01129	AO-72	Sortie-operations associated with IR-102/141 have been eliminated from all four alternatives and affected resource categories have been re-analyzed to reflect this change.
01130	AO-73	Section 2.4 of the EIS demonstrates that all of the MTRs mentioned in the comment were considered in the noise analysis.
01130	AO-74	Information on average speeds of aircraft has been added to the EIS. The altitude distribution per aircraft type is presented in Table 2.3-3.
00827	AO-75	The noise analysis and modeling performed in the EIS represent the best available, scientifically validated methods. The Air Force's approach to characterizing noise exposure consisted of summing the acoustic energy produced by individual aircraft operations over a period of time, and expressing this quantity in terms of time-weighted sound levels. Expressing aircraft noise exposure in time-weighted average sound levels has been standard practice since the early 1970s. Although variant methods have been proposed, none has received the scientific or agency validation of time-weighted sound average for noise exposure. No other method of assessing aircraft noise impacts is demonstrably superior. Many of the concepts and arguments presented in the comments have been reviewed by Dr. Sanford Fidell, world renown noise expert and cited as such by the commentor. Dr. Fidell's assessment concluded that the comments are incomplete, internally inconsistent and misleading. The assertion in the comments that DNL is inappropriate as a measure of noise impacts and annoyance is not borne out by the scientific literature or agency procedures. The Federal Interagency Committee on Noise, as late as 1992, validated the use of DNL for analysis of aircraft noise impact and community annoyance. No credible alternative to DNL for prediction of human response to noise exists. Neither the literature review (which is incomplete) nor the invalid replacement for the Schultz curve presented in the comment demonstrates that the analysis in the EIS is inaccurate or inappropriate. See also response AO-60.
01131	AO-76	Although "surges" can generate an unusually large number of sorties for fighter aircraft, the maintenance and coordination requirements, along with the limited number of airframes make a "tremendous increase in daily flights" improbable for bombers. Both Barksdale and Dyess AFBs conduct a few exercises annually designed to strengthen maintenance and operational practices. Barksdale AFB conducts exercises approximately twice a year, with a typical exercise involving a total of 10 aircraft taking off within 1 to 2 hours and following predetermined routing. Dyess AFB exercises approximately four times per year during a three to four day time frame, typically using six sorties per day. Normally, these exercises take place on non-routine MTRs and the MTRs are closed to non-participating aircraft during the time of the exercise. In addition, these MTRs are chosen to develop the operators' experience, therefore, the routes commonly traversed for training would not be used. Since RBTI proposed airspace would be routine training, these exercises could reasonably result in fewer sorties within RBTI airspace during these times.

	AO-76	If RBTI airspace were the designated routing during an exercise, the six sorties per day for Dyess AFB or the ten from Barksdale AFB are already accounted for and analyzed in the RBTI EIS.
08007	AO-77	The EIS in Section 2.4.2 states that the proposed Lancer MOA would not expand the area currently under MOA airspace, and indicates that airspace use would increase substantially.
08007	AO-78	As indicated in Table 2.3-3, different types of aircraft would operate at different percentages of time within the MOA. For example, out of a 45-minute sortie-operation in a MOA, a B-1 would spend, on average, 18 minutes (40%) between 3,000 and 5,000 AGL. The remaining 27 minutes would involve flight above 5,000 feet AGL. Since noise decreases with altitude, and 35 to 80 percent of the flight activities would be above 20,000 feet AGL, noise levels in the MOA would remain low.
08011	AO-79	Speech interference sometimes occurs when background noise levels exceed 65 dB. Within houses, which usually provide insulation that reduces noise levels by 20 dB or more, the potential for speech interference decreases.
08019	AO-80	B-1 aircraft already fly on the MTRs mentioned in the comment. Refer to Appendix B of the EIS. Any changes to the altitude of flights within the MTRs or to the amount of sortie-operations performed by specific aircraft would need to be assessed through the NEPA process.
08027	AO-81	The maximum A-weighted sound level (L_{max}) of a B-1 overflight ranges from 117 dBA at 300 feet above ground level (AGL) to 75 dBA at 10,000 feet AGL. The A-weighted sound exposure levels (SEL) which is the single number representation of the noise energy dose, ranges from 116 dBA at 300 feet AGL to 83 dBA at 10,000 feet AGL. The data are found in Section 4.1.1, Tables 4.1.1 and Figure 4.1.3. The referenced levels of 45 and 62 dBA are the Day-Night Average Sound Levels or DNL. Refer to Appendix G for additional information on various noise metrics.
08085	AO-82	The analysis uses the most recent data on aircraft operations, noise factors, and emissions. B-52s have been flying since the 1950s and B-1s have been flying since the mid-1980s. Past use of the airspace has included sortie-operations by these aircraft types.
08094	AO-83	As detailed throughout the EIS, an average of 10 sortie-operations would occur on a daily basis in the parts of the MTR proposed for the heaviest use.
08103	AO-84	All flight activities proposed under RBTI are reported in the EIS, Section 4.1. The Air Force has no additional proposals with regard to the affected airspace. Should such proposals arise in the future, they would be assessed through the NEPA process.
08103	AO-85	The EIS details aircraft emissions throughout Section 4.1. Information on increases in PM_{10} is presented for each alternative. $PM_{2.5}$ was not assessed as the EPA has yet to establish a standard for this metric. The analysis does evaluate aircraft activities at 300 feet AGL. See also response for AO-62.
08103	AO-86	No refueling tracks associated with RBTI occur over the area mentioned in the comment. See also response to AO-50.
08122	AO-87	The baseline for the RBTI noise analysis correctly presents the noise levels attributed to existing or previously approved aircraft operations. Each of the proposed alternatives are analyzed to determine the change in the noise levels (increases or decreases) resulting from the addition of the RBTI. Evaluation of the changes in the noise environment against a non-existent baseline would present an inaccurate characterization of the impacts.
08122	AO-88	Since its designation in the early 1990s, IR-178 has encompassed the same

		area. Predecessor MTRs such as IR-165 also overlay much of the same area and supported bomber sorties since the 1970s.
08170	AO-89	Approximately 12 average daily sortie-operations (260 days/year) could occur in the segments of proposed IR-153 overlying Philmont Scout Ranch. As detailed in the EIS, these flights would be dispersed horizontally and vertically, thereby minimizing the potential for a single location to be overflown repeatedly.
08184	AO-90	Noise will not be trapped in the valleys of northeastern New Mexico. Noise traveling in rays away from aircraft reaches the surface of the earth at an angle relative to the position of the aircraft. The noise level experienced in the valley would depend upon the altitude and lateral distance of the aircraft from the valley as well as the location of the receiver. Dispersion of overflights across a Military Training Route corridor and vertically within its altitude structure, limit the probability of exclusively flying over the same spot.
08193	AO-91	Balloon and glider flight activity must also adhere to FAA regulations. Pre-planning of such activities to avoid areas of other civil and military aviation would prevent conflicts.
08196	AO-92	The cumulative noise levels (DNL) presented in EIS are complimented by single event noise levels for the B-1 and the B-52, as well as other aircraft who use the affected airspace. Data on A-weighted maximum sound levels (L_{max}) are found in Tables 4.1.1; A-weighted sound exposure levels (SEL) are presented in Figure 4.1.3.
08227	AO-93	Use of all airspace is managed by the FAA. All proposed sortie-operations for RBTI are presented in the EIS and detailed according to airspace units. Should the Air Force propose to use other airspace units not environmentally assessed for a particular type or number of aircraft, it would undertake an analysis governed by the NEPA process.
08323 08331	AO-94	As demonstrated in the EIS (Section 4.1), the safety records of B-52s and B-1s are both exceptional and the probability of a mishap is extremely low. The coincidences necessary to result in an event such as described in the comment would reduce the probability of occurrence to the infinitesimal level.
01130 08337	AO-95	Neither the B-52 nor the B-1 carry hydrazine. F-16s, which carry small canisters of hydrazine, would represent a minor (about 2%) user of the airspace.
09011	AO-96	The Air Force has reviewed the recently adopted Final Regional Haze Rule. Analysis in the EIS shows that the amount of particulate matter (PM_{10}), a common source of haze, generated in New Mexico would be less than 0.3% of the PSD Class I increment. Similarly, NO_x emissions from RBTI would represent approximately 2% of the PSD Class I increment (Section 4.1.5 and Table 4.1-21). These small amounts would only occur in the most intensively used segments which account for about 10% of the proposed MTR. All other segments would contribute less PM_{10} and NO_x based on fewer daily flights and/or use of higher altitudes. For this reason, and because the flight activity would be dispersed over thousands of square miles, it is unlikely that RBTI aircraft emissions would represent a factor affecting New Mexico's compliance with the Regional Haze rule.
09011	AO-97	The Pecos Wilderness Area would lie 17 to 18 miles from the edge of the proposed MTR, Wheeler Peak Wilderness Area would be roughly 7 miles from the MTR's edge, and Carlsbad Caverns National Park would lie more than 30 miles from any of the airspace units proposed for increased use under RBTI. Given this distance, the infrequency of flight activities, the volume of air in which the emissions would dissipate, and the

		extremely low concentrations of emission (see Section 4.1 of EIS), these PSD Class I areas are not expected to be affected.
09011	AO-98	Section 4.1.1 (Aircraft Emissions and Air Quality) describes that total emissions of criteria pollutants were derived for all alternatives by calculating military aircraft emissions for affected MOAs and MTRs in each alternative. All military aircraft flying in the airspace were included. Appendix B provides information on the total number and type of sortie-operations for each affected airspace unit.
09012	AO-99	The EIS does account for the effects of increased numbers of sortie-operations within the defined limits of the airspace units, whether they would be expanded or decreased under a particular alternative. For example, the DNL noise analyses (section 4.1) accounts for the horizontal and vertical "concentration" of aircraft sortie-operations within the MTRs and MOAs. The model used in this analysis incorporates the "concentration" and/or "dispersal" of aircraft within the particular airspace unit and the results of the analysis reflect the size of the airspace unit. In addition, for each alternative the EIS does describe the probability of any single location being overflown based on the size of the airspace unit and the nature of its proposed use.
09013	AO-100	The referenced section and appendix describe the methodology used to assess noise from all types of Air Force aircraft, including B-52s and B-1s. This methodology addresses the noise from B-52s and B-1s specifically for the airspace affected by the RBTI alternatives. Other, older reviews, such as those prepared for basing of aircraft would not be pertinent to the analysis in this EIS.
09013	AO-101	The definition of DNL in the Executive Summary has been enhanced.
09013	AO-102	In Section 4.1.1, the draft EIS did address the noise generated by single event overflights at altitudes ranging from 300 feet AGL to 25,000 feet AGL. It details how the both instantaneous (Table 4.1-1) and single overflight noise energy doses (Sound Exposure Levels) generate noise and are perceived by observers on the ground. Under each alternative in Section 4.1.1, the probability of any single location is discussed along with existing FAA procedures for avoiding overflight of persons, structures, and vehicles. Section 4.1.2 also addresses the potential effects of noise on communities underlying the affected airspace and on other types of land uses. The EIS shows that flights within MTRs would be dispersed and sporadic. For MOAs, the flights would be dispersed within a large volume of airspace. In either case, the probability of repeated, low-altitude overflights over a specific location would be unlikely.
09013	AO-103	This has been modified in the final EIS.
09013	AO-104	These locations and procedures for each noise sensitive area under each MTR are published in the AP-1A/B circulars. This reference is included in the final EIS.
09013	AO-105	The percentages of potential mishaps per year are correct as published in the draft EIS.
09013	AO-106	For each alternative in Section 4.1, the EIS discussed the potential effects of the action on civil aviation. See also response BR-2.
09014	AO-107	Section 4.1, Aircraft Noise Assessment Methods, presents the methodology used to model noise for all airspace units. Appendix G provides further detail on this and other noise topics.
01130	AO-108	These references are available at the Air Force's project files at Dyess AFB, Public Affairs Office.
09018	AO-109	The EIS does not make this argument. The alternatives for RBTI overlie federal, state, and private lands. Alternatives B and C overlie more private lands, but identification of these alternatives was based on operational

		factors (Section 2.1) and did not "target" any particular land ownership.
09020	AO-110	The use of 65 DNL in the referenced section of the EIS was not used as a threshold for impacts. It simply provided a point of reference. The same paragraph recognizes that the aircraft noise would be expected to affect wilderness and solitary experiences.
01129 01131	AO-111	The EIS recognizes that neither 65 DNL nor 55 DNL is a standard or threshold used solely to determine potential impacts. Many factors were considered in addressing the effects of aircraft noise from RBTI. The amount of change in noise conditions, the number of overflights, the timing of those overflights, the vertical and horizontal dispersion of overflights all formed a part of the analytical process. Description of the potential effects of noise on sleep disturbance, speech interference, and other factors is presented in Section 4.1 of the EIS. Various noise levels are discussed in regard to evaluating these effects.
01130	AO-112	The airspeeds reported in the EIS and used in the analysis are those which the aircraft are expected to fly. Use of maximum airspeeds would be inappropriate for the type of training and airspace.
01130	AO-113	Figure 4.1-2 is an illustrative example. The airspeed used for the B-52 is 10 nm/hour less than the aircraft would be expected to fly in an MTR and MOA.
01130	AO-114	All the requested information is presented in the EIS in Chapters 2.0 and 4.0.
01130	AO-115	Both nighttime and startle penalties were used, as appropriate, in the noise analysis. See also response BR-1.
01130	AO-116	Other aircraft users would represent minor users (less than 2%) of the MOA. With such minor use, the probability of mishaps for such aircraft would be even lower than that defined for the B-52s and B-1s.
01130	AO-117	Halon 1211 and 1301 are being replaced with an EPA approved agent.
01130	AO-118	Refueling for B-52s and B-1s occurs at altitudes above 10,000 feet AGL. Although the potential for minimal leakage during refueling exists, fuel would evaporate before reaching the ground.
01130	AO-119	The low noise levels and associated lack of change in annoyance are a result of the emphasis on use of higher altitudes. See Table 2.3-3 in the EIS.
01130	AO-120	Aircraft would avoid emitters since they represent threats. See also response AO-60 and AF-6.
01130	AO-121	Section 4.1.1 describes the rationale for using less than 45 DNL rather than lower, potentially inaccurate values.
01131	AO-122	L_{max} and SEL metrics apply to a single overflight irrespective of the location or alternative. A B-52 at 500 feet AGL generates the same sound level in Alternative A, B, C, or D.
01131	AO-123	The percent probability of mishaps already accounts for the total annual sortie-operations for the B-1s and B-52s. Also, the mathematical operation performed in the comment is inaccurate, since the probability of both events occurring is derived by multiplying the percent probabilities, not adding them. Thus the combined probability of a Class A mishap would be 0.0014 percent.
01131	AO-124	The analysis, in Section 4.1, addresses hearing loss, speech interference, sleep loss, and physiological health.
08076 08088 08103 08103	AO-125	This issue has been addressed in Section 4.1 of the EIS. Aircraft emissions are not anticipated to effect soils, surface waters, or ground water.
01130	AO-126	The EIS describes that hearing loss occurs due to consistent, long duration exposure to noise, such as that in a factory. The noise from aircraft using

		an MTR or MOA would be sporadic, brief, and dispersed. Moreover, no noise levels generated by aircraft would approach those noted in hearing loss studies. The studies used in the EIS are pertinent to the kinds of noise generated under the RBTI proposal. See also response BR-1.

Air Force Policy (AF)

Letter #	Response #	Response
00001	AF-1	Although there was no way of telling the exact years you were in the Air Force, we queried the Luke AFB Airspace Management Office to find the Range you referred to in your comment. As far back as the 1960s, one range was used by both Williams AFB and Luke AFB and it was known as the Luke Range; it is still in use, but has been renamed as the Barry Goldwater Range.
00005 08083 00189 08090 08067 08126	AF-2	Aircraft observed at low-altitude are likely on military training routes that already exist in this area (see Figures 2.4-3, 2.4-6 and 2.4-9). However, when individuals observe military aircraft that they feel are in violation of a federal air regulation should report them to the Dyess Air Force Base at (800) 699-5169. See also response BR-5.
00019	AF-3	See Sections 1.3 and 1.4 of the EIS.
00020 00039 00349 00365	AF-4	Aircrews are governed in their flying practices by both Federal Aviation Administration rules and Air Force regulations. "Zooming up" inhabited ski slopes is not acceptable. The Air Force takes disciplinary measures for breaking flight rules. These can vary from a reprimand, establishing an Unfavorable Information File, taking a pilot's wings, grounding a pilot, to dismissing a pilot from the Air Force. Whenever a citizen sees an Air Force aircrew member breaking flight rules, the Air Force encourages you to note your location, exact time, and nature of the incident and report it as soon as possible to the nearest Air Force Base Public Affairs Office. If you can identify the type of aircraft it helps, but the time and location are essential in helping track the responsible party. The Air Force's relationship with citizens and communities are important to us.
00023	AF-5	There are presently two large ranges, over mostly government owned land, that are used on a limited basis by both Barksdale and Dyess AFBs. These ranges are the Nellis Range Complex near Las Vegas, Nevada, and the Utah Test and Training Range (UTTR) near Salt Lake City, Utah. The problem with using either, or both of these ranges exclusively is the transit distance, range accessibility, and available flying hours. Under the budget constraints of today's environment it is incumbent on the Air Force to make the most out of every training dollar. Traveling these long distances on a regular basis to achieve limited training objectives would not allow us to train the number of crew-members essential to sustain our forces at even the present levels. Since several other bases use Nellis and UTTR, range access is limited. While developing the RBTI alternatives every effort was made to use existing airspace. Alternatives B and C would use existing IR-178 (which is already flown approximately 6 times per day) for low-altitude, terrain avoidance training and would expand existing MOAs for high altitude training. Even if RBTI were not adopted, the use of IR-178 and the MOAs would continue at present levels. For a more thorough comparison of the existing airspace versus the RBTI proposal see Section 2.4 of the EIS.
00042 08097 00137 08129 00152 08171 00983 08208 08006 08220 08083 08222 08094 08314	AF-6	Aircraft observed at low-altitudes below or around the proposed military operations areas are likely on military training routes that already exist in these areas (see Figures 2.4-3, 2.4-6 and 2.4-9). Aircraft operating within a military training route or military operations area are required to remain within the confines of their assigned airspace. Military pilots flying over sparsely populated areas will avoid all visible persons, vessels, vehicles or structures by 500 feet. Air Force aircraft operate under instrument flight rules to the maximum extent possible (AFI 11-202V3, Chap 8), and will be under an air traffic control clearance and on an assigned radio frequency. See also response BR-5.

00074	AF-7	RBTI flights would occur on weekdays, 260 days out of the year. Dyess AFB airspace management office is planning to record a schedule that can be reviewed by calling (800) 699-5169.
00094 08157 00345 08222 00983 08233 08039 08357 08044	AF-8	Aircraft observed at low-altitude are likely on existing military training routes that already exist in this area (see Figures 2.4-3, 2.4-6 and 2.4-9). However, when individuals observe military aircraft that they feel are in violation of a federal air regulation should report them to the Cannon Air Force Base, Public Affairs Office, (505) 784-4131.
00111	AF-9	Selection of the RBTI proposed alternatives was based primarily on operational criteria, Chapter 2 describes these in detail. Also, see Section 4.4 for a discussion on Socioeconomics and Environmental Justice.
00116 08127	AF-10	The flying unit that manages the airspace over that particular area determines areas designated as noise sensitive. Determination is based on many factors including mission requirements, overflight rules and good neighbor policy. Once it is determined to designate an area noise sensitive, the appropriate coordination is accomplished to publish it.
00156	AF-11	Pilots wear two forms of ear protection, depending on the situation. One set serves as protection during ground operations while preparing for flight. The second form is in the helmets that pilots wear for protection during flight.
00244 00266 00598	AF-12	In case of an Air Force mishap (accident) there are, in most cases, mutual aid agreements between geographically located Air Force Bases and local fire fighting departments. If RBTI were implemented the Air Force would address this issue and enter into agreements with the appropriate federal, state, and/or local fire fighting and emergency response organizations.
00246	AF-13	The purpose of the Partners in Flight program is to establish a mechanism to bring together federal, state, and non-governmental organizations involved in the conservation and management of neotropical migratory birds. The objectives of the program are to determine the status and causes of population changes, to maintain habitat for healthy neotropical migratory bird populations, and to facilitate a cooperative partnership effort among concerned groups. In contrast, the objective of the environmental impact analysis process is to anticipate impacts. However, while not specifically working through the Partners in Flight Program, the Air Force's process has involved federal, state, and non-governmental organizations which are involved in that program.
00283 08195	AF-14	The National Environmental Policy Act ensures the public is actively involved and informed during the environmental impact analysis process. The EIS does include a discussion of cumulative effects (Section 5.0) to ensure the public is informed of all actions that could possible be impacted by the RBTI proposal. In addition, the Federal Register provides a public record of all EISs published by the federal government. See also response AF-13.
00044 08008 00247 08026 00296 08034 00333 08051 00721 08153 00973 08308 01130	AF-15	Compensation claims for damages associated with aircraft overflights are handled on a case-by-case basis. If damage occurs, affected citizens should contact Dyess AFB legal office. The address is 7BW/JA, 466 5th Street, Suite 224, Dyess AFB, TX 79607. The telephone number is (800) 699-5169 and ask for the claims office or (915) 696-2034. See also response BR-5.
00331	AF-16	No restricted airspace is planned or proposed as part of this project. The airspace proposed near Angel Fire is an MTR that is located over an already existing training route.
00332	AF-17	No restricted airspace is planned or proposed as part of this project. The airspace that is proposed is an MTR and a MOA. To the maximum extent possible, in selecting the locations for this airspace, the Air Force used existing airspace.
00334	AF-18	ACC/SCCF is the office responsible for frequency-related requests. Formal requests for RBTI have been submitted and are currently awaiting approval. ACC/SCCF will ensure all ACCR 11-456 requirements are met.

00334	AF-19	This issue has been identified and is being addressed, along with other construction-related issues, by a team of operational and design experts. Construction design with equipment raised to required heights should remedy the issues raised.
00334	AF-20	Technicians working at an associated Electronic Scoring Site typically maintain mini-MUTES. Parts for RBTI Mini-MUTES would be supplied through the Dyess AFB supply system. Technicians would transport the parts to the various Mini-Mutes in specially designed trucks that also serve as maintenance work areas. In the past, Mini-MUTES have been successfully maintained and logistically supported in numerous places with varying climate conditions.
00334	AF-21	If RBTI were implemented, the ESSs at La Junta, Colorado and Harrison, Arkansas would be closed because the training available now would be available in the RBTI airspace complex. The money, manpower, logistics, etc. needed to maintain those sites would not make fiscal sense. La Junta and Harrison both lack the desired variable terrain and/or assets needed to fully optimize and integrate aircrew training. Belle Fourche (now known as Colony) offers both the terrain and, with its associated Powder River MOA and Mini-MUTES, the training opportunities desired. The Colony complex, however, is too distant to meet the daily training requirements of Barksdale and Dyess AFBs on a regular basis. The main customers of the Colony Range are Ellsworth AFB, located within 75 nm, and Minot AFB located within 250 nm. These two bases will still use Colony extensively, while Barksdale and Dyess AFBs would be the main users for the RBTI airspace complex.
00387	AF-22	Training at low altitudes through mountainous terrain has been a regular part of Air Force training for many years. While not flawless, the safety record for this type of training has been extremely impressive. Special routes, called MTRs (Military Training Routes), are designed to allow low-altitude training with as little impact on surrounding communities as possible. When developing the RBTI alternatives every effort was made to use existing MTRs whenever possible, and/or link already existing routes to avoid any undue burden on areas not already under military airspace. For a comparison of existing special use airspace versus the RBTI proposed airspace for Alternative D (New Mexico alternative), see Section 2.4 of the EIS.
00689	AF-23	The Air Force does not set aside funds for defense or compensation of lawsuits.
00846	AF-24	Dialogue has and will continue to occur with federal, state, and local agencies. The Air Force is currently consulting with the U.S. Fish and Wildlife Service. Other state and local agencies have been notified of the RBTI proposal and their comments reviewed and addressed.
00962	AF-25	Please refer to Section 1.2 of the EIS for a description of the current mission and training requirements. However, tactics that were used in the Persian Gulf are still used today and will be into the future.
00970	AF-26	There have been no recent modifications to MTR IR-178. There are, however, several options available to the aircrew (see Figure 2.3-1 in the EIS). For example, one option would enter at point "A" and exit at point "CK," another could exit at points "AT" or "BK." Since aircrews will often not include on their flight charts parts of the route that will not be flown, it is possible to view several different maps of IR-178.
00983	AF-27	The electronic equipment that would be used for RBTI is carefully controlled to not interfere with radio, television, satellite dishes, microwaves, and other similar devices.
00983	AF-28	No weapons or ordnance would be stored at the emitter sites.
00983	AF-29	As indicated in Section 2.0 of the EIS, ordnance delivery training would be electronically simulated and no ordnance of any kind would be involved in these training missions.
01130	AF-30	Refer to Section 2.1.3.

