AO-16 1) B-1s and B-52s crash. You have access to the Air Force Aerospace Safety Directorate accident investigation board reports. I urge you to read the B-52 and B-1 files. Or, just recalling popular news media coverage of recent years, think of the B-52 crashing while practicing for an airshow at Fairchild AFB (attempting a tight turn at low altitude) or the burned out wreckage of the B-1 that crashed during a low altitude desert overflight due to a fuel imbalance.

AF-51 2) B-52s were not meant to be low level bombers. The plane was originally named the "Stratofortress." It was not designed as a bugsmasher. The plane is a high altitude horizontal bomber.

AF-51 3) B-52s are very old airframes. Some people will tell you that they are not up to the stresses required in low altitude maneuvering.

4) Philmont is a rotten place to fly. The weather is horrendous in the summer due to sudden, violent thunderstorms. On average, the area at which Philmont is the epicenter (the Sangre de Cristo range of the Southern Rockies) has lightning and thunderstorms 70 days per year making it the second most storm-ridden part of America. Nothing else in the west even comes close with the exception of the Front Range in Colorado (a crescent formed by the Gulf coasts of FL, AL, MS has the highest concentration of thunderstorms -- about 100 days per year).

Comprising part of the east slope of the Rockies, Philmont is in an area where there is a tremendous incidence of downburst and windshear activity. Downburst/windshear warning systems are now nearly commonplace -- at major airports (but not in the wilderness).

There are already military wreckages in the Sangre de Cristos. The majority are above timberline where the fire hazard to forests and people were minimal. On one of Philmont's peaks, there is the wreckage of a WWII B-24 Liberator which crashed in 1942 from very low altitude due to windshear. Torrents of rain at the time of that crash prevented a spreading forest fire. Within a few miles of Philmont, there is another military bomber wreckage related to flying too low (on the very top of Little Baldy Mountain in the Costilla Peak cluster). The only way to overcome windshear is to have thousands of feet of altitude for recovery. No such luxury with RBTI.

5) The altitudes are below FAA minima for flying over "open assemblies of people." There are up to 5,000 people in Philmont's back countryon any given day in the summer, including clusters of up to several hundred people at various camps along the RBTI route.

000566

The solution is to find an unpopulated, mountainous area which is not such a national treasure -- and fly through it instead of Philmont. Or fly one of the other routes where the problems are less severe. For example, if a B-52 went into the Organ Pipe Mountains just west of White Sands Proving Grounds in southern New Mexico, the environmental impact would be one demolished airplane, a dead crew, and a lot of blackened rocks.

That's tragic enough, but if the same B-52 went in at Philmont, the additional impact would be a mass conflagration related to the fuel load of dead trees and the almost certain major loss of life due to the mountains being populated by thousands of Scouts and their leaders. The forest fire problem is already severe. In the past few years, Philmont has not received enough moisture in the winter and spring to eliminate open fire bans (cooking and evening campfires) which are in effect even at this writing.

Unlike some of the other potential route areas, the Air Force hasn't heard much protest from Colfax County, New Mexico. That is because it is so sparsely populated. The area proposed for overflights has only a few villages, unlike other areas including Taos, NM, which has a large, vocal population. Looking at it another way, Philmont is Colfax County's largest community. Including Philmont's staff, the campers, the Philmont Training Center, Philmont is a transient community of about 25,000 people. They can't protest directly because they don't live there a full 12 months out of the year.

The Air Force is currently holding hearings at "town meetings" in communities along the proposed routes. A final selection will be announced in November. The environmental impact statement (EIS) done for the Air Force is hopelessly riddled with gross inaccuracies. To make a decision favoring alternative D based on the EIS would be a great mistake. For example, the EIS describes Philmont as an uninhabited grassland where RBTI would not create any safety, health or land management issues.

To summarize, I trust that you will support RBTI -- it is a valuable program. However, I hope you will endeavor to see that it is implemented in some area other than through Philmont. RBTI will make proven problems intolerable. It invites a calamity when one of the bombers goes in, and that is a very, very real possibility made more likely by the terrain, unique population of Philmont, excessively adverse flying weather, and the unfortunately strong potential for major forest fires.

Thank you for your attention to this matter.

Sincerely,

William F. Cass

000567

Honorable F. Whitten Peters
Acting Secretary of the Air Force
1670 Air Force Pentagon
Washington, DC 20330

May 11, 1999

Dear Mr. Peters,

BR-6 I am writing to request your firm support in opposing the selection of "Alternative D" under the USAF's proposed Realistic Bomber Training Initiative (RBTI) involving low flying B-52s and B-1s (as low as 300'). As one of several proposed southwestern routes, "D" traverses Philmont Scout Ranch in northeastern New Mexico's Colfax County. Philmont, truly a national treasure, is the 137,000 acre backpacking and training facility of the Boy Scouts of America. I do not protest RBTI since it is a valuable program -- my only complaint, as a Philmont alumnus, is with the proposed route over Philmont.

Several years ago, the USAF ceased its low altitude F-16/F-111 flights over the Ranch as a result of Philmont protests. RBTI's multiple daily flights (up to 16) will create much more severe problems:

a) Program: Philmont is a transient community of 25,000 people with over 3,000 campers in Philmont's backcountry every day in the summer. Daily, several hundred of them are engaged in spar pole climbing, rock climbing and rappelling, and horse back riding. The sudden roaring of jet engines will distract climbers and bolt horses thereby creating injuries (or worse).

b) Environmental: Appreciation and protection of the wilderness are key parts of Philmont's program. RBTI is inconsistent with wilderness preservation. RBTI will have a damaging effect upon both the unique western wildlife and Philmont herds of cattle, horses, burros, and buffalo. The effect of the unburned portion of jet fuel in the engine exhaust or dumped fuel itself, vaporizing and falling to ground level is as yet unknown, but believed to be anything but beneficial.

c) Safety: The environmental impact study done for the USAF is seriously flawed when it describes Philmont as an "uninhabited" grassland. The smaller portion of Philmont's acreage is prairie. Most of Philmont is mountainous with many peaks in the 10,000 to 12,444' range. Philmont has a tremendous fuel load of dead trees in its forests, and is in the midst of a long term drought. Open fire bans are in effect now. A crashing bomber will create an epic fire of Yellowstone proportions. B-1s and B-52s do not have enviable safety records. The nature of the flights (weaving around mountain peaks and facing violent weather, including frequent, low-level wind shears) dramatically increases the chance of a crash. Unfortunately, Philmont does not have a well-developed highway system for evacuations in case of massive forest fires.

d) I love Philmont. I am taking a leave of absence from my job to spend it away from technology and the "real world" for the summer. One of the last things I want to see during my getaway is technology screaming overhead. I am hoping to spend the summer listening to the sounds of nature.

000567

For the above reasons, I seek your help in advocating the selection of a different RBTI route, preferably one that is over a more sparsely populated, less environmentally sensitive area. You, or a member of your staff may wish to liaise with Rep. Ed Pease's (Indiana) legislative assistant, Greg Good, who has additional information on RBTI.

There is too much at stake to allow RBTI to overfly Philmont. Please act now – final route determination starts in June. Thank you for helping to see that alternative D is not selected.

Sincerely,

Adelbert "Pat" Custodio

Philmont Scout Ranch

May 5, 1999

000568

The Honorable Whitten F. Peters
Secretary United States Air Force
1670 Air Force Pentagon
Washington, D.C. 20330-1670

Dear Secretary Peters:

We have read Senator Domenici's news release and his corresponding letter to you of April 12th. We find them both quite diplomatic and understanding of the Air Force point of view. The issue is not, however, how strongly we support the Air Force and its need for specializing training. That we all understand. What is of great consequences here is their proposed choice of location and how it would directly affect this entire community.

We know that the Environmental Impact Statement they presented is flawed and that the predictable amount of noise from such continuous flight activity would be devistating to many aspects in the lives of citizens living in the designated zones. You may not be aware that much of nothern New Mexico's economy is ultimately linked to tourism and the outside funds that enter this area from the people who find the charm of Taos and its environs appealing. The tranquility of life experience in our mountains, along our rivers and streams, our state parks and national forests, camp grounds and scout camps is essential to the lives of not only those who come as tourists or guests but is a significant factor in the choice people make when they come to New Mexico or stay in new Mexico as residents.

BR-4

These low flying flights would have severe consequences on the indigenous activities here especially where livestock is concerned as well as an unsettling effect on most of the wildlife in the affected area. This includes vast elk breeding grounds on the San Antonio Peak and in the Villa Vidal unit of the Carson National forest. The Villa Vidal is so closely regulated by the U.S. Fish and Wildlife Service that it is forbidden to leave the main highway during the months of May and June, even on foot or on horseback, because of the calving season. Imagine the results from continuous 200 to 300 foot overflights. There are many endangered species in these areas lets not add civilians to the list.

BR-3

Nearly as important as an accurate EIS would be and Ecological Impact Statement prepared by people with expertise in the local ecological systems by the U.S. Fish & Wildlife Service. Why has this not been addressed? The quality of our environment is a direct result of the state of this ecology both of which have an impact on the "socioeconomics" of the entire region.

BI-8

Sincerely,

Howard & Mara Taylor

000569

Sunday, May 09, 1999

Honorable F. Whitten Peters
Acting Secretary of the Air Force
1670 Air Force Pentagon
Washington, DC 20330

Dear Honorable F. Whitten Peters,

BR-6

I am writing to request your firm support in opposing the selection of "Alternative D" under the USAF's proposed Realistic Bomber Training Initiative (RBTI) involving low flying B-52s and B-1s (as low as 300'). As one of several proposed southwestern routes, "D" traverses Philmont Scout Ranch in northeastern New Mexico's Colfax County. Philmont, truly a national treasure, is the 137,000-acre backpacking and training facility of the Boy Scouts of America. I do not protest RBTI since it is a valuable program -- my only complaint, as a Philmont alumnus, is with the proposed route over Philmont.

Several years ago, the USAF ceased its low altitude F-16/F-111 flights over the Ranch as a result of Philmont protests. RBTI's multiple daily flights (up to 16) will create much more severe problems:

a) Program: Philmont is a transient community of 25,000 people with over 3,000 campers in Philmont's back country every day in the summer. Daily, several hundred of them are engaged in spar pole climbing, rock climbing and rapelling, and horse back riding. The sudden roaring of jet engines will distract climbers and bolt horses thereby creating injuries (or worse).

b) Environmental: Appreciation and protection of the wilderness are key parts of Philmont's program. RBTI is inconsistent with wilderness preservation. RBTI will have a damaging effect upon both the unique western wildlife and Philmont herds of cattle, horses, burros, and buffalo. The effect of the unburned portion of jet fuel in the engine exhaust or dumped fuel itself, vaporizing and falling to ground level is as yet unknown, but believed to be anything but beneficial.

c) Safety: The environmental impact study done for the USAF is seriously flawed when it describes Philmont as "uninhabited" grassland. The smaller portion of Philmont's acreage is prairie. Most of Philmont is mountainous with many peaks in the 10,000 to 12,444' range. Philmont has a tremendous fuel load of dead trees in its forests, and is in the midst of a long-term drought. Open fire bans are in effect now. A crashing bomber will create an epic fire of Yellowstone proportions. B-1s and B-52s do not have enviable safety records. The nature of the flights (weaving around mountain peaks and facing violent weather, including frequent, low-level wind shears) dramatically increases the chance of a crash. Unfortunately, Philmont does not have a well-developed highway system for evacuations in case of massive forest fires.

For the above reasons, I seek your help in advocating the selection of a different RBTI route, preferably one that is over a more sparsely populated, less environmentally sensitive area. You or a member of your staff may wish to liaise with Rep. Ed Pease's (Indiana) legislative assistant, Greg Good, who has additional information on RBTI.

There is too much at stake to allow RBTI to overfly Philmont. Please act now – final route determination starts in June. Thank you for helping to see that alternative D is not selected.

Alpharetta, Ga.

F. Whitten Peters
Acting Sectary of the Air Force
1670 Air Force Pentagon
Washington, D.C. 20330-1670

Dear Secretary Peters:

BR-6

The purpose of my drafting this correspondence to you is to call to your attention a possible serious situation that may come to pass if folks like yourself wont intervene.

First let me say that I am not a bleeding heart environmentalist or activist. The situation however, that I am about to relate to you does need positive and swift action.

I am speaking of the air force plan to expand the MTR network for a B-52/B-1 low alt. route that would over fly the Philmont Boy Scout reservation.

Philmont New Mexico has been a Meca, or rather "The Meca" of boy scouts for many many years. These are hollowed grounds. A place where scouts can ,to coin a phrase "be one with nature. For several days during the summertime scouts, hike, camp cook and Learn the ways of scouting in the peace and solitude of the desert.

To have daily low altitude operations over the Philmont ranch, would be a death sentence to the quiet and solitude of this mostly untouched part of our country.

The route specifically in question would be Alternative D. These routes are proposed for opps from Dyess AFB Tx. and from Barksdale AFB in Louisiana. At this time there are 2 other alternative routes that would over fly west Tx.

I myself am a pilot and have been for many years. I love the beauty of looking up and seeing a low flying heavy loud aircraft but there is a time and place for everything and Philmont is neither.

There are also legitimate safety reasons for not allowing Bombers to operate over the scouts who will populate Philmont through out the summer. Emergency fuel dumping , and the very remote (but possible) chance of an accident over Philmont.

This is the problem and I will look to your help and guidance in preserving this wonderful and remote place, free of the tools of big city life.

Sincerely,

Martin Frisch

May 1, 1999

000571

TY

Dear Secretary Peters,

Northern New Mexico is not the area for Realistic Bomber Training! It has a fragile eco-system, wilderness area and communities commited to preserving their quality of life. Rich in cultural heritage and natural beauty, this area contributes heavily to the appeal of the State of New Mexico. RBTI would destroy that!

We request that realistic bomber training NOT be expanded to this area and that you eliminate the current flights (foreign and domestic) and refueling over the Town of Taos and the Taos Pueblo.

Thousands of people are adversely effected and we wonder why our own Air Force is determined to be at war with the citizens of Northern New Mexico.

Sincerely,

Suzanne Betz

000572

4/18/99

Dear Sir:

TY I'm writing this letter today to let you know of my opposition to the bombers flying over northern New Mexico.

Three years ago I moved to Cimarron, New Mexico from Los Angeles, Ca. My husband and I had retired and were looking for a quiet and peaceful place so we decided on Northern New Mexico with its beautiful skies and peaceful people and atmosphere. Their are so few places left and now that is being threatened by you.

Please give us our little place of peace and quiet so we can enjoy our remaining years.

Thank you for reading my letter.

Marlene Blevins

Cimarron, New Mexico

000573

EDMUND R. HOBBS, COLONEL, USAF, RETIRED

SAN ANTONIO, TEXAS

Maj Brent Adams, RBTI EIS Proj Mgr
Hq ACC/CEVPP
129 Andrews St, Suite 102
Langley AFB, VA 23665-2769

Dear Major Adams:

BR-6 I write to request your opposition to the selection of Alternative D of the U.S. Air Force's Realistic Bomber Training Initiative, which would traverse the densely forested mountains comprising the Philmont Scout Ranch in northeast New Mexico's Colfax County. More than 2600 flights per year, some as low as 300 feet above ground level, are proposed. These flights will harm the environment and destroy the wilderness experience of the campers, and pose a serious threat to their safety.

Philmont is the largest and most famous Scout camp in the world. It is a historic and beautiful natural preserve, on a par with the best of our national parks, renowned for its spacious sky, wildlife, mountain vistas, peace, and unspoiled wilderness. Annually it attracts more than 18,000 young people from across the nation. They hike the forest trails in two-week expeditions, learn to rely on themselves and work with each other, and live in remote mountain country little changed since the days of Kit Carson. They engage in such activities as rock climbing, rapelling, spar pole climbing, and horseback riding. A Philmont expedition is never forgotten, a formative experience for virtually every participant, a priceless lesson in leadership, often a turning point in a young life. Low level aerial operations are completely incompatible with the unique experience provided in this rustic setting. The physical presence of high speed aircraft in such close proximity would be highly intrusive, the surprise appearance and deafening scream shattering the solitude and spoiling the wilderness experience which is the core of a Philmont trek.