00983	AF-31	Both the MTR and MOA could be used under instrument meteorological conditions.
00983	AF-32	Specific altitudes are mission-dependent. In Section 2.3 (Table 2.3-3) there is a discussion and the table shows the proposed altitude distribution for the RBTI proposal.
01131	AF-33	Aircrews fly within the corridor, not necessarily along the centerline.
01131	AF-34	The EIS has been prepared in accordance with NEPA and CEQ regulations, neither of which establishes a requirement to consider a national cope for the proposed action. Therefore, a national needs assessment is beyond the scope of what is required for decisionmaking.
00983	AF-35	Under RBTI, no training would involve supersonic flight. However, all Air Force pilots that engage in supersonic flight are required to log the time, altitude, and position at the time they go supersonic. All supersonic activity has occurred within current authorized guidelines.
08008 09005	AF-36	For the areas in Texas associated with the RBTI proposal, the Dyess AFB Public Affairs Office (800) 699-5169 is available to address aircraft noise complaints. This office takes all such calls seriously.
08009 08095 08152 08160 08233	AF-37	For complaints within Texas, the Dyess AFB Public Affairs office 1-800-699-5169 is available to address aircraft noise complaints. All calls are taken seriously. For complaints within New Mexico the Cannon AFB Public Affairs office (505) 784-4131 is available to address aircraft noise complaints.
08050	AF-38	Both surface-to-air and air-to-air threats were analyzed and risks associated with those threats were determined before our aircrews were sent into harms way. Initially, during Desert Storm, it was safer for B-52 aircrews to accomplish low-altitude bombing missions against Iraqi targets. As Desert Storm progressed, the risks associated with high-altitude bombing were lessened and B-52s were mainly used at the higher altitudes. B-1s and B-2s were not used in Desert Storm. In contrast, B-1s and B-52s were used mainly for higher altitude bombing missions in Desert Fox (Iraq) and Operation Allied Force (Yugoslavia). The B-2s were also used for the first time in Operation Allied Force (Yugoslavia) at high-altitude.
08094	AF-39	Balmorhea is inside the boundary of the existing IR-178 military training route. Officials at Barksdale and Dyess AFBs have modified their aircraft flight paths to avoid Balmorhea and Saragosa. Should RBTI Alternative B or C be chosen, avoidance of these towns would continue.
08103	AF-40	Thank you for your request to participate as a cooperating agency in the preparation of the Realistic Bomber Training Initiative (RBTI) Environmental Impact Statement (EIS), however, we respectfully decline your offer. The Air Force welcomes and encourages the cooperation, contributions, and participation of local citizens, agencies, and governmental entities at any time during the EIS process. We have found the scoping, public hearings, and the public participation process as set forth at CFR Part 1501.7 and 40 CFR Part 1503 to be effective in gaining the valuable input we need to complete such documents.
08103	AF-41	No such records exist to base legitimate estimates. Analysis in this document was accomplished using programs accepted by the Federal Aviation Administration and Environmental Protection Agency. See response BR-1 and Appendix G for how the actual flight aircraft noise levels are measured.
08103	AF-42	Anticipated sortie-operations are provided in Appendix B. Each alternative has a detailed description of aircraft flight operations in a section entitled "Airspace and Flight Operations, see Sections 2.3 and 2.4. Section 4.1 provides an analysis of the topics you have described.
08107 08363	AF-43	The FAA has made a provision for military training below 10,000 feet MSL at speeds above 250 knots. This exemption is allowed on military training routes and in special use airspace (restricted areas and military operations area). These areas are charted on civil aviation sectional charts so those civilian pilots will know where this training is being accomplished. See also

		response BR-2.
08129	AF-44	All known aircraft at Dyess AFB, who would participate in the RBTI proposal, are addressed in the EIS and would fly on the routes described in the EIS.
08151	AF-45	The Air Force does try to accommodate traditional and recreational land uses as much as possible. When agencies, like Game and Fish, coordinate with the Air Force, these needs may be accommodated depending upon Air Force mission requirements.
08188	AF-46	The entry point for the proposed IR-153 avoids the Chama River Canyon Wilderness Area and other sensitive areas. Aircraft would be entering the route at 17,000 feet MSL or as assigned by air traffic control. They would not be descending to low altitude until after they enter the route and are heading away from the Chama River Canyon Wilderness Area.
08188	AF-47	The RBTI proposal involves only simulation of ordnance delivery. See Sections 2.4.1 and 4.1 of the EIS.
08234	AF-48	Military training airspace is scheduled in accordance with agreements between the Federal Aviation Administration and the scheduling authority. When the airspace is scheduled for use, the Federal Aviation Administration is notified and if this time is outside that already published on the aeronautical charts, the FAA is responsible for publishing a Notice to Airman. This notice provides the active time of the airspace. The Air Force also proposes to establish an 800 number to provide the planned weekly use of the RBTI airspace.
08246	AF-49	Under RBTI, the B-52s (or B-1s) would not be taking-off or landing in the MTRs or MOAs. The FAA, however, does state that controllers are required to apply separation of at least 5 miles to aircraft operating directly behind a heavy [e.g., B-52] jet at the same altitude or less than 1,000 feet below due to the possible effects of wake turbulence (Aeronautical Information Manual 99 [AIM] para. 7-3-9. In addition, AIM 99 (para. 7-3-8) states that the flight disciplines necessary to insure the pilot must exercise vortex avoidance during VFR operations.
00431 08182 08251 08313	AF-50	We appreciate your request to extend the public comment period for the draft EIS for RBTI. However, the Air Force has already extended the comment period from 45 to 90 days. We believe the additional 45 days allowed adequate time for individuals to provide comments on the draft EIS.
00566 08301	AF-51	(Part 1) Commercial airlines replace aircraft quicker due to their higher use when compared to the average number of service hours of the B-52. The B-52s service life is estimated to last until 2048. Two of the factors that contribute to this longevity are the number of years that the B-52 remained on the ground for generated alert during the Cold War and the structural upgrades received by the B-52. (Part 2) B-52 maintenance uses parts from decommissioned aircraft. All parts used are thoroughly tested to the same standards as new parts. (Part 3) The B-52 started flying low-altitude, high-speed flight in 1961 due to the development of Soviet fighters having the capability to destroy high-altitude flying aircraft. By August 1964, all B-52s were structurally modified to increase wing strength to handle the additional stresses of low-altitude flight. (Part 4) Flying at low altitude gives the B-52 several tactical advantages. All radar is line-of-sight and cannot see through terrain or over the natural curvature of the earth—the lower an aircraft can fly, the greater reduction of the range of detection by the radar, therefore, less time for an enemy to react. This also allows the B-52 to achieve one of the most basic principles of combat—surprise. Concealing one's intentions creates an opportunity to strike the enemy when they are unaware or unprepared.
08384	AF-52	Analysis in the EIS did review the complete mission of both sites that are

		proposed for decommissioning under RBTI, including C-130 use from Little Rock AFB.
09013	AF-53	Operational requirements for B-52s and B-1s are detailed in the Air Force's Description of Proposed Action and Alternatives which is part of the project file. The information is synthesized in Sections 1.0 and 2.0 of the EIS.
09018	AF-54	Assuming that the tactics applicable to one conflict, like Kosovo, will apply to a different future conflict would be a costly mistake. Each conflict and each tactical situation within a conflict calls for identifying the best tactics capable of achieving the mission safely. The use of low altitude flight provides important tactical advantages. For example, all radar is line-of-sight and cannot see through terrain or over the natural curvature of the earth. By flying at low altitudes, aircrews can hide from enemy radar and achieve surprise—an important factor in war. Many aircraft, including B-52s, used these tactics during the Gulf War. Since the need for low-altitude tactics continues, aircrews must receive realistic training in their use.
00375 08111 08092 08174 08096	AF-55	The Air Force does comply with federal aviation regulations. Over sparsely populated areas, pilots will avoid all visible persons, vessels, vehicles, or structures by 500 feet. Over congested areas, pilots will overfly no lower than 1,000 feet above the highest obstacle within 2,000 feet.

Land Management and Use (LU)

Letter #	Response #	Response
00104 00105 00245	LU-1	Under Alternative D, aircraft would fly over a portion of the Wild and Scenic Rio Grande River. FAA regulations do not prohibit flight over such designated rivers, however, FAA does suggest that flight altitudes of greater than 2,000 ft AGL be maintained when flying over these areas.
00191 01131 00244 08176 00328 08179 00531 08190 00565 08237 00906 08256 01103 08332	LU-2	Communities under the airspace were identified using databases from the states of New Mexico and Texas, as well as U.S. Geographic Services maps. Analyses were done using a Geographic Information System (GIS). Not all communities were included in these data sources. Given the vast region covered by the proposed airspace, every community was not identified by name in the EIS. However, the EIS has been modified to reflect the total number of people overflown under each proposed alternative.
00361 01131	LU-3	As stated in Section 4.2.5 of the EIS, all the special use land management areas under proposed IR-153 would experience changes in noise levels greater than 10 dB. Most visitors in these areas would notice the change in noise level and noise could be expected to adversely affect the recreational experience. As also stated in the EIS, visual intrusion of military aircraft could adversely affect the recreational experiences of visitors to public recreation areas underlying the proposed airspace.
00780	LU-4	While Nature Conservancy lands were not specifically recognized in the EIS resource maps, state and federal special use land management areas were identified and the vegetation delineated in west Texas. In Section 4.3, the habitat and biological diversity of west Texas, whether private, state, or federally owned was described.
01130	LU-5	As stated in the EIS, the proposed emitter sites are not immediately adjacent to any recreational areas. Site #88 would be 3.5 miles from Big Lake, site #59 about 10 miles from Lake Toyah, and site #65 approximately 3 miles from Lake J.B. Thomas. The emitters themselves should not represent visual intrusions for recreationists nor would overflights occur directly above any of these sites. As described in Section 2, the emitters are simulating enemy threats, therefore, the aircraft are training to avoid such threats.
01130	LU-6	Emitters would be placed more than 400 feet from the highway. The maximum height of the emitter would be about 17 feet high, lower than most windmills found along this route.
01130	LU-7	Aircrew members must follow Air Force and FAA regulations that dictate the altitudes aircraft can fly over buildings and people. Whether over private, state, or federal property, the regulations are the same so that everyone is protected equally.
01130	LU-8	As described in the EIS, airspace was proposed over less populated areas and to take advantage of existing routes. Visitors, because of their short-term stay would be flown over less than permanent inhabitants would be overflown.
08279 08332	LU-9	The special use land management areas (e.g., national parks and forests, wildlife refuges) are listed in Section 4.2.5 of the EIS. The Chama River Canyon Wilderness Area is located in the Santa Fe National Forest. The Valle Vidal Unit is located in the Carson National Forest. The EIS has been modified to reflect the Valle Vidal Unit. Alternative D proposed airspace does not overlie Santa Rosa State Park.
09013	LU-10	This has been modified in the final EIS.
09014	LU-11	Maps in the EIS do include the locations of: Capulin Volcano National Monument and Fort Union National Monument (Figure 4.2-8) and Big Bend National Park (Figure 4.2-4 and others). The legend coding these sites includes national parks and monuments. Information on the Sante Fe

		National Historic Trail has been added to Section 4.5 of the EIS. Lake Merideth National Recreation Area and the Alibates Flint Quarries National Monument were not depicted because they lie well outside the affected area.
09014	LU-12	In accordance with NEPA and CEQ guidelines to focus on those aspects of the environment potentially affected by an action, the EIS addressed only those potentially affected NPS units. Fort Union National Monument, Lake Merideth National Recreation Area, and the Alibates Flint Quarry National Monument all lie more than 4 nm away from the edge of any affected airspace unit. Therefore, these sites are not addressed in the EIS. In contrast, the document has been modified to include discussion of Capulin Volcano National Monument because it underlies the existing Mt. Dora MOA. The Sante Fe National Historic Trail is discussed further in Section 4.5.
09015	LU-13	Review of the referenced section did not reveal the contradiction in the number of special land use management areas addressed for Alternative D.
09015	LU-14	This has been modified in the final EIS.
09015	LU-15	While individual hunters may be startled and annoyed by sporadic overflights, there is nothing to suggest that hunters as a group would modify or cease their hunting activities as result of the proposed alternatives. For example, the Laughlin MOA situated over Sutton County, Texas, (a county that has seen increased hunting revenues over the past 15 years) had over 9,500 sortie-operations in 1997, over 4,000 sortie-operations in 1998. The increase in hunters and hunting that has occurred, at the same time as thousands of sortie-operations, indicates that aircraft overflights have not frightened wildlife away nor dissuaded hunters from using the area.
09015	LU-16	Based on available map data, the northern limits of the Latir Peaks Wilderness Area lies 3 to 4 miles south of the proposed corridor of IR-153.

Biological Resources (BI)

Letter #		Response #	Response
00012	00828	BI-1	Scientific evidence suggests that the effects of noise on large mammals (deer, elk, bighorn sheep, bear, bison, and others) is transitory and of short duration and that the animals appear to habituate to noise through repeated exposure without long-term discernible negative effects. Animals unaccustomed to noise can be startled and may injure themselves, especially confined. The discussion on the effects of noise and overflights on wildlife in section 4.3 and Appendix G has been clarified in the EIS. Even though the RBTI under Alternative D may overfly the Valle Vidal area, studies indicate that aircraft overflights should not have a long-term effect on the elk herds.

00773			
00023	01020	BI-2	The discussion of bird migration routes, such as those of the sandhill crane and the whooping crane, has been modified in the EIS. Even with increases in sortie-operations, the potential for bird-aircraft strikes in IR-178 and proposed IR-153 would be negligible, however, there is a small potential for impacts to migratory birds from overflights. Few bird-aircraft strikes have occurred in IR-178 and the secondary MTRs that overlap and intersect proposed IR-153. Use of the Bird Avoidance Model by the Air Force for planning and flying training sorties is expected to further reduce the number of strikes. Migratory birds often make brief flights in response to aircraft overflights, although they are unlikely to leave a food source. If individuals startle and injure themselves, then impacts due to overflights may occur. Monarch butterflies, which are not a species of concern, threatened or endangered, migrate through central Texas and New Mexico in October and March to reach winter and summer breeding areas. They may fly in groups of up to millions, as low as 3 feet above the ground, or singly, to over 3,000 feet depending upon the direction of the prevailing winds (Brower 1996). If aircraft overflights correspond to specific areas of butterfly migrations, then some butterflies may be affected by direct contact, but should not affect the monarch populations as a whole. The effects of noise on large mammals are discussed in response BI-1 and on wildlife in BI-3.

00043	00399	BI-3	The effects of noise on wildlife have been expanded and are discussed in detail in section 4.3 and Appendix G. Although some conflicting results exist, when using recent, applicable studies, the majority of the scientific evidence suggests that effects are short-term and that animals habituate to noise through repeated exposure without long-term effects. Military aircraft presently overfly most of these areas. See response BI-2 for a discussion of Bird-Aircraft Strikes and BR-3 for a discussion of the effects of noise on domestic livestock. No effects to plants from overflights have been demonstrated. The construction of the emitter and scoring sites would disturb less than 20 acres of native and cultivated vegetation.

00045 00045 00711 00804 08084		BI-4	Like many other species, doves or owls may be momentarily startled or be flushed from trees, but they are unlikely to permanently leave a food source. Owls have been known to roost and nest near runways and under overflight paths on military installations. They habituate to overflight noise and have not been known to abandon such areas because of aircraft effects. They are more likely to be upset by ground-based activities. Please see section 4.3 and Appendix G for the effects of noise on wildlife.
00104 00113 00157 00178 00181 00188 00195 00208 00209 00210 00287 00288 00292 00294 00356 00418 00421 00507 00565 00950 00953 00955 00956 00979	00984 00985 00989 01016 01030 01031 01036 01037 01042 01078 01089 01099 01103 08178 08180 08199 08240 08264 08297 08343 08349 08355 08359 08378	BI-5	As stated in the EIS, federally listed threatened and endangered species, such as spotted owls and eagles, are found in the area. Numerous studies regarding these and similar species have not found aircraft overflights to affect the breeding success or the survivability of these species. See response BI-2 for a discussion of bird-aircraft strikes and the effects of noise and overflights on migrating birds. However, the FWS considers aircraft flights below 1,600 feet AGL in the months of March through August to be potentially harmful to Mexican spotted owls and flights below 2,000 feet AGL from October to March to be potentially harmful to bald eagles. Please see response BI-2 for effects to migratory birds, BI-3 for the effects of noise on wildlife, BR-3 for effects on livestock, and BI-1 for effects on large mammals.
00191 08228		BI-6	The EIS has been changed to reflect the Rio Grande as a bird migration flyway.
00246 08180		BI-7	Although fish do startle in response to low flying aircraft noise and probably to the shadows of aircraft as well, they have been found to habituate to the sound. See BR-4 for the effects of noise and overflights on the economy.
00568		BI-8	As is preferred by the FWS, the biological impacts analysis for RBTI is included within the EIS. Effects from noise, overflights, other aircraft operations, construction, and ground operation are discussed in section 4.3.
00868 00868 00868 01129 01130 01131		BI-9	An expanded version of the effects of noise on wildlife is presented in section 4.3 and Appendix G. Several authors, in addition to Ellis *et al.* 1991, have been cited to support the conclusion that raptors and other animals habituate to noise. As stated in the EIS, naïve animals, or those not previously exposed to noise, may be startled by sudden loud sounds and as a result could occasionally be injured. However, military aircraft currently overfly the area. A number of articles, including more recent studies on bighorn sheep and others, support the interpretation that the effects of noise on large mammals such as deer, elk, bighorn sheep, bear, and others are transitory and of short duration and that the animal habituate to noise

		through repeated exposure without long-term discernible negative effects. However, particular responses may vary by individual or species.
00983 08195	BI-10	The Air Force complies with the intent of the Migratory Bird Treaty Act as a stipulation under Attachment 4 of AFI 32-7064. They participate in the "Partners in Flight" program as a part of this compliance. Please see response AF-13.
01130 01131 09014 09016	BI-11	Although the FWS has given the project a consultation number, the information regarding FWS consultation has been clarified in the EIS to reflect that the Air Force informally discussed RBTI with the FWS prior to publication of the draft EIS. Since that time the Air Force has identified a preferred alternative and entered into further consultation with the FWS.
01130	BI-12	The effects of noise on game animals such as deer, quail, migratory birds, and other game birds is similar to effects on other wildlife. Scientific evidence suggests that the effects of noise on wildlife is transitory and of short duration and that the animals appear to habituate to noise through repeated exposure without long-term discernible negative effects. However, animals unaccustomed to noise can be startled and may injure themselves, especially if confined. Migratory birds often make brief flights in response to aircraft overflights, although they are unlikely to leave a food source. If individuals startle and injure themselves, then impacts due to overflights may occur.
01130	BI-13	In general, wildlife habituate to the noise associated with low-altitude aircraft overflights. Avoidance and flight tend to occur with naïve animals, although differences in individual reactions to noise do occur.
01131 09015	BI-14	This has been modified in the final EIS.
01131	BI-15	Common wildlife species are listed in Appendix H.
01131	BI-16	The effects of noise on birds have been expanded in Appendix G. Several authors, in addition to Ellis *et al*. 1991 have been cited to support the conclusion that raptors and other animals habituate to noise. As stated in the EIS, naïve animals, or those not previously exposed to noise, may be startled by sudden loud sounds.
01131 09015	BI-17	This has been modified in the final EIS.
01131	BI-18	Please see response CE-2.
08023	BI-19	Jet engine emissions either burn and dissipate, or fall to the ground as small inert particles. These particles are not injurious to wildlife.
08342	BI-20	Even with increases in sortie-operations, the potential for bird-aircraft strikes in IR-178 and proposed IR-153 would be negligible. Few bird-aircraft strikes have occurred in IR-178 and the secondary MTRs that overlap and intersect proposed IR-153. Use of the Bird Avoidance Model by the Air Force for planning and flying training sorties is expected to further reduce the number of strikes.
09013	BI-21	The draft and final EISs include a description of the FWS estimate (Section 4.3.5) of potential impacts to threatened and endangered species due to aircraft overflights like those under Alternative D. The Air Force considered this viewpoint along with the data and studies available on overflight effects to wildlife in defining the overall magnitude of effects.
09013 09013 09013	BI-22	The field surveys were current, specifically conducted for RBTI. Section 2.4.1 notes that biological surveys were conducted and references Appendix E, which summarizes the results of the survey. Appendix E has been augmented with further details on survey methods. This summary indicates that no threatened, endangered, or other species or their habitats would be affected. A separate Biological Assessment is not necessary because the Air Force intends to use the information presented in the EIS for consultation.
09013	BI-23	The Air Force believes available map data would not adequately portray the level of detail necessary for appropriate analysis. Available map data are

		either spotty in coverage or based on incomplete surveys. In addition, the FWS discourages publishing locations of sensitive species.
09013	BI-24	This has been modified in the final EIS.
09013	BI-25	The draft EIS in Section 4.1, clearly states that all bird migration activity is consistently monitored and modeled by the Air Force to prevent bird-aircraft strikes. The EIS states that aircrews use current information on bird activity to plan and conduct training. This information is more accurate than a simple comparison of flight routes and airspace use.
09014 09016	BI-26	Data on the distribution and abundance of the northern aplomado falcon was derived from the available literature and data resulting from surveys and other studies. The FWS served as a primary source for information on this species, and Mr. Angel Montoya, an aplomado falcon expert with the FWS in New Mexico, provided considerable information on the subject. In addition, data were derived from the EIS and Biological Assessment for the Proposed Expansion of German Air Force Operations at Holloman AFB (1998). Subsequent data provided by the FWS has been added to the EIS to indicate that 11 sightings have been documented since 1991. FWS contends that the aplomado falcon is a possible resident along the Texas/Mexico border. This was modified in the EIS.
09014	BI-27	As stated in the EIS and reflected by the species occurrence tables in Appendix H, the referenced species and/or their habitat are found in the region. Individual maps would merely reflect the same information already described in the EIS. This information was derived from recent data provided by the FWS and state wildlife agencies, as well as scientific literature and professional knowledge pertinent to the topic. The text was modified in the EIS.
09015	BI-28	Summaries of past studies presented in the draft EIS along with clarifications in the final EIS indicate that it is possible that individual elk may or may not react to jet overflights. Available data have not shown that if such reactions occur, they would be of a nature affecting migration or reproduction. Please see response BI-1.
09015	BI-29	Clarification of noise effects studies on wildlife has been included in Section 4.3. Many of the sources listed by the commentor either pertain to species that are not relevant to this analysis or concern supersonic noise, helicopters, or have been addressed in more recent studies. Please see an expanded version of the effects of noise on wildlife in Appendix G.
09016	BI-30	Appendix H has been updated with the 6 April 1999 list from FWS.
09020	BI-31	The statement in the EIS is intended to provide a context for understanding impacts. It is important in that wildlife previously exposed to overflights and aircraft noise are not “naïve,” and may respond differently than wildlife never exposed to overflights.

Socioeconomics and Environmental Justice (SE)

Letter #	Response #	Response
08085	SE-1	Council on Environmental Quality Regulations (40 CFR 1508.8(b)) state that the EIS must assess "indirect effects, which are caused by the action and are later in time or farther removed in distance, but are still reasonable foreseeable." Future land uses of privately owned land cannot be reasonably foreseen at this time. A reasonable assumption is that future land use patterns would be similar to those in the affected area today. Also, please see BR-4.
08236	SE-2	While there are various economic approaches to measure goods and services that do not have prices associated with them, there are no widely accepted, proven methods that could accommodate the variability in perceived noise annoyance and behavioral changes associated with the proposed alternative.
00133 08379 08381 09002 09021	SE-3	The methods used in the analysis of the EIS are appropriate and proven. The analysis used county-level economic multipliers supplied by the U.S. Department of Commerce and takes into account the cities (including La Junta) within the county. This method ensures consistency and comparability of analysis for any location. This method established that changes in population and jobs would be less than one percent countywide. Such a change would not be expected to impact population-affected resources such as schools, libraries, and fire and police protection.
00983 00983 09008	SE-4	Section 4.4.5 of the EIS demonstrates that northeastern New Mexico would receive 44 new long-term jobs and 133 short-term jobs should Alternative D be implemented. Direct and indirect revenues from construction would total about $12 million, and long term revenues would be about $2 million per year.
00191 00364 00531 00828 00868 00970 01130 01131 08009 08081 08096 08148 08279 09013 09014	SE-5	As stated in Section 4.4 of the EIS, no populations of any kind, including minority or low-income populations, would be subject to noise levels of 65 DNL or greater under any alternative. As such, minority and low-income populations would not be disproportionately affected. The concept of environmental justice addresses the actions of federal agencies and determining if those actions disproportionately impact human health and environmental conditions in minority and low-income communities (Executive Order [EO] 12898). The use of 65 DNL as a guideline, not a firm "standard," for the evaluation of environmental justice issues, relative to sporadic military training flights, is consistent with the intent of EO 12898. While the DNL of 65 is the level most often recognized as being compatible with residential land use, it was only one of several criteria, not the sole criterion, which was used in the environmental justice analysis. Various components of the proposed action were considered individually and collectively, namely construction, commissioning/decommissioning of facilities, and aircraft operations. The facility-related components either contributed to or removed revenue from the affected areas. Construction and commissioning contributions would occur primarily in Reeves and Taylor Counties (Texas) for Alternatives B and C, or in the tri-county area of Quay, Harding, and Union (New Mexico) and Taylor County (Texas). Boone County, Arkansas and Otero County, Colorado would experience a revenue decrease from the decommissioning of facilities. With respect to aircraft operations, first, the majority of the proposed alternatives occur in existing airspace where military activity has occurred at varying levels for many years. Only 11 to 17 percent of the RBTI proposed airspace is new (Alternative B, 15%; Alternative C, 17%; and Alternative D, 11%). Second, demographic analysis of the census tracts and block numbering areas show the majority, i.e., over 50 percent, of the affected

		population does not belong to either a minority or low-income group (the final EIS Section 4.4 has been modified to reflect this information).
01130	SE-6	The 1990 census data were used because only these data are comprehensive, validated, and comparable from one geographic area to another.

Cultural Resources (CU)

Letter #		Response #	Response
00039	01032	CU-1	The effects of noise and vibrations from aircraft overflights are discussed in section 4.5.1 and Appendix G. Studies of adobe structures, in particular, and stone and concrete structures as well, show that damage is unlikely to occur from subsonic noise or vibrations from overflights. Aircraft must generate a maximum sound level (L_{max}) of greater than 120 dB at less than 150 feet to potentially result in structural damage. RBTI aircraft would not exceed this level. The proposed IR-153 would not overlie Taos Pueblo, but would be located approximately 10 miles east of the pueblo.

00043	01015	CU-2	The effects of noise and aircraft overflights on archaeological and historical resources are discussed in section 4.5. Historic structures and petroglyphs are unlikely to be affected by vibrations (please see response CU-1). Since most of the route underlies existing military airspace, noise and overflights would not represent an intrusion to the setting, where setting is an important criterion for historic significance. In addition, the most important of these properties, those on the National Register, are unlikely to be overflown in the MOA and would only occasionally be overflown on MTRs. The proposed IR-153 would not overlie Taos Pueblo, but would be located approximately 10 miles east of the pueblo.

APPENDIX A
STUDY AREA AND TERRAIN VARIABILITY SUPPORTING DOCUMENTATION

Introduction

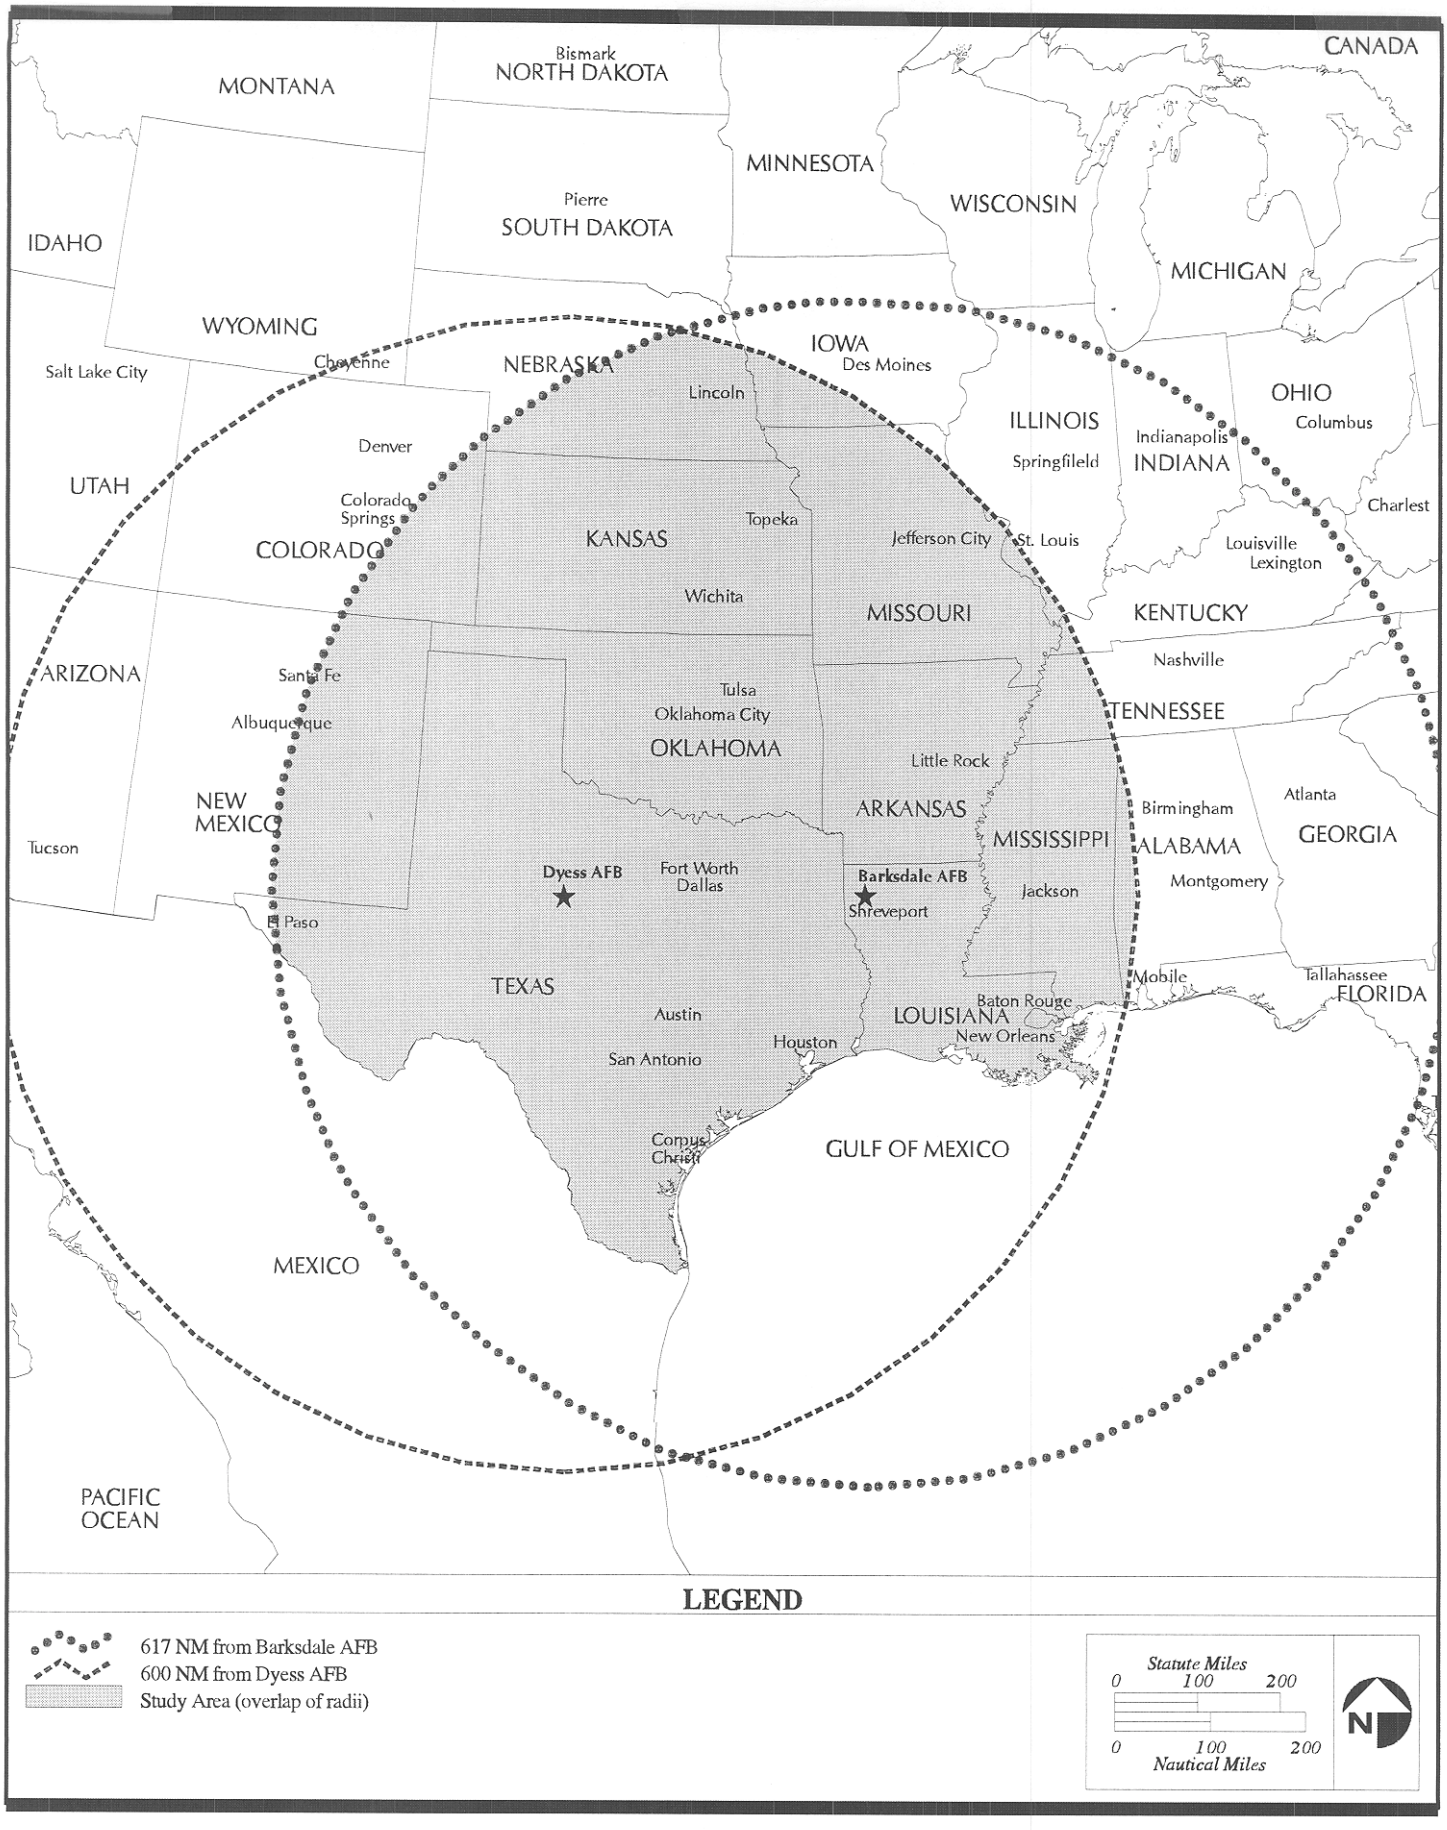
The RBTI study area was defined by creating a circle around Barksdale AFB and a circle around Dyess AFB; each circle has a radius of approximately 600 nautical miles (nm) from Barksdale and Dyess AFBs (Figure A-1). Terrain variability was then identified meeting the criteria defined as necessary for simulating realistic combat conditions. The discussion below explains how the 600 nm radius was derived and the process followed for determining terrain variability.

600 Nautical Mile Determination

The times and airspeeds for outbound and return distances for mission flight events were used to determine the distance from the bases to training assets to meet optimum average sortie duration (ASD) goals. The ASD is calculated using a unit's total number of flying hours divided by the number of sorties that must be flown (see Section 1.3.3 in RBTI EIS for further discussion). Tables A-1 and A-2 show the maximum distance for a B-52 and B-1 flying from the base and returning within the optimum ASD. These distances do not include flight time along a Military Training Route (MTR) since any given route does not necessarily provide either outbound or inbound distance. Nor do these distances include flight time that occurs around the base airfield for take-offs and landings.

Table A-1.
B-52 Maximum Distance - Based on Optimum ASD from Barksdale AFB

Flight Event	*Time (minutes)*	*Airspeed (nm/minute)*	*Distance (nm)*
Departure	15	4	60
En route to IR	45	7	315
Air Refueling	60	6	360
En route to MTR	20	7	140
En route to MOA	20	7	140
MOA	20	7	140
En route to Base	20	4	80
TOTAL	200	NA	1,235
Maximum Outbound or Inbound Distance			617.5



Average Sortie Duration Radii from Barksdale and Dyess AFBs

Figure A-1

Table A-2 **B-1 Maximum Distance–Based on Optimum ASD from Dyess AFB**			
Flight Event	*Time (minutes)*	*Airspeed (nm/minute)*	*Distance (nm)*
Departure	15	4	60
En route to IR	30	7	210
Air Refueling	60	6	360
En route to MTR	20	7	140
En route to MOA	20	7	140
MOA	30	7	210
En route to Base	20	4	80
TOTAL	200	NA	1,200
Maximum Outbound or Inbound Distance			600

Because an aircraft must return to base, training assets should not be located farther than one-half the distance of the aircraft's maximum allotted flight time (i.e., one-half of 1,200 nm equals 600 nm) from a base. Each half of the maximum distance represents the length for the outbound or inbound segment of a sortie. For B-52s, the longest outbound or inbound distance is about 617.5 nm from Barksdale AFB. For B-1s from Dyess AFB, the halfway point of a sortie lies within approximately 600 nm of the base. The overlapping section of the distances from each base accounts for approximately 65 percent of the total area. Since most of the two areas coincide, development of interrelated training assets within the overlapping section would enhance efficiency for the units at both bases. These overlapping areas were used to define the RBTI study area and the area in which the search for alternatives was conducted. Figure A-1 illustrates the area encompassed relative to each base and shows their degree of overlap.

Terrain Variability

Under RBTI, varied terrain differences results in better training opportunities for simulating realistic combat conditions. As mentioned in Section 2.1.1 of the RBTI EIS, the optimal MTR should overlie a minimum of 240 nm of contiguous terrain and offer high to moderate variability. Terrain variability is a combination of both slope and elevation. To identify those areas with terrain variability, a Geographic Information Systems (GIS) modeling program was employed. This GIS model compared the elevation and slope differences for each square mile under a candidate MTR to the elevations of all surrounding square miles.

Classes of elevation differences were assigned to each square mile, on a scale of 1 to 8, with 1 reflecting "low" elevation differences and 8 indicating "high" elevation differences. An identical process was applied to slope differences, where 1 represented the lowest slope differences and 8 showed the highest slope differences. Since elevation and slope both factor into terrain variability, both factors were added together to assign a single measure of terrain variability for each square mile. For example, the lowest measure of terrain variability an area could receive might be 2 (1 for elevation plus 1 for slope); the highest could be 16 (8 for elevation plus 8 for slope).

For purposes of this proposal, lands with a combined total score of 4 or less (elevation and slope differences) represented low terrain variability. Lands under MTRs offering a combined value of greater than 4 but less than 10 comprised moderately variable terrain, and values greater than 10 indicated high terrain variability. Using the GIS model, a search was conducted on all MTRs within the study area to determine the classes of terrain variability. The degree of variability found within

an MTR was then used to assist in alternative MTR selection. All MTRs within the study area with low terrain variability were eliminated from further consideration as potential alternatives. All those exhibiting moderate and/or high variability were further evaluated in the alternative identification process (see EIS, Section 2.1.1).

APPENDIX B
SORTIE-OPERATIONS

The following tables present the number of sortie-operations flown within the existing (Alternative A) and proposed (Alternatives B, C, and D) airspace. A sortie-operation is the use of one airspace unit (for example, an MTR or MOA) by a single aircraft. One sortie (i.e., a take-off, mission, and landing) by a single aircraft may include several sortie-operations. The following tables provide a breakdown of each airspace unit (MTRs and MOAs), the number of sortie-operations within that airspace unit, and the type of aircraft using that airspace unit by alternative. They also present information on estimated average daily sortie-operations for existing and proposed IR-178 and proposed IR-153. These tables supplement the data found Sections 2.3.1 (Alternative A), 2.4.2 (Alternative B), 2.4.3 (Alternative C), and 2.4.4 (Alternative D) of the RBTI EIS.

[1] P = Primary airspace used by B-1s from Dyess AFB and/or B-52s from Barksdale AFB.

[2] S = Secondary airspace unit intersects with primary airspace unit used by B-1s from Dyess AFB and/or B-52s from Barksdale AFB.

[a] secondary MTRs overlapping a portion of the segment.

[b] secondary MTRs overlapping a portion of the segment.

APPENDIX C
AIRSPACE MANAGEMENT

The following provides a description of how airspace is managed by the Federal Aviation Administration (FAA) as it relates to those types of airspace used by the Air Force. It explains the process followed when the Air Force proposes airspace modifications for both Military Operations Areas (MOAs) and Military Training Routes (MTRs). In addition, this appendix offers specific information on IR-178, both existing (Alternative A) and proposed (Alternatives B, C, and D).

As is described in the RBTI EIS (Sections 1.4.1 and 2.1.1), MTRs are three-dimensional highways in the sky, having height (altitude) as well as length and width. Aircraft follow these routes within the assigned altitudes and width. Under RBTI, proposed IR-178 (Alternatives B and C) and proposed IR-153 (Alternative D) segments have an assigned width and height; Tables C-1 through C-3 provide these altitudes (both floor and ceiling) and width of the existing and proposed MTR segments.

Processing Airspace

FAA Order 7400.2D prescribes policy, criteria, and procedures applicable to Special Use Airspace (SUA). This order applies to all regional and field organizations involved in rule making and non-rule making actions associated with this airspace. FAA Order 1050.1D establishes policy and procedure and assigns responsibility for assuring agency compliance with environmental procedures set forth in the Council on Environmental Quality (CEQ) regulation for implementing the procedural provisions of the National Environmental Policy Act (NEPA). FAA Order 1050.1D, Appendix 3, describes the FAA's environmental responsibilities in relation to SUA. FAA Order 7490.XX, which is in draft form and in agency coordination, incorporates many of the practical environmental review steps taken in the process of establishing and modifying special use airspace. This draft document, which is more specific than FAA Order 1050.1D, Appendix 3, is used by the Southwest Region Air Traffic Division as a practical guide to the FAA review process.

SUA falls into two categories. One category consists of airspace subject to rule making actions relating to restricted and prohibited areas. The other category consists of airspace subject to non-rule making actions related to alert areas, controlled firing areas, offshore warning areas, and MOAs. MOAs are established to separate and/or segregate certain nonhazardous military activities from aircraft flying under Instrument Flight Rules (IFR) and to identify these activities for aircraft flying under Visual Flight Rules (VFR). Final approval authority for MOAs rests with the Airspace and Rules Division (ATA-400), Headquarters FAA.

When a MOA proposal is submitted to the FAA Regional Air Traffic Division, the regional FAA office reviews the proposal from an aeronautical perspective and conducts a preliminary review of the proponent's environmental documentation. Since the FAA is the approval authority for SUA actions, it cannot take a position on any particular SUA proposal prior to the completion of the NEPA and aeronautical processing phases. When the regional FAA office is notified early in the environmental process and asked by the military to participate in NEPA meetings and scoping actions, the regional FAA Air Traffic Division designates the FAA representatives and encourages participation in the NEPA process.

According to CEQ guidelines, the FAA has the discretion to adopt an environmental assessment or an environmental impact statement prepared by the military, provided that the FAA independently

reviews the document and assesses whether it meets the standard for adequacy under NEPA, CEQ regulations, and the FAA's own regulations. In adopting the document, the FAA must assume responsibility for the scope and content of the document or prepare its own supportive environmental documents and issue an independent decision document. It is important to note that the FAA usually does not begin the environmental review process until there is a formal airspace proposal submitted. In the majority of past cases, the FAA has not been informed of the proponent's initiation of NEPA actions until the environmental documentation has been sent to the regional office along with the airspace proposal.

Environmental Programs Division (ATA-300) of the FAA was established to assist and support the review process for airspace actions. In addition, each FAA region has a trained environmental specialist in its Air Traffic Division who initiates the environmental review process for military SUA proposals and examines environmental documentation coming from that region. This regional review ensures that applicable impact categories and any specific FAA environmental concerns are considered in the documents. Concurrent with the regional review, the ATA-300 office begins the review process with information forwarded by the region and from the military proponent.

During the process, the FAA regional office has the following responsibilities:

- Examining document format;
- Confirming that the proposed airspace falls within the area that was environmentally assessed and that justification for the proposal is included;
- Reviewing the timeliness, level of controversy, and whether public and interagency involvement has been encouraged or sought by the proponent;
- Analyzing public comments and interagency letters related to airspace issues;
- Ensuring that the concerns raised during public comment have been addressed;
- Determining whether cumulative impacts from a regional perspective are addressed; and
- Ascertaining whether decision documents are reflective of the actions being proposed.

The regional specialist may either coordinate directly with the military proponent or coordinate within the FAA to ATA-300 regarding any questions or comments about the documentation. When ATA-300 has concerns with the proponent’s environmental documentation or efforts, it will transmit these concerns back to the regional office, which will then forward these concerns to the proponent for answers or comments. This review process may cause delays in the approval process, with some actions taking much longer than a year to resolve. ATA-300 coordinates environmental actions and works with Headquarters FAA Environmental Law Branch (AGC-620) to determine the ultimate sufficiency of environmental actions taken by the proponent.

MTRs are neither rule making nor non-rule making actions, nor are they categorized as SUA. FAA Order 1050.1D makes reference to SUA but not to MTRs. These routes are considered in FAA Order 7610.4H as Special Military Operations. Chapter 11 of this order prescribes policy, criteria, and administrative and operating procedures pertaining to routes for military training conducted below 10,000 feet Mean Sea Level (MSL) and in excess of 250 knots indicated airspeed. There are two main types of MTRs: Instrument Routes (IRs) and Visual Routes (VRs). IRs allow Instrument Flight Rules (IFRs) separation from other known air traffic and VRs allow flight under Visual Flight Rules (VFRs). IRs and VRs have different actions, procedures, and/or processes for approval.

IR requirements are validated by the appropriate military major command and are coordinated with FAA Air Route Traffic Control Centers for aeronautical concurrence. Once the routes are formally proposed, they are forwarded to the appropriate military major command headquarters for review and environmental certification. Formal proposals are reviewed at the FAA Regional Air Traffic Division. FAA Order 7610.4H states that the regional Air Traffic division shall:

- Coordinate all proposals with other interested FAA divisions;
- Determine when proposals will increase the burden on civil users of the navigable airspace and coordinate those proposals with the appropriate civil aviation user groups; and
- Approve or disapprove the proposal and notify the regional military representative, in writing, within 45 days of receipt of the original proposal.

These requirements are aeronautically focused, with no reference to environmental review. This order also states that the FAA Regional Air Traffic Division is the final approval authority for all IR proposals and revisions. Regional offices have historically viewed this role as approval based upon aeronautical effects. The review of the environmental documentation is not prescribed or assigned to the FAA regional Air Traffic Division by order; however, this review is normally made to assure that the military's environmental process has been addressed.

Final approval authority for the establishment of VRs rests with the appropriate military major command headquarters. FAA Order 7610.4H states that the FAA Regional Air Traffic Division in whose area the route originates shall submit the approved FAA form 7110-4 to the National Flight Data Center, so that it can be issued via the National Flight Data Digest for charting and description in appropriate Flight Publications. As with IRs, the review of the VR's environmental documentation is not prescribed or assigned to the FAA Regional Air Traffic Division; however, this review is normally made to ensure the military's environmental process has been addressed. Also, MTR environmental documents are not normally retained in the FAA regional offices, since the MTR programs rest with the military.