The aircraft sound and exhaust fuel vapor will doubtless affect the ecosystem, impacting the wildlife, water quality, and air purity in this virgin area. The safety issue is the over-riding concern. Two thirds of the scouts who come to Philmont ride horses, and very few are accomplished equestrians. There is a real risk of harm to inexperienced young riders by high performance aircraft suddenly appearing on top of them after silent approach. The possibility of misadventure or accidental crash and fire cannot be discounted either. Philmont has a tremendous fuel load in terms of dead trees, and is in a drought.

The Boy Scouts of America are solid citizens, and I doubt few would dispute the need to appropriately train our aircrews to defend us. Conducting this training over Philmont makes as much sense as doing it over Yosemite Valley or Yellowstone National Park. Surely this training can be conducted in other areas, such as the desert mountains of southern New Mexico, west Texas, Nevada, or western Arizona, with lesser impact on the land and the many people who use it.

Philmont Scout Ranch is a national treasure. The proposal to conduct low level flight operations in this area places the essence of its program at risk for this and future generations of young Americans. Please act to prevent selection of Alternative D.

Sincerely,

Edmund R. Hobbs

000574

L. SCOTT SMITH

SCHENECTADY, NEW YORK

May 24, 1999

Major Brent Adams
RBTI EIS Project Manager
HQ ACC/CEVPP
129 Andrews Street, Suite 102
Langley AFB, VA 23665-2769

Dear Major Adams:

BR-6 I am writing to request your firm support in opposition to Alternative D under the U. S. Air Force's proposed Realistic Bomber Training Initiative (RBTI). The Air Force seeks to establish new training routes for low level B1 and B52 flights from bases in Texas and Louisiana. One of these routes, Alternative D, traverses Philmont Scout Ranch in northeastern New Mexico.

Philmont is a 213 square mile mountain backpacking and high adventure facility of the Boy Scouts of America. Each year over 20 thousand scouts and their adult leaders come from all over America to participate in two week wilderness backpacking trips in Philmont's mountains. Many also camp and work on conservation projects in the contiguous Carson National Forest. On any given day in the summer, up to 5000 scouts and scouters will be hiking and camping in Philmont's backcountry. The program include rock climbing and rappelling, mountain horseback riding, and lumbering inspired spar pole climbing.

The Air Force's proposed alternative D will establish a military training route directly over most of Philmont. In excess of 2600 flights per year, some as low as 300 feet above ground level proposed. I am concerned that these training flights would negatively impact the health and safety of Philmont's scouts and the fragile mountain ecosystem.

While supporting the principles of RBTI, Philmont represents a unique resource that deserves more thorough consideration. The Air Force's Environmental Impact statement (EIS) appears to contain faulty data which may invalidate the conclusions.

- *Philmont is primarily uninhabited grassland.* Over 60% of Philmont is forested mountain terrain. As a former staff member we used to caution new scouts. "Some trails on Philmont go uphill ... steep uphill. Some trails on Philmont go downhill ... steep downhill. There are no level trails at Philmont."
- *Noise level will vary from 62-68 dB.* At 300 feet, a B52 produces 117dB causing ground crews to wear attenuating headsets. This 50 dB difference corresponds to 10,000 times more acoustic power than claimed by the EIS.
- *Residents will get used to the noise.* A typical scout spends only 2 weeks at Philmont. If he is awakened by the 20% of night flights, as is likely sleeping only in a tent rather than a structure, I suspect it will impact his performance and hence may compromise his safety in the program activities.
- *Flight operations would not be expect to preclude land uses or ... preempt recreation uses, threaten public health and safety or be inconsistent with applicable regulations.* Unburned jet fuel finding its way to the ground or being dumped in an emergency over Philmont's long term drought and fuel-loaded lands, creates the potential for a serious fire that would endanger hundreds of lives. Philmont is most concerned about how RBTI will impact program, health and safety.

Philmont is the largest and most famous Scout camp in the world. It is a national resource that has positively impacted the lives of hundreds of thousands of our nation's young adults for more than sixty years. It deserves and demands our protection. Thank you for helping to see that Alternative D is not selected.

Sincerely,

Scott Smith

Jimmy Bacon

Greenville, SC

000575

Dear Major Adams,

BR-6 I am writing to request your firm support in opposing the selection of Alternative D under the U.S. Air Force's proposed Realistic Bomber Training Initiative (RBTI). The Air Force is seeking to establish a new training rout for low-level B-1 and B-52 bomber flights from bases in Texas and Louisiana. One of the proposed routes, Alternative D, traverses Philmont Scout Ranch in northeastern New Mexico's Calfax County.

Philmont is a 137,000acre mountain backpacking and high adventure facility of the Boy Scouts of America. Each year thousands of Scouts and their adult leaders from across the nation participate in two-week wilderness backpacking trips in the mountains of Philmont. Many of them also camp and work on conservation projects in the adjacent Valley Vidal Wilderness of the Carson National Forest.

The Air Force's proposed Alternative D will establish a military training route directly over most of Philmont. More than 2600 flights each year, some as low as 300 feet above ground level, are proposed for the segment over Philmont. As a 1998 participant of the Philmont trek, I have serious concerns about the impact of the Air Force's proposal on the health and safety of Scouts attending Philmont and the potential effects of daily low-level flights on the ranch itself.

On any given day in the summer, as many as 5,000 Scouts and Scouters will be hiking and camping in Philmont's backcountry. Each day, several hundred of them will be engaged in activities such as rock climbing and rappelling, spar pole climbing, and mountain horseback rides. The sudden roar of jet engines has a high likelihood of distracting an inexperienced climber or causing a horse to bolt on a narrow mountain trail with resulting injury or worse.

Appreciation and protection of the wilderness and our natural resources is a key part of the Philmont program. Scouts from around the world have a unique opportunity to see and experience wildlife in native habitat. Noise and emissions from bomber cannot help but have a damaging effect on that wildlife, as well as on Philmont's herds of buffalo, horses, cattle, and burros. The disruptive effects of noisy bomber overflights on Philmont's famous living history programs, in which Scouts experience the lifestyles of the West's mountain men, homesteads, lumberers, d cowboys, are obvious.

Most of Philmont is mountainous with many peaks in the 100,00' to 12,000' range. Philmont has a tremendous fuel load of dead trees in its forest and is in the midst of a long-term drought. Unburned jest fuel finding its way to the ground or being dumped in an emergency over such terrain, with campers using backpacking stoves for cooking creates the potential for a serious fire that would endanger hundreds of lives. The possibility of a crash, however remote, is simply not acceptable for the safety of these Scouts.

For these reasons, I seek your help in advocating the selection of a different RBTI route. I ask that you express your opposition to Alternative D to the Secretary of the Air Force and other defense officials who may be involved in this decision. Please act now, as the public comment period ends in June.

Philmont is the largest and most famous Scout camp in the world. It is a national resource that has positively impacted the lives of hundreds of our nation's youth for more than sixty years. It deserves and demands our protection. Thank you for helping to see that Alternative D is not selected.

Sincerely,

Jimmy Bacon, Eagle Scout

KARL C. COLLINS

May 22, 1999

Major Brent Adams
RBTI EIS Project Manager
HQ ACC/CEVPP
129 Andrews Street, Suite 102
Langley AFB, VA 23665-2769

Major Adams

BR-6 I am writing to register my opposition to the selection of Alternate D under the proposed Realistic Bomber Training Initiative (RBTI). This alternative traverses Philmont Scout Ranch in northeastern New Mexico's Colfax County.

Philmont is a 137,000 acre mountain backpacking and high adventure ranch of the Boy Scouts of America. Each year, thousands of Scouts and their adult leaders from across the nation participate in two-week wilderness backpacking trips in the mountains of Philmont. Many of them also camp and work on conservation projects in the adjacent Valle Vidal Wilderness of the Carson National Forest.

For the boys who are able and chosen, a Philmont trek is a capstone experience of their scouting career. These Scouts are older boys who have made significant achievements in scouting and have prepared arduously for months in advance. Philmont has been a goal and dream of Scouts for over sixty years. In several weeks our troop will be proud to be sending 7 boys and 2 adults to Philmont. And we hope to send another crew in two years from now.

As a boy who worked hard, and earned the rank of Eagle Scout, I dreamed of attending Philmont, but did not have the opportunity. Now that my son is 11 years old and working his way up in scouting, I am again active in Scouting, as an adult leader, helping boys become men of character and leadership. I again hope that some day I will have the opportunity to go to Philmont, with my son, and with other Scouts.

The impact of up to 2,660 low altitude overflights of Philmont Scout Ranch per year would be devastating to the wilderness high adventure experience for our Scouts. On any given day in the summer there are up to 5000 Scouts and leaders hiking, and camping, and several hundred boys rock climbing and on horseback. Besides affecting the quality of the experience, the sudden noise and surprise will lead or contribute to accidents on the part of these novice climbers and riders.

The impact of noise, exhaust, and unburned jet fuel on the wildlife, buffalo, horses and cattle are also a concern. Philmont includes habitat for 3 endangered species that will be affected. I do not even want to contemplate the consequences of a crash or emergency fuel dumping in this arid, high altitude environment.

I appreciate the need for training for our military forces, as the Scouting Motto says, "Be Prepared". But there are other alternatives that do not have this impact. I ask your support in opposing the selection of Alternative D of the Realistic Bomber Training Initiative.

Sincerely,

Karl Collins

Major Brent Adams
RBTI EIS Project Manager
HQ ACC/CEVPP
129 Andrews Street, Suite 102
Langley AFB, VA 23665-2769

Dear Major Adams:

BR-6 I would like to express my opposition to the proposed overflights of Philmont Scout Ranch in Cimmarron, NM. I have been to Philmont three times, once as a camper and twice as a staff member. The wilderness experience at Philmont has been a big part of my life. I want other kids to be able to see Philmont like I saw it (and hope to see it again). Thousands of low-level bomber flights every year would destroy the atmosphere of the Philmont I knew.

Sincerely,

Patrick Hagan

BLOOMINGTON, IN •

Sasha Barefield

Sunset, SC

000578

Dear Major Adams,

BR-6 Recently my brother Aaron wrote, to you, a letter concerning an Alternate D route. I am also writing to request your firm support in opposing the selection of Alternative D under the U.S. Air Force's proposed Realistic Bomber Training Initiative (RBTI). The Air Force is seeking to establish a new training rout for low-level B-1 and B-52 bomber flights from bases in Texas and Louisiana. One of the proposed routes, Alternative D, traverses Philmont Scout Ranch in northeastern New Mexico's Colfax County.

Philmont is a 137,000-acre mountain backpacking and high adventure facility of the Boy Scouts of America. Each year thousands of Scouts and their adult leaders from across the nation participate in two-week wilderness backpacking trips in the mountains of Philmont. Many of them also camp and work on conservation projects in the adjacent Valley Vidal Wilderness of the Carson National Forest.

The Air Force's proposed Alternative D will establish a military training route directly over most of Philmont. More than 2,600 flights each year, some as low as 300 feet above ground level, are proposed for the segment over Philmont. As a current Philmont staff member, I have serious concerns about the impact of the Air Force's proposal on the health and safety of Scouts attending Philmont and the potential effects of daily low-level flights on the ranch itself.

On any given day in the summer, as many as 5,000Scouts and Scouters will be hiking and camping in Philmont's backcountry. Each day, several hundred of them will be engaged in activities such as rock climbing and rappelling, spar pole climbing, and mountain horseback rides. The sudden roar of jet engines has a high likelihood of distracting an inexperienced climber or causing a horse to bolt on a narrow mountain trail with resulting injury or worse.

Appreciation and protection of the wilderness and our natural resources is a key part of the Philmont program. Scouts from around the world have a unique opportunity to see and experience wildlife in native habitat. Noise and emissions from bomber cannot help but have a damaging effect on that wildlife, as well as on Philmont's herds of buffalo, horses, cattle, and burros. The disruptive effects of noisy bomber overflights on Philmont's famous living history programs, in which Scouts experience the lifestyles of the West's mountain men, homesteads, lumberers, & cowboys, are obvious.

Most of Philmont is mountainous with many peaks in the 100,00' to 12,000' range. Philmont has a tremendous fuel load of dead trees in its forest and is in the midst of a long-term drought. Unburned jest fuel finding its way to the ground or being dumped in an emergency over such terrain, with campers using backpacking stoves for cooking creates the potential for a serious fire that would endanger hundreds of lives. The possibility of a crash, however remote, is simply not acceptable for the safety of these Scouts.

For these reasons, I seek your help in advocating the selection of a different RBTI route. I ask that you express your opposition to Alternative D to the Secretary of the Air Force and other defense officials who may be involved in this decision. Please act now, as the public comment period ends in June.

Philmont is the largest and most famous Scout camp in the world. It is a national resource that has positively impacted the lives of hundreds of our nation's youth for more than sixty years. It deserves and demands our protection. Thank you for helping to see that Alternative D is not selected.

Sincerely,

Sasha Barefield

Dear Major Adams,

PD-5 I am writing to express my concern with the Air Force's Realistic Bombing Initiative (RBTI) plan for northeast New Mexico and the effect it will have on Philmont Scout Ranch located near Cimarron, New Mexico.

Of the four sites being considered for its RBTI, the path near the proposed Mt. Dora MAO is the one that would affect Philmont. The flights over Philmont are to be at an altitude of 300-500 feet, and would be conducted by B-52 and B-1 bombers.

My two major concerns are for the safety of the boys and the preservation of the wilderness experience. Philmont is one of the few places left in the United States where young people can experience true wilderness away from the distractions of the modern world. B-1's and B-52;s do not have enviable safety records. Flying at 300-500 feet of altitude leaves an extremely small margin of error for both pilot and aircraft.

As a former US Army Division Staff Officer, we used computer simulations for Company to Brigade sized units which could simulate combat situations very realistically. This enabled us to ascertain the leadership skills of the various staffs without involving hundreds to thousands of troops which reduced the cost to the US Taxpayer drastically. I am sure a computer program could be developed for the crews of the B-52's and the B-1's which would measure their flight training skills just as well as the actual flight itself.

As a retired military officer, I fully support the need for military training. However, as a Philmont alumnus, I do take issue with the flight routes over Philmont Scout Ranch.

Several years ago the USAF ceased its low altitude F-16 and F-111 flights over the Ranch as a result of Philmont protests. Now with the B-52's and B-1 flights planned over Philmont, not only would that be a constant intrusion but it would also disrupt a large wildlife population.

Thank you for giving consideration to this concern of mine which, by the way, I'm sure is shared by thousands of other Scouting leaders throughout our country.

Sincerely,

Gerald W. Sylvester, LTC AUS (Ret)

Centerville, TX

Dear Major Adams:

BR-6 I am writing to concerning the selecting of Alternative D under the U.S. Air Force's proposed Realistic Bomber Training Initiative (RBTI). This proposed training route would result in thousands of low level B-1 and B-52 bomber flights over Philmont Scout Ranch in northern New Mexico's Colfax County.

Philmont is the largest and by far most famous Scout Camp in the world. I covers 137,000 acres of land just outside of the town of Cimarron. The area is rich with natural beauty and history. It has had a profound impact on hundreds of thousands of young men and women from around the world. It is truly one of our nations greatest resources. It is a place that provides such programs as horseback riding, shooting sports, challenge courses, rock climbing and countless others. All of these are part of an extended wilderness backpacking or horseback trek.

The effects of low level bomber flights on the program would be devastating. The beauty and serenity of the outdoors would be ruined, but aesthetics is not my chief concern. We do many programs with riding and pack animals. To date our safety record is excellent. Constant noise would make it very difficult and even dangerous to work with the horses and burros. Also, Philmont is a working cattle, horse and buffalo ranch. Also, many years ago Colfax County was the sight of a huge gold rush. The result is that there are hundreds of mines just within the boundaries of Philmont. We have capped off almost all of these, but there is no way to tell the effects of constant vibrations on the abandoned mines as well as the two active mines that we use for tours.

I wholeheartedly support a state of readiness on the part of our military services. Scouting has historically had very close ties with all branches of the military. I can also see why Colfax County would at first appear an ideal place to run these training flights. It just so happens that the route fell immediately over an area with a very large seasonal population. On behalf of the 25,000 youth and adults that will be at Philmont this summer, I would ask you to reevaluate the impact of Alternative D.