Air Route Traffic Control Center
8000 Louisiana Blvd. NE
Albuquerque, NM 87109

DEC 31 1998

Alton Chavis
Chief, Environmental Analysis Branch
HQ ACC/CEVP
129 Andrews Street, Suite 102
Langley AFB, VA 23665-2769

Dear Mr. Chavis:

As per the request in your memorandum dated December 17, 1998, Subject: Cooperating Agency Point of Contact (POC) for Realistic Bomber Training Initiative (RBTI) Environmental Impact Statement (EIS), Albuquerque Center will serve as a cooperating agency. We designate David B. Wingert, Support Manager, Airspace and Procedures, ZAB-530, as our POC. Dave can be reached at DSN 245-1530 or (505) 856-4530.

Sincerely,

for Joan M. Mallen
Air Traffic Manager

ASW-530

APPENDIX D

CANDIDATE EMITTER SITES AND ELECTRONIC SCORING SITE LOCATIONS

The Air Force carefully studied each candidate site for emitters and electronic scoring sites. This process resulted in identification of more candidate sites than would be needed under each action alternative. Should an action alternative be selected after completion of the Record of Decision, the ten emitter and two electronic scoring sites would also be selected.

Out of the 42 candidate sites, 40 are located on private land and two on federal government property. To acquire the right to construct and operate the ground-based assets on private property, the Air Force would need to lease or purchase 11 sites (for five MTR emitters, five MOA emitters, and one MTR Electronic Scoring Site). The twelfth site would accommodate the en route Electronic Scoring Site. These candidate sites for the en route Electronic Scoring Site are found on government property and are located near and managed by Dyess AFB. They represent the only candidates for the one en route Electronic Scoring Site proposed for all three action alternatives. To meet the requirements for the Electronic Scoring Site, the Air Force would construct a new building, link it to on-site power, telephone, and water sources, and install a septic system. For the emitter sites, existing power and telephone lines would be used to the greatest extent possible.

The following county maps identify the candidate emitter and Electronic Scoring Sites. Given the large geographic extent of the study area, the scales of the maps are not similar. Major roads, towns, and rivers are provided to assist the reader in locating the site. The maps are arranged alphabetically, first by state, then by county. The following list provides the figure numbers:

New Mexico counties:

Colfax	D-1
Guadalupe	D-2
Harding	D-3
Mora	D-4
Quay	D-5
Union	D-6

Texas counties:

APPENDIX E
FIELD SURVEY RESULTS

To support RBTI, an interrelated system of ground-based and airspace assets would be developed. The ground-based assets would include an Electronic Scoring Site (ESS) system composed of five MTR and five MOA emitter sites, as well as one MTR and one en route Electronic Scoring Site—all twelve sites would be 15 acres in size. Depending on the action alternative chosen, sites would be located in western Texas or northeastern New Mexico.

The Air Force identified a total of 42 candidate sites for these ground-based assets. Field investigations by professional scientists were conducted at each of the 15-acre sites for hazardous wastes and contamination; wetlands and threatened and endangered species; and archaeological resources. The following table outlines the results of these investigations and the field methods are described below.

Section 4.3 (Biological Resources) and Section 4.5 (Cultural Resources), in the RBTI final EIS, discuss each of the sites and the potential for impacts. Appendix H (Biological Resources Support Documentation) provides an index to the species identified in the RBTI EIS as well as the state and federal threatened, endangered, and sensitive species found in the RBTI study area. Section 2.5.4 discusses the results of the Environmental Baseline Survey.

Environmental Baseline Survey

Site assessments were generated by conducting a visual inspection of the candidate sites, interviewing available landowners, and reviewing all available data on potential contamination sources. Documents reviewed consisted of environmental databases from federal and state regulatory agencies, aerial photographs, historic maps, site plans, floor plans, and chain-of-title information.

Biology

A background literature review was conducted prior to the site visits. Pertinent soil surveys of each county (dates ranging from 1973 to 1994), topographic maps, and National Wetland Inventory maps (dates ranging from 1987 to 1994) were used to identify potential jurisdictional wetlands, non-jurisdictional wetlands, and "Waters of the United States." Sensitive species of concern were also identified by state and federal agencies. The following agencies were contacted regarding sensitive species that could potentially be affected by the RBTI project.

The US Fish and Wildlife Service in Albuquerque, NM.

The US Fish and Wildlife Service in Austin, TX

The US Fish and Wildlife Service in Arlington, TX.

Texas Parks and Wildlife Department, Texas Biological and Conservation Data System.

Internet data from the US Fish and Wildlife Service, Texas Parks and Wildlife Department, New Mexico Department of Game and Fish, and The New Mexico Natural Heritage Program.

Each of the 42 candidate emitter and electronic scoring sites were visited by biologists: the Texas surveys were conducted 20-28 April 1998 and the New Mexico surveys were conducted 11-18 May 1998. Field visits were also conducted 10-11 September 1998 in order to survey additional sites in Texas that were added to the program at that time. Dominant plant species were identified and vegetation cover was determined, wildlife observations were recorded, and potential habitat for threatened and endangered species, and other species of concern, were noted when present. Site data forms were used to record wetland indicators, or lack of the indicators, and species observed. Scaled maps were drawn and photographs were taken.

Cultural Resources

All 42 candidate sites, 22 sites in western Texas and 20 sites in northeastern New Mexico, were intensively and systematically surveyed for cultural resources. Prior to fieldwork, a records search was conducted for all emitter and electronic emitter site locations in Texas through the Texas Archaeological Research Laboratory (TARL) and in New Mexico through the Archaeological Records Management Section (ARMS) of the New Mexico Historic Preservation Division. The goal was to identify all previously recorded prehistoric and historic resources within one mile of each site.

Fieldwork involved an intensive pedestrian survey of each of the forty-two 15-acre parcels in Texas and New Mexico. Archaeologists surveyed each parcel in a north-south direction using transect intervals spaced 25 meters apart or less. The specific transect interval at a candidate emitter and electronic scoring site depended on the field conditions, terrain, and surface visibility. Once an artifact was encountered, transects were reduced to three meters or less. In general, surface visibility was very good and the transect interval was close enough to identify any potentially significant cultural resources.

All archaeological resources were recorded and characteristics of the site were noted on quadrat summary forms. For prehistoric and historic sites identified at the Texas locations, State of Texas Archaeological Site Data Forms were filled out. For sites found in New Mexico, the Laboratory of Anthropology Site Record was completed, photographs of archaeological sites were taken, and artifacts were drawn to scale. Isolated finds were documented in field notes; neither Texas nor New Mexico require a specific isolate form. No architectural resources over 50 years old were identified on any of the candidate sites in either Texas or New Mexico.

Table E-1. Field Survey Results

Site Type	*Candidate Sites*	*Alternative*	*County*	*State*	*Current Land Use*	*EBS Concerns*	*Biological Concerns*	*Cultural Concerns*
MTR emitter	2	D	Guadalupe	NM	Grazing	None	None	1 prehistoric isolate

APPENDIX F
AIR QUALITY

This appendix includes supporting data for the air quality analysis for all four alternatives. Tables F-1 through F-3 present the total emissions and tons per year of criteria pollutants for each affected Air Quality Control Region (AQCR) associated with Alternatives A, B, and C. Table F-4 presents the same type of data for baseline emissions of Alternative D; Table F-5 presents projected emissions totals for Alternative D. Tables F-6 through F-8 contain the MAILS input information and results for Alternatives A, B, C, and D.

Note: The MAILS analysis presented for Alternatives B and C in this appendix include calculations for GAF Tornados flying on IR-102/141 and overlapping with IR-178. As described in Section 2.2 of the EIS, IR-102/141 has been eliminated and no Tornados would fly on this MTR. Therefore, the discussion of the MAILS results presented in Sections 4.1.3 and 4.1.4 of the EIS has been modified to reflect the elimination of Tornado aircraft on IR 102/141.

APPENDIX G
NOISE

AIRCRAFT NOISE ANALYSIS

Noise is generally described as unwanted sound. Unwanted sound can be based on objective effects (hearing loss, damage to structures, etc.) or subjective judgments (community annoyance). Noise analysis thus requires a combination of physical measurement of sound, physical and physiological effects, plus psycho- and socioacoustic effects.

Section 1 of this Appendix describes how sound is measured, and summarizes noise impact in terms of community acceptability and land use compatibility. Section 2 gives detailed descriptions of the effects of noise which lead to the impact guidelines presented in Section 1. Section 3 provides a description of the specific methods used to predict aircraft noise.

1.0 NOISE DESCRIPTORS AND IMPACT

The aircraft noise assessed in this document is the continuous sound generated by the aircraft's engines and also by air flowing over the aircraft itself. Section 1.1 describes the quantities which are used to describe sound. Section 1.2 describes the specific noise metrics used for noise impact analysis. Section 1.3 describes how environmental impact and land use compatibility are judged in terms of these quantities.

1.1 QUANTIFYING SOUND

Measurement and perception of sound involves two basic physical characteristics: amplitude and frequency. Amplitude is a measure of the strength of the sound and is directly measured in terms of the pressure of a sound wave. Because sound pressure varies in time, various types of pressure averages are usually used. Frequency, commonly perceived as pitch, is the number of times per second the sound causes air molecules to oscillate. Frequency is measured in units of cycles per second, or Hertz (Hz).

Amplitude. The loudest sounds the human ear can comfortably hear have acoustic energy one trillion times the acoustic energy of sounds the ear can barely detect. Because of this vast range, attempts to represent sound amplitude by pressure are generally unwieldy. Sound is therefore usually represented on a logarithmic scale with a unit called the decibel (dB). Sound on the decibel scale is referred to as a sound level. The threshold of human hearing is approximately 0 dB, and the threshold of discomfort or pain is around 120 dB.

Because of the logarithmic nature of the decibel scale, sounds levels do not add and subtract directly and are somewhat cumbersome to handle mathematically. However, some simple rules of thumb are useful in dealing with sound levels. First, if a sound's intensity is doubled, the sound level increases by 3 dB, regardless of the initial sound level. Thus, for example:

60 dB + 60 dB = 63 dB, and

80 dB + 80 dB = 83 dB.

The total sound level produced by two sounds of different levels is usually only slightly more than the higher of the two. For example:

60.0 dB + 70.0 dB = 70.4 dB.

Because the addition of sound levels behaves differently than that of ordinary numbers, such addition is often referred to as "decibel addition" or "energy addition." The latter term arises from the fact that combination of decibel values consists of first converting each decibel value to its corresponding acoustic energy, then adding the energies using the normal rules of addition, and finally converting the total energy back to its decibel equivalent.

The difference in dB between two sounds represents the ratio of the amplitudes of those two sounds. Because human senses tend to be proportional (i.e., detect whether one sound is twice as big as another) rather than absolute (i.e., detect whether one sound is a given number of pressure units bigger than another), the decibel scale correlates well with human response.

Under laboratory conditions, differences in sound level of 1 dB can be detected by the human ear. In the community, the smallest change in average noise level that can be detected is about 3 dB. A change in sound level of about 10 dB is usually perceived by the average person as a doubling (or halving) of the sound's loudness, and this relation holds true for loud sounds and for quieter sounds. A decrease in sound level of 10 dB actually represents a 90 percent decrease in sound *intensity* but only a 50 percent decrease in perceived *loudness* because of the nonlinear response of the human ear (similar to most human senses).

Frequency. The normal human ear can hear frequencies from about 20 Hz to about 20,000 Hz. It is most sensitive to sounds in the 1,000 to 4,000 Hz range. When measuring community response to noise, it is common to adjust the frequency content of the measured sound to correspond to the frequency sensitivity of the human ear. This adjustment is called A-weighting (American National Standards Institute [ANSI] 1988). Sound levels that have been so adjusted are referred to as A-weighted sound levels. The amplitude of A-weighted sound levels is measured in dB. It is common for some noise analysts to denote the unit of A-weighted sounds by dBA or dB(A). As long as the use of A-weighting is understood, there is no difference between dB, dBA or dB(A). It is only important that the use of A-weighting be made clear. In this study, sound levels are reported in dB and are A-weighted unless otherwise specified.

Time Averaging. Sound pressure of a continuous sound varies greatly with time, so it is customary to deal with sound levels that represent averages over time. Levels presented as instantaneous (i.e., as might be read from the dial of a sound level meter), are based on averages of sound energy over either 1/8 second (fast) or one second (slow). The formal definitions of fast and slow levels are somewhat complex, with details that are important to the makers and users of instrumentation. They may, however, be thought of as levels corresponding to the root-mean-square sound pressure measured over the 1/8-second or 1-second periods. The most common uses of the fast or slow sound level in environmental analysis is in the discussion of the maximum sound level that occurs from the action, and in discussions of typical sound levels. Figure G-1 is a chart of A-weighted sound levels of typical sounds. Some (air conditioner, vacuum cleaner) are continuous sounds whose levels are constant for some time. Some (automobile, heavy truck) are the maximum sound during a vehicle passby. Some (urban daytime, urban nighttime) are averages over some extended period. A variety

of noise metrics have been developed to describe noise over different time periods. These are described in Section 1.2.

1.2 NOISE METRICS

1.2.1 Maximum Sound Level

The highest A-weighted sound level measured during a single event in which the sound level changes value as time goes on (e.g., an aircraft overflight) is called the maximum A-weighted sound level or maximum sound level, for short. It is usually abbreviated by ALM, L_{max} or L_{Amax}. The maximum sound level is important in judging the interference caused by a noise event with conversation, TV or radio listening, sleep, or other common activities.

1.2.2 Peak Sound Level

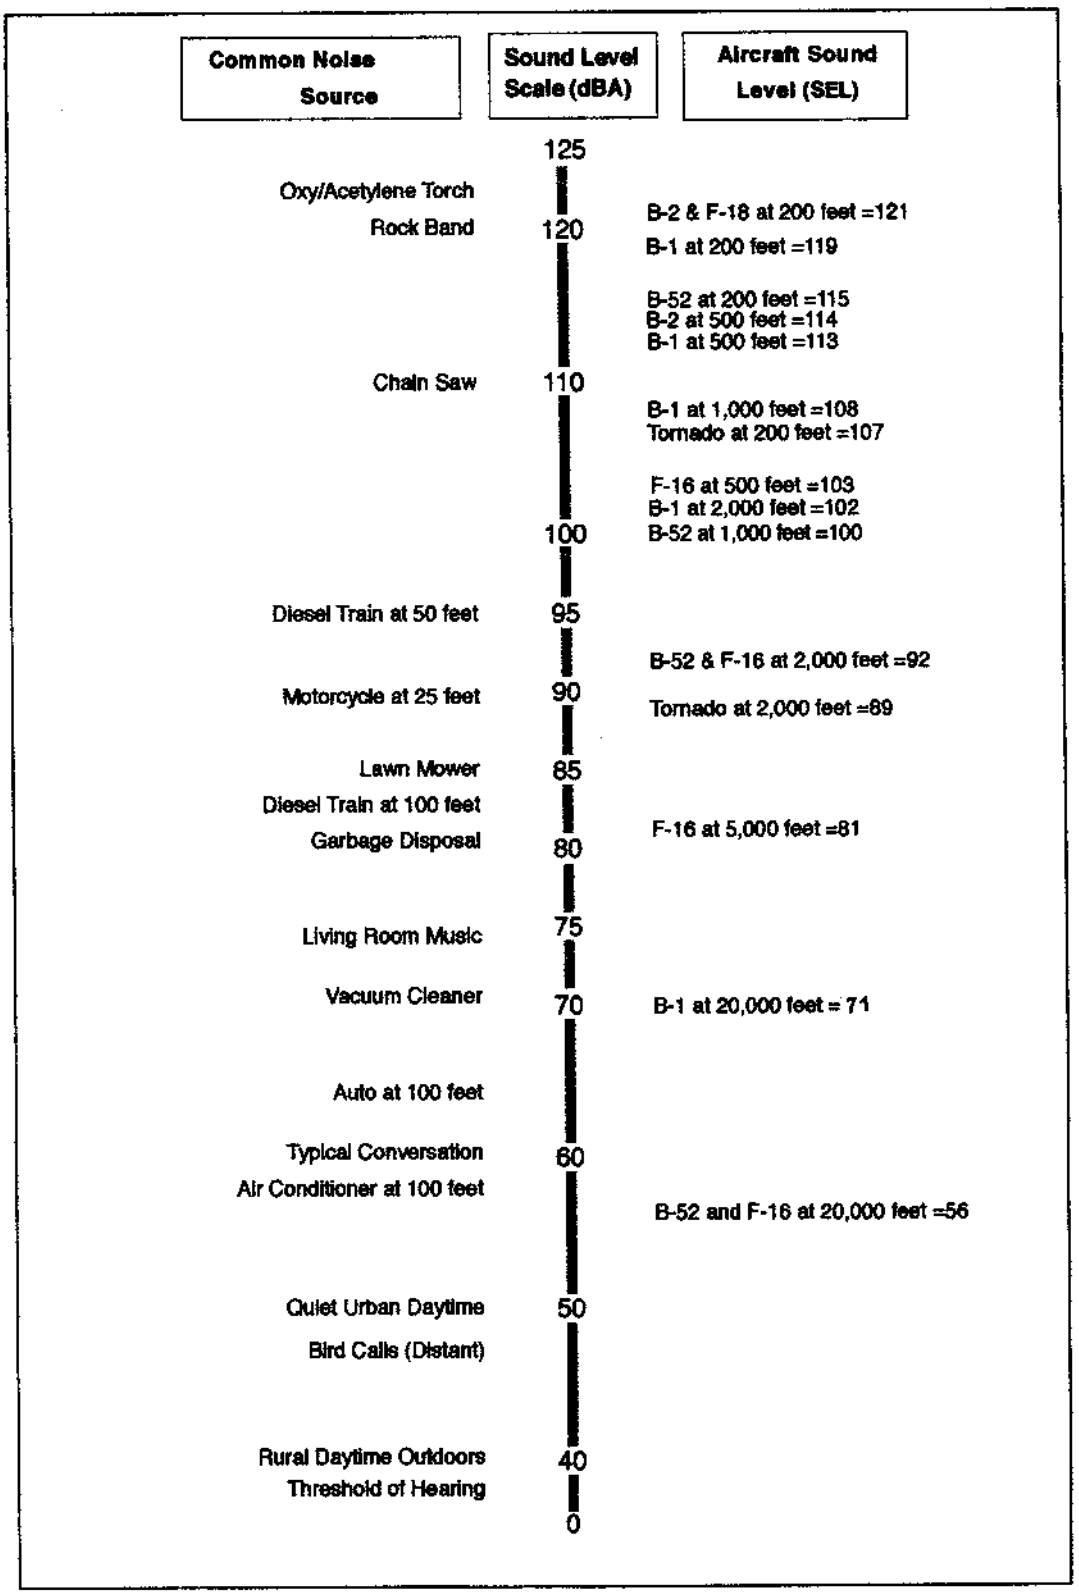
For impulsive sounds, the true instantaneous sound pressure is of interest. For sonic booms, this is the peak pressure of the shock wave. This pressure is usually presented in physical units of pounds per square foot. Sometimes it is represented on the decibel scale, with symbol L_{pk}. Peak sound levels do not use A weighting.

1.2.3 Sound Exposure Level

Individual time-varying noise events have two main characteristics—a sound level which changes throughout the event and a period of time during which the event is heard. Although the maximum sound level, described above, provides some measure of the intrusiveness of the event, it alone does not completely describe the total event. The period of time during which the sound is heard is also significant. The Sound Exposure Level (abbreviated SEL or L_{AE} for A-weighted sounds) combines both of these characteristics into a single metric.

Sound exposure level is a composite metric which represents both the intensity of a sound and its duration. Mathematically, the mean square sound pressure is computed over the duration of the event, then multiplied by the duration in seconds, and the resultant product is turned into a sound level. It does not directly represent the sound level heard at any given time, but rather provides a measure of the net impact of the entire acoustic event. It has been well established in the scientific community that Sound Exposure Level measures this impact much more reliably than just the maximum sound level.

Because the sound exposure level and the maximum sound level are both used to describe single events, there is sometimes confusion between the two, so the specific metric used should be clearly stated.



Typical A-Weighted Sound Levels of Common Sounds **Figure G-1**

1.2.4 Equivalent Sound Level

For longer periods of time, total sound is represented by the equivalent continuous sound pressure level (L_{eq}). L_{eq} is the average sound level over some time period (often an hour or a day, but any explicit time span can be specified), with the averaging being done on the same energy basis as used for SEL. SEL and L_{eq} are closely related, differing by (a) whether they are applied over a specific time period or over an event, and (b) whether the duration of the event is included or divided out.

Just as SEL has proven to be a good measure of the noise impact of a single event, L_{eq} has been established to be a good measure of the impact of a series of events during a given time period. Also, while L_{eq} is defined as an average, it is effectively a sum over that time period and is thus a measure of the cumulative impact of noise.

1.2.5 Day-Night Average Sound Level

Noise tends to be more intrusive at night than during the day. This effect is accounted for by applying a 10-dB penalty to events that occur after 10 PM and before 7 AM. If L_{eq} is computed over a 24-hour period with this nighttime penalty applied, the result is the day-night average sound level (DNL or L_{dn}). DNL is the community noise metric recommended by the U.S. Environmental Protection Agency (U.S. Environmental Protection Agency [USEPA] 1972) and has been adopted by most federal agencies (Federal Interagency Committee on Noise [FICON] 1992). It has been well established that DNL correlates well with community response to noise (Schultz 1978; Finegold *et al*. 1994). This correlation is presented in Section 1.3.

While DNL carries the nomenclature "average," it incorporates all of the noise at a given location. For this reason, DNL is often referred to as a "cumulative" metric. It accounts for the total, or cumulative, noise impact.

1.2.6 Onset-Adjusted Monthly Day-Night Average Sound Level

Aircraft operations in military airspaces generate a noise environment somewhat different from other community noise environments. Overflights are sporadic, occurring at random times and varying from day to day and week to week. This situation differs from most community noise environments, in which noise tends to be continuous or patterned. Individual military overflight events also differ from typical community noise events: noise from a low-altitude, high-airspeed flyover can have a rather sudden onset.

To represent these differences, the conventional Day-Night Average Sound Level metric is adjusted to account for the "surprise" effect of the sudden onset of aircraft noise events on humans. For aircraft exhibiting a rate of increase in sound level (called onset rate) of 15 to 150 dB per second, an adjustment or penalty ranging from 0 to 11 dB is added to the normal Sound Exposure Level. Onset rates above 150 dB per second require an 11 dB penalty, while onset rates below 15 dB per second require no adjustment. The Day-Night Average Sound Level is then determined in the same manner as for conventional aircraft noise events and is designated as Onset-Rate Adjusted Day-Night Average Sound Level (abbreviated L_{dnmr}). Because of the irregular occurrences of aircraft operations, the number of average daily operations is determined by using the calendar month with the highest number of operations. The monthly average is denoted L_{dnmr}.

1.3 NOISE IMPACT

1.3.1 Community Reaction

Studies of community annoyance to numerous types of environmental noise show that DNL correlates well with impact. Schultz (1978) showed a consistent relationship between DNL and annoyance. Figure G-2 shows Shultz's original curve fit. This result shows that there is a remarkable consistency in results of attitudinal surveys which relate the percentages of groups of people who express various degrees of annoyance when exposed to different Day-Night Average Sound Levels.

A more recent study has reaffirmed this relationship (Fidell *et al.* 1991). Figure G-3 (FICON 1992) shows an updated form of the curve fit (Finegold *et al*. 1994) in comparison with the original. The updated fit, which does not differ substantially from the original, is the current preferred form. In general, correlation coefficients of 0.85 to 0.95 are found between the percentages of groups of people highly annoyed and the level of average noise exposure. The correlation coefficients for the annoyance of individuals are relatively low, however, on the order of 0.5 or less. This is not surprising, considering the varying personal factors which influence the manner in which individuals react to noise. Nevertheless, findings substantiate that community annoyance to aircraft noise is represented quite reliably using Day-Night Average Sound Level.

As noted earlier for Sound Exposure Level, Day-Night Average Sound Level does not represent the sound level heard at any particular time, but rather represents the total sound exposure. It accounts for the sound level of individual noise events, the duration of those events, and the number of events. Its use is endorsed by the scientific community (ANSI 1988, ANSI 1980, FICON 1992, FICUN 1980, USEPA 1972).

While DNL is the best metric for quantitatively assessing cumulative noise impact, it does not lend itself to intuitive interpretation by non-experts. Accordingly, it is common for environmental noise analyses to include other metrics for illustrative purposes. A general indication of the noise environment can be presented by noting the maximum sound levels which can occur and the number of times per day noise events will be loud enough to be heard. Use of other metrics as supplements to DNL has been endorsed by federal agencies (FICON 1992).

There are several points of interest in the noise-annoyance relation. The first is DNL of 65 dB. This is a level most commonly used for noise planning purposes, and represents a compromise between community impact and the need for activities like aviation which do cause noise. Areas exposed to DNL above 65 dB are generally not considered suitable for residential use. The second is DNL of 55 dB, which was identified by EPA as a level below which there is effectively no adverse impact (USEPA 1972). The third is DNL of 75 dB. This is the lowest level at which adverse health effects could be credible (USEPA 1972). The very high annoyance levels make such areas unsuitable for residential land use.

1.3.2. Land Use Compatibility

As noted above, the inherent variability between individuals makes it impossible to predict accurately how any individual will react to a given noise event. Nevertheless, when a community is considered as a whole, its overall reaction to noise can be represented with a high degree of confidence. As described above, the best noise exposure metric for this correlation is the Day-Night Average Sound Level or Onset-Rate Adjusted Day-Night Average Sound Level for military overflights.

In June 1980, an ad hoc Federal Interagency Committee on Urban Noise published guidelines (FICUN 1980) relating Day-Night Average Sound Levels to compatible land uses. This committee was composed of representatives from the United States Departments of Defense, Transportation, and Housing and Urban Development; the Environmental Protection Agency; and the Veterans Administration. Since the issuance of these guidelines, federal agencies have generally adopted these guidelines for their noise analyses.

Following the lead of the committee, the Department of Defense and the Federal Aviation Administration (FAA) adopted the concept of land-use compatibility as the accepted measure of aircraft noise effect. The FAA included the committee's guidelines in the Federal Aviation Regulations. These regulations are reprinted in Table G-1, along with the explanatory notes included in the regulation. Although these guidelines are not mandatory (note the footnote "*" in the table), they provide the best means for determining noise impact in airport communities. In general, residential land uses normally are not compatible with outdoor Day-Night Average Sound Levels (DNL values) above 65 dB, and the extent of land areas and populations exposed to DNL of 65 dB and higher provides the best means for assessing the noise impacts of alternative aircraft actions.

2.0 NOISE EFFECTS

The discussion in section 1.3 presents the global effect of noise on communities. The following sections describe particular noise effects.

2.1 HEARING LOSS

Noise-induced hearing loss is probably the best defined of the potential effects of human exposure to excessive noise. Federal work place standards for protection from hearing loss allow a time-average level of 90 dB over an 8-hour work period, or 85 dB averaged over a 16-hour period. Even the most protective criterion (no measurable hearing loss for the most sensitive portion of the population at the ear's most sensitive frequency, 4,000 Hz, after a 40-year exposure) suggests a time-average sound level of 70 dB over a 24-hour period (USEPA 1972).

Table G-1. Land-Use Compatibility With Yearly Day-Night Average Sound Levels

* The designations contained in this table do not constitute a federal determination that any use of land covered by the program is acceptable or unacceptable under federal, state, or local law. The responsibility for determining the acceptable and permissible land uses and the relationship between specific properties and specific noise contours rests with the local authorities. FAA determinations under Part 150 are not intended to substitute federally determined land uses for those determined to be appropriate by local authorities in response to locally determined needs and values in achieving noise-compatible land uses.

KEY TO TABLE G-1

SLUCM = Standard Land-Use Coding Manual.

Y (YES) = Land Use and related structures compatible without restrictions.

N (No) = Land Use and related structures are not compatible and should be prohibited.

NLR = Noise Level Reduction (outdoor to indoor) to be achieved through incorporation of noise attenuation into the design and construction of the structure.

25, 30, or 35 = Land Use and related structures generally compatible; measures to achieve NLR of 25, 30, or 35 dB must be incorporated into design and construction of structures.

NOTES FOR TABLE G-1

(1) Where the community determines that residential or school uses must be allowed, measures to achieve outdoor-to-indoor Noise Level Reduction (NLR) of at least 25 dB and 30 dB should be incorporated into building codes and be considered in individual approvals. Normal residential construction can be expected to provide an NLR of 20 dB; thus the reduction requirements are often stated as 5, 10, or 15 dB over standard construction and normally assume mechanical ventilation and closed windows year-round. However, the use of NLR criteria will not eliminate outdoor noise problems.

(2) Measures to achieve NLR 25 dB must be incorporated into the design and construction of portions of these buildings where the public is received, office areas, noise-sensitive areas, or where the normal noise level is low.

(3) Measures to achieve NLR 30 dB must be incorporated into the design and construction of portions of these buildings where the public is received, office areas, noise-sensitive areas, or where the normal noise level is low.

(4) Measures to achieve NLR 35 dB must be incorporated into the design and construction of portions of these buildings where the public is received, office areas, noise-sensitive areas, or where the normal noise level is low.

(5) Land-use compatible provided special sound reinforcement systems are installed.

(6) Residential buildings require an NLR of 25.

(7) Residential buildings require an NLR of 30.

(8) Residential buildings not permitted.

2.2 NONAUDITORY HEALTH EFFECTS

Nonauditory health effects of long-term noise exposure, where noise may act as a risk factor, have not been found to occur at levels below those protective against noise-induced hearing loss, described above. Most studies attempting to clarify such health effects have found that noise exposure levels established for hearing protection will also protect against any potential nonauditory health effects, at least in work place conditions. The best scientific summary of these findings is contained in the lead paper at the National Institutes of Health Conference on Noise and Hearing Loss held on 22 to 24 January 1990 in Washington, D.C. This lead paper stated the following: "The nonauditory effects of chronic noise exposure, when noise is suspected to act as one of the risk factors in the development of hypertension, cardiovascular disease, and other nervous disorders, have never been proven to occur as chronic manifestations at levels below these criteria (an average of 75 dBA for complete protection against hearing loss for an eight-hour day). At the 1988 International Congress on Noise as a Public Health Problem, most studies attempting to clarify such health effects did not find them at levels below the criteria protective of noise-induced hearing loss, and even above these criteria, results regarding such health effects were ambiguous. Consequently, it can be concluded that establishing and enforcing exposure levels protecting against noise-induced hearing loss would not only solve the noise-induced hearing loss problem but also any potential nonauditory health effects in the work place." (von Gierke 1990; parenthetical wording added for clarification).

Although these findings were directed specifically at noise effects in the work place, they are equally applicable to aircraft noise effects in the community environment. Research studies regarding the nonauditory health effects of aircraft noise are ambiguous at best, and often contradictory. Yet, even those studies which purport to find such health effects use time-average noise levels of 75 dB and higher for their research.

For example, in an often-quoted paper, two UCLA researchers found a relation between aircraft noise levels under the approach path to Los Angeles International Airport (LAX) and increased mortality rates among the exposed residents by using an average noise exposure level greater than 75 dB for the "noise-exposed" population (Meecham and Shaw 1979). Nevertheless, three other UCLA professors analyzed those same data and found no relation between noise exposure and mortality rates (Frericks *et al.* 1980).

As a second example, two other UCLA researchers used this same population near LAX to show a higher rate of birth defects during the period of 1970 to 1972 when compared with a control group residing away from the airport (Jones and Tauscher 1978). Based on this report, a separate group at the U.S. Centers for Disease Control performed a more thorough study of populations near Atlanta's Hartsfield International Airport for 1970 to 1972 and found no relation in their study of 17 identified categories of birth defects to aircraft noise levels above 65 dB (Edmonds 1979).

A review of health effects, prepared by a Committee of the Health Council of the Netherlands (1996) reviewed currently available published information on this topic. They concluded that the threshold for possible long-term health effects was a 16-hour (0600 to 2200) L_{eq} of 70 dB. Projecting this to 24 hours and applying the 10 dB nighttime penalty used with DNL, this corresponds to DNL of about 75 dB. The study also affirmed the risk threshold for hearing loss, as discussed earlier.

In summary, there is no scientific basis for a claim that potential health effects exist for aircraft time-average sound levels below 75 dB.

2.3 ANNOYANCE

The primary effect of aircraft noise on exposed communities is one of annoyance. Noise annoyance is defined by the U.S. Environmental Protection Agency as any negative subjective reaction on the part of an individual or group (USEPA 1972). As noted in the discussion of Day-Night Average Sound Level above, community annoyance is best measured by that metric.

Because the EPA Levels Document (USEPA 1972) identified DNL of 55 dB as ". . . requisite to protect public health and welfare with an adequate margin of safety," it is commonly assumed that 55 dB should be adopted as a criterion for community noise analysis. From a noise exposure perspective, that would be an ideal selection. However, financial and technical resources are generally not available to achieve that goal. Most agencies have identified DNL of 65 dB as a criterion which protects those most impacted by noise, and which can often be achieved on a practical basis (FICON 1992). This corresponds to about 12 percent of the exposed population being highly annoyed. Although DNL of 65 dB is widely used as a benchmark for significant noise impact, and is often an acceptable compromise, it is not a statutory limit and it is appropriate to consider other thresholds in particular cases.

2.4 SPEECH INTERFERENCE

Speech interference associated with aircraft noise is a primary cause of annoyance to individuals on the ground. The disruption of routine activities such as radio or television listening, telephone use, or family conversation gives rise to frustration and irritation. The quality of speech communication is also important in classrooms, offices, and industrial settings and can cause fatigue and vocal strain in those who attempt to communicate over the noise. Research has shown that the use of the Sound Exposure Level metric will measure speech interference successfully, and that a Sound Exposure Level exceeding 65 dB will begin to interfere with speech communication.

2.5 SLEEP INTERFERENCE

Sleep interference is another source of annoyance associated with aircraft noise. This is especially true because of the intermittent nature and content of aircraft noise, which is more disturbing than continuous noise of equal energy and neutral meaning. Sleep interference may be measured in either of two ways. "Arousal" represents actual awakening from sleep, while a change in "sleep stage" represents a shift from one of four sleep stages to another stage of lighter sleep without actual awakening. In general, arousal requires a somewhat higher noise level than does a change in sleep stage.

An analysis sponsored by the U.S. Air Force summarized 21 published studies concerning the effects of noise on sleep (Pearsons *et al.* 1989). The analysis concluded that a lack of reliable in-home studies, combined with large differences among the results from the various laboratory studies, did not permit development of an acceptably accurate assessment procedure. The noise events used in the laboratory studies and in contrived in-home studies were presented at much higher rates of occurrence than would normally be experienced. None of the laboratory studies were of sufficiently long duration to determine any effects of habituation, such as that which would occur under normal community conditions. A recent extensive study of sleep interference in people's own homes (Ollerhead 1992) showed very little disturbance from aircraft noise.

There is some controversy associated with the recent studies, so a conservative approach should be taken in judging sleep interference. Based on older data, the U.S. Environmental Protection Agency identified an indoor Day-Night Average Sound Level of 45 dB as necessary to protect against sleep interference (USEPA 1972). Assuming a very conservative structural noise insulation of 20 dB for typical dwelling units, this corresponds to an outdoor Day-Night Average Sound Level of 65 dB as minimizing sleep interference.

A 1984 publication reviewed the probability of arousal or behavioral awakening in terms of Sound Exposure Level (Kryter 1984). Figure G-4, extracted from Figure 10.37 of Kryter (1984), indicates that an indoor Sound Exposure Level of 65 dB or lower should awaken less than 5 percent of those exposed. These results do not include any habituation over time by sleeping subjects. Nevertheless, this provides a reasonable guideline for assessing sleep interference and corresponds to similar guidance for speech interference, as noted above.

2.6 NOISE EFFECTS ON LIVESTOCK AND WILDLIFE

Animal responses to aircraft are influenced by many variables including aircraft size, proximity (both height above the ground and lateral distance), engine noise, color, and flight profile. The type of aircraft (e.g., fixed-wing versus rotary-winged [helicopters]) and its flight mission may also produce different levels of disturbance and animal response (Smith *et al.* 1988).

LIVESTOCK

A large bibliography of studies on the effects of aircraft noise on livestock has found a varied effect, although a large number of the studies minimize the effects of aircraft overflight on the health and well-being of these animals. The following is a summary of the literature findings by major domestic animal types found in the RBTI region. Although some studies report that the comprehensive effects on aircraft noise on domestic animals is inconclusive, a majority of the literature reviewed indicates that domestic animals exhibit minimal behavioral reactions to military overflights and seem to habituate to the disturbances over a period of time. There is no evidence from these studies that aircraft overflights affect feed intake, growth, or production rates in any way.

Cattle. A study in Sweden found that no adverse effects were observed, and behavioral reactions were considered minimal in 20 cattle and 18 sheep that were exposed to 28 sonic booms and 10 low-altitude subsonic flights over 4 days (Espmark *et al*. 1974). The authors determined there was a strong tendency for the animals to adapt to aircraft overflight disturbance, which would minimize any long-term effects.

In response to concerns about overflight effects on pregnant cattle, cattle safety and milk production, the Department of the Air Force prepared a handbook for environmental protection that summarizes the literature on the impacts of low-altitude flights on livestock (and poultry) and includes specific mention of case studies conducted in numerous airspaces across the country. Negative results have been found in a few studies, but are not reproduced in other similar studies. One study in 1983 suggested that two of ten cows in late pregnancy aborted after showing rising estrogen and falling progesterone levels correlated with 59 aircraft overflights, while the other 8 cows showed no changes in their blood concentrations and calved normally (USAF 1993). Another, in 1982, showed abortion results in 3 out of 5 pregnant cattle after exposing them to flyovers by six different aircraft

(USAF 1993). A third study in 1983 suggests feedlot cattle could stampede and injure themselves when exposed to low level overflight (USAF 1993).

Negative findings were few, however, and the findings of little or no effect were more prevalent. A study in 1978 by Rowe and Smithies examined the causes of 1,763 abortions in Wisconsin dairy cattle over a 1-year time period and none were associated with aircraft disturbances (USAF 1993). In 1987, Anderson contacted 7 livestock operators for production data and no effects of low altitude and supersonic flights were noted. Three out of 43 cattle previously exposed to low altitude flights showed a startle response to an F/A-18 aircraft flying overhead at 500 feet AGL and 400 knots by running less than 10 meters. They resumed normal activity within 1 minute (USAF 1993). A study (Beyer 1983) found that helicopters caused more of a reaction than other low aircraft overflights and even the helicopters at 30 to 60 feet overhead did not affect milk production and pregnancies of 44 cows and heifers in a 1964 study (USAF 1993). Additionally, the 1983 Beyer study showed that 5 pregnant dairy cows in a pasture did not even run, nor disturb their pregnancies, after being overflown by 79 low-altitude helicopter flights and 4 low-altitude, subsonic jet aircraft flights (USAF 1993). A 1956 study found that the reactions of dairy and beef cattle to noise from low-altitude, subsonic aircraft were similar to those caused by flying paper, strange persons, or other moving objects (USAF 1993). In addition, Broucek (USAF 1992) found that dairy cows react to the sound of a tractor engine (97 dB) with an increased white blood cell count (the cells that fight infection), an increased sugar reserve in the blood (a response to adrenaline or fear) and a lowered red blood cell count (cells that carry oxygen to the body) (Gladwin *et al*. 1988). Overall, the U.S. Forest Service has concluded in a report to Congress (USFS 1992) that "evidence both from field studies of wild ungulates and laboratory studies of domestic stock indicate that the risks of damage are small [from aircraft approaches of 50 to 100 meters (m)], as animals take care not to damage themselves. If animals are simply overflown by aircraft at altitudes of 50 to 100 m, there is no evidence that mothers and young are separated, that animals collide with obstructions (unless confined) or that they traverse dangerous ground at too high a rate." These varied study results suggest that although the confining of cattle could magnify animal response to aircraft overflight, there is no proven cause-and-effect link between startling cattle from aircraft overflights and abortion rates or lower milk production in cattle.

Bison. Bison do not react as strongly to surrounding disturbances, as do cattle. A study in 1972 by Frazier observed bison with high and low-altitude (100-1000 feet AGL at 450 knots) overflights with F-15 aircraft at a ground noise level of 90 dBA; the bison "appeared oblivious" to the aircraft noise and continued grazing throughout all aircraft passes (Gladwin *et al*. 1988). Aircraft overflights appear to have little, if any effect on bison.

Horses. Horses have been observed for reactions to overflights as well. Several studies were summarized showing a varied response of horses to low-altitude aircraft overflights. Observations made in 1966 and 1968 noted that the horses galloped around in response to jet flyovers (USAF 1993). Bowles (1995) cites Kruger and Erath as observing horses exhibiting intensive flight reactions, random movements, and biting/kicking behavior. However, no injuries or abortions occurred and there was evidence that the mares adapted somewhat to the flyovers over a month's time (USAF 1993). Although horses notice the overflights, it does not appear to affect their survivability or their procreation and they do seem to habituate to these disturbances.

WILDLIFE

The potential sources of impacts to wildlife from aircraft overflights are the visual effect of the approaching aircraft and the associated subsonic noise. Any visual impacts would be most likely to occur along those portions of MTRs that are below 1,000 feet AGL, the altitude accounting for most reactions to visual stimuli by wildlife (Lamp 1989, Bowles 1995).

Noise effects to wildlife are classified as primary, secondary, and tertiary effects. Primary effects are direct, physiological changes to the auditory system, (i.e., ear drum rupture, temporary and permanent hearing threshold shifts, and the masking of auditory signals). These primary effects are not expected to occur as described in the following discussion. Secondary effects include non-auditory effects such as stress and associated physiological response (i.e., increased blood pressure, use of available glucose, and blood corticosteroid levels); behavior modifications; interference with mating or reproduction; and impaired ability to obtain adequate food, cover, or water. The possibility of secondary effects occurring are more likely than primary effects and will be explored in detail as follows. Tertiary effects are the direct result of primary and secondary effects, and include population declines, habitat loss, and species extinction. Tertiary effects of aircraft overflight are difficult to pinpoint because the intricate details involved in ecosystem function include many factors not related to the overflight operations.

Behavioral experiments have demonstrated that noise at high levels is mildly aversive in and of itself, apparently because the physiological effects stimulated by noise are aversive (e.g., muscular flinch, vasoconstriction, bradycardia) (Bowles 1997). However, noise is not aversive enough to be an effective conditioning stimulus over the long term. This explains the failure of most acoustic harassment devices to deter wildlife, such as deer, from favored areas (Bowles 1997).

Literature available on aircraft overflights on wildlife specifically related to the RBTI includes fixed-wing aircraft overflight studies conducted in the early 1970s through mid-1998. In the past, literature discussing different types of aircraft were used to argue whether any aircraft overflights adversely affected wildlife. Much of this literature discussed helicopter overflight, which is not included in the RBTI action. Helicopter overflight is found to have a greater effect on wildlife because helicopters do not typically leave an area as rapidly as fixed-wing aircraft. Helicopters have a percussive effect from the beat of the rotors, and helicopters are often used to chase, dart, and capture wildlife and could cause a greater fear factor among wildlife populations that have interacted with helicopters in this way. Therefore, studies on helicopters will not be discussed.

Some caution has also been suggested when extrapolating studies using one species, for the results that might happen for another. For this reason, only studies relating to RBTI-associated species will be used to discuss impacts.

Most of the effects of noise are mild enough that they may never be detectable as changes in population size or population growth against the background of normal variation (Bowles 1995). Many other environmental variables (e.g., predators, weather, changing prey base, ground based human disturbance) may influence reproductive success and confound the ability to identify the ultimate factor in limiting productivity of a certain nest, area, or region (Smith *et al.* 1988). In contrast, the effects of other human intrusions near nests, foraging areas, dens, etc. (e.g., hiking, bird watching, timber harvesting, boating) are readily detected and substantially affect wildlife behavior and reproductive success (USFS 1992).

The following discusses the aircraft overflight effects on wildlife by species type.

Large Herbivores: The large wild herbivores under the RBTI airspaces include mule deer, elk, bighorn sheep, and pronghorn antelope. There have been many studies of aircraft noise on mammals. Some of these studies have examined the noise response of mammals under laboratory conditions (e.g., Weisenberger *et al*. 1996). Other researchers have investigated the physiological and behavioral responses of mammals in the field (Lamp 1987). Laboratory studies previously showed habituation results to continuous noise exposure. Now, both the current field and laboratory data indicate that mammals (e.g., pronghorn, bighorn sheep, elk, and mule deer) show that the effects are transient and of short duration and suggest that the animals appear to habituate to noise through repeated exposure without long-term discernible negative effects (Workman *et al*. 1992; Krausman *et al*. 1993, 1998; Weisenberger *et al*. 1996). Therefore, changes to the number and types of overflight are not expected to result in major impacts to wildlife populations.

Mule deer. Mule deer were observed for jet fighter overflight responses. None of the three jet fighter flights below 3000 feet AGL and none of the 18 jet fighter flights above 3000 feet AGL caused mule deer to run (Kroodsma 1988). Wild animals exposed to intense noise with sudden onset can panic and injure themselves or their young, however, this is usually the result of active pursuit (such as the perceived pursuit of a low flying aircraft). Animals control their movements to minimize risk. Loss rates have varied greatly in the few documented cases of injury or loss. Mammals and raptors appear to have little susceptibility to those losses, whereas the most significant losses have been observed among waterfowl. Panic responses habituate quickly and completely, usually with fewer than five exposures (Bowles 1997).

Small Mammals: Small mammals under the RBTI airspaces include the Mexican long-nosed bat, black-tailed jackrabbit, black-tailed prairie dog, desert cottontail, Ord's kangaroo rat, plains harvest mouse, southern plains woodrat, and thirteen-lined ground squirrel.

One recent three-year study by McClenaghan and Bowles (1995) focused on chronic military aircraft exposure. It was conducted in south-central Arizona characterized by creosote and mixed Sonoran Desert scrub. The sites were exposed to low-altitude flights of more than 20,000 sound events in excess of 80 dB with 115.5 dB being the highest A-weighted single event level (SEL) recorded. The control sites received noise levels at least an order of magnitude lower with an average of 51.3 dB and none were over 100 dB. The control area event rate was approximately one flight per day. Numerous kangaroo rat and pocket mouse species and the white-throated wood rat were included in the study. Populations densities, body weight, reproductive activity, recruitment by immigration and reproduction, survival rate month to month were measured. Overall, the outcome of the study suggests the effects of lifetime exposure to intermittent aircraft noise on animal demography are likely to be small and difficult to detect, if they exist at all (McClenaghan and Bowles 1995), which is consistent with what is found in laboratory species and humans (Kryter 1994).

Raptors: Birds of prey, or raptors, in the area include ferruginous hawk, bald eagle, golden eagle, great-horned owl, spotted owl, burrowing owl, peregrine falcons, prairie falcons, and aplomado falcon.

Peregrine and prairie falcons: Peregrines occupy their breeding habitat by March 1, with egg laying occurring from March 15 to May 15. During this period of egg laying and initial incubation, peregrines are most susceptible to disturbance and abandonment (USFWS 1984). A study (Ellis *et*

al. 1991) of low-altitude overflights above prairie falcon and other similar raptors showed no permanent nest abandonment or reduction in reproductive success. Abandonment is less likely during the period from May 16 until the fledged young have dispersed from the nest area (usually by August 15).

In studies on the impacts of low-altitude jet overflights on nesting peregrine and prairie falcons, Ellis (1981) and Ellis *et al.* (1991) found that responses to extremely frequent and nearby jet aircraft were often minimal and never associated with reproductive failure. Typically, birds quickly resumed normal activities within a few seconds following an overflight. While the falcons were noticeably alarmed by the noise stimuli in this study, the negative responses were brief and not detrimental to reproductive success during the course of the study.

In 1995, a three year study was initiated for the U.S. Air Force by the Alaska Cooperative Fish and Wildlife Research Unit, University of Alaska, Fairbanks, and Alaska Biological Research to assess the effects of jet overflights on the behavior, nesting success, and productivity of nesting peregrine falcons beneath five MOAs in interior Alaska (Ritchie *et al.* 1998). An average of 34 nests per year were monitored over the three year study, with an average of 28 and 27 overflights each, respectively, through the nesting season. Daily sound exposure levels (SEL) ranged from 60 to 110.6 dBA. Overall, the average number of young per successful pair was greater at the experimental sites than at the control sites (Ritchie *et al.* 1998).

Mexican Spotted Owl. Johnson and Reynolds (1996) studied F-16 aircraft overflights directly over several Mexican spotted owls located under an existing MOA. Adult and juvenile birds were observed and found to have minimal to no reactions.