Sincerely,

Henry Saner,
Ranger ('96 & '97)

RBTI EIS Project Manager
HQ ACC/CEVPP
129 Andrews Street, Suite 102
Langley AFB, VA 23665-2769

Dear Major Adams:

BR-6 We request your strong support in opposing the selection of "Alternative D" under the U. S. Air Force's (USAF) proposed *Realistic Bomber Training Initiative* (RBTI) involving low flying B-52s and B-1s (as low as 300'). As one of several proposed southwestern routes, "D" traverses ***Philmont Scout Ranch*** in northeastern New Mexico's Colfax County. Philmont, truly a national treasure, is the 137,000-acre backpacking and training facility for the **Boy Scouts of America**. We agree with RBTI since it is a valuable program -- our only complaint, as Philmont alumni, is with the proposed route over Philmont.

Several years ago, the USAF ceased its low altitude F-16/F-111 flights over Philmont as a result of Philmont requests. RBTI's multiple daily flights (up to 16) will create much more severe problems:

a) Program: Philmont is a transient community of 25,000 people with over 3,000 campers in Philmont's back-country every Summer day. Daily, several hundred Scouts and leaders are engaged in spar pole climbing, rock climbing/rappelling, and horseback riding. The sudden roaring of jet engines can distract climbers and bolt horses, thereby creating injuries (or worse).

b) Environmental: Appreciation and protection of the wilderness are key parts of Philmont's program. RBTI is inconsistent with wilderness preservation. RBTI will have a damaging effect upon both the unique western wildlife and Philmont herds of cattle, horses, burros, and buffalo. The effect of the unburned portion of jet fuel in the engine exhaust or dumped fuel itself, vaporizing and falling to ground level is as yet unknown, but believed not to be beneficial.

c) Safety: The environmental impact study completed for the USAF is seriously flawed when it describes Philmont as an "uninhabited" grassland. The smaller portion of Philmont's acreage is prairie. Most of Philmont is mountainous with many peaks in the 10,000' to 12,444' range. Philmont has a tremendous fuel load of dead trees in its forests, and is in the midst of a long-term drought. Open fire bans are in effect now. A crashing bomber would most likely create an epic fire, of Yellowstone proportions. B-1s and B-52s do not have enviable safety records. The nature of the flights (weaving around mountain peaks and facing violent weather, including frequent, low-level wind shears) dramatically increases the possibility of a crash. Unfortunately, Philmont does not have a well-developed highway system for evacuations, in case of massive forest fires.

For the above reasons, we seek your help in advocating the selection of a different RBTI route, preferably one that is over a more sparsely populated, less environmentally sensitive area. You, or a member of your staff may wish to contact Rep. Ed Pease's (Indiana) legislative assistant, Greg Good, who has additional information about RBTI.

There is too much at stake to allow RBTI to over-fly Philmont. Please act now -- final route determination starts in June. Thank you for helping to see that alternative D is not selected.

Sincerely,

William A. Hill

David C. Lee

000583

BR-6 I am writing to request your firm support in opposing the selection of Alternative D under the U.S. Air Force's proposed Realistic Bomber Training Initiative (RBTI). The Air Force is seeking to establish a new training route for low-level B-1 and B-52 bomber flights from bases in Texas and Louisiana. One of the proposed routes, Alternative D, traverses Philmont Scout Ranch in northeastern New Mexico's Colfax County.

Philmont is a 137,000-acre mountain backpacking and high adventure facility of the Boy Scouts of America. Each year, thousands of Scouts and their adult leaders from across the nation participate in two-week wilderness backpacking trips in the mountains of Philmont. Many of them also camp and work on conservation projects in the adjacent Valle Vidal Wilderness of the Carson National Forest.

The Air Force's proposed Alternative D will establish a military training route directly over most of Philmont. More than 2600 flights each year, some as low as 300 feet above ground level, are proposed for the segment over Philmont. As a former Philmont staff member, I have serious concerns about the impact of the Air Force's proposal on the health and safety of Scouts attending Philmont and the potential effects of daily low-level flights on the ranch itself.

On any given day in the summer, as many as 5,000 Scouts and Scouters will be hiking and camping in Philmont's backcountry. Each day, several hundred of them will be engaged in activities such as rock climbing and rappelling, spar pole climbing, and mountain horseback rides. The sudden roar of jet engines has a high likelihood of distracting an inexperienced climber or causing a horse to bolt on a narrow mountain trail with resulting serious injury (or worse).

Appreciation and protection of the wilderness and our natural resources is a key part of the Philmont program. Scouts from around the world have a unique opportunity to see and experience wildlife in native habitat. Noise and emissions from bombers cannot help but have a damaging effect on that wildlife, as well as on Philmont's herds of buffalo, horses, cattle and burros. The disruptive effects of noisy bomber overflights on Philmont's famous living history programs, in which Scouts experience the lifestyles of the West's mountain men, homesteaders, lumberers and cowboys, are obvious.

Most of Philmont is mountainous with many peaks in the 10,000f to 12,000f range. Philmont has a tremendous fuel load of dead trees in its forests and is in the midst of a long-term drought. Unburned jet fuel finding its way to the ground or being dumped in an emergency over such terrain, with campers using backpacking stoves for cooking, creates the potential for a serious fire that would endanger hundreds of lives. The possibility of a crash, however remote, is simply not acceptable for the safety of these Scouts.

For these reasons, I seek your help in advocating the selection of a different RBTI route. I ask that you express your opposition to Alternative D to the Secretary of the Air Force and other defense officials who may be involved in this decision. Please act now, as the public comment period ends in June and a final decision will be made this year. You or a member of your staff may wish to contact Greg Dodd, Chief of Staff for Congressman Ed Pease of Indiana, who can provide additional information.

Philmont is the largest and most famous Scout camp in the world. It is a national resource that has positively impacted the lives of hundreds of thousands of our nation's youth for more than sixty years. It deserves and demands our protection. Thank you for helping to see that Alternative D is not selected.

Sincerely,

May 22, 1999

Dear Sir,

I feel the Environmental Impact Statement (EIS), Draft Stage, of the Realistic Bomber Training Initiative, is unfair and unjust!

I have alot of respect for the military, and believe in a strong defense, however, not at the expense of tax-paying private home + landowners

PD-7 when there is plenty of federal land set aside for this very purpose!

So far, from what I have seen, the Air Force personnel pushing these new flight paths have been arrogant, unreasonable, and treated anyone that oppose their plans as "the enemy."

We don't want their noise, crashes, property damage, + decreased land value.

Sincerely,

Jeri Walker

29 May, 1999

Dear Major Adams

BR-6 I am writing to request your firm support in opposing the selection of "Alternative D" under the USAF's proposed Realistic Bomber Training Initiative (RBTI) involving low flying B-52s and B-1s (as low as 300'). As one of several proposed southwestern routes, "D" traverses Philmont Scout Ranch in northeastern New Mexico's Colfax County. Philmont, truly a national treasure, is the 137,000 acre backpacking and training facility of the Boy Scouts of America. I do not protest RBTI since it is a valuable program -- my only complaint, as a Philmont alumnus, is with the proposed route over Philmont.

Several years ago, the USAF ceased its low altitude F-16/F-111 flights over the Ranch as a result of Philmont protests. RBTI's multiple daily flights (up to 16) will create much more severe problems:

- Program: Philmont is a transient community of 25,000 people with over 3,000 campers in Philmont's back country every day in the summer. Daily, several hundred of them are engaged in spar pole climbing, rock climbing and rappelling, and horse back riding. The sudden roaring of jet engines will distract climbers and bolt horses thereby creating injuries (or worse).
- Environmental: Appreciation and protection of the wilderness are key parts of Philmont's program. RBTI is inconsistent with wilderness preservation. The expected level of noise pollution (117 dB at 300'!) is totally inconsistent with the wilderness preservation ethic fostered by the Scouts. The effect of the unburned portion of jet fuel in the engine exhaust or dumped fuel itself, vaporizing and falling to ground level is as yet unknown, but believed to be anything but beneficial.
- Safety: The environmental impact study done for the USAF is seriously flawed when it describes Philmont as an "uninhabited" grassland. The smaller portion of Philmont's acreage is prairie. Most of Philmont is mountainous with many peaks in the 10,000 to 12,444' range. Philmont has a tremendous fuel load of dead trees in its forests, and is in the midst of a long term drought. Open fire bans are in effect now. A crashing bomber will create an epic fire of Yellowstone proportions. B-1s and B-52s do not have enviable safety records. The nature of the flights (weaving around mountain peaks and facing violent weather, including frequent, low-level wind shears) dramatically increases the chance of a crash. Unfortunately, Philmont does not have a well-developed highway system for evacuations in case of massive forest fires.

For the above reasons, I seek your help in advocating the selection of a different RBTI route, preferably one that is over a more sparsely populated, less environmentally sensitive area. There is too much at stake to allow RBTI to overfly Philmont. Please act now -- final route determination starts in June. Thank you for helping to see that alternative D is not selected.

Sincerely,

Maj. Brent Adams
RBTI EIS Project Manager
HQ ACC/CEVPP
129 Andrews St., Ste. 102
Langley AFB, VA 23665-2769

Greetings Maj. Adams:

I am writing in regards to the Air Force plans implementing more flights of their huge planes over my part of the desert - Terlingua Ranch, Texas. My husband and I go to our place twice a year on vacation now. In two years, when my husband retires, we will move to Terlingua Ranch for good. I hate to see these planes flying so low over our area. We were camping out one night near Cedar Springs (about 20 miles from our house), which is way out in the middle of nowhere. In the middle of the night one of these huge planes flew right over our heads (200 ft above the ground?) and nearly scared us to death as you can imagine. The reason we know it was an Air Force plane was that a similar incident happened the next morning.

PD-20 It seems to me there has to be a better way. Why not have these pilots fly over the ocean? Or perhaps train pilots on a flight simulator. The latter idea seems like it would save the Air Force a lot of money.

Naturally no one wants this in their backyard. Please reconsider.

Sincerely,

Kathleen McKown

Dear Major Adams:

I am opposed to the Air Force's proposed RBTI known as Lancer – Option B in the DEIS. My concern(s) about the proposal and the DEIS are as follows:

BR-4 We think the Bomber training should be over a thinly populated area because the noise over this proposed area will have such an impact on our people and the cattle. The noise will have an effect on our property values and with expenses so high and prices we get for our cotton & feed are so low that the farmers are having a hard time making a living now. We are proud of our air force but want them to train elsewhere.

Respectfully,

Sincerely yours: Ms. Jewett Smith

Major Brent Adams
RBTI EIS Project Manager
HQ ACC/CEVP
129 Andrews Street Suite 102
Langley AFB, VA 23665-2769

Dear Major Adams:

BR-4 We own and operate two businesses in Eagle Nest. We are very concerned that the RBTI alternative D will result in a decline of tourist traffic in our area and cause businesses such as ours to suffer economic loss. We do not feel that the Draft Environmental Study has adequately studied the effect of low flying bombers on the fragile economy of this area.

The Air Force has changed the route to address other groups concerns, yet we are still in the primary area and will be affected by this type of training. We understand the need for adequate training, however, we feel that the damage to our economic base of tourism and the peace and serenity of this area is too great a price to pay. We are nearly 100 percent dependent on tourists for our living and any reduction would be harmful to all the businesses in this area.

We ask that you eliminate alternative D as an option for the proposed training.

Sincerely,

Fred Jones

Judy Jones

BR-6 I am writing to request your firm support in opposing the selection of "Alternative D" under the USAF's proposed Realistic Bomber Training Initiative (RBTI) involving low flying B-52s and B-1s (as low as 300'). As one of several proposed southwestern routes, "D" traverses Philmont Scout Ranch in northeastern New Mexico's Colfax County. Philmont, truly a national treasure, is the 137,000 acre backpacking and training facility of the Boy Scouts of America. I do not protest RBTI since it is a valuable program – my only complaint, as a Philmont alumnus, is with the proposed route over Philmont.

Several years ago, the USAF ceased its low altitude F-16/F-111 flights over the Ranch as a result of Philmont protests. RBTI's multiple daily flights (up to 16) will create much more severe problems:

a) Program: Philmont is a transient community of 25,000 people with over 3,000 campers in Philmont's back country every day in the summer. Daily, several hundred of them are engaged in spar pole climbing, rock climbing and rapelling, and horse back riding. The sudden roaring of jet engines will distract climbers and bolt horses thereby creating injuries (or worse).

b) Environmental: Appreciation and protection of the wilderness are key parts of Philmont's program. RBTI is inconsistent with wilderness preservation. RBTI will have a damaging effect upon both the unique western wildlife and Philmont herds of cattle, horses, burros, and buffalo. The effect of the unburned portion of jet fuel in the engine exhaust or dumped fuel itself, vaporizing and falling to ground level is as yet unknown, but believed to be anything but beneficial.

c) Safety: The environmental impact study done for the USAF is seriously flawed when it describes Philmont as an "uninhabited" grassland. The smaller portion of Philmont's acreage is prairie. Most of Philmont is mountainous with many peaks in the 10,000 to 12,444' range. Philmont has a tremendous fuel load of dead trees in its forests, and is in the midst of a long term drought. Open fire bans are in effect now. A crashing bomber will create an epic fire of Yellowstone proportions. B-1s and B-52s do not have enviable safety records. The nature of the flights (weaving around mountain peaks and facing violent weather, including frequent, low-level wind shears) dramatically increases the chance of a crash. Unfortunately, Philmont does not have a well-developed highway system for evacuations in case of massive forest fires.

For the above reasons, I seek your help in advocating the selection of a different RBTI route, preferably one that is over a more sparsely populated, less environmentally sensitive area. You, or a member of your staff may wish to liaise with Rep. Ed Pease's (Indiana) legislative assistant, Greg Good, who has additional information on RBTI.

There is too much at stake to allow RBTI to overfly Philmont. Please act now – final route determination starts in June. Thank you for helping to see that alternative D is not selected.

Respectfully,

Jeffrey Barta
Second Lieutenant, U.S. Army

Major Brent Adams
RBTI EIS Project Manager
HQ ACC/CEVPP
129 Andrews St., Suite 102
Langley AFB, VA 23665-2769

Dear Major Adams:

BR-6 I am writing to request your firm support in opposing the selection of Alternative D under the U.S. Air Force's proposed Realistic Bomber Training Initiative (RBTI). The Air Force is seeking to establish a new training route for low-level B-1 and B-52 bomber flights from bases in Texas and Louisiana. One of the proposed routes, Alternative D, traverses Philmont Scout Ranch in northeastern New Mexico's Colfax County.

Philmont is a 137,000-acre mountain backpacking and high adventure facility of the Boy Scouts of America. Each year, thousands of Scouts and their adult leaders from across the nation participate in two-week wilderness backpacking trips in the mountains of Philmont. Many of them also camp and work on conservation projects in the adjacent Valle Vidal Wilderness of the Carson National Forest.

The Air Force's proposed Alternative D will establish a military training route directly over most of Philmont. More than 2600 flights each year, some as low as 300 feet above ground level, are proposed for the segment over Philmont. As a former Philmont staff member, I have serious concerns about the impact of the Air Force's proposal on the health and safety of Scouts attending Philmont and the potential effects of daily low-level flights on the ranch itself.

On any given day in the summer, as many as 5,000 Scouts and Scouters will be hiking and camping in Philmont's backcountry. Each day, several hundred of them will be engaged in activities such as rock climbing and rappelling, spar pole climbing, and mountain horseback rides. The sudden roar of jet engines has a high likelihood of distracting an inexperienced climber or causing a horse to bolt on a narrow mountain trail with resulting serious injury (or worse).

Appreciation and protection of the wilderness and our natural resources is a key part of the Philmont program. Scouts from around the world have a unique opportunity to see and experience wildlife in native habitat. Noise and emissions from bombers, cannot help but have a damaging effect on that wildlife, as well as on Philmont's herds of buffalo, horses, cattle and burros. The disruptive effects of noisy bomber overflights on Philmont's famous living history programs, in which Scouts experience the lifestyles of the West's mountain men, homesteaders, lumberers and cowboys, are obvious.