Bald Eagle. Fleischner and Weisberg (1986) have shown that bald eagles are susceptible to being startled by loud noised during the breeding season. Bald eagles (threatened) typically respond to the proximity of disturbance, such as from pedestrian traffic or aircraft within 100 meters, because of the increased visibility of the perceived threat rather than noise level (Ellis *et al*. 1991). Bald eagles' reactions to commercial jet flight, although minor (e.g., looking), were twice as likely to occur at eagle-jet distances of one half mile or less (Fleischner and Weisber, 1986). Another study by Fraser *et al*. (1985) stated that over 850 overflights of active bald eagle nests only resulted in two eagles (10 percent) that interrupted their incubation or brooding activities during these overflights. Awbrey and Bowles (1990) suggested that eagles are particularly resistant to being disturbed from their nests.

Other Raptors. There have been no studies on the responses of aplomado falcons to aircraft overflights but there have been studies on the closely related peregrine and prairie falcons and other raptors (e.g., Ellis *et al*. 1991). These studies suggest that falcons will nest within areas overflown by low-level jet aircraft. Although birds do at times flush from nests, they soon return and nest success is not affected. Peregrine falcons and other raptor species are known to nest in the immediate vicinity of airports under the flight patterns where aircraft land and take-off.

Lamp (1989) found in a study of the impacts to wildlife of aircraft overflights at Naval Air Station Fallon in northern Nevada, that nesting raptors (golden eagle, bald eagle, prairie falcon, Swainson's hawk, and goshawk) either showed no response to low-level flights (less than 3,000 feet AGL) or only showed minor reactions. Minor reactions consisted of the bird assuming an alert posture or turning its head and watching the aircraft pass overhead. Duration of raptor response to aircraft

disturbances was monitored for one year and was found to average 14 seconds for low-level overflights. All raptor nests under observation successfully fledged young (Lamp 1989).

In a literature review of raptor responses to aircraft noise, Manci *et al.* (1988) found that most studies of raptors did not show a negative response to overflights. When negative responses were observed they were predominantly associated with rotary-winged aircraft or jet aircraft that were repeatedly passing within one-half mile of a nest. The USFWS indicated as part of consultations associated with a Cannon AFB action that flights at or below 2,000 feet AGL from October 1 through March 1 could result in adverse impacts to wintering bald eagles (USFWS 1998). However, Fraser *et al*. (1985) believes that raptors habituate to overflights rapidly, sometimes tolerating aircraft approaches of 65 feet or less.

Other birds: The passerines present under the RBTI airspace include black-throated sparrow, dark-eyed junco, loggerhead shrike, white-faced ibis, cactus wren, mourning dove, and vesper sparrow. Federally listed birds that could be found under the airspaces include the interior least tern and southwestern willow flycatcher. As opposed to other taxa, many researchers (Bowles 1997, Ellis *et al*. 1991, Klein 1973, Pritchett *et al*. 1978) have studies the effects of aircraft noise on birds and mammals. Some of these studies have examined the noise response of birds under laboratory conditions (e.g., Book and Bradley n.d.). Other researchers have investigated the physiological and behavioral responses of birds in the field (Ellis *et al*. 1991, Henson and Grant 1991). The primary criticism of the previous laboratory studies is that the results invariably show habituation to continuous noise exposure. Both the current field and laboratory data, however, indicate that many birds appear to habituate to noise through repeated exposure without long-term discernible negative effects.

Passerines. Passerines (i.e., perching birds or song birds) cannot be driven any great distance from a favored food by a nonspecific disturbance, such as aircraft overflight (USFS 1992). However, Manci *et al*. (1988) states that reproductive losses have been reported for small territorial passerines after exposure to low-altitude overflights.

Black Ducks. One recent study measured the heart rate of black ducks for 4 days and subjected them to simulated aircraft noise for 48 episodes per day with peak volume of 110 dB. Acute response occurred on the first day but diminished rapidly after that. This indicated the ability of black ducks to habituate to the auditory component of low altitude aircraft overflight (Harms *et al*. 1997).

Migratory Waterfowl. Migratory waterfowl have shown to have moderate responses and habituate slowly to aircraft overflight. For example, migratory waterfowl often make brief flights in response to aircraft overflights. If individuals are susceptible to damage as a result of these moderate responses, noise may continue to have an impact over long periods. For example, gulls nesting in colonies can take advantage of brief defensive flights to cannibalize one another's eggs (Burger 1981). Unfortunately, little information is available on the actual extent of such losses. Migrants and animals living in areas with high concentrations of predators are the most vulnerable.

Wading Birds. A literature synthesis by Manci *et al*. (1988) cited Black *et al*. (1984) as studying wading bird colony effects of low-altitude (less than 500 feet AGL) military training flights. It was found that reproductive activity including nest success, nestling survival, and nestling chronology, was independent of F-16 overflights, but was related to ecological factors including location and physical characteristics of the colony and climatology.

Sandhill Cranes. In a literature review by the USAF (1993), two studies were referenced that noted aircraft noise caused a cessation of intensive calling, but birds rarely left the nest, when overflown.

Fish, Reptiles, and Amphibians: Reptile and amphibians identified under the RBTI airspaces include Mojave rattlesnake, side-blotched lizard, Texas horned lizard, yellow mud turtle, Texas banded gecko, Great Plains skink, Couch's spadefoot toad, and the Great Plains toad. The effects of overflight noise on fish, reptiles, and amphibians have been poorly studied, but conclusions about their expected responses have been speculated on through the known physiology and behavior for these taxa (Gladwin *et al*. 1988). Although fish do startle in response to low flying aircraft noise and probably to the shadows of aircraft as well, they have been found to habituate to the sound and overflights. Noise is also readily and well attenuated by water surfaces, fish are not expected to be affected by noise from overflights. Reptiles and amphibians that respond to low frequencies and those that respond to ground vibration, such as toads (genus *Scaphiopus*), may be affected by noise. However, RBTI activities are unlikely to cause ground vibrations noticeable to these species.

2.7 NOISE EFFECTS ON STRUCTURES

Normally, the most sensitive components of a structure to airborne noise are the windows and, infrequently, the plastered walls and ceilings. An evaluation of the peak sound pressures impinging on the structure is normally sufficient to determine the possibility of damage. In general, at sound levels above 130 dB, there is the possibility of the excitation of structural component resonance. While certain frequencies (such as 30 Hz for window breakage) may be of more concern than other frequencies, conservatively, only sounds lasting more than one second above a sound level of 130 dB are potentially damaging to structural components.

In a 1989 study, directed specifically at low-altitude, high-speed aircraft showed that there is little probability of structural damage from such operations (Sutherland 1990). One finding in that study is that sound levels at damaging frequencies (e.g., 30 Hz for window breakage or 15 to 25 Hz for whole-house response) rarely occur below 130 dB.

Noise-induced structural vibration may also cause annoyance to dwelling occupants because of induced secondary vibrations, or "rattle," of objects within the dwelling, such as hanging pictures, dishes, plaques, and bric-a-brac. Window panes may also vibrate noticeably when exposed to high levels of noise, causing homeowners fear of breakage. In general, such noise-induced vibrations occur at sound levels above those considered normally incompatible with residential land use. Thus assessments of noise exposure levels for compatible land use should also be protective of noise-induced secondary vibrations.

2.8 NOISE EFFECTS ON TERRAIN

Members of the public often perceive that noise from low-flying aircraft can cause avalanches or landslides by disturbing fragile soil or snow structures, especially in mountainous areas, causing landslides or avalanches. There are no known instances of such effects, and it is considered improbable that such effects will result from routine, subsonic aircraft operations**.**

2.9 NOISE EFFECTS ON HISTORICAL AND ARCHAEOLOGICAL SITES

Because of the potential for increased fragility of structural components of historical buildings and other historical sites, aircraft noise may affect such sites more severely than newer, modern structures. Again, there are few scientific studies of such effects to provide guidance for their assessment.

One study involved the measurements of sound levels and structural vibration levels in a superbly restored plantation house, originally built in 1795, and now situated approximately 1,500 feet from the centerline at the departure end of Runway 19L at Washington Dulles International Airport (IAD). These measurements were made in connection with the proposed scheduled operation of the supersonic Concorde airplane at IAD (Wesler 1977). There was special concern for the building's windows, since roughly half of the 324 panes were original. No instances of structural damage were found. Interestingly, despite the high levels of noise during Concorde takeoffs, the induced structural vibration levels were actually less than those induced by touring groups and vacuum cleaning within the building itself.

As noted above for the noise effects of noise-induced vibrations of normal structures, assessments of noise exposure levels for normally compatible land uses should also be protective of historic and archaeological sites.

3.0 NOISE MODELING

An aircraft in subsonic flight generally emits noise from two sources: the engines and flow noise around the airframe. Noise generation mechanisms are complex, and in practical models the noise sources must be based on measured data. The Air Force has developed a series of computer models and aircraft noise data bases for this purpose. The models include NOISEMAP (Moulton 1992) for noise around airbases, ROUTEMAP (Lucas and Plotkin 1988) for noise associated with low-level training routes, and MR_NMAP (Lucas and Calamia 1996) for use in MOAs and ranges. These models use the NOISEFILE database developed by the Air Force. NOISEFILE data includes SEL and L_{max} as a function of speed and power setting for aircraft in straight flight.

Noise from an individual aircraft is a time-varying continuous sound. It is first audible as the aircraft approaches, increases to a maximum when the aircraft is near its closest point, then diminishes as it departs. The noise depends on the speed and power setting of the aircraft, and its trajectory. The models noted above divide the trajectory into segments whose noise can be computed from the data in NOISEFILE. The contributions from these segments are summed.

MR_NMAP was used to compute noise levels in the affected airspace for this EIS. The primary noise metric computed by MR_NMAP was L_{dnmr} averaged over each airspace. Supporting routines from NOISEMAP were used to calculate SEL and L_{max} for various flight altitudes and lateral offsets from a ground receiver position.

APPENDIX H
BIOLOGICAL RESOURCES SUPPORT DOCUMENTATION

The following tables provide a list of all plant and wildlife species mentioned in Section 4.3 (Biological Resources) of the RBTI EIS. These lists include both their common and scientific names. Tables describing all species mentioned in the text that are listed as state and federal threatened, endangered, and sensitive species are also provided. This appendix also includes correspondence between the Air Force and USFWS regarding informal discussions for RBTI.

Table	Title	Page
H-1	Representative Plant Species in the Affected Areas	H-2
H-2	Representative Wildlife Species in the Affected Areas	H-3

Table H-1. Representative Plant Species in the Affected Area	
Common Name	*Scientific Name*
Acacia	*Acacia* spp.
Agave	*Agave* spp.
Arizona fescue	*Festuca arizonica*
Bitterweed	*Hymenoxys odorata*
Black grama	*Bouteloua eriopoda*
Broadleaf milkweed	*Ascelpias latifolia*
Broomweed	*Amphiachyris* spp. and *Gutierrezia* spp.
Buffalograss	*Buchloe dactyloides*
Cane bluestem	*Bothriochloa barbinodis*
Catclaw	*Acacia greggii*
Catclaw mimosa	*Mimosa biuncifera*
Creosote bush	*Larrea tridentata*
Douglas fir	*Pseudotsuga menziesii*
Fragrant ash	*Fraxinus cuspidata*
Galleta grass	*Hilaria jamesii*
Gambel (=shin) oak	*Quercus gambelii*
Guajillo	*Acacia berlandieri*
Juniper	*Juniperus* spp.
Little bluestem	*Schizachyrium scoparium*
Live oak	*Quercus turbinella*
Mesquite	*Prosopis* spp.
Mexican pinyon	*Pinus cembroides*
Mountain laurel	*Sophora secundiflora*
Mountain muhly	*Muhlenbergia montana*
Needlegrass	*Achnatherum* spp.
Ocotillo	*Fouquieria splendens*
Pinyon pine	*Pinus edulis*
Pinyon ricegrass	*Piptochaetium fimbriatum*
Plains lovegrass	*Eragrostis intermedia*
Ponderosa pine	*Pinus ponderosa*
Post oak	*Quercus margarettiae*
Pricklypear and cholla	*Opuntia* spp.
Sage	*Artemisia* spp.
Sand shin oak	*Quercus havardii*
Sandpaper oak	*Quercus pungens*
Sideoats grama	*Bouteloua curtipendula*
Snakeweed	*Gutierrezia* spp.
Soapweed	*Yucca glauca*
Switchgrass	*Panicum capillare*
Tarbush	*Floureusia cernua*
Texas bluestem	*Schizachyrium cirratum*
Texas grama	*Bouteloua rigidiseta*
Texas kidneywood	*Eysenhardtia texana*
Threeawn grass	*Aristida* spp.
Tobosa	*Hilaria mutica*
Walnut	*Juglans* spp.
White fir	*Abies concolor*
Whitethorn	*Acacia constricta*
Wolftail	*Lycurus phleoides*
Yucca	*Yucca* spp.

Table H-2. Representative Wildlife Species in the Affected Area (page 1 of 3)	
Common Name	*Scientific Name*
REPTILES AND AMPIBIANS	
Checkered whiptail	*Cnemidophorus tesselatus*
Couch's spadefoot toad	*Scaphiopus couchii*
Crevice spiny lizard	*Scleoporus poinsettii*
Four-lined skink	*Eumeces tetragrammus*
Great Plains skink	*Eumeces obsoletus*
Great Plains toad	*Bufo cognatus*
Greater earless lizard	*Cophosaurus texanus*
Kingsnake	*Lampropeltis* spp.
Lesser earless lizard	*Holbrookia maculata*
Mojave rattlesnake	*Crotalus scutulatus*
Ornate box turtle	*Terrapene ornata*
Plains black-headed snake	*Tantilla nigriceps*
Plains spadefoot	*Scaphiopus bombifrons*
Prairie lizard	*Sceloporus undulatus*
Red-spotted toad	*Bufo punctatus*
Side-blotched lizard	*Uta stansburiana*
Six-lined racerunner	*Cnemidophorus sexlineatus*
Skink	*Eumeces* spp.
Texas banded gecko	*Coleonyx brevis*
Texas black-headed snake	*Tantilla atriceps*
Texas horned lizard	*Phrynosoma cornutum*
Texas spotted whiptail	*Cnemidophorus gularis*
Trans-Pecos ratsnake	*Elaphe subocularis*
Western boreal toad	*Bufo boreas*
Western diamondback	*Crotalus atrox*
Western hognose snake	*Heterodon nasicus*
Yellow mud turtle	*Kinosternon flavescens*

Table H-2. Representative Wildlife Species in the Affected Area (page 2 of 3)	
Common Name	*Scientific Name*
BIRDS	
Acorn woodpecker	*Melanerpes formicivorus*
American dipper	*Cinclus mexicanus*
American peregrine falcon	*Falco peregrinus anatum*
Bald eagle	*Haliaeetus leucocephalus*
Black phoebe	*Sayornis nigricans*
Black-capped vireo	*Vireo atricapillus*
Black-headed grosbeak	*Pheucticus melanocephalus*
Black-throated sparrow	*Amphispiza bilineata*
Brown pelican	*Pelecanus occidentalis*
Brown-headed cowbird	*Molothrus ater*
Burrowing owl	*Athene cunicularia*
Cactus wren	*Campylorhynchus brunneicapillus*
Chihuahuan raven	*Corvus cryptoleucus*
Common nighthawk	*Chordeiles minor*
Common poorwill	*Nyctidromus albicollis*
Cooper's hawk	*Accipiter cooperi*
Crested caracara	*Caracara plancus*
Crissal thrasher	*Toxostoma crissale*
Dark-eyed junco	*Junco hyemalis*
Eastern bluebird	*Sialia sialia*
Golden eagle	*Aquila chrysaetos*
Golden-cheeked warbler	*Dendroica chrysoparia*
Grasshopper sparrow	*Ammodramus savannarum*
Greater roadrunner	*Geococcyx californianus*
Great-horned owl	*Bubo virginianus*
Harris' hawk	*Parabuteo unicinctus*
Interior least tern	*Sterna antillarum athalassos*
Juniper titmouse	*Baeolophus griseus*
Lark bunting	*Calamospiza melanocorys*
Lark sparrow	*Chondestes grammacus*
Mexican spotted owl	*Strix occidentalis lucida*
Mountain chickadee	*Parus gambeli*
Mountain plover	*Charadrius montanus*
Mourning dove	*Zenaida macroura*
Northern aplomado falcon	*Falco femoralis septentrionalis*
Northern bobwhite	*Colinus virginianus*
Northern cardinal	*Cardinalis cardinalis*
Northern flicker	*Colaptes auratus*
Piping plover	*Charadrius melodus*
Prairie falcon	*Falco mexicanus*
Sandhill crane	*Grus canadensis*
Scaled quail	*Callipepla squamata*
Scissor-tailed flycatcher	*Tyrannus forficatus*
Southwestern willow flycatcher	*Empidonax traillii extimus*
Stellar's jay	*Cyanocitta stelleri*
Upland sandpiper	*Bartramia longicauda*
Vesper sparrow	*Pooecetes gramineus*
Western wood-pewee	*Contopus sordidulus*
Whooping crane	*Grus americana*

Table H-2. Representative Wildlife Species in the Affected Area (page 3 of 3)	
Common Name	*Scientific Name*
MAMMALS	
American bison	*Bos bison*
Badger	*Taxidea taxus*
Bighorn sheep	*Ovis canadensis*
Black-footed ferret	*Mustela nigripes*
Black-tailed jackrabbit	*Lepus californicus*
Black-tailed prairie dog	*Cynomys ludovicianus*
Chipmunk	*Tamias* spp.
Collared peccary	*Pecari tajacu*
Coyote	*Canis latrans*
Desert cottontail	*Sylvilagus audubonii*
Desert mule deer	*Odocoileus hemionus crooki*
Elk	*Cervus elaphus*
Hispid pocket mouse	*Chaetodipus hispidus*
Kangaroo rat	*Dipodomys* spp.
Mexican (=greater) long-nosed bat	*Leptonycteris nivalis*
Mule deer	*Odocoileus hemionus*
Northern grasshopper mouse	*Oncychomys leucogaster*
Ocelot	*Leopardus pardalis*
Ord's kangaroo rat	*Dipodomys ordii*
Plains harvest mouse	*Reithrodontomys montanus*
Plains pocket gopher	*Geomys bursarius*
Plains pocket mouse	*Perognathus flavescens*
Pronghorn	*Antilocapra americana*
Ringtail	*Bassariscus astutus*
Sonoran Desert pocket mouse	*Chaetodipus penicillatus*
Southern plains woodrat	*Neotoma micropus*
Spotted ground squirrel	*Spermophilus spilosoma*
Swift fox	*Vulpes velox*
Thirteen-lined ground squirrel	*Spermophilus tridecemlineatus*

Albuquerque, NM 87113

FROM: HQ ACC/CEVP
129 Andrews St., Suite 102
Langley AFB, VA 23665-2969

SUBJECT: Realistic Bomber Training Initiative (RBTI)

DATE: December 22, 1997

1. The United States Air Force (Air Force) is in the process of preparing an Environmental Impact Statement (EIS) to assess the potential environmental impacts of a proposal to implement the Realistic Bomber Training Initiative in the airspace and land in west Texas and northeastern New Mexico. This proposal is intended to provide efficient, integrated training opportunities for aircrews flying B-1 and B-52 aircraft from Dyess Air Force Base (AFB), Texas and Barksdale AFB, Louisiana, respectively. The proposed action for RBTI would involve several interrelated elements:

A. Modifications and additions to existing military training route (MTR) airspace used generally for low-altitude navigation training activities;
B. Modifications and additions to existing military operations area (MOA) airspace used for medium to high altitude training and maneuvering;
C. Increased flights by B-1 and B-52 aircraft in the MTR and MOA airspace;
D. Acquisition of a total of 12, 15-acre parcels under the MTR and MOA airspace for construction and operation of an Electronic Scoring Site system consisting of electronic emitters and associated facilities; and
E. Closure of existing Electronic Scoring Site systems at Harrison, Arkansas and La Junta, Colorado, and transfer of equipment to the proposed Electronic Scoring Site system developed for RBTI.

2. The proposed RBTI project could potentially affect those areas under MTR (low-altitude scoring site) and the MOA (high-altitude scoring site) where the emitter sites will be located. The accompanying maps identify those areas of potential impact. Pursuant to ESA and NEPA, we would like to request information regarding federally listed threatened, endangered, candidate, and proposed to be listed species that occur or may occur in the potentially affected area. To support this data collection effort, please provide the requested information to: Ogden Environmental and Energy Services, RBTI EIS, 910 Main Street, Suite 352, Boise, Idaho, 83702. If you could provide or direct us to a source of digital information on species list/concentration sites, we would be grateful. Until the extent of the potential impact to species is determined, no determination regarding the need for Section 7 consultation will be made.

3. The Air Force intends to hold public scoping meetings in the affected areas of Texas, New Mexico, Arkansas, and Colorado. Dates, times, and locations for these meetings will be announced through newspaper notifications and other media sources accessible to the public and agencies. These meetings are the first step in soliciting public and government agency comments on the RBTI proposal as required by NEPA. During the meetings, the Air Force will describe the proposed action and alternatives, the National Environmental Policy Act process, and outline the opportunities for involvement in the process.

4. If you have any specific questions about the RBTI proposal, we encourage you to contact Ms. Brenda Cook at the following address: HQ ACC/CEVP, Attention: Brenda Cook, 129 Andrews Street, Suite 102, Langley AFB, VA 23665-5542, (757) 764-9339 or RBTI EIS, 7th CES/CEV, 710 3rd Street, Dyess AFB, TX, 79607. Thank you for your assistance in this matter.

Langley AFB, Virginia 23665-2969

Dear Ms. Cook:

This responds to your December 22, 1997, request for information regarding federally listed, proposed, and candidate species that could occur within the proposed training area. The U.S. Air Force is in the process of preparing an Environmental Impact Statement to assess the potential impacts of a proposal to implement the Realistic Bomber Training Initiative (RBTI) in the airspace and land within west Texas and northeastern New Mexico. The proposed action is intended to provide efficient, integrated training opportunities for aircrews flying B-1 and B-52 aircraft from Dyess Air Force Base (AFB), Texas and Barksdale AFB, Louisiana, and would involve the following activities: 1) Modifications and additions to existing military training route (MTR) airspace used for low-altitude navigation training activities; 2) Modifications and additions to existing military operations area (MOA) airspace used for medium to high altitude training and maneuvering; 3) Increased flights by B-1 and B-52 aircraft in the MTR and MOA airspace; 4) Acquisition of a total of 12, 15-acre parcels under the MTR and MOA airspace for construction and operation of an Electronic Scoring Site system consisting of electronic emitters and associated facilities; and 5) Closure of existing Electronic Scoring Site systems at Harrison, Arkansas and La Junta, Colorado and transfer of equipment to the proposed Electronic Scoring Site system developed for RBTI.

These operations may potentially affect threatened and endangered species in counties where overflights and ground disturbing activities occur. The U.S. Fish and Wildlife Service (Service) is particularly concerned about the potential adverse impacts of low-level flight noise disturbance on nesting raptors. The Service is currently in formal consultation with the Air Force, under Section 7 of the Endangered Species Act of 1973, as amended, on the proposed expansion of German Air Force (GAF) operations at Holloman AFB and continued use of existing MTRs and MOAs managed by Holloman, Cannon, and Air National Guard. Our main concern is that these actions may affect the

following threatened and endangered species: American peregrine falcon, northern aplomado falcon, bald eagle and Mexican spotted owl. Based on the maps provided, it appears that the RBTI will use some of the same airspace as the GAF proposal. The Service is concerned about the additive impacts of all military flights within this airspace. On January 14 and 15, 1998, Service and Air Force personnel met to discuss the RBTI and other proposals and whether it was feasible to combine them into the ongoing GAF consultation. The Air Force determined that it was not possible and informed the Service that the GAF consultation is still the top priority. It was agreed that the RBTI and other proposals, for which there is currently no information, are lower priority and will not be addressed by the Service until the GAF consultation is completed because of limited staff availability.

In New Mexico, the proposed action could impact airspace and/or land in the following counties: Colfax, Eddy, Guadalupe, Harding, Lea, Mora, Quay, Rio Arriba, San Miguel, Taos, and Union. Enclosed is a list of endangered, threatened and candidate species that may be found in these counties. These species should be considered in the analysis of environmental effects for the proposed action. Due to staffing constraints we are unable to provide more specific information at this time. We recommend you contact the Arlington and Austin Ecological Services Field Offices for information concerning federally listed species in Texas, and the New Mexico Department of Game and Fish and the New Mexico Energy, Minerals and Natural Resources Department, Forestry and Resources Conservation Division for information concerning fish, wildlife, and plants of State concern. In addition, we suggest you contact land management agencies (Federal, State, and Tribal) and private land owners for information concerning habitat and occurrence/concentration sites within the region of influence.