Most of Philmont is mountainous with many peaks in the 10,000 to 12,000 range. Philmont has a tremendous fuel load of dead trees in its forest and is in the midst of a long-term drought. Unburned jet fuel finding its way to the ground or being dumped in an emergency over such terrain, with campers using backpacking stoves for cooking, creates the potential for a serious fire that would endanger hundreds of lives. The possibility of a crash, however remote, is simply not acceptable for the safety of these Scouts.

For these reasons, I seek your help in advocating the selection of a different RBTI route. I ask that you express your opposition to Alternative D to the Secretary of the Air Force and other defense officials who may be involved in this decision. Please act now, as the public comment period ends in June and a final decision will be made this year. You or a member of your staff may wish to contact Greg Dodd, Chief of Staff for Congressman Ed Pease of Indiana, who can provide additional information.

Philmont is the largest and most famous Scout camp in the world. It is a national resource that has positively impacted the lives of hundreds of thousands of our nation's youth for more than sixty years. It deserves and demands our protection. Thank you for helping to see that Alternative D is not selected.

Sincerely,

John Cabeza

TERLINGUA AREA VOLUNTEER FIRE DEPARTMENT

Major Brent Adams, RBTI EIS Project Manager
HQ ACC/CEVPP
129 Andrews St., Suite 102
Langley AFB, VA. 23665-2769

Dear Major Adams;

I feel the Environmental Impact Statement (EIS), Draft Stage, of the Realistic Bomber Training Initiative (RBTI), is unfair and unjust. I am also extremely concerned over the possible hazards that could become realities. As Fire Chief, myself and the other members of this department can foresee the possible devastation that could exist if a crash of one of these planes would occur. We are an all volunteer fire department, and cover almost 3000 square miles of South Brewster County with antiquated equipment, which includes three fire trucks with a total of 1040 gallons of water, and a 1973 tanker with a water capacity of 1200 gallons and almost unserviceable brakes and equipment. And water is very scarce here! We sustain as a fire department by contributions and fund raisers only, as we receive no subsistence from the county or state. We usually respond adequately, although communications here is poor. We surmise that the USAF and/or other governmental agencies would assist if such an event should occur, but it would be our responsibility initially, and it would be catastrophic to our grasslands, not to mention if a structure was involved. The wind here most often blows at high rates.

AF-12

This is such a small picture, but a vital, utmost one. We would appreciate your attention. Thanks for your cooperation.

Sincerely,
Guy W. Eastman. Fire Chief

TERLINGUA, TEXAS

Langley AFB, VA 23665-2769

Dear Major Adams,

BR-6 I am writing to dissuade the Air Force from using Philmont Scout Ranch in the Realistic Bomber Training Initiative and shift the flight path to another location.

I have hiked and camped at Philmont for three summer expeditions and worked the following three summers as a ranger and camp director. I am now a life member of the Philmont Staff Association. There are over 25,000 campers that visit the ranch with over 500 staff each summer. Most come from far away to include New York, the Virgin Islands, and Puerto Rico plus locations around the world. Scouts have saved and done many money-making projects to finance their way to this national scout ranch. These scouts are trained in environmental and natural sciences and are there for a wilderness experience. They are not there for the thrill of being buzzed by a bomber flying the nap of the land using GPS.

I have retired from the military with 28 years in the Army Reserve. I know that with some careful planning, the routes could be changed to significantly alter the Environmental Impact Plan which is prepared by the Operations Division. With Mt. Baldy (12441 feet) in the North end of Philmont , Wheeler Peak (over 13,000 feet) in the next range west, and with the city of Raton as possible obstacles, it may be more advantageous to fly well south of Philmont.

I realize that flight training is very important to keep America strong, however, I would like this flight route to be moved away from Philmont due to its environmental impact.

Sincerely,

Paul Quigley

Jeffery Murphy
Pastor

May 22, 1999

Dear Major Adams,

BR-6 As a former Boy Scout and former staff member at Philmont Scout Ranch in Cimarron, N.M., I was disturbed to learn of the proposed "Realistic Bomber Training Initiative" flights over Philmont.

Philmont is a national treasure. For generations it has provided wilderness and leadership training for young people across the country and around the world. RBTI flights would endanger the natural environment of this wildlife preserve and would disturb programming at Philmont. Much of Philmont's programming and work is done on horseback. Therefore, there is a danger that the noise from such flights would cause horses to throw their riders. There is also a danger of a crash on Philmont itself.

Although the area around Philmont is sparsely populated, on any given day in the summer there are more than 5,000 campers and staff members on Philmont. I hope that you will help protect this national treasure by taking measures to assure that there will be no RBTI flights over Philmont.

Thank you for your help and consideration.

Sincerely,

Jeff Murphy

Dear Major Adams:

BR-6 I am writing to request your firm support in opposing the selection of Alternative D under the U.S. Air Force's proposed Realistic Bomber Training Initiative (RBTI). The Air Force is seeking to establish a new training route for low-level B-1 and B-52 bomber flights from bases in Texas and Louisiana. One of the proposed routes, Alternative D, traverses Philmont Scout Ranch in northeastern New Mexico's Colfax County.

Philmont is a 137,000 acre mountain backpacking and wilderness high adventure facility of the Boy Scouts of America. Each year, thousands of Scouts and their adult leaders from across the nation participate in two-week wilderness backpacking trips in the mountains of Philmont. Many of them also camp and work on conservation projects in the adjacent Valle Vidal Wilderness of the Carson National Forest.

The Air Force's proposed Alternative D will establish a military training route directly over most of Philmont. More than 2,600 flights each year, some as low as 300 feet about ground level, are proposed for the segment over Philmont. As a Philmont staff member, I have serious concerns about the impact of the Air Force's proposal on the health and safety of Scouts attending Philmont and the potential effects of daily low-level flights on the ranch itself.

On any given day in the summer, as many as 5,000 Scouts and Scouters will be hiking and camping in Philmont's backcountry. Each day, several hundred of them will be engaged in activities such as rock climbing and rappelling, spar pole climbing, and mountain horseback riding. The sudden roar of jet engines has a high likelihood of distracting an inexperienced climber or causing a horse to bolt on a narrow mountain trail with resulting serious injury (or worse).

Appreciation and protection of the wilderness and our natural resources is a key part of the Philmont program. Scouts from around the world have a unique opportunity to see and experience wildlife in native habitat (including at least three endangered species: the bald eagle, the peregrine falcon, and the Mexican spotted owl). Noise and emissions from bombers cannot help but have a damaging effect on that wildlife, as well as on Philmont's herds of buffalo, horses, cattle, and burros. The disruptive effects of noisy bomber overflights on Philmont's famous living history programs, in which Scouts experience the lifestyles of the West's mountain men, homesteaders, lumberers and cowboys, are obvious.

Most of Philmont is mountainous with many peaks in the 10,000' to 12,000' range. Philmont has a tremendous fuel load of dead trees in its forests and is in the midst of a long-term draught. Unburned jet fuel finding its way to the ground or being dumped in an emergency over such terrain, with campers using backpacking stoves for cooking, creates the potential for a serious fire that would endanger hundreds of lives. The possibility of a crash, however remote, is simply not acceptable for the safety of those Scouts.

For these reasons, I seek your help in advocating the selection of a different RBTI route. I ask that you express your opposition to Alternative D to the Secretary of the Air Force and other defense officials who may be involved in this decision. Please act now, as the public comment period ends in June and a final decision will be made this year. You or a member of your staff may wish to contact Greg Dodd, Chief of Staff for Congressman Ed Pease of Indiana, who can provide additional information.

Philmont is the largest and most famous Scout camp in the world. It is a national resource that has positively impacted the lives of hundreds of thousands of our nation's youth for more than sixty years. It deserves and demands our protection. Thank you for helping to see that Alternative D is not selected.

Sincerely,

Rabbi Scott Rosenberg

5/29/99

Dear Major Adams;

BR-6 I am writing to request your firm support in opposing the selection of "Alternative D" under the USAF's proposed Realistic Bomber Training Initiative (RBTI) involving low flying B-52s and B-1s (as low as 300'). As one of several proposed southwestern routes, "D" traverses Philmont Scout Ranch in northeastern New Mexico's Colfax County. Philmont, truly a national treasure, is the 137,000 acre backpacking and training facility of the Boy Scouts of America. I do not protest RBTI since it is a valuable program -- my only complaint, as a Philmont alumnus, is with the proposed route over Philmont.

Several years ago, the USAF ceased its low altitude F-16/F-111 flights over the Ranch as a result of Philmont protests. RBTI's multiple daily flights (up to 16) will create much more severe problems:

a) Program: Philmont is a transient community of 25,000 people with over 3,000 campers in Philmont's back country every day in the summer. Daily, several hundred of them are engaged in spar pole climbing, rock climbing and rapelling, and horse back riding. The sudden roaring of jet engines will distract climbers and bolt horses thereby creating injuries (or worse).

b) Environmental: Appreciation and protection of the wilderness are key parts of Philmont's program. RBTI is inconsistent with wilderness preservation. RBTI will have a damaging effect upon both the unique western wildlife and Philmont herds of cattle, horses, burros, and buffalo. The effect of the unburned portion of jet fuel in the engine exhaust or dumped fuel itself, vaporizing and falling to ground level is as yet unknown, but believed to be anything but beneficial.

c) Safety: The environmental impact study done for the USAF is seriously flawed when it describes Philmont as an "uninhabited" grassland. The smaller portion of Philmont's acreage is prairie. Most of Philmont is mountainous with many peaks in the 10,000 to 12,444' range. Philmont has a tremendous fuel load of dead trees in its forests, and is in the midst of a long term drought. Open fire bans are in effect now. A crashing bomber will create an epic fire of Yellowstone proportions. B-1s and B-52s do not have enviable safety records. The nature of the flights (weaving around mountain peaks and facing violent weather, including frequent, low-level wind shears) dramatically increases the chance of a crash. Unfortunately, Philmont does not have a well-developed highway system for evacuations in case of massive forest fires.

For the above reasons, I seek your help in advocating the selection of a different RBTI route, preferably one that is over a more sparsely populated, less environmentally sensitive area. You, or a member of your staff may wish to liaise with Rep. Ed Pease's (Indiana) legislative assistant, Greg Good, who has additional information on RBTI.

There is too much at stake to allow RBTI to overfly Philmont. Please act now -- final route determination starts in June. Thank you for helping to see that alternative D is not selected.

Sincerly,

Thomas E. Strack

Dear Major Adams:

I am opposed to the Air Force's proposed RBTI known as Lancer – Option B in the DEIS. My concern(s) about the proposal and the DEIS are as follows:

BR-4 ① the effect on my property values. I don't feel this aspect has been adequately addressed;

AO-18 ② as a teacher I'm concerned about the noise level during low flying training missions. I grew up near the old Carswell AFB, I know first hand about noise and sonic boom disruptions;

BI-2 ③ I'm concerned about the effect on our migratory bird populations.

I enjoy the quiet, peaceful lifestyle that this area affords me. I enjoy watching the geese and cranes. Please go somewhere else!

Sincerely yours: Rebecca L. Henley

Comments
RBTI /DEIS
spec. Alt. "D" Mt. Dora MOA

Dear Major Adams,

The subject document essentially answers all its own questions: *Existing Alternative "A" is infinitely preferable to proposals "B","C" or "D".* We understand that reaction from all three threatened communities is one of general outrage. In the interest of my own self control, and your overwhelming mail load, here are some but not all of my own objections.

Potential Effects table p. ES-3 - conclusively eliminates Alt. D (Mt. Dora Northern New Mexico): *five* black diamonds signifying adverse effects of unacceptable magnitude (compared to two each for B and C, none for Area A). The table erroneously dismisses socioeconomic, cultural and natural resources effects as inconsequential. Tourism and recreation are our two main economic resources, a big part of which is the ski industry. The Mt. Dora MOA traverses Bobcat Pass at 200 to 300 ft. AGL. *There are a lot of ski lifts up there.* Add black diamonds (and black mariahs). The table on page 4-110, entitled Communities Potentially Affected, deliberately leaves out almost all of the counties in Area D. Appendix I, Socioeconomics, does not cover socioeconomics at all.

BR-4

Soil Erosion p. 4-141 shows effects to be two and one half times as severe as effects in "B" and "C".

Endangered species - perhaps the most cynical and infuriating section of all. On page 4-108 e.g., even the Air Force concedes the thousands (not "10" as your report suggests) of low-altitude flights are "potentially significant". This is no less than a euphemism for *F-A-I-A-L* to helpless animals. The USAF's cavalier dismissal of "startling" ranchers and recreationists (sic) - humans would at least comprehend the outrage committed against them: this kind of shock would permanently traumatize, drive mad, or kill, a deer. Think about it: if I went out and stunned a bald eagle, *I'd go to jail.* Through what twisted, abysmal arrogance does the U.S. government contemplate devastating its own endangered list?!!

BI-1

Electronic Scoring Sites - Page 4-140 enumerates some engineering obstacles regarding ESS. Why not apply this same ingenuity to moving your B-1 and B-52 bases closer to your *existing* bomb sites?! The report does say this is impractical, well it's not as impractical as all the plans in this imperfect, incomplete, and cynical report.

CONCLUSION - For the U.S. Government to take the trouble to designate a wilderness preservation area and then overlay it with a federally designated *BOMBING RANGE* is lunacy. Not only the present victims of this scheme, *but your own children and their descendants* stand to benefit or suffer from the decisions you make today.

KEEP ALTERNATIVE "A" !!

Thank you for your attention to this protest.

Dear Major Adams:

I am opposed to the Air Force's proposed RBTI known as Lancer – Option B in the DEIS. My concern(s) about the proposal and the DEIS are as follows:

You have a full letter of my concerns over the proposed flights.
Briefly there is no authority for the flights when we are not at war to cause pain or discomfort to Civilian population flights below 500' feet are Trespass. The size and noise of planes
BR-3 at 2000' would be very bothersom Causing loss of sleep and cattle being disturbed. I have Cattle which are spooky at best and I would have a difficult time of returning my cows to their home which in the long run Could Cause in time of war a shortage of supplies for armed services

Dear Major Adams:

BR-6 With this letter, I wish to communicate my concerns regarding the U.S. Air Force's proposal to use the air space over the Philmont Scout Ranch of the Boy Scouts of America as a training route for B-1 and B-52 jet aircraft.

As a commercially rated pilot, who visits New Mexico several times each year relating to our transportation facility located outside of Albuquerque, I am very familiar with the regulations regarding the use of the airspace over the State of New Mexico. I realize that approximately one-third of New Mexico's airspace is already reserved for use by the U.S. military and other defense related work. As a pilot, I am very concerned about the continued expansion throughout the United States of airspace designated solely for the use of the U.S. military.

I am also an Eagle Scout, who had the fantastic opportunity to visit the Philmont Scout Ranch near Cimarron, New Mexico in 1976. It is a beautiful facility that offers our youth a very unique experience that I hope can be enjoyed into the coming century in the way that I was able to enjoy it. I would like to strongly express my opposition to the selection of routes for these jet aircraft over Philmont due to the loss of tranquility and, possibly, wildlife at the facility.

Last, I think we all need to be concerned about safety when there are so many young people using this facility each year. I hope that you agree with my concerns and will make every effort to help the Boy Scouts of America prevent this proposal from becoming a reality.

If you wish to discuss this matter with me, please do not hesitate to contact me at (540) 877-3202.

Sincerely,

Gerald F. Smith, Jr.

REF: USAF Proposal to Over Fly Philmont National Scout Ranch (NM) - RBTI Route D

Major Adams,

TY RBTI Route D is just a bad idea. On any given day, Philmont has up to 5,000 campers visiting. Our national security doesn't depend on B1s and B52s making practice sorties as low as 300 feet over a Boy Scout camp.

For almost four years, I resided in an apartment just west of Torrejon AFB outside Madrid. When 72 F16s take off over your quarters, it gets very noisy. This noise was necessary for us to win the Cold War.

Noise over Philmont is not necessary - there's lots of acreage available other than that of a Boy Scout camp.

Please deep six RBTI Route D.

Thank you.