In future communications regarding this project, please refer to Consultation # 2-22-98-I-124. If we can be of further assistance, please contact Carol Torrez of my staff at (505) 761-4525 ext. 115.

Sincerely,

Jennifer Fowler-Propst

RE: Realistic Bomber Training Initiative

Dear Sir:

This letter responds to the memorandum from HQ ACC/CEVP, Langley AFB, to Nancy Kaufman, Regional Director, Region 2, U.S. Fish and Wildlife Service (Service), dated December 22, 1997. The letter states that the Air Force is in the process of preparing an Environmental Impact Statement for the subject project proposal. As requested, we are providing you with a list of threatened and endangered species from the counties in Texas that could be affected, according to the maps provided.

The New Mexico Ecological Service Field Office of the Service will be the lead office for consultation on this project. However, we will be of assistance to you for assessment of affects on species occurring in Texas, if needed. Please contact Mr. Nathan Allan, at (512) 490-0063, if you need further information.

Sincerely,

/s/ William Seawell

SUBJECT: Realistic Bomber Training Initiative (RBTI), Cons. #2-22-98-I-124

1. This is a request for consultation under the Endangered Species Act for possible impacts to listed species or species proposed for listing that may be caused by the implementation of the Realistic Bomber Training Initiative (RBTI) by the United States Air Force (Air Force). Pursuant to the National Environmental Policy Act (NEPA), this request is for consultation on all of the alternatives considered, since final selection of an alternative will not occur until the NEPA process is completed with a Record of Decision.

2. The Air Force has developed this project in ways that allow us to conclude that the proposed action may affect but is not likely to adversely affect any listed species or critical habitat. Consequently, we believe the proposed action qualifies under 50 CFR 402.14(b)(1) as an exception to the requirement for formal consultation, and seek your written concurrence with this conclusion.

3. We look forward to a successful conclusion of this consultation. Please direct any questions to Mr. Roy Barker, HQ ACC/CEVPN at (757) 764-9338.

Biological Evaluation

BIOLOGICAL EVALUATION
Realistic Bomber Training Initiative

1. In accordance with the U.S. Fish and Wildlife Service's request during a 22 Sep 99 meeting with Ms. Torrez, the Air Force is providing the following material in support of consultation #2-22-98-I-124:

   A. This document, which:

   - summarizes the analysis of potential impacts to listed species or species proposed for listing as identified and discussed in the Draft Environmental Impact Statement (EIS) for RBTI, which was previously provided to you,
   - details the applicability to RBTI of recent consultations on other Air Force actions in the region,
   - presents relevant mitigation measures resulting from those consultations, and
   - discusses the potential of RBTI to affect the mountain plover and the aplomado falcon. (This information will appear in the Final EIS.)

   B. Maps showing RBTI alternatives, areas of RBTI alternatives covered under previous consultations, and airspace not previously consulted on that is associated with RBTI.

   C. A copy of the RBTI Natural Resources Report describing the background, methods, and results of biological surveys of candidate emitter sites and Electronic Scoring Sites.

   D. A CD containing photographs (in MS Word software) of the candidate emitter and scoring sites described in the Natural Resources Report.

   E. An updated version of Appendix H from the Draft EIS reflecting changes and corrections made to species lists at the request of Ms Torrez.

2. **Background.** The Air Force is in the process of preparing a Final EIS to assess the potential environmental impacts of a proposal to implement RBTI in the airspace and land in western Texas or northeastern New Mexico. This proposal is intended to provide efficient, integrated training opportunities for aircrews flying B-1 and B-52 aircraft from Dyess Air Force Base (AFB), Texas and Barksdale AFB, Louisiana, respectively. The Draft EIS was provided to the U.S. Fish and Wildlife Service in March, 1999. As detailed in Section 2.4 of the Draft EIS, the proposed action for RBTI would involve several interrelated elements:

   - Modifications (including elimination in some cases) and additions to existing Military Training Route (MTR) airspace used for low-altitude (300 to 3,000 feet above ground level [AGL]) training activities;

- Modifications (including elimination in some cases) and additions to existing Military Operations Area (MOA) airspace used for training and maneuvering above 3,000 feet AGL;

- Increased annual flights by B-1 and B-52 aircraft in the proposed MTR and MOA airspace;

- Acquisition of twelve 15-acre parcels under or near the proposed MTR and MOA airspace for construction and operation of an Electronic Scoring Site system consisting of 10 electronic emitters and 2 scoring sites; and

- Closure of existing Electronic Scoring Sites at Harrison, Arkansas and La Junta, Colorado.

The proposed action for RBTI has three alternative locations: Alternatives B, C, and D. Regardless of the alternative ultimately selected, the basic features of the proposed action, as outlined above, would be the same. A fourth alternative, Alternative A (No-Action), would involve no changes to current conditions or operations.

3. **Related Consultations.** The Air Force has conducted several recent consultations that overlap with areas affected by RBTI (See attached maps). These previous consultations resulted in mitigation measures affecting airspace also associated with RBTI alternatives. The outcomes of those consultations are found in:

   - Consultation #2-22-96-F-334: Biological Opinion dated 8 May 98 for the Proposed Expansion German Air Force (GAF) Operations at Holloman AFB, New Mexico

   - Consultation #2-22-98-I-224: USFWS Letter dated 14 Dec 98 for Proposed Force Structure and Foreign Military Sales at Cannon AFB, New Mexico (Cannon)

   RBTI operations would incorporate the GAF and Cannon consultation commitments as applicable, depending upon the RBTI alternative selected.

4. **Summaries of Anticipated Species Effects From Air Operations.** The only potential effects from aircraft operations associated with the alternatives for the proposed action would derive from noise and visual disturbance. Consequently, this discussion will focus on species that might be affected by noise and visual disturbance (e.g., birds and mammals).

   a) Alternative A. This is the No-Action Alternative. Its selection would entail no change in the current bomber training activities on the existing IR-178, or in the shape or size of the airspace. The affected area lies primarily within the same area covered by Alternatives B and C (see discussion for Alternative B below).

   Areas under Alternative A that do not overlap with Alternatives B and C are in portions of southeastern New Mexico and Texas (segments VW through YZ, AA-AB through AS-AT, and BA-BB through BJ-BK). This area is either rangeland or agricultural land. Potential habitat for the proposed mountain plover is found there. Listed species

potentially there include: bald eagle, brown pelican, interior least tern, northern aplomado falcon, southwestern willow flycatcher, and black-footed ferret.

The northern aplomado falcon has not recently been sighted this far north. However, some portions of this Alternative overfly a portion of the species' historical range and it could occur in the area as a rare transient visitor.

The bald eagle, brown pelican, and interior least tern depend on major water bodies and would only occur in the area affected by Alternative A as rare transient visitors.

The southwestern willow flycatcher has specific habitat requirements that are not commonly found under the affected airspace. This species is not known to occur in the affected areas of either New Mexico or Texas.

The black-footed ferret was last reported in Bailey County, Texas, in 1963 and is not expected to be found beneath Alternative A.

In consideration of these factors, and factors discussed below for the areas where this alternative "overlaps" other alternatives, the Air Force has concluded that Alternative A is not likely to affect listed species.

b) Alternative B. This alternative is located primarily in western Texas.

About 33 percent of Alternative B airspace (IR-178 segments AG-AH, AH-AI, AI-AJ, AJ-AK, and the proposed Lancer MOA) would involve flights only above 2,000 feet AGL, which the Air Force believes is high enough to avoid an adverse effect on listed species.

Another 33 percent of the total airspace (IR-178 segments AB, BC, CD, DE, EF, FG, GH, HI, IJ, JK, and half of KL) coincide with (but are at various points wider than) segments of IR-102/141 consulted on for GAF. As we previously reported to you, it has been decided that the GAF-related operations will now not take place on IR-102/141. RBTI aircraft using these areas will operate under the Terms and Conditions of the GAF Biological Opinion.

Another 33 percent of the airspace includes new areas not previously overflown by military aircraft or consulted on. This includes IR-178 segments VA-VB, VB-R, KL (partial), LM, MN, NO, OP, PQ, QR, RS, ST, TU, UV, VW, WA, WX, XY, YZ, Z-AA, AA-AB, AB-AC, AC-AD, AD-AE, AE-AF, AF-AG, O-OA, and OA-AE.

Potential impacts for Alternative B are as follows:

- Black-capped vireos are known to nest in only two Texas counties affected by Alternative B: Pecos and Brewster (USFWS 1991). In a report to Congress in 1992, the U.S. Forest Service reviewed potential impacts of aircraft overflights. Among their conclusions were: passerines cannot be driven any great distance from a favored food by a non-specific disturbance and; while passerines avoid intermittent or unpredictable sources of disturbance more than predictable ones, they return rapidly

to feed or roost once the disturbance ceases. In consideration of the infrequency of overflight that birds under this airspace may experience, the Air Force has concluded that RBTI Alternative B may affect, but is not expected to adversely affect this species

- The mountain plover was once thought to be particularly associated with Lea County, New Mexico (Ligon 1961), but there are no records of it in this county for 25 years (the 1970s through 1995) (Sager 1996), and the species is currently classified by the New Mexico Department of Game and Fish as uncommon in Lea County. The mountain plover has also been reported in Eddy County, New Mexico, as well as Jeff Davis, Brewster, Dawson, and Lynn counties in Texas. Air operations over Dawson and Lynn counties would take place at a minimum altitude of 3,000 feet AGL. The other three counties have not had confirmed nesting activity, although they are likely to be visited by migrants as they fly between their winter home in southern Texas and Mexico and the common breeding area in northern New Mexico (Peterson 1990). In consideration of these factors, the Air Force has concluded that Alternative B is not likely to jeopardize the continued existence of this proposed species.

- The northern aplomado falcon is a potential resident along the Texas and Mexico border. During GAF consultations for this species, it was determined that aircraft overflight actions "may affect but are not likely to jeopardize the continued existence of" the northern aplomado falcon. As a result of the GAF consultation, the Air Force has initiated annual aplomado falcon surveys (with reports of findings to the USFWS) under airspace flown by GAF aircraft. By expanding the ongoing northern aplomado falcon survey/reporting effort to cover potential falcon habitat under that airspace associated with RBTI Alternative B and which is overflown below 2,000 feet AGL, the Air Force believes it may conclude that Alternative B may affect, but is not likely to adversely affect, the northern aplomado falcon.

- Based on their known distribution and available habitat, none of the listed mammal species in this region (black-footed ferret, Mexican long-nosed bat, black bear, and ocelot) are expected to be found under the airspace affected by this alternative. Therefore, Alternative B is expected to have no effect on these species.

- The remaining listed bird species found in the region either do not have habitat directly under the airspace or would only be transient visitors in the area (see Appendix H of the Draft EIS, Table H-10, for a complete listing of sensitive species). Transient visitors include the bald eagle, interior least tern, whooping crane, piping plover, and brown pelican. Because of the small chance of overflight, these species would experience no adverse effect from Alternative B. Species that do not have habitat under the airspace include Mexican spotted owl, southwestern willow flycatcher, and golden-cheeked warbler. These species would experience no effect from Alternative B.

- Aircraft overflights from Alternative B are expected to have no effect on the 14 listed or proposed-for-listing plant species potentially found under the affected airspace. The six sensitive fish species present are expected to experience no adverse effect due

to habituation and to noise attenuation at the air/water interface. The only listed reptile species (the Concho water snake) is likewise not expected to respond to aircraft overflights. Therefore, Alternative B is not expected to adversely affect this species.

In summary, the Air Force has concluded that Alternative B may affect, but is not likely to adversely affect, listed species.

c) Alternative C. This alternative is very similar to Alternative B, and is roughly 75 percent existing airspace.

Under this alternative, aircraft would use the proposed Texon MOA (instead of the Lancer MOA and IR-178 segments AE-AF through AJ-AK in Alternative B). All flights in the Texon MOA would be at or above 3,000 feet AGL, which the Air Force believes is high enough to preclude an adverse effect on listed species.

IR-178 segments AB, BC, CD, DE, EF, FG, GH, HI, IJ, JK, and half of KL) coincide with (but are at various points wider than) segments of IR-102/141 which were consulted on for GAF. As we previously reported to you, it has been decided that the GAF-related operations will now not take place on IR-102/141. Like Alternative B, this alternative would include new IR-178 segments VA-VB and VB-R, but Alternative C would additionally have new segment N-NA. All segments of IR-178 would have minimum altitudes of less than 2,000 feet AGL, and RBTI aircraft using these areas would operate under the Terms and Conditions of the GAF Biological Opinion.

In summary, the overall potential effects for this alternative would be the same as for Alternative B. Consequently, the Air Force has concluded that Alternative C may affect, but is not likely to adversely affect, listed species.

d) Alternative D. This alternative is mostly located in northeastern New Mexico, with four counties in northern Texas also affected. Much of the airspace associated with Alternative D was covered in the Cannon and/or GAF consultations, although some segments will now be widened. New segments are Z-ZA (which would be flown at or above 2,000 feet AGL) and CD, WA-WB. Potential impacts for this alternative are as follows:

- Concentrations of wintering bald eagles occur within Alternative D. Those populations along the Canadian River and at Conchas Lake are under high-altitude overflight areas (greater than 2,000 feet AGL) and are expected to experience no adverse effect. Populations along the Pecos River and the Rio Chama could experience lower overflights, which could result in an adverse effect. New airspace in reconfigured segment HI is adjacent to a designated roost area. With the application of the eagle overflight restrictions described in the Cannon consultation to RBTI Alternative D, the Air Force concludes that Alternative D may affect, but is not likely to adversely affect, the bald eagle. The flight restrictions are as follows:

- *Avoid known nest sites by 1 mile laterally or 2,000 feet AGL during the entire bald eagle breeding season (October 1 to July 15).*
- *Avoid water bodies (named lakes, perennial rivers, and reservoirs) by 2,000 feet AGL October 1 through March 1 of each year.*
- *Avoid known roost sites by a minimum of 1,000 feet AGL from October 1 through March 1 of each year.*

- The Mexican spotted owl has potential habitat along the Rio Chama which would be overflown. Low-altitude overflight in this area could result in an adverse effect. By applying to RBTI Alternative D the Mexican spotted owl overflight restrictions described in the Cannon consultation, the Air Force concludes that Alternative D may affect, but is not likely to adversely affect, the Mexican spotted owl. The flight restrictions are as follows:

  - *Avoid known protected activity centers by 2,000 feet AGL and 2,900 feet laterally during the period 1 March to 31 August.*
  - *Overflights along the western segments of IR-109 and IR-111 will be restricted to 2,000 feet AGL during the breeding season (March 1 - August 31 of each year) to avoid impacts to inadequately surveyed owl habitat.*

- The mountain plover is considered to potentially occur in all of the 15 counties overflown by Alternative D. The mountain plover is considered common in only three affected New Mexico counties (Union, Colfax, and Torrance). Union and Colfax, the two counties identified by U.S. Fish and Wildlife Service as of high concern (USFWS 1999), would not experience overflight below 2000 feet AGL. Torrance County is crossed only in the northeast corner, leaving most of the county unaffected. Four Texas counties (Dallum, Hartley, Oldham, and Potter) have a low relative abundance. Flights in Dallum County would be over 3,000 feet AGL, and flights in Potter County and half of Oldham would be over 2,000 feet AGL, so any populations of mountain plovers in these areas would not be disturbed by low overflight. The remaining eight counties have uncommon to rare breeding populations (NMDGF 1997). In summary, low-altitude overflight would occur only over the uncommon to rare mountain plover population sites in the state, leaving most of the concentrations of birds relatively unaffected. In consideration of these factors, the Air Force has concluded that Alternative D is not likely to jeopardize the continued existence of this proposed species.

- Piping plover have been reported in the state on only six occasions. Because of the infrequency of exposure, the piping plover is likely to experience no effect from the Alternative D.

- The whooping crane exists only as a poorly performing experimental flock in New Mexico that is soon to be extirpated. The closest frequently used habitat is hundreds of miles from the RBTI area along the south coast of Texas. The state of New Mexico is considering delisting the whooping crane. Since this species occurs so

infrequently in the state as to warrant consideration for delisting, the Air Force concludes that all RBTI alternatives are likely to have no effect on this species.

- The brown pelican is only a rare visitor to the area, occurring primarily as immature wanderers during the summer and fall seasons: presumably these are storm-driven birds. Therefore, because of the infrequency of exposure, Alternative D is likely to have no effect on this species.

- The southwestern willow flycatcher is predominantly found in the southwestern portion of New Mexico and not underneath the proposed alternative airspace. Habitat has been identified along the Rio Grande west of Taos. However, the Alternative D proposed flight path bypasses this habitat to the north by more than 15 miles. Critical habitat in New Mexico is restricted to portions of the Gila, San Francisco, and Tularosa rivers in the southwestern corner of the state and is not found under the affected airspace. Therefore, Alternative D is likely to have no effect on this species.

- The interior least tern does not have nesting habitat under Alternative D airspace, although wintering or migrating birds may use wetlands and open water in the proposed project area. These same areas are frequented by the bald eagle, and are avoided by aircraft. This avoidance will afford coincidental protection to the tern. Therefore, the Air Force concludes that Alternative D will have no adverse effect on the interior least tern.

- The only listed mammal potentially found in the area is the black-footed ferret, but it is considered extirpated from the area. Therefore, Alternative D would have no effect on the black-footed ferret.

- By the very nature of the proposed action and the species themselves, the two listed plants and three listed fish species would not be affected by aircraft overflight under Alternative D. Proposed RBTI activities would have no effect on the holy ghost ipomopsis and the puzzle sunflower, and no adverse effect on the Arkansas River shiner, Colorado squawfish, and Pecos blunt-nose shiner.

In summary, the Air Force has concluded that Alternative D may affect, but is not likely to adversely affect, listed species.

7. **Summary of Anticipated Species Effects From Electronic Scoring and Emitter Sites.** As detailed in Section 2.4.1 of the Draft EIS, the Air Force specifically sought candidate sites that were previously disturbed in order to avoid impacts to biological and other resources. Development of the ten selected emitter sites would consist of the installation of a chain-link fence, a 14-foot-wide gravel driveway, and 0.25-acre gravel parking lot at each 15-acre site. The two electronic scoring sites would have a chain-link fence, a 14-foot-wide asphalt driveway, and a 3-acre asphalt pad. The attached Natural Resources Report details the methodology and findings of the site surveys. Key points are outlined below:

   - Surveys of the 42 candidate emitter and electronic scoring sites were conducted 20-28 Apr 98 and 10-11 Sep 98 in Texas and 11-18 May 98 in New Mexico.

- Biologists conducting the survey were Kirk Lakey and Scot Greenwood. Mr. Lakey is a Senior Biologist with The Environmental Company, Inc., and has a B.S. degree in Range Management and Wildlife Habitat Management and over 14 years' experience. Mr. Greenwood is an Environmental Analyst with Ogden Environmental and Energy Services Company, Inc., and has a B.S. degree in Natural Resources and Environmental Science and three years' experience.

- Sensitive plants surveyed include, but were not limited to, those listed in the Draft EIS Appendix H, Table H-4. All species observed were noted so that unexpected sensitive species present would have been discovered.

- The overall habitat disturbed by the sites would be less than 20 acres over twelve locations, all of which have already been disturbed by agriculture, grazing, or oil and gas development.

No listed species or potential habitat were observed during biological surveys of each of the candidate Electronic Scoring Sites and emitter sites in Texas or New Mexico. No sites are near known locations of listed bird species. Therefore, even though the sites overlap the general range of several sensitive bird, mammal, and reptile species, site inspections lead the Air Force to conclude that no adverse effect on listed wildlife species and no effect on listed plant species is expected from the development of these sites.

APPENDIX I
SOCIOECONOMICS

This Appendix provides detailed supporting information for the socioeconomic analysis discussed in Section 4.4. Appendix I describes the methodology and assumptions used in the analysis, as well as the direct and indirect output, earnings, and employment impacts for each affected region. Changes in regional population and attendant impacts to public services are also assessed.

Economic Impact Methodology

An examination of economic effects requires a systematic analysis of the relationships among industries within regions because these relationships largely determine how regional economies are likely to respond to project changes. Regional input-output multipliers account for industry relationships within regions and are useful tools for estimating regional economic impacts.

The Regional Input-Output Modeling System (RIMS II) of the U.S. Bureau of Economic Analysis (BEA) was used for this analysis (U.S. Bureau of Economic Analysis 1997). RIMS II is widely used in both the public and private sectors and is based on an accounting framework called an input-output (I-O) table. For each industry, an I-O table shows the distribution of the inputs purchased and the outputs sold. A typical I-O table in RIMS II is derived mainly from two data sources: BEA's national I-O table, which shows the input and output structure of nearly 500 U.S. industries, and BEA's regional economic accounts, which are used to adjust the national I-O table to reflect a region's industrial structure and trading patterns.

Local procurement for goods and services, as well as local expenditures by employees support additional, indirect output, earnings, and jobs. Final-demand multipliers for output, earnings, and employment measure the economic impact of a change in final demand, in earnings, or in employment on a region's economy. Specific RIMS II regional multipliers developed by BEA for Boone County, Arkansas; Otero County, Colorado; Taylor and Reeves counties, Texas; and Quay, Union, and Harding counties, New Mexico were used in this EIS.

For this analysis, the following assumptions were made:

- All economic activity is assumed to occur within the affected counties (i.e., all expenditures are local).
- Maintenance expenditures are assumed to be the same for the existing and proposed scoring and emitter facilities.
- Maintenance expenditures are assumed to equal producers' prices.
- Expenditures associated with the un-manned emitter sites are assumed to occur in the county where the associated scoring facility is located.
- The creation of scoring facility operations positions would result in in-migration of personnel.
- The loss of scoring facility operations positions would result in out-migration of affected personnel.

- Quay, Union, and Harding counties, New Mexico are considered one economic region.

1.0 Alternative A: No-Action

Under Alternative A: No-Action, there would be no construction or changes in existing operations. No new socioeconomic impacts would be associated with this alternative.

2.0 Alternative B: IR-178/Lancer MOA

2.1 Construction Impacts

Under this alternative, construction costs are estimated to range from $3.6 million to $5 million for each scoring facility at Abilene, Taylor County, and Pecos, Reeves County. Construction costs for the associated emitter sites would range from $300,000 to $680,000 per site. Construction would take place in 2001 and last for 12 to 18 months for each scoring site and less than 2 months for each emitter site. Construction activities would employ an average of eight workers at any one time. Estimated costs to acquire fee, lease, and easement rights for the 10 emitter sites would be approximately $500,000. For the purposes of this analysis, half of the construction costs associated with the emitter sites are assessed in Taylor County and the other half in Reeves County.

The construction expenditures of approximately $4.3 million for each scoring facility and $2.7 million for five emitter sites would total approximately $7 million each in Taylor and Reeves counties. The impacts of facility construction are shown in Table I-1.

Table I-1. Estimated Construction Impacts Under Alternative B

Impact Based on the Change in Final Demand	*Taylor County*	*Reeves County*
Change in Final Demand	$7,000,000	$7,000,000
Final-demand multipliers:		
Output (dollars)	1.6471	1.2934
Earnings (dollars)	0.4892	0.2772
Employment[a] (jobs)	19.9	11.3
Impact on:		
Output	$11,530,000	$9,054,000
Earnings	$3,424,000	$1,940,000
Employment (jobs)	140	80

[a] The employment multiplier is measured on the basis of a $1 million change in output delivered to final demand.
Source: U.S. Bureau of Economic Analysis, 1998.

No changes to population would occur from construction activities. The required construction force of eight workers would be expected to be available from the local labor supply. Indirect jobs associated with construction expenditures would be approximately 140 and 80 in Taylor and Reeves counties, respectively. Most indirect job growth would occur in the services, wholesale, and retail trade industries. This would represent about 1 percent of current employment in both counties. No in-migration would be expected as a result of indirect job growth. Increased earnings as a result of construction activities would represent approximately 1 percent of current county personal income. This would represent a minor beneficial impact to the economy.

2.2 Ground Operations Impacts

The scoring facilities in Taylor and Reeves counties would employ 31 and 30 people, respectively, at an average salary of $30,000. It is assumed that these personnel would in-migrate to the area for employment. Annual maintenance costs for each scoring site would be approximately $150,000. The emitter sites would be unmanned; annual maintenance costs would be less than $50,000.

Total earnings paid in Taylor and Reeves counties would be $930,000 and $900,000, respectively. Annual maintenance costs would be approximately $175,000 in each county. Impacts associated with operations are shown in Tables I-2 and I-3.

Table I-2. Estimated Operations Impacts in Taylor County Under Alternative B

		Final-Demand Multiplier			*Impact*		
Industry	*Regional Purchases (dollars)*	*Output (dollars)*	*Earnings (dollars)*	*Employment*[a] *(jobs)*	*Output (dollars)*	*Earnings (dollars)*	*Employment (jobs)*
Utilities	43,750	1.4413	0.2357	6.2	63,000	10,000	1
Wholesale Trade	52,500	1.5560	0.4413	14.9	82,000	23,000	1
Insurance	17,500	1.8682	0.5732	20.9	33,000	10,000	1
Business Services	61,250	1.6593	0.5729	22.0	102,000	35,000	2
Households	930,000	0.9761	0.2659	12.9	907,000	247,000	12
Sub total	1,105,000				1,187,000	325,000	17
Initial Change					175,000	930,000	31
Total					1,362,000	1,255,000	48

[a] The employment multiplier is measured on the basis of a $1 million change in output delivered to final demand.
Source: U.S. Bureau of Economic Analysis 1998.

Table I-3. Estimated Operations Impacts in Reeves County Under Alternative B

		Final-Demand Multiplier			*Impact*		
Industry	*Regional Purchases (dollars)*	*Output (dollars)*	*Earnings (dollars)*	*Employment* [a] *(jobs)*	*Output (dollars)*	*Earnings (dollars)*	*Employment (jobs)*
Utilities	43,750	1.5844	0.1657	3.9	69,000	44,000	1
Wholesale Trade	52,500	1.2511	0.2898	9.4	66,000	15,000	1
Insurance	17,500	1.4229	.5096	17.9	25,000	9,000	1
Business Services	61,250	1.3520	0.5060	19.1	83,000	31,000	2
Households	900,000	0.5768	0.1468	7.8	519,000	132,000	7
Subtotal	1,075,000				762,000	231,000	12
Initial Change					175,000	900,000	30
Total					937,000	1,131,000	42

[a] The employment multiplier is measured on the basis of a $1 million change in output delivered to final demand.
Source: U.S. Bureau of Economic Analysis 1998.

Given an average household size of 2.8 and 3.3 in Taylor and Reeves counties, respectively (U.S. Census 1990), direct population change as a result of operations would be 87 in Taylor County and 99 in Reeves County. This would represent less than 1 percent of county population. No impacts would be expected to population-affected resources such as schools, libraries, fire and police protection, housing, etc.

Indirect jobs created as a result of operations would be 17 and 12 in Taylor and Reeves counties, respectively. Most indirect job growth would occur in the services, wholesale, and retail trade industries. Indirect job growth would represent less than 1 percent of county employment. The local labor pool would be expected to absorb this additional demand; no significant change in the unemployment rates and no in-migration of labor would be expected.

Increased earnings as a result of operations would represent approximately 1 percent of current county personal income. This would represent a minor beneficial impact to the economy.

2.3 Decommissioning Impacts

Under Alternative B, the electronic scoring facilities located in Harrison, Boone County, Arkansas and La Junta, Otero County, Colorado would be decommissioned and the equipment from the associated eight emitter sites removed. The decommissioning of the facilities would result in the loss of 30 positions in Harrison and 31 positions in La Junta. Affected personnel are assumed to move from the areas. The scoring facilities would be offered for sale to other federal and local governmental agencies and the leased emitter site property would be returned to the landowners.

Decommissioning would result in the loss of earnings of $900,000 and $930,000 in Boone and Otero counties, respectively. In each county, annual maintenance expenditures of $150,000 for the scoring facilities and $20,000 for the associated emitter sites would cease. Impacts associated with decommissioning are shown in Tables I-4 and I-5.

Table I-4. Estimated Decommissioning Impacts in Boone County Under Alternative B

		Final-Demand Multiplier			*Impact*		
Industry	*Regional Purchases (dollars)*	*Output (dollars)*	*Earnings (dollars)*	*Employment*[a] *(jobs)*	*Output (dollars)*	*Earnings (dollars)*	*Employment (jobs)*
Utilities	-42,500	1.2994	0.2069	6.5	-55,000	-9,000	-1
Wholesale Trade	-51,000	1.4112	0.3720	15.1	-72,000	-19,000	-1
Insurance	-17,000	1.5673	0.5674	25.3	-27,000	-10,000	-1
Business Services	-59,500	1.4972	0.5787	31.7	-89,000	-34,000	-2
Households	-900,000	0.7695	0.1952	11.1	-693,000	-176,000	-10
Subtotal	-1,070,000				-936,000	-248,000	-15
Initial Change					-170,000	-900,000	-30
Total					-1,106,000	-1,148,000	-45

Table I-5. Estimated Decommissioning Impacts in Otero County Under Alternative B

		Final-Demand Multiplier			*Impact*		
Industry	*Regional Purchases (dollars)*	*Output (dollars)*	*Earnings (dollars)*	*Employment*[a] *(jobs)*	*Output (dollars)*	*Earnings (dollars)*	*Employment (jobs)*
Utilities	-42,500	1.2458	0.1873	5.2	-53,000	-43,000	-1
Wholesale Trade	-51,000	1.3421	0.3442	11.5	-68,000	-18,000	-1
Insurance	-17,000	1.4949	0.5753	21	-25,000	-10,000	-1
Business Services	-59,500	1.4394	0.5213	21.7	-86,000	-31,000	-2
Households	-930,000	0.6950	0.1850	9.3	-646,000	-172,000	-9
Subtotal	-1,100,000				-878,000	-274,000	-14
Initial Change					-170,000	-930,000	-31
Total					-1,048,000	-1,204,000	-45

[a] The employment multiplier is measured on the basis of a $1 million change in output delivered to final demand.
Source: U.S. Bureau of Economic Analysis 1998.

Given an average household size of 2.5 and 2.7 in Boone and Otero counties, respectively (U.S. Census 1990), direct population loss as a result of decommissioning would be 75 in Boone County and 84 in Otero County. This would represent less than 1 percent of county population. No impacts would be expected to population-affected resources such as schools, libraries, fire and police protection, and housing.

Indirect jobs lost as a result of decommissioning would be 15 and 14 in Boone and Otero Counties, respectively. Most indirect job loss would occur in the services, wholesale, and retail trade industries. Indirect job loss would represent less than 1 percent of county employment. The county economies would be expected to absorb this additional capacity of labor; no significant change in the unemployment rates or out-migration of labor would be expected.

Lost earnings as a result of decommissioning would represent approximately 1 percent of current county personal income. This would represent a minor negative impact to the economy.

3.0 Alternative C: IR-178/Texon MOA

3.1 Construction Impacts

Impacts would be the same as those described for Alternative B.

3.2 Operations Impacts

Impacts would be the same as those described for Alternative B.

3.3 Decommissioning Impacts

Impacts would be the same as those described for Alternative B.

4.0 Alternative D: IR-153/Mt. Dora MOA

4.1 Construction Impacts

For the proposed Taylor County, Texas site, construction impacts would be the same as described under Alternative B. The proposed three scoring sites in New Mexico are located in Quay, Union, and Harding counties, near Tucumcari. Given the size and economic activity in the region, the three counties are considered one economic region for this analysis. Construction costs for the proposed Tucumcari scoring site would range from $3.6 million to $5 million. Construction costs for the associated emitter sites would range from $300,000 to $680,000 per site. Construction would take place in 2001 and last for 12 to 18 months for the scoring site and less than 2 months for each emitter site. Construction activities would employ an average of eight workers at any one time. Costs to acquire fee, lease, and easement rights for the 10 emitter sites would be approximately $500,000. For the purposes of this analysis, half of the construction costs associated with the emitter sites are assessed in Taylor County, Texas, and the other half in the tri-county region of Quay, Union, and Harding counties, New Mexico.

The construction expenditures of approximately $4.3 million for the scoring facility and $2.7 million for five emitter sites would total approximately $7 million in the tri-county region. The impacts of facility construction are shown in Table I-6.

Table I-6. Estimated Construction Impacts Under Alternative D	
Impact Based on the Change in Final Demand	*Tri-County Region of Quay, Union, and Harding Counties*
Change in Final Demand	$7,000,000
Final-demand multipliers:	
Output (dollars)	1.3992
Earnings (dollars)	0.3927
Employment[a] (jobs)	18.9
Impact on:	
Output	$9,794,000
Earnings	$2,749,000
Employment (jobs)	133

[a] The employment multiplier is measured on the basis of a $1 million change in output delivered to final demand.
Source: U.S. Bureau of Economic Analysis 1998.

No changes to population would occur from construction activities. The required construction force would be expected to be available from the local labor supply. Indirect jobs associated with construction expenditures would be approximately 133. Most indirect job growth would occur in the services, wholesale, and retail trade industries. This would represent about 2 percent of current employment. No in-migration would be expected as a result of new indirect job growth. Increased earnings would represent approximately 2 percent of current regional personal income. This would represent a minor beneficial impact to the regional economy.

4.2 Operations Impacts

For the proposed Taylor County site, ground operations impacts would be the same as described for Alternative B. The facility near Tucumcari would employ 30 people at an average salary of $30,000. It is assumed that all these personnel would in-migrate to the area for employment. Annual maintenance costs for the Tucumcari site would be approximately $150,000. The emitter sites would be unmanned; annual maintenance costs would be less than $50,000.

Total earnings paid in the region would be $900,000. Annual maintenance costs would be approximately $175,000. Impacts associated with operations are shown in Table I-7.

Table I-7. Estimated Operations Impacts in the Tri-County Region, New Mexico Under Alternative D

		Final-Demand Multiplier			*Impact*		
Industry	*Regional Purchases (dollars)*	*Output (dollars)*	*Earnings (dollars)*	*Employment[a] (jobs)*	*Output (dollars)*	*Earnings (dollars)*	*Employment (jobs)*
Utilities		1.4031	0.2496	8.3	61,000	11,000	1
Wholesale Trade	52,500	1.3479	0.4203	16.8	71,000	22,000	1
Insurance	17,500	1.5030	0.5670	24.9	26,000	10,000	1
Business Services	61,250	1.3900	0.5133	23.4	85,000	31,000	2
Households	900,000	0.6436	0.1759	9.9	579,000	158,000	9
Subtotal	1,075,000				822,000	232,000	14
Initial Change					175,000	900,000	30
Total					997,000	1,132,000	44

[a]: The employment multiplier is measured on the basis of a $1 million change in output delivered to final demand.
Source: U.S. Bureau of Economic Analysis 1998.

Given an average household size of 2.6 in the tri-county region (U.S. Census 1990), direct population change as a result of operations would be 78. This would represent less than 1 percent of regional population. No impacts would be expected to population-affected resources such as schools, libraries, fire and police protection, and housing.

Indirect jobs created as a result of operations would be 14, less than 1 percent of regional employment. Most indirect job growth would occur in the services, wholesale, and retail trade industries. The local labor pool would be expected to absorb this additional demand; no significant change in the unemployment rates and no in-migration of labor would be expected.

Increased earnings as a result of operations would represent approximately 1 percent of current regional personal income. This would represent a minor beneficial impact to the regional economy.

4.3 Decommissioning Impacts

The impacts would be the same as those described for Alternative B.

APPENDIX J
SOIL EROSION CALCULATIONS

Assumptions and Background for Calculations

While long-term wind and water caused soil erosion rates are predicted to be low in areas with established permanent cover and hardened surfaces (graveled pads, roads, etc.), potentially moderate erosion losses may occur on unimproved roads, other bare areas, and during short-term construction practices. If not protected, the majority of soils found on RBTI have the potential for water and wind erosion. However, best management practices would be followed and the erosion potential would be minimal. The following describes how soil erosion is calculated and Table J-1 provides the data that were used for these calculations.

Excessive water runoff causes three types of erosion: sheet, rill, and gully. The Universal Soil Loss Equation (USLE) can be used to estimate loss rates due to sheet and rill erosion. Gully erosion is more apparent when it occurs and is calculated by direct volume measurements. It is difficult to predict gully erosion rates: it is based on site specific factors and professional judgment.

Wind-caused erosion is typically most severe where soil textures are sandy. Moisture helps bind soil particles together, therefore, this type of erosion occurs predominantly during dry periods. Fine textured soils are susceptible to wind erosion if pulverized, as on road surfaces. Airborne dust, or fugitive dust, can be a result of this type of erosion.

USLE factors used to calculate sheet and rill erosion rates were obtained from various USDA-NRCS (SCS) soil surveys, NRCS technical guides, and NRCS soil scientists from New Mexico and Texas. Gully erosion estimates were based on site specific data provided by qualified field crew and technical staff after review of proposed construction concepts. Gully erosion may be a factor on localized sites and should be added to overall loss calculations. If it is known to occur, gully erosion can be estimated using an average gully size (e.g., v-shaped gully 30 ft. long by 2 ft. wide at ground surface by 1 ft. deep = 30 $ft.^3$ = 1.1 $yd.^3$, which is about 1 ton of soil).

Wind erosion estimates are based on NRCS methodologies (Wind Erosion Equation or WEQ), as well as an EPA standard method for calculating losses due to construction practices, in the form of fugitive dust (1.2 tons/ac/month x 50% reduction factor with Best Management Practice use = 0.6 tons/ac/month). Because some factors are site specific, WEQ calculations were made for each candidate MTR and MOA emitter and electronic scoring site. A 70% overall reduction factor that recognizes application of Best Management Practices is used in this analysis for WEQ. Care must be used when generalizing about wind erosion (see Assumptions).

Formulas, factors, and assumptions used in all cases are listed below.

Summary

1. Calculate area (acres) of ground to be disturbed (roads and right-of-ways, building pad areas, etc.), according to soil types listed for each emitter/scoring site.
2. Total predicted soil lost for given site = (acres x USLE factors) + (acres x Wind Erosion factors) + gully losses if any.

Assumptions

1. Total disturbed area for MTR/MOA sites = 0.6 acres.
2. Total disturbed area for ESS sites = 3.3 acres.
3. Bare soil construction period at each site is 10 days (0.33 months).
4. Erosion will be negligible after construction period is completed.
5. 250 lbs./ac. vegetation cover and/or coarse fragments, and no soil clods or crusts in construction areas (pulverized soil conditions).
6. Moderate to high erosion factors are used in USLE calculations (*P* factor equals *1*, *C* factor adjusted for low cover with low management =0.50, slope length *L* maximum and gradient *S* low, all other factors per NRCS FOTGs).
7. Wind erosion loss as fugitive dust will be reduced by 50% with application of Best Management Practices such as watering and soil stockpiling.
8. Other wind erosion losses to saltation, suspension, and surface creep, as calculated by WEQ will be reduced by 70% with application of Best Management Practices such as watering, covering with erosion fabric, and soil stockpiling.
9. Moderate to high erosion factors are used in Wind Erosion Equation (*K* factor set to 1, *L* factor at maximum length for graded site, *V* factor set low converted to small grain equivalents, all other factors per NRCS FOTGs).
10. Wind erosion calculated on 12-month basis and reduced to 10-day period. Because wind erosion periods vary on monthly basis, actual erosion rates will depend on weather conditions during construction periods.
11. Gully erosion will be minimal except on margins of steepest sites.

Factors and Calculations

(Note: Factors used in the USLE are not the same as in the Wind Erosion Equation)
BMP = Best Management Practice
USLE: R x K x LS x C x P = A in *tons/ac/year*

Wind Erosion Equation: f (I K C L V) = E x BMP reduction factor = E_{Tot} in *tons/ac/year*.

Fugitive Dust: 1.2 tons/ac/month x BMP reduction factor = D in *tons/ac/month*

Table J-1. Soil Erosion Calculations for Candidate Emitter and Electronic Scoring Sites

* *Little evidence that gully erosion may occur on site was observed.*

** *Short-term erosion rates. Actual rates will depend on weather factors during construction period. Long-term erosion is not expected to exceed natural back-ground rates. Sites are relatively level and will be paved with rock or asphalt.*

APPENDIX K
IDENTIFYING THE PREFERRED ALTERNATIVE AND ENVIRONMENTALLY PREFERRED ALTERNATIVE

In conformance with the Council on Environmental Quality (CEQ) regulations (40 CFR 1502.14(e)), the Air Force evaluated information acquired during the RBTI environmental impact analysis process to determine the Air Force's preferred alternative. In addition, as required by 40 CFR 1505.2(b), the environmentally preferred alternative, necessary for the future Record of Decision is identified as well. The two-fold process is discussed below.

Identification of the preferred action alternative and environmentally preferred action alternative followed independent processes. For the preferred alternative, the Air Force evaluated each action alternative to identify which one best met the operational goals of RBTI. Although each action alternative achieves RBTI operational requirements, they can be differentiated by the level of training potential and operational utility. These differences were identified during the NEPA process. Identification of a preferred alternative followed review of the technical analysis, comments received from the public and agencies, as well as input from the FAA, a cooperating agency on this EIS.

For the environmentally preferred alternative, the Air Force evaluated each of the action alternatives based on the results of the environmental analysis as well as public and agency comments on the draft EIS. This evaluation differentiated the action alternatives according to the nature and magnitude of their environmental consequences.

Preferred Alternative

The process for identifying a preferred alternative from among the three action alternatives consisted of a two-part screening. A coarse screening was conducted, followed by a fine screening.

Step 1: Coarse Screening. During coarse screening, the Air Force evaluated the operational utility of each action alternative. Section 2.4 of the EIS indicates that all three alternatives met the rigorous requirements of the systematic alternative identification process in order to be carried forward for analysis in the EIS. This means they all fulfilled the operational requirements. Further evaluation, as presented in Section 2.6.3 of the EIS and summarized below, established that the expected operational outcomes of all three alternatives were similar, although Alternatives B and C would provide slightly more combat training time than Alternative D.

	Alternative B	Alternative C	Alternative D
Percent reduction in low-value transit time	67 – 71%	67 – 71%	45 – 75%
Percent increase in proportion of combat training time	20 – 26%	26 – 29%	18 – 26%

In addition, training activities in Alternative D are more likely to be adversely constrained by weather than the other two action alternatives. The northeastern New Mexico area, where Alternative D is located, is prone to afternoon thunderstorms during the summer months and severe snowstorms during the winter months potentially impairing the ability for military aircraft to train. Western Texas, where Alternatives B and C are located, receives less severe weather. This factor and the operational considerations described above resulted in eliminating Alternative D from being carried forward for fine screening. At this coarse level of consideration, Alternatives B and C had approximately equal potential for being identified as the preferred alternative. Both were carried forward for fine screening.

Step 2: Fine Screening. Alternatives B and C were then assessed in detail to determine the extent to which operational differences had been identified by the technical analysis, agency input, public comments, and cooperating agency (FAA) input.

Both Alternatives B and C would achieve RBTI operational goals almost equally. In terms of training value, Alternative C would provide slightly more combat training time than Alternative B. Since this difference was minor, input from the FAA was the primary tool used to differentiate between the two alternatives. The FAA indicated that the modification and increased use of the proposed Texon MOA/ATCAA within Alternative C could significantly impair IFR traffic, would require rigid management with little or no capability to support any flight changes or delayed operations, necessitate rerouting of civil and commercial aircraft using affected jet routes and federal airways, and possibly require restructuring of the airspace. Given these constraints, the operational flexibility of the proposed Texon MOA/ATCAA would be limited.

In contrast, the proposed Lancer MOA/ATCAA associated with Alternative B offers flexibility and is better suited to support the designated training activities with less potential interference to other aviation in the area. While the proposed Lancer MOA/ATCAA could require rerouting of civil and commercial aircraft, the amount of traffic would be minimal and easily accommodated by the FAA. The proposed Lancer MOA/ATCAA would allow less constrained flow into and out of the training airspace. These factors make Alternative B the more operationally preferable alternative, therefore, it has been identified as the Air Force's preferred alternative.

Environmentally Preferred Alternative

Independent of the identification of the preferred alternative, the Air Force evaluated all three action alternatives to determine the environmentally preferred alternative. Similar to the operational evaluation, a two-step coarse and fine screening approach was used.

Step 1: Coarse Screening. This effort focused on differentiating the overall potential for environmental impacts among the three action alternatives. An assessment of the environmental analysis in the EIS, public comments, and agency input demonstrated that Alternative D, IR-153/Mt. Dora MOA, was the least preferred alternative.

Review of the impact summary table in the Executive Summary of the EIS (repeated below) reveals that in three of the six resource categories, the magnitude of potential impacts for Alternative D would exceed those resulting from Alternatives B and C. In the other three categories, all action alternatives were considered equal. Implementing Alternative D would result in substantial (>10 dB) increases in noise over 22 of 38 segments of proposed IR-153. In contrast, four segments in Alternative B and two in Alternative C would be subjected to similar changes in noise levels. Both

the analysis and comments from agencies indicated that Alternative D has the potential to affect more special use land management areas and threatened or endangered species due to increased aircraft noise and overflights.

Alternatives B and C each have the potential for fewer and lower magnitude environmental impacts than Alternative D. At this coarse level of consideration, Alternatives B and C had approximately equal potential for being identified as the environmentally preferred alternative.

Potential Effects of RBTI Alternatives

EIS Section	*Resource*	*Alternative A*	*Alternative B*	*Alternative C*	*Alternative D*
4.1	Airspace and Aircraft Operations	⊗	♦	♦	♦♦[1]
4.2	Land Management and Use	⊗	♦	♦	♦♦
4.3	Biological Resources	⊗	⊗	⊗	♦
4.4	Socioeconomics and Environmental Justice	⊗	⊗	⊗	⊗
4.5	Cultural Resources	⊗	⊗	⊗	⊗
4.6	Soils and Water Resources	⊗	⊗	⊗	⊗

⊗ = Negligible/inconsequential effects
♦ = Potential adverse effects
♦♦ = Magnitude of potential adverse effects
[1] = Applies to noise

Step 2: Fine Screening. This second level of screening addressed each environmental resource category, individually and cumulatively, to determine if there were environmental discriminators between the two alternatives. Although no dramatic differences were identified from either the EIS analysis or comments, a detailed interdisciplinary review revealed the relative environmental differences presented below.

Airspace and Aircraft Operations. Both alternatives include similar modifications to existing IR-178. Although proposed IR-178 in Alternative B would involve more total airspace, it would create less new airspace, both in total and proportionally. With respect to the MOAs/ATCAAs associated with these alternatives, the proposed Lancer MOA/ATCAA (Alternative B) would reduce the total area affected by this type of airspace, (90 percent would be composed of existing airspace), whereas modifications to the proposed Texon MOA/ATCAA (Alternative C) would increase the total area underlying MOA airspace by 25 percent (with 25 percent of the MOA comprised of new airspace). Coupled with the operational constraints and issues derived from the FAA, these factors make Alternative C less environmentally preferred in terms of airspace management.

Because of similar location, structure, and projected use, neither Alternative B or C is measurably different than the other with regard to noise, air quality, or aircraft safety.

Land Management and Use. Land management and uses underlying the airspace for both Alternatives B and C are relatively similar since the alternatives cover similar area. Ranching, farming, and hunting (through leases) represent the most common land management and uses. Both

alternatives overlie the same two special use land management areas and noise levels at each area increase no more than 3 dB. While population under Alternative B is greater, the establishment of more new airspace in Alternative C affects more locations not previously exposed to aircraft noise. This factor suggests that Alternative B would be slightly preferable to Alternative C.

Biological Resources. No substantive differences were identified between the two alternatives during the screening. Both affect almost the same area and habitats.

Socioeconomics and Environmental Justice. No discernible differences in socioeconomic and environmental justice impacts would result from these two alternatives. Short-term and long-term revenues from construction and operation of the emitters and electronic scoring sites would be identical and apply to the same counties.

Cultural Resources. The number of cultural resources potentially affected by construction of emitter and electronic scoring sites would be one less under Alternative B. Although these resources could be avoided under both Alternatives B and C, the reduced potential for effects makes Alternative B minimally preferable to Alternative C.

Soils and Water. No substantive differences were identified between the two alternatives during the screening. Soil loss and erosion would be minimal under each alternative, and neither would effect water use or availability.

Cumulative Effects. The areas affected by and the timing of both alternatives would be very similar. No known or foreseeable actions would interact with either alternative. Neither alternative could be considered environmentally preferable.

Fine screening of environmental impacts revealed minor differences in the potential consequences of Alternatives B and C. Since Alternative B offers somewhat less potential for environmental impacts, it has been identified as the environmentally preferred alternative.

In conclusion, Alternative B is environmentally preferred. Therefore, the Air Force's preferred alternative and the environmentally preferred alternatives are one in the same -- Alternative B, IR-178/Lancer MOA.