Good Scouting,

Richard Hicks

Dear Major Adams:

I am opposed to the Air Force's proposed RBTI known as Lancer – Option B in the DEIS. My concern(s) about the proposal and the DEIS are as follows:

We have a ranch in Kent County. It is situated on a very picturesque piece of land. Not only is the scenery beautiful but it is home to abundant wildlife. Low-flying planes would destroy the
BI-3 peace & quiet, drive the wildlife out,
BR-4 ruin our cattle business, and lessen the value of our land.
Please do not use this air space for your low-flying aircraft. Do not destroy our way of life!

Sincerely yours: Carla C. Allen

Major Brent Adams
RBTI EIS Project Manager
HQ ACC/CEVPP
129 Andrews Air Force Base Suite 102
Langley AFB, VA. 23665-2769

Dear Major Adams,

BR-6 I have been involved as a volunteer in the Scouting program for many years and have appreciated the outdoor experiences available for boys and leaders at the National Scout Training Center at Philmont Ranch in Northern New Mexico.

I understand that consideration is being given by the Air Force to include this area for low level training flights, which would involve B1 and B52 bombers.

Such a move would have a disastrous effect on this wilderness camp and the Scout training programs. The health and safety of the campers could become a serious issue in this pristine, secluded acreage enjoyed by the 25,000 plus scouts and leaders who visit there each year, and have done so for many years.

I would urge you to reconsider this area as one which should not be disturbed with the noise of low flying aircraft and that other areas, outside of the Philmont Ranch area, be used.

Thank you for your consideration.

Sincerely,

Vance Cannon

129 Andrews Street, Suite 102
Langley AFB, Va 23665-2769

Dear Sir, 6/1/99

I feel the Environmental Impact Statement (EIS), Draft Stage, of the Realistic Bomber Training Initiative, is unfair and unjust.

I have lived in the Big Bend area of Texas for 25 years. I was not informed about the recent public hearings on the Draft EIS. The U.S. Air Force could have done more to publicize this hearing to the residents of the affected area. I have been able to read a copy of the Draft EIS and I am opposed to implementation of any of the Alternatives that are being proposed. The project is just too controversial.

BR-5 Low Level Realistic Combat Training Flights(LLRCTF's) are an invasion of private property and a direct impact to the human environment. No other NATO countries allow low level combat training flights. Why should private citizens in the sanctity of their private property have to bear this invasive activity? The United States Government has plenty of Federal land in Nevada for the purpose of training our pilots.
PD-4

The Draft EIS does not definitively demonstrate that the LLRCTF's are in compliance with the Clean Air Act.

I am not satisfied with the opinions of the Draft EIS that there will be no significant impact to the human and natural environments from the following:
AO-11
AO-7
1. poltution from jet fuel
2. possible crashes and ensuing fires
3. noise and the startle effect

AO-28 At about 11:30 pm at night in February of 1999 I was driving from Alpine to Terlingua, Texas. Out of nowhere I was buzzed by a fighter jet at about 200 feet. The noise was so explosive that I was spooked and nearly swerved off the road. I felt like I was a mock target.

Sincerely,
Tracy Lynch

Dear Major Adams:

I am opposed to the Air Force's proposed RBTI known as Lancer – Option B in the DEIS. My concern(s) about the proposal and the DEIS are as follows:

BR-4 The land that farmers have struggled to pay for in 40 years of drouth, hail etc will drop in Value. Ranching + farming Operations will Never be the same as today. As we have experienced the low flying planes sheer buzzard, Not to Mention the Noise factor.

Wild life has begun to make a come back in the Area, one can only imagine the impact Bombers would have on hunting, fishing etc.

I beg you, please Save our Economy stop the Bombers, + preserve our Quality of life.

Consider Government owned lands as training Areas instead of farm + ranching lands.

Dear Major Adams,

BR-6 I am writing this to express my concern with the Air Force's Realistic Bomber Training Initiative (RBTI) plan for northern New Mexico and the effect it will have on the Boy Scouts of America's Philmont Scout Ranch located near Cimarron.

Philmont is over 127,00 acres of mostly wilderness in the Sangre de Cristo Mountains in northeastern New Mexico. During peak times, there are between 5,000 and 6,000 people in the camp including about 650 at the base camp either arriving or leaving, about 3,500 backpacking in the mountains, approximately 1,000 on staff and 500-700 at the Philmont Training Center.

The Air Force is considering four sites for its RTBI. The one that would affect Philmont is the path near the proposed Mt. Dora MAO (Military Operations Area). They are planning numerous flights per year, 20% of which will be between the hours of 10PM and 2AM. Flights over the scout ranch would be between 300 and 100 feet and would include B-52 and B-1 bombers.

My main concern is for the safety of the boys. An accident could turn into a tragedy, which could cost untold numbers of lives. The late night and early morning flights would also disturb everyone's sleep and lead to fatigue while on the trail.

I don't say that I am opposed to the flights themselves for I know our national defense must remain in a state of constant readiness at all times. All I ask is that they be scheduled in a different location. This is one of the last pristine wilderness areas left for our young people to enjoy. Let's leave it in the condition that is in now.

Thank you for considering my concern and the concern of all scouters and scouts everywhere.

Sincerely Yours,

Martin Lucas

Dear Major Adams:

I am opposed to the Air Force's proposed RBTI known as Lancer – Option B in the DEIS. My concern(s) about the proposal and the DEIS are as follows:

My ranch in Kent County provides only a small income, outside of recreational income.

BR-4 The noise disturbance from low flying planes could destroy hunting & recreational activities causing me a great loss of income and a loss in value of my land.

Please stay out of this area.

Sincerely yours:

Langley AFB, VA 23665-2769

Dear Major Adams:

BR-6 I am writing to request your firm support in opposing the selection of "Alternative D" under the USAF's proposed Realistic Bomber Training Initiative (RBTI) involving low flying B-52s and B-1s (as low as 300'). As one of several proposed southwestern routes, "D" traverses Philmont Scout Ranch in northeastern New Mexico's Colfax County. Philmont, truly a national treasure, is the 137,000 acre backpacking and training facility of the Boy Scouts of America. I do not protest RBTI since it is a valuable program -- my only complaint, as a Philmont alumnus, is with the proposed route over Philmont.

Several years ago, the USAF ceased its low altitude F-16/F-111 flights over the Ranch as a result of Philmont protests. RBTI's multiple daily flights (up to 16) will create much more severe problems:

a) Program: Philmont is a transient community of 25,000 people with over 3,000 campers in Philmont's back country every day in the summer. Daily, several hundred of them are engaged in spar pole climbing, rock climbing and rapelling, and horse back riding. The sudden roaring of jet engines will distract climbers and bolt horses thereby creating injuries (or worse).

b) Environmental: Appreciation and protection of the wilderness are key parts of Philmont's program. RBTI is inconsistent with wilderness preservation. RBTI will have a damaging effect upon both the unique western wildlife and Philmont herds of cattle, horses, burros, and buffalo. The effect of the unburned portion of jet fuel in the engine exhaust or dumped fuel itself, vaporizing and falling to ground level is as yet unknown, but believed to be anything but beneficial.

c) Safety: The environmental impact study done for the USAF is seriously flawed when it describes Philmont as an "uninhabited" grassland. The smaller portion of Philmont's acreage is prairie. Most of Philmont is mountainous with many peaks in the 10,000 to 12,444' range. Philmont has a tremendous fuel load of dead trees in its forests, and is in the midst of a long term drought. Open fire bans are in effect now. A crashing bomber will create an epic fire of Yellowstone proportions. B-1s and B-52s do not have enviable safety records. The nature of the flights (weaving around mountain peaks and facing violent weather, including frequent, low-level wind shears) dramatically increases the chance of a crash. Unfortunately, Philmont does not have a well-developed highway system for evacuations in case of massive forest fires.

For the above reasons, I seek your help in advocating the selection of a different RBTI route, preferably one that is over a more sparsely populated, less environmentally sensitive area. There is too much at stake to allow RBTI to overfly Philmont. Please act now -- final route determination starts in June. Thank you for helping to see that alternative D is not selected.

Sincerely,
Stephen Markle

Dear Major Adams:

I am **opposed** to the Air Force's proposed RBTI known as Lancer-Option B in the DEIS. My concerns about the proposal and the DEIS are that it will disturb my happiness. It's obvious that low flying aircraft will create unnecessary noise and pollution for me. If not, you'd fly over Abilene and the community where you provide wealth and your people reside. **PD-4**

One of the reasons I moved to Snyder was to get away from the big city noise and pollution. Snyder has provided that up until now. Pollution is becoming more and more a problem in Snyder due to the federal government. So why don't you keep this unwelcome infringement of rights out of here? Go mess-up your own area and leave us alone.

Sincerely

Doug Scott

REALISTIC BOMBER TRAINING INTITIATIVE

Public Hearing Comment Sheet

Location: Harding County, New Mexico
Date: April 1999

Thank you for providing your comments on the Realistic Bomber Training Initiative Proposal.

I Mary C Gonzales from Bueyeros, New Mexico feel that Alternative A should be implemented. (No Action)
The reasons are as follows:
1. The northeast Corner of New Mexico is a habitat for Golden Eagles and migrating Cranes, Geese, as well as other wildlife. In the past few years the number of deer in the area has dropped significantly. In the past months I would see 40-50 deer during the hunting season that number is down to about 7. I suspect that the noise from the jets has disturbed the deers natural habitat. **BI-1**
2. The internationally known Philmont Boy Scout Ranch would no longer be a pristine wilderness area. For

000634

generations Boy Scouts from throughout the world have flocked to Philmont as the ultimate experience in their primitive Scouting adventures. The low level jet flights a day would certainly disturb the pleasantness and peacefulness of Philmont Boy Scout Ranch. Ten jet flights a day would be disgraceful.
3. The serenity of the ~~[illegible]~~ environment for humans has also been disturbed with the continual flight patterns of the jets. The jet noise is like a miscarriage to the quality of life for our families who have lived in this area since homesteading in 1860. See attached incident summary. **BR-7**
4. Ranching in the area has become more difficult because of the sudden flights that spook the cattle and the horses. The jets fly so low that the pilots head gear is visible, and the planes are twin tails which I'm not. My family had the tenacity to homestead in the Bueyeros/Dallagos area in 1860's because the geography of the terrain consists only to a mother Cows - Calf ranching operation. We have survived drought, depression, the nations of the World Wars, hazards, fires, grasshoppers, etc. but luckily they've passed by only to come. Unfortunately the jets flights and their noise are unpredictable and if implemented will continue indefinitely. **BR-1**
5. The 99 year old Sacred Heart Church of Bueyeros suffered major structural damage

I, Mary C. Gonzales, from Bueyeros, New Mexico feel that Alternative A should be implemented. (No action)

The reasons are as follows:

1. The northeast corner of New Mexico is a habitat for Golden Eagles and migrating Canadian Geese as well as other wildlife. In the past ten years the number of deer in the area has dropped significantly. In the past, hunters would see 40 - 50 deer during the hunting season, that number is down to about 7. I suspect that the noise from the jets has disturbed the deers natural habitat.

2. The internationally known Philmont Boy Scout Ranch would no longer be a pristine wilderness area. For generations Boy Scouts from through out the world have flocked to Philmont as the ultimate experience in their pristine scouting adventures. One low level jet flights a day would certainly disturb the pristine wildness of Philmont Boy Scout Ranch ten flights a day would be disastrous.

3. The serenity of the environment for humans has also been disturbed with the continual flight patterns of the jets. The jet noise is also a nuisance to the quality of life for our families who have lived in this area since homesteading in 1860. *See attached incident summary.

4. Ranching in the area has become more difficult because of the sudden flights that spook the cattle and the horses. The jets fly so low that the pilots head gear is visible, and if the planes are single or twin tailed. My family had the tenacity to homestead in the Bueyeros/Gallegos area in 1860s because the geography of the terrain lends its self to a mother cow - calf ranching operation. We have survived droughts, depressions, the rations of the World Wars, blizzards, fires, grasshoppers, etc., but luckily they are present for only a time. Unfortunately the jets flights and their noise are unpredictable and if implemented will continue indefinitely.

5. The 99 year old Sacred Heart Church of Bueyeros suffered major structural damage with the jets that have been practicing in the area. We recently completed a restoration project of the 99 year old church to its original states and once again there are new cracks in the walls due to the jets that fly so low. The original stained glass windows are from Belgium and they are no longer available. I personally have been in the Church during jet fly bys and the entire structure shakes.

6. New Mexico and its natives have been very generous in allowing the Federal Government to have control of large amounts of land for the specific purpose of Military Bases and Testing. My husband served in WWII in the AmeriCal Division (The only Division without a # formed on the Island of Caledonia) and we are patriotic in serving our country. New Mexico suffered greatly in the Fall of Bataan, The Beaches of Normandy, and the clean up operation of Okinawa. During the Korean War one of our local families sent 5 sons to serve and 4 returned "shell socked". Again during the Vietnam War New Mexico sent a larger percentage of soldiers to fight in comparison to our population. We strongly believe that RBTI could be located on existing Federal Military Bases and air space in the Southern Desert of New Mexico. We feel the Foreign Low Level Training Flights are especially intrusive on native New Mexicans.

000634

I, Mary C. Gonzales, strongly oppose the placement of the RBTI in northern New Mexico. I would like a copy of the Environmental Impact Statement of the RBTI. I am sending a copy of this letter to my New Mexico Congressmen.

Sincerely,

Mary C. Gonzales

May 17, 1999

Major Brent Adams
RBTI EIS Project Manager
HQ ACC/CEVPP
129 Andrews Street, Suite 102
Langley AFB, VA 23665 - 2769

Dear Major Brent Adams:

In the mid-afternoon of late July or early August of 1987, my daughter, Rebecca Gonzales de Archuleta and her son Miguel P. Archuleta were out in the family garden. Suddenly out of know where a extremely low flying jet buzzed the Ranch Headquarters. Miguel Archuleta who was 18 months old immediately hit the ground and tried to get under a tomato plant. His primal instincts told him to hide because the sound of the jet was so frightening. The jets noise was so loud that my daughter said she was not able to look at the jet. She said she covered her ears and got down to get her son, because she too was frightened that the jet would crash. The infant was so frightened that the next day that another jet passed he cried for a long period of time. For a period of about a year he would cry or be frightened by any airplane that he saw or heard.

My daughter came into the house and called Senator Domenici Office. They told her to contact Cannon Air Force Base in Clovis, New Mexico. My daughter did call Cannon and spoke to a woman who asked her if she could identify if the jet was a twin tail or single tail jet. Because she was so frightened she was not able to get a good look at the jet. After the jet was a short distance away she looked up and that it appeared to be grayish blue, not camouflaged. She also explained to the lady she spoke to about the nearby location of the historic Sacred Heart Church in the Bueyeros. Other low level flights continued.

Another incident our family members experienced while they were opening a gate was a very low level flying jet flew so low that we could see that it was camafloged. We could also actually see the pilots head gear. One never knew when the next low level flight would occur and cause a ringing in our ears. My brother, Amarante Casados who lives with me is bedridden and has very sensitive hearing. The jet noise is especially disturbing to him.

I, Mary C. Gonzales, am giving this statement as an oath of truth and your attention in this matter is sincerely appreciated.

Sincerely,

Mary C. Gonzales

Trans-Pecos Protection Group, Inc.

Alpine, Texas

A Non-Profit Information Organization

June 1, 1999

To:

Major Brent Adams
RBTI EIS Project Manager
HQ ACC/CEVPP
129 Andrews Street, Suite 102
Langley AFB, VA 23665-2769

Subject:

A Formal Complaint Relative To The Proposed Actions Concerning The United States Air Force Realistic Bomber Training Initiative And The Environmental Impact Statement Process Required By The National Environmental Policy Act.

Please be advised the Trans-Pecos Protection Group, Inc. (The Group) has found the actions of the Department of Defense (DoD), United States Air Force (USAF), Air Combat Command (ACC), have not complied with the requirements of the National Environmental Policy Act of 1969 as Amended (NEPA), relative to accepting and exercising their responsible authority.

The Group finds these insufficient actions to be unjust and unfair to the citizens of the United States of America (U.S.A.), and do not protect and enhance the Human Environment. The Group finds the DoD/USAF/ACC, as the final decision makers, to have failed in their requirement to comply with the NEPA, et al.

The Group finds these insufficient actions of the DoD/USAF/ACC have not complied with the requirements of the NEPA Process relative to "Purpose", Sec. 2 [42 USC§ 4321]; Title I, Sec. 101 [42 USC § 4331]; Sec. 102 [42 USC § 4332; Sec. 103 [42 USC § 4333; Sec. 104 [42 USC § 4334; Sec. 105 [42 USC § 4335; Title II in total, and the Council on Environmental Quality, Executive Office of the President, Regulations For Implementing The Procedural Provisions Of The National Environmental Policy Act.

To date, The Group finds the entire NEPA Process by the DoD/USAF/ACC to be in non-compliance and insufficient. The following are examples of these insufficiencies: (1) The Group finds the notice process of the DoD/USAF/ACC's

GE-22 decision to take action on this Realistic Bomber Training Initiative (RBTI) to be insufficient. (2) The Group finds the scoping process of the DoD/USAF/ACC for this

000635

GE-22 proposed project (RBTI) to be insufficient. (3) The Group finds a lack of ability and facility on the part of the DoD/USAF/ACC to involve the public in the decision making process, relative to this RBTI Environmental Impact Statement (EIS). (4) The Group finds the notice process of the DoD/USAF/ACC relative to the Draft, EIS, RBTI insufficient. (5) The Group finds the "public meeting" process of the DoD/USAF/ACC relative to the Draft, EIS, RBTI insufficient. (6) Relative to the above examples, and with the additional lack of compliance with the governing Policy and Statutes of the U.S.A., The Group finds the context and content of the Draft EIS RBTI to be totally without merit.

The Group requests DoD/USAF/ACC to authorize their representatives to organize and take action on meeting with The Group in an effort to determine the DoD/USAF/ACC actions required to comply with the Policies and Federal Statutes of the U.S.A. relative to of the Human Environment as defined by the NEPA.

Respectfully,

Harold Bryan Kelley
Spokesman/President

"Ignorance Is The Curse Of God; Knowledge The Wings Wherewith We Fly Unto Heaven"

000636

APRIL 17, 1999
TAOS, NEW MEXICO

THIS REPORT IS RESPECTFULLY PRESENTED AT AN AIR FORCE HEARING AT THE KACHINA LODGE REGARDING PROPOSAL "D" OF R.B.T.I. BASED AT LANGLEY AIR FORCE BASE VIRGINIA, 23665-2769

AIR FORCE PERSONNEL AND FELLOW TAOSENOS:

IN WORLD WAR II MY THREE BROTHERS SERVED IN THE ARMED FORCES. FOUR PEOPLE IN MY IMMEDIATE FAMILY BUILT WWII AIRCRAFT FOR YEARS. TWO OF MY COUSINS DIED IN WWII BOMBER FLIGHTS, SO I DEEPLY RESPECT BEING SO WELL DEFENDED BY THE U.S. AIR FORCE.

I DO SEE SOME CURRENT ISSUES TO ADDRESS. ABOUT 10 YEARS AGO THE FIRST ENVIRONMENTAL IMPACT STATEMENT FOR A TAOS AIRPORT EXPANSION WAS REJECTED BY A SANTA FE COURT, SINCE ONE OF THE PROSPECTIVE BUILDERS CREATED HIS OWN E.I.S. THIS TYPE OF CONFLICT OF INTEREST, IT SEEMS, IS NOW REPEATED VIA AIR FORCE CONTRACTED DRAFTING. THE CURRENT E.I.S., FOR REALISTIC BOMBER TRAINING INITIATIVE ALTERNATIVE D WAS DESIGNED TO FIT AIR FORCE DESIRES, OBVIOUSLY SIDE-STEPPING AND UNDERSTATING THE VAST, WELL-DOCUMENTED POTENTIAL HAZARDS TO HUMANS, ANIMALS AND PLANTS.

000636

OUR TAOS MAYOR, FRED PERALTA, HAS CITED FEAR OF FOREST FIRES BEING GENERATED BY PLAN D FLIGHTS. THESE HAZARDS WOULD UNDOUBTEDLY BE COMPOUNDED BY SIGNIFICANT ECONOMIC DEPRESSION IN AN ALREADY IMPOVERISHED AREA.

IN THE JUNE 1998 AIR FORCE NEWSLETTER I READ THAT PUBLIC HEARINGS IN JANUARY AND FEBRUARY 1998 REGARDING R.B.T.I. CONDUCTED IN FOUR STATES INCLUDING NEW MEXICO DREW ONLY 535 CITIZENS GRAND TOTAL. CAPTAIN KANGAROO TAUGHT ME HOW TO COUNT, SO I NOTICED THAT IN THIS TIME PERIOD TAOS MEETINGS ALONE WERE ATTENDED BY AT LEAST 600 PEOPLE, VIRTUALLY ALL OPPOSING PLAN D. TOO BAD SOME OUTSIDE MONITORING OF R.B.T.I. PROTEST LETTERS CAN'T BE DONE. THE F.D.A. LAST YEAR STOPPED AN EVASIVE ORGANIC FOOD LABELING PLAN AFTER RECEIVING THOUSANDS OF PROTEST LETTERS.

FIVE YEARS AGO, I BEGAN AN INFORMAL STUDY OF SANCTUARY TRAUMA. THIS WAS TO ISOLATE SYMPTOMS OF A PERSON WHO FELT SAFE UNTIL SOME QUICK AND UNEXPECTED INVASION HAPPENED TO HIM – SOMETIMES REPEATEDLY. RAPISTS AND GUN SHOTS WERE SOME TYPICAL INVADERS. SOME DOMINANT POST TRAUMA SYMPTOMS ARE:

1. QUICK RETREAT WHEN SIMILAR SOUNDS OCCUR.
2. DANGEROUS ISOLATION FOR SELF-PROTECTION, SINCE A TRUST

000636

WAS BROKEN.

3. FEAR OF A CLOSE RELATIONSHIP INCLUDING SEX AND PARENTING.
4. IN EXTREME TRAUMAS, VIOLENCE AND DESTRUCTION WHEN VICTIM WAS APPROACHED IN THE SAME OR SIMILAR MANNER TO WHERE THE ORIGINAL INVASION OCCURRED.

AMONG SPECIAL EDUCATION AUTHORITIES, THERE IS WIDESPREAD AGREEMENT THAT HEARING LOSS IS THE MOST SERIOUS SENSORY IMPAIRMENT. MY SON-IN-LAW SUFFERS A SERIOUS HEARING LOSS AFTER TWO-WEEK SUMMER ARTILLERY PRACTICES IN THE WASHINGTON DESERT EAST OF THE CASCADE MOUNTAINS. THE NATIONAL GUARD ISSUED EARPLUGS TO HIM, WHICH HE NEGLECTED TO WEAR. UNDER PLAN D, WHICH CALLS FOR 2,600 FLIGHTS PER YEAR, WOULD ALL OF US HAVE TO WEAR EARPLUGS 24 HOURS A DAY? SINCE 15% OF THESE FLIGHTS WOULD OCCUR BETWEEN 10 PM AND 6 AM, VERY LITTLE SILENCE COULD BE ASSURED.

MY PEDIATRICIAN IN HOUSTON SAID MY CHILDREN WOULDN'T BE PRONE TO EAR INFECTIONS WHEN THEY WERE OLDER, THAT THE

AO-47 EAR DRUM WOULD GROW STRONGER. HOW ARE WE TO PROTECT INFANTS AND YOUNG CHILDREN FROM FLIGHTS AS LOW AS 200 FEET WITH SOUNDS HITTING 120 DECIBELS?

TOWARD THE END OF APRIL 1999, THREE AIR FORCE BOMBERS FLEW AT 300 FEET OVER MY HOUSE ON TWO PEAKS (TAOS COUNTY). THE

000636

SOUND AND VISUAL INVASION WAS DISTURBING.

RATHER THAN INCREASING OVERFLIGHTS IN NORTHERN NEW MEXICO, I THINK CURRENT FLIGHTS SHOULD BE REVIEWED AND REDUCED BY THE AIR FORCE.

CONSIDERING THE SAD PROSPECTS AFOREMENTIONED, I WOULD CALL PLAN D OF R.B.T.I. A POTENTIAL "OUTRAGE TO THE EAR DRUMS" WITH PERMANENT DAMAGE AS SERIOUS AS BULLET WOUNDS.

LOSS OF SLEEP IS ANOTHER LARGE FACTOR IN THIS IMPOSSIBLE, UNWORKABLE, INHUMANE BATTERY OF OFFENSES OFFERED TO US IN ALTERNATIVE D.

"I SAY SCRAP IT."

SINCERELY YOURS,

Jane Tate

Major Brent Adams
RBTI EIS Prj. Mgr.
HQ ACC/CEVPP
129 Andrews Street, Ste 102
Langley AFB, VA 23665-2769

Dear Major Adams:

BR-6 I am writing to express my concern with the Air Force's Realistic Bomber Training Initiative (RBTI) plan for northern New Mexico and the effect it will have on the Boy Scouts of America's Philmont Scout Ranch located near Cimarron.

If you are not familiar with Philmont, it is over 127,000 acres of mostly wilderness in the Sange de Cristo mountains in northeastern New Mexico. At any time during the summer there are between 5,000 and 6,000 people in the camp either backpacking, at the base camp or at the Philmont Training Center. In a typical year, over 30,000 people will enjoy a Philmont experience of some type.

For over 60 years Philmont has been considered the "crown jewel" of scout camps. My family and I had the privilege to visit Philmont in 1997. While I attended an outdoor training course, my wife and two sons attended a program designed specifically for them. The Philmont experience exemplifies the true meaning of scouting. It was an experience we'll never forget.

The Air Force is considering four sites for its RBTI which involve low flying B-52s and B-1s. Alternative D traverses Philmont Scout Ranch.

One of my concerns is for the over 3,000 campers in Philmont's back country every day in the summer. These campers are engaged in rock climbing and repelling, backpacking and camping in the mountainous wilderness, and horse back riding. Philmont is a physically demanding program. A low flying bomber would at the least provide a rude awakening to weary campers.

Another concern is for the preservation of the wilderness experience. There are few places where young people can experience true wilderness, away from the distractions of the modern world. Philmont is one of those few places.

000637

I do not protest RBTI since it is a valuable program. One might only turn on the news to recognize the importance of military preparedness with increasing world tensions. My only concern is with the proposed route over Philmont.

Thank you for your consideration in this matter.

Very truly yours,

John L. Walker

Langley AFB, VA 23665-2769

Dear Major Adams,

BR-6 I am writing to request your firm support in opposing the selection of Alternative D under the U.S. Air Force's proposed Realistic Bomber Training Initiative (RBTI). The Air Force is seeking to establish a new training route for low-level B-1 and B-52 bomber flights from bases in Texas and Louisiana. One of the proposed routes, Alternative D, traverses Philmont Scout Ranch in northeastern New Mexico's Colfax County.

Philmont is a 137,000-acre mountain backpacking and high adventure facility of the Boy Scouts of America. Each year, thousands of Scouts and their adult leaders from across the nation participate in two-week wilderness backpacking trips in the mountains of Philmont. Many of them also camp and work on conservation projects in the adjacent Valley Vidal Wilderness of the Carson National Forest.

The Air Forces proposed Alternative D would establish a military training route directly over most of Philmont. More than 2,600 flights each year, some as low as 300 feet above ground level, are proposed for the segment over Philmont. As a Scouter, I have serious concerns about the impact of the Air Force's proposal on the health and safety of Scouts attending Philmont and the potential effects of daily low-level flights on the ranch itself.

On any given day in the summer, as many as 5,000 Scouts and Scouters will be hiking and camping in Philmont's backcountry. Each day, several hundred of them will be engaging in activities such as rock climbing and rappelling, spar pole climbing, and mountain horseback rides. The sudden roar of jet engines has a high likelihood of distracting an inexperienced climber or causing a horse to bolt on a narrow mountain trail with resulting serious injury (or worse).

Appreciation and protection of the wilderness and our natural resources is a key part of the Philmont program. Scouts from around the world have a unique opportunity to see and experience wildlife in native habitat. Noise and emissions from bombers cannot help but have a damaging effect of that wildlife, as well as on Philmont's herds of buffalo, horses, cattle, and

St. Louis, MO

000638

burros. The disruptive effects of noisy bomber flights on Philmont's famous living history programs, in which Scouts experience the lifestyles of the West's mountain men, homesteaders, lumberers, and cowboys, are obvious.

Most of Philmont is mountainous with many peaks in the 10,000 to 20,000 foot range. Philmont has a tremendous fuel load of dead trees and is in the midst of a long-term drought. Unburned jet fuel finding its way to the ground or being dumped in an emergency over such terrain, with campers using backpacking stoves for cooking, creates the potential for a serious fire that would endanger hundreds of lives. The possibility of a crash, however remote, is simply not acceptable for the safety of these Scouts.

For these reasons, I seek your help in advocating the selection of a different RBTI route. I ask that you express your opposition to Alternative D to the Secretary of the Air Force and other defense officials who may be involved in this decision. Please act now, as the public comment period ends in June and a final decision will be made this year.

Philmont is the largest and most famous Scout camp in the world. It is a national resource that has positively impacted the lives of hundreds of thousands of our nation's youth for more than sixty years. It deserves and demands our protection. Thank you for helping to see that Alternative D is not selected.

Sincerely,

Darrell R. Case

Please act now, as the public comment period ends in June and a final decision will be made this year. You or a member of your staff may wish to contact Greg Dodd, Chief of Staff for Congressman Ed Pease of Indiana, who can provide additional information.

000640

As the mother of a future scout, I hope the same pristine beauty and wonderful growth experience that I shared with my father will still be available to share with my son. In this time of uncertainty and unrest with our youth, especially in our schools, we need to do everything we can to promote family values and understanding. We should protect any resource we have that teaches these ideals; not destroy them, or render them useless.

Philmont is the largest and most famous Scout camp in the world. It is a national resource that has positively impacted the lives of hundreds of thousands of our nation's youth for more than sixty years. It deserves and demands our protection. Thank you for helping to see that Alternative D is not selected.

Sincerely,

Mrs Stacey Locke

Langley AFB, Va 23665-2769

Dear Major Adams:

BR-6

The draft environmental impact statement for the Realistic Bomber Training Initiative is surely defective in not reflecting the environmental and human impacts of Alternative D.

Philmont Scout Ranch is unique in its mission to preserve, as high adventure wilderness, a non-government owned magnificent stretch of western geography dedicated to leadership development of America's young people through the Scouting program.

The United States preserves wilderness areas to free vestiges of wild America from the intrusion of human impacts. No doubt the proposed alternative flight paths, rightfully, avoid these areas; for it is difficult to imagine a more invasive intrusion into the wilderness experience than bomber training runs.

How ironic and unconscionable, then, for the United States to propose invasion of the tranquility of the Philmont Country and destruction of its leadership development role!

Since the late 1930s, almost a million young people and their adult leaders have experienced the joy of camping, hiking, horseback riding, and learning first hand about America's great western natural and historical heritage in the Sangre de Christo Range between Cimarron and Taos, New Mexico.

000641

We who have been to Philmont will always treasure every moment we were privileged to breathe its crystal air, to hear its waters sing, to learn of our Native American, Spanish, French, and Anglo ancestors, to experience rock climbing, horseback riding, wilderness survival skills, to be thankful for the opportunity and watchfulness of our country.

Those whom the United States will deprive of this experience are our children and grandchildren who have the greatest need to learn respect for each other, for the land, and for their obligation to make good choices for those who will follow.

Training our pilots is crucial to America, so is the training of those who must pilot our nation's destiny in every other walk of life. Those who would walk Philmont in peace and preparation now need the country's protection for this endeavor of the body and the spirit.

Please look to your science and your wisdom. Alternative D is fatally defective. It should be withdrawn immediately.

Sincerely,

Gregory J. Hobbs, Jr.

Re: RBTI Proposed Alternative C - Texon

Dear Major Adams,

My husband and I have several reasons opposing the above RBTI - Texon.

We have cattle, sheep and goats grazing on land in the proposed area. In gathering the livestock to spray, shear, mark, or etc., we drive them several miles to the pens. Some jets (green or grey) have been flying very low for several years and the noise does interfere with the gathering and working.

BR-3

Also, we have hunting leases on the land and the noise of from the jets do have a

BR-4

-2-

000642

negative effect to the hunters.

The competition of air space is another concern as to the cloud-seeding planes.

Rain is vital to our economy. During drought, the cloud seeding is very important to us.

BR-2

Please consider our concerns. We know that you will try to do the right thing for us.

Sincerely.

Imogene & Charles Jackson

Langley A.F.B Va. 23665-2769

Dear Major Adams:

In regard To the low flying Bombers The Air Force is determined To force on this eight County Area, My plea to you Please Save Our Economy "Stop The Bombers" The quality of life as we know it would be devastated.

I might add Sandhill Cranes fly To our fields by The hundreds, even thousands. To feed in grain fields, wheat fields etc. Their being here would be a hazzard To those expensive bombers, do Our young pilots Care That Tax payer Monies Are hard To have To pay. ?? I Think not.

AO-19

If you Took Time To listen To The Testimonies. given by ranchers, farmers, Teachers. Concernied parents & grandparents. & you listened with your heart. you will hear Our Cry. The report mentioned was Taped at the Snyder TX. Meeting. April 7, 1999

Thank you for your help.

Lahrue Fippit

Tahoka, TX.

Lynn Co. Texas

MARK YOUR CALENDARS!

000643

YOU NEED TO BE HERE!

What:
Public Hearing -The USAF will be holding a hearing on the proposed establishment of the low-level B-1 and B-52 bomber training site over our property.

When:
Wednesday, April 7th 5:00 – 9:00 p.m.

Note:
This is the only hearing in our area.

Where:
Snyder High School – located at 3801 Austin Avenue in Snyder

Attending the public hearing is the primary way for you to let the USAF know that you are concerned about the proposed Realistic Bomber Training Initiative. The Air Force uses the attendance as an indicator of the level of opposition. The initial hearing last winter was not publicized and attendance was poor. **Don't let them think we don't care!** Come to the meeting with your concerns about how this will impact you and your land. We need to let them know we are opposed to the concept of turning our backyard into a bomber training ground. **DON'T ASSUME SOMEONE ELSE WILL BE THERE. LET YOUR FRIENDS AND NEIGHBORS KNOW HOW IMPORTANT IT IS FOR EVERYONE TO ATTEND!**

The USAF is proposing the establishment of RBTI over the eight county area -- Borden, Dawson, Fisher, Garza, Lynn, Kent, Scurry and Stonewall counties.. Our land will become one of the most active training grounds for the B-1 and B-52 bombers in the country. The USAF could fly as many as 15 to 25 missions in the training site daily. These flights will start out at 3,000 feet. However, we suspect that flights as low as 500 feet are likely in the future. **This is not just another training area. It will turn our land into one of the major bomber training sites in the country!**

The RBTI will significantly impact the local economy and our way of living.

- This activity will essentially eliminate hunting in the area, costing us an estimated tens of millions of dollars in lost sales at stores, motels, restaurants and hunting leases.
- Medical studies have demonstrated the harmful effects of jet noise, including the startle effect on humans. Livestock are also startled by the noise.
- Land values will drop! The economic impact will hit all parts of our economy in the end.
- Lost tax revenues for our schools.

INVEST AN EVENING AND SAVE OUR ECONOMY

H.E.P.A. Inc.

Sonic boom shakes city

By ELIZABETH LANGTON
Avalanche-Journal

A deafening boom about 4:15 p.m. Friday rattled windows from Slaton to Post, South Lubbock County and Abernathy, sending a flood of calls to emergency agencies.

The sound was a sonic boom, according to reports from the Federal Aviation Administration to Lubbock police and the National Weather Service.

The FAA reported a B-1 bomber caused the noise, police said. The plane's origin could not be determined.

A few buildings sustained broken glass and dislodged signs, but the Lubbock Fire Department and the Lubbock County Sheriff's Office received no reports of major damage.

The rumor going around this area, The Pilots in Two B1 Bombers have been racing to make these Sonic booms.

000643

Sonic boom caused by B1 bomber causes stir in Lubbock neighborhoods

Continued from Page One

"The phones lit up," a fire dispatcher said. "We got calls from all over town. It was pretty hairy there for about 10 or 15 minutes."

South Lubbock resident Corinne Lawson said people in her neighborhood came running outside after the noise.

"That hit, and it shook my car," she said. "My friend told me it nearly knocked her phone out of the wall."

As a plane flies, it pushes sound waves out in all directions at speed of sound, about 740 mph.

Like a boat's wake, People on the ground hear a noise like thunder as the shock wave rolls by, according to YES Magazine, Canada's science magazine for kids.

The shock wave follows the plane at a shock wave.

Elizabeth Langton can be contacted at 766-8795 or elangton@avalanchet.net

Major Adams:

BR-6

I am writing to request your support in opposing the selection of Alternative D under the Air Force's proposed Realistic Bomber Training Initiative (RBTI). The Air Force is seeking to establish a new training route for low-level B-1 and B-52 bomber flights from bases in Texas and Louisiana. One of the proposed routes, Alternative D, traverses Philmont Scout Ranch in northeastern New Mexico's Colfax County.

Philmont is a 137,000-acre mountain backpacking and high adventure facility of the Boy Scouts of America. Each year, thousands of Scouts and their adult leaders from across the nation participate in two-week backpacking trips in the mountains of Philmont. Many of them also camp and work on conservation projects in the adjacent Valle Vidal Wilderness of the Carson National Forest.

The Air Force's proposed Alternative D will establish a military training route directly over most of Philmont. More than 2,600 flights each year, some as low as 300 feet above ground level, are proposed for the segment over Philmont. As a former Philmont staff member, I am very concerned about the impact of the of the Air Force's proposal on the health and safety of Scouts attending Philmont and the effects on the ranch itself.

On any given day in the summer, as many as 5,000 Boy Scouts and adult leaders will be hiking and camping in Philmont's backcountry. Each day, several hundred of them will be engaged in activities such as rock climbing and repelling, spar pole climbing, and mountain horseback rides. The sudden roar of jet engines has a high likelihood of distracting an inexperienced climber or causing a horse to bolt on a narrow mountain tail with resulting serious injury (or worse).

Appreciation and protection of the wilderness and our natural resources is a key part of the Philmont program. Scouts from around the world have a unique opportunity to see and experience wildlife in native habitat. Noise and emissions from bombers cannot help but have a damaging effect on that wildlife, as well as on Philmont's herds of buffalo, horses, cattle, and burros. The disruptive effects of noisy bomber overflights on Philmont's living history programs, in which Scouts experience the lifestyles of the West's mountain men, homesteaders lumberers, and cowboys, are obvious.

000644

Most of Philmont is mountainous with many peaks in the 10,000' to 12,000' range. Philmont has a tremendous fuel load of dead trees in its forests and is in the midst of a long-term drought. Unburned jet fuel creates the potential for a serious fire that would endanger many lives. The possibility of a crash, however remote, is not acceptable for the safety of these Scouts.

Philmont is the largest and most famous Scout camp in the world. It is a national resource that has positively impacted the lives of hundreds of thousands of our nation's youth for more than sixty years. It deserves and demands our protection. Thank you for helping to see that Alternative D is not selected.

000645

Ten Points for Opposition to RBTI Alternative D (over Philmont)

The EIS (Environmental Impact Statement) incorrectly concludes that very few population centers are affected. On any given day in the summer months, over 5,000 people will be living and camping directly under the flight path at Philmont.

Safety of horseback riders will be endangered,. Philmont provides trail rides or pack trips for 5600 to 9500 mostly inexperienced riders each summer on steep and narrow mountain trails. As many as 165 inexperienced people may be on horseback on the ranch at various times during the day. The startle effect of a high-decibel low-level flight could easily cause one or more horses to spook and bolt with a novice rider aboard. With the number of flights proposed, it will be only a matter of time before Philmont experiences a serious injury or death due to a rider being thrown from or dragged by a startled horse.

Increased noise levels will interfere with staff trying to provide safety instruction to rock climbers, spar pole climbers, and rifle range shooters. The noise level of a B-52 at 300 feet is 117 decibels. Staff trying to teach safety techniques required in climbing rock faces or firing black powder rifles should not have to compete with such noise interference.

The high noise levels generated by B-1 and B-52 bombers flying only a few hundred feet above ground level are greater than being near a chain saw or a diesel train. Campers at Philmont will be exposed to such noise levels for more than six hours during a typical 12-day stay based on projected flight operations. This is not a true wilderness experience.

The possibility of a crash is very real. The EIS estimates the chances of a "Class A mishap" at one every 15 years for a B-1 on the training route that would include Philmont. Aside from the real risk to Scouts who might be in the path of an errant bomber, a crash on Philmont would have the potential of starting a serious forest fire that could devastate the ranch.

The EIS fails to mention any impact of flyovers on Philmont's two National Historic sites, The Kit Carson / Maxwell Abreu houses at Rayado and the Villa Philmonte.

The flights can be expected to have serious impacts on Philmont's wildlife and will overfly the habitats of at least three endangered species, the bald eagle, peregrine falcon, and Mexican spotted owl. The U S Fish and Wildlife Service has concluded that overflights at less than 1,000 feet will significantly impact these species.

No one has investigated the cumulative effects of the planned noise levels and vibrations on the hundreds of abandoned and the two active mines on Philmont.

No plane burns all of its fuel. At higher altitudes, unburned fuel dissipates in the atmosphere. At lower altitudes, one must expect that some unburned fuel will find its way to the ground and streams on Philmont. The effects of a plane in trouble at low altitude dumping fuel over Philmont with numerous cook stoves and campfires are easily imagined.

Philmont is a national treasure and provides a wilderness camping experience for thousands of Scouts, America's future leaders, every year. That experience should be preserved since alternative training sites exist which do not jeopardize the program experience offered by Philmont and the safety of thousands of young people participating in it each year.

RE: Opposition to Realistic Bomber Training Initiative (RBTI), Alternative D, over Philmont Scout Ranch, Colfax County, New Mexico

Dear Major Adams:

BR-6 I am writing to request your firm support in opposing the selection of Alternative D under the U.S. Air Force's proposed Realistic Bomber Training Initiative (RBTI). The Air Force is seeking to establish a new training route for low-level B-1 and B-52 bomber flights from bases in Texas and Louisiana. One of the proposed routes, Alternative D, traverses Philmont Scout Ranch in northeastern New Mexico's Colfax County. As a former Philmont staff member, I have serious concerns about the impact of the Air Force's proposal on the health and safety of Scouts attending Philmont and the potential effects of daily low-level flights on the ranch itself.

Philmont is a 137,000-acre mountain backpacking and high adventure facility of the Boy Scouts of America. Each year, thousands of Scouts and their adult leaders from across the nation participate in two-week wilderness backpacking trips in the mountains of Philmont. Many of them also camp and work on conservation projects in the adjacent Valle Vidal Wilderness of the Carson National Forest.

The Air Force's proposed Alternative D will establish a military training route directly over most of Philmont. More than 2,600 flights each year, some as low as 300 feet above ground level, are proposed for the segment over Philmont. The increased noise levels will not only ruin the wilderness experience, but will interfere with Philmont's staff trying to provide safety instruction to rock climbers, spar pole climbers, rifle range shooters, and horseback riders. The noise level of a B-52 at 300 feet is 170 decibels, and the high noise levels generated by B-1 and B-52 bombers flying only a few hundred feet above the ground will be greater than being near a chain saw or a diesel train.

The EIS (Environmental Impact Statement) incorrectly concludes that very few population centers are affected. On any given day in the summer months, over 5,000 people will be living and camping directly under the flight path at Philmont. Each day, several hundred of them will be engaged in activities such as rock climbing, rappelling, spar pole climbing, mountain horseback activities, and rifle shooting. The sudden roar of jet engines has a high likelihood of distracting an inexperienced climber or causing a horse to spook and bolt. It will only be a matter of time before Philmont experiences a serious injury and/or death due to a fallen climber or rider being thrown from or dragged by a startled horse. In addition, the EIS fails to mention any impact of fly-overs on Philmont's two national historic sites, the Kit Carson/Maxwell Abreu houses at Rayado and the Villa Philmonte.

Appreciation and protection of the wilderness and our natural resources is a key part of the Philmont program. Scouts from around the world have a unique opportunity to see and experience wildlife in native habitats. The military training route described in Alternative D will affect such endangered species as the bald eagle, the peregrine falcon, and the Mexican spotted owl. The U.S. Fish and Wildlife Service has concluded that overflights at less than 1,000 feet will significantly impact these species. Noise and emissions from bombers cannot help but have a damaging effect on that wildlife, as well as on Philmont's herds of buffalo, horses, cattle, and burros. The disruptive effects of noisy bomber overflights on Philmont's famous living history programs, in which Scouts experience the lifestyles of the West's mountain men, homesteaders, lumberers, and cowboys are obvious, but no one has investigated the cumulative effects of planned noise levels and vibrations on the hundreds of abandoned and the two active gold and silver mines on the Philmont Scout Ranch. Here again, the continued long-term effect of low-level vibrations could possibly cause a mine to collapse with large numbers of Scouts suffering serious injury and/or death.

Most of Philmont is mountainous, with many peaks in the 10,000 to 12,000 foot range. Philmont has a tremendous fuel load of dead trees in its forests and is in the midst of a long-term drought. Unburned jet fuel finding its way to the ground or being dumped in an emergency over such terrain, with campers using backpacking stoves for cooking, creates the potential for a serious fire that would endanger hundreds of lives. The possibility of a crash, however remote, is simply not acceptable for the safety of these Scouts, and a crash on Philmont would have the potential of starting a serious forest fire that could devastate the ranch and the surrounding mountainous terrain.

For these reasons, I seek your help in advocating the selection of a different RBTI route. I ask that you express your opposition to Alternative D to the Secretary of the Air Force and other defense officials who may be involved in this decision. Please act now, as the public comment period ends in June, and a final decision will be made this year. You or a member of your staff may wish to contact Greg Dodd, Chief of Staff, or Congressman Ed Pease of Indiana, who can provide additional information.

Philmont is a national treasure and is the largest and most famous Scout camp in the world. Every year it provides a wilderness camping experience for thousands of Scouts, America's future leaders. This experience must be preserved, especially since alternative training sites exist which do not jeopardize the program experience offered by Philmont and the safety of thousands of young people participating in it each year. Philmont is a national resource that has positively impacted the lives of hundreds of thousands of our nation's youth for more than sixty years. It deserves and demands our protection. Thank you for helping to see that Alternative D is not selected.

Very truly yours,

DAVID M. POSEY, M.D.

May 22, 1999

Colonel Lee C. Bauer or Major Brent Adams

Thank you for your letter on behalf of the Secretary of the Air Force.

I strongly disagree with your statement in paragraph 2 "... RBTI will ultimately save the taxpayers money." Staying in Texas will save the taxpayers money & re-locating the bombers to a less closer to your existing "practice areas." Please remember that the thousands of people living in Northern New Mexico are taxpayers also. RBTI will ruin our fragile tourist economy, not to mention a quality of life held dear for generations.

BR-4

It is clear from our elected officials that this is the least desireable of your 4 choices. Follow that.

Suzanne Bath

Langley AFB, VA 23665-2769

Dear Major Adams:

I am opposed to the Air Force's proposed RBTI known as Lancer – Option B in the DEIS. My concern(s) about the proposal and the DEIS are as follows:

I have about 300 boats + Canoes at about 10 different Places in about 5 to 7 mile radius. I have a friend with a small Plane that every time he comes over, if the boats are 1/2 mi from the shore, they run all the way home to get in the Barn. These are Reg. or subject to Registration with boats + Boat boats. This is about 16 years of Breeding, some of these boats I Paid $500 each for, I don't think my Cows would go through the fences but I think the boats will.

Langley AF, VA 23665-2769

Dear Major Adams:

BR-6 I am writing to obtain your support in opposing the proposal to allow USAF training flights over Philmont Scout Ranch - Alternative D of the proposed realistic bomber training initiative (RBTI).

Philmont, in NE new Mexico, is a 137,000 acre high adventure facility of the Boy Scouts of America. Each summer over 20,000 scouts and their leaders engage in back-packing and camping in a mountainous area for an experience unmatched anywhere in the US - or even in the world - because we have many international visitors. Philmont has even served as a training experience for many in the Air Force Academy in Colorado Springs.

As a physician who has spent many summers at Philmont, I have great concern over the health, safety and welfare of those enjoying this unique wilderness experience if the planned 2600 flights a year of Alternative D of the RBTI should occur over Philmont.

My concerns can be summarized as follows:

1. Scouts riding horses,, climbing spar poles, rock-climbing or rapelling may suffer serious falls or injuries if distracted by the sudden noise of jets flying overhead - especially if some are at low altitudes.
2. Unburned jet fuel discharged from aircraft in an area where there are camp stoves and many tinder-like dead trees and brush may start fires.
3. Danger of plane crashes in the mountains is ever present and could cause great damage to the wilderness and cause forest fires.
4. Aircraft noise cannot help but have a harmful effect on the wildlife that many hikers expect in the wilderness as well as affecting the behavior of many domestic animals such as horses, cattle and the herds of bison that roam part of the ranch.
5. The noise level of low flying planes will ruin the camping experience for many who come to escape urban noise and confusion and will interfere with educational sessions that will be repeatedly interrupted by obnoxious sounds from aeroplanes.
6.

By advocating a different alternative for the RBTI you can help assure that thousands of American youth will continue to enjoy invaluable wilderness adventures at Philmont - experiences which will be irretrievably lost if aircraft are almost constantly overhead during the camping season. Please express your opposition to Alternative D to the secretary of the Air Force and other defense officials involved in this decision before the end of June when public comment ends. For further information you can contact Chief of Staff, Greg Dodd, of Congressman Ed Pease of Indiana.

Philmont is the most famous scout camp in the world: a national treasure that has affected the lives of hundreds of thousands of youth for more than sixty years. This proposal by the Air Force is truly a crisis for this facility, which deserves and demands our protection. Thanks for seeing that Alternative D is not selected.

Sincerely,

John B. Redford, M.D.

RBTI Letter — Page 1 of 1

000651

Dear Major Adams,

BR-6 I am writing to request your firm support in opposing the selection of "Alternative D" under the USAF's proposed Realistic Bomber Training Initiative (RBTI) involving low flying B-52s and B-1s (as low as 300'). As one of several proposed southwestern routes, "D" traverses Philmont Scout Ranch in northeastern New Mexico's Colfax County. Philmont, truly a national treasure, is the 137,000 acre backpacking and training facility of the Boy Scouts of America. I do not protest RBTI since it is a valuable program -- my only complaint, as a Philmont alumnus, is with the proposed route over Philmont.

Several years ago, the USAF ceased its low altitude F-16/F-111 flights over the Ranch as a result of Philmont protests. RBTI's multiple daily flights (up to 16) will create much more severe problems:

a) Program: Philmont is a transient community of 25,000 people with over 3,000 campers in Philmont's back country every day in the summer. Daily, several hundred of them are engaged in spar pole climbing, rock climbing and rapeling, and horse back riding. The sudden roaring of jet engines will distract climbers and bolt horses thereby creating injuries (or worse).

b) Environmental: Appreciation and protection of the wilderness are key parts of Philmont's program. RBTI is inconsistent with wilderness preservation. RBTI wil have a damaging effect upon botn the unique western wildlife and Philmont herds of cattle, horses, burros, and buffalo. The effect of the unburned portion of jet fuel in the engine exhaust or dumped fuel itself, vaporizing and falling to ground level is as yet unknown, but believed to be anything but beneficial.

c) Safety: The environmental impact study done for the USAF is seriously flawed when it describes Philmont as an "uninhabited" grassland. The smaller portion of Philmont's acreage is prairie. Most of Philmont is mountainous with many peaks in the 10,000 to 12,444' range. Philmont has a tremendous fuel load of dead trees in its forests, and is in the midst of a long term drought. Open fire bans are in effect now. A crashing bomber will create an epic fire of Yellowstone proportions. B-1s and B-52s do not have enviable safety records. The nature of the flights (weaving around mountain peaks and facing violent weather, including frequent, low-level wind shears) dramatically increases the chance of a crash. Unfortunately, Philmont does not have a well-developed highway system for evacuations in case of massive forest fires.

For the above reasons, i seek your help in advocating the selection of a different RBTI route, preferably one that is over a more sparsely populated, less environmentally sensitive area. You, or a member of your staff may wish to liaise with Rep. Ed Pease's (Indiana) legislative assistant, Greg Good, who has additional information on RBTI.

There is too much at stake to allow RBTI to overfly Philmont. Please act now -- final route determination starts in June. Thank you for helping to see that alternative D is not selected.

Major, over twenty years ago I was privileged to spend part of my summer at Philmont. I think it is one of the most beautiful places on earth. It must be preserved as a true wilderness area.

Very Truly yours,
John Morris

Langley AFB, VA 23665-2769

Dear Major Adams:

I am opposed to the Air Force's proposed RBTI known as Lancer – Option B in the DEIS. My concern(s) about the proposal and the DEIS are as follows:

As an employee of a family that owns and operates a 35,000 acre plus cattle ranch in Lamesa, Texas, I am kept apprised of the many medical and environmental problems that can affect the development of a good calf crop.

BR-4 I feel, therefore, that the low level flying planes will definitely have a negative impact on the cattle industry in the designated area.

My main question is: If the government already owns many acres of

PD-7 uninhabited land not that far away from the proposed area, why does it have to do the testing over privately owned land? Are you proposing to do the testing over privately owned land just because it's convenient for the Air Force and "Just Because You Can"? Where is the regard for any lasting effects?

I think the government needs to rethink the proposal and come up with a more favorable solution.

As a member of HEPA, an 80 year old widow still working to pay my fair share to support myself, my family, my community and my Nation, I think I have a right to protest the threat to our rights as private property owners

I am again voicing my opposition to the proposal that the Airforce establish the Realistic Bomber Training Initiative over the 8 county area in which my family and I own agricultural land and homes which we have worked a lifetime to accumulate. Such a training program as is being proposed could well destroy our means of livlihood, endanger our lives, destroy the economy and our environment.

As you well know, since 1980, USAF Regulations have been in violation of The National Environmental Act (NEPA), The Clean Air Act and the Freedom of Information Act.

BR-5 When flying at 500 ft. above ground level the DoD Air Forces are flying on Populated Private Property. They are trespassing.

Each time Military Aircraft engines are started, there is a Negative Impact to the National Environment, no matter where they fly. The National Environment Policy requires Populated Private Property to be considered as part of the Human Environment.

This Negative Environmental Impact is composed of excessive noise that can deafen and chemical pollutants that can kill! Harm to livestock, wild-life , plant life, etc., etc.

Probably the most important aspect of all the negatives could be killing the morale of multigenerations of families who have tended the soil through drouths, depressions, tornadoes, hails, floods, pestilences etc. in an effort to produce food to help feed the world.

I understand there are federally owned lands with sparse or no population where the Air Force training can be conducted without impacting so many good, tax paying citizens.

Respectfully,

LSCLFarm Partnership

Dear Major Adams:

Re: RBTI - Realistic Bomber Training Initiative

BR-6 I have been following the progress of the RBTI process for several months now. I have family that lives directly in the flight path of Alternative D, and am a frequent visitor to the Philmont Scout Ranch. As such, I am very concerned about the outcome of this initiative.

Over the past several months, I have expressed my concerns about RBTI to Senators Warner, Binghaman, Voinovich and DeWine, as well as to Representatives LaTourette, Pease and Hastert. I have asked each of them to forward on my concerns to you and hopefully they have.

I have also spent considerable time talking to friends and family members about this initiative. Unfortunately, the biggest problem I have encountered is getting people (including members of my own family) to believe that RBTI is not another "urban legend." I do have to admit, the thought that the USAF would even consider conducting low-altitude bomber training runs over a busy Boy Scout camp does sound a bit unbelievable. Once I convince them that this is actually being seriously considered, their reaction is typically "that would be a real bad thing."

I tend to look at things very logically. When I first heard that Alternative D included the vast majority of Philmont, logic told me that this was a very bad idea. I have no quarrel with the USAF's need to conduct this training, however, I have serious concerns regarding the saftey of the thousands of Boy Scouts who work so hard to get to Philmont. Since it appears that there are two alternatives that meet the USAF's training requirements (and don't involve training over a busy Boy Scout camp), I would encourage you to not select Alternative D. I would hope that the outcry you have heard from other Scouters would indicate that there are people all over the country who strongly oppose Alternative D.

I appreciate your time, and will anxiously await the final decision on this issue.

Sincerely,
Kevin M. Caine
Kevin M. Caine

000657

BR-6 Dear Major Brent Adams,

I am an active member of the Boy Scouts of America and I am writing because I oppose the USAF's proposed Realistic Bomber Training Initiative involving low flying B-52s and B-1s.The RBTI will take place over Philmont Scout Ranch in northeastern New Mexico's Colfax County.Philmont is a 137,000 acre backpacking and training Facility of the BSA.Daily several hundred are involved in some sort of mountain climbing or horseback riding.The tremendous sound of the jets could distract the climber or startle the horse, therefore resulting in injury or even death.The jets would take away from Philmonts secludedness.The jets would damage the enviroment greatly and with all the dead trees in parts a plane crash could ignite a forest fire that could not be controlled.For these reasons I ask that you change the site for the RBTI to a less populated one and help keep Philmont the way it has been for over 60 years.

Sincerely,
Eric Purcell

Dear Major Adams:

BR-6 I am writing to request your firm support in opposing the selection of "Alternative D" under the USAF's proposed Realistic Bomber Training Initiative (RBTI) involving low flying B-52s and B-1s (as low as 300'). As one of several proposed southwestern routes, "D" traverses Philmont Scout Ranch in northeastern New Mexico's Colfax County. Philmont, truly a national treasure, is the 137,000 acre backpacking and training facility of the Boy Scouts of America. I do not protest RBTI since it is a valuable program -- my only complaint, as a Scout leader, is with the proposed route over Philmont.

Several years ago, the USAF ceased its low altitude F-16/F-111 flights over the Ranch as a result of Philmont protests. RBTI's multiple daily flights (up to 16) will create much more severe problems:

a) Program: Philmont is a transient community of 25,000 people with over 3,000 campers in Philmont's back country every day in the summer. Daily, several hundred of them are engaged in spar pole climbing, rock climbing and rapelling, and horse back riding. The sudden roaring of jet engines will distract climbers and bolt horses thereby creating injuries (or worse).

b) Environmental: Appreciation and protection of the wilderness are key parts of Philmont's program. RBTI is inconsistent with wilderness preservation. RBTI will have a damaging effect upon both the unique western wildlife and Philmont herds of cattle, horses, burros, and buffalo. The effect of the unburned portion of jet fuel in the engine exhaust or dumped fuel itself, vaporizing and falling to ground level is as yet unknown, but believed to be anything but beneficial.

c) Safety: The environmental impact study done for the USAF is seriously flawed when it describes Philmont as an "uninhabited" grassland. The smaller portion of Philmont's acreage is prairie. Most of Philmont is mountainous with many peaks in the 10,000 to 12,444' range. Philmont has a tremendous fuel load of dead trees in its forests, and is in the midst of a long term drought. Open fire bans are in effect now. A crashing bomber will create an epic fire of Yellowstone proportions. B-1s and B-52s do not have enviable safety records. The nature of the flights (weaving around mountain peaks and facing violent weather, including frequent, low-level wind shears) dramatically increases the chance of a crash. Unfortunately, Philmont does not have a well-developed highway system for evacuations in case of massive forest fires.

For the above reasons, I seek your help in advocating the selection of a different RBTI route, preferably one that is over a more sparsely populated, less environmentally sensitive area.

There is too much at stake to allow RBTI to overfly Philmont. Please act now -- final route determination starts in June. Thank you for helping to see that alternative D is not selected.

Sincerely,

Barbara Gleason (Mrs.)

25 May 1999

Major Adams,

BR-6 I am writing to request your firm support in opposing the selection of Alternate D under the U.S. Air Force's proposed Realistic Bomber Training Initiative (RBTI). The Air Force is seeking to establish a new training route for low-level B-1 and B-52 bomber flights from bases in Texas and Louisiana. One of the proposed routes, Alternate D, traverses Philmont Scout Ranch in northeastern New Mexico's Colfax County.

Philmont is a 137,000-acre mountain backpacking and high adventure facility of the Boy Scouts of America. Each year, thousands of Scouts and their adult leaders from across the nation participate in two-week wilderness backpacking trips in the mountains of Philmont. Many of them also camp and work on conservation projects in the adjacent Valle Vidal Wilderness and Carson National Forest.

The Air Force's proposed Alternative D will establish a military training route directly over most of Philmont. More than 2600 flights each year, some as low as 300 feet above ground level, are proposed for the segment over Philmont.I have serious concerns about the impact of the Air Force's proposal on the health and safety of the scouts attending Philmont and the potential effects of daily low-level flights on the ranch itself. Also, consider the impact such flights would have on a "wilderness" experience.

On any given day in the summer, as many as 5,000 Scouts and Scouters will be hiking and camping in Philmont's back country. Each day, several hundred of them will be engaged in activities such as rock climbing and repelling , spar pole climbing, and mountain horseback rides. The sudden roar of jet engines has a high likelihood of distracting an inexperienced climber or causing a horse to bolt on a narrow mountain trail with resulting serious injury (or worse). Eventually, critical verbal directions from an instructor may not be received by a inexperienced individual with possible devastating results.

Appreciation and protection of the wilderness and our natural resources is a key part of the Philmont program. Scouts from around the world have a unique opportunity to see and experience wildlife in native habitat. Noise and emissions from low flying bombers cannot help but have a damaging effect on that wildlife, as well as on Philmont's herds of buffalo, horses, cattle and burros. The disruptive effects of noisy bomber overflights on Philmont,s famous living history programs, in which Scouts experience the lifestyles of the old West's mountain men, homesteaders, lumberers and cowboys, are obvious.

Most of Philmont is mountainous with peaks in the 10,000' to 12,000' range. Philmont has a tremendous fuel load of dead trees in its forests and is in the midst of a long term drought. Unburned Jet fuel finding its way to the ground or being dumped in an emergency over such terrain, with campers using backpacking stoves for cooking, creates the potential for a serious fire that would endanger hundreds of lives. The possibility of a crash, however remote, is simply not acceptable for the safety of these scouts.

For these reasons, I seek your help in advocating the selection of a different RBTI route than Alternate D. I ask that you express your opposition to Alternate D to the Secretary of the Air Force and other defense officials who may be involved in this decision. Please act now, as the public comment period ends in June and a final decision will be made later this year.

Philmont is the largest and most famous Scout camp in the world. It is a national resource that has positively impacted the lives of thousands of our nation's youth for more than sixty years. It deserves and demands our protection. Thank you for helping to see that Alternate D is not selected.

Sincerely,

Elizabeth A. Pitts

Dear Major Adams,

BR-6 I would like to request your support in opposing the selection of "Alternative D" under the USAF's proposed Realistic Bomber Training Initiative (RBTI) involving low flying B-52s and B-1s (as low as 300'). As one of several proposed southwestern routes, "D" traverses Philmont Scout Ranch in northeastern New Mexico's Colfax County. I backpacked through Philmont as a Boy Scout three different summers, and I loved the natural environment there so much that I applied for and served on the seasonal staff for three summers. I believe RBTI is very important but that it should not cross over Philmont Scout Ranch. As a former staff member I can personally testify that the distractions of low flying planes can and will cause a number of problems.

a) Program: Philmont is a transient community of 25,000 people with over 3,000 campers in Philmont's back country every day in the summer. Daily, several hundred of them are engaged in spar pole climbing, rock climbing and rapelling, and horse back riding. The sudden roaring of jet engines will distract climbers and bolt horses thereby creating injuries.

b) Environmental: Appreciation and protection of the wilderness are key parts of Philmont's program. RBTI is inconsistent with wilderness preservation. RBTI will have a damaging effect upon both the unique western wildlife and Philmont herds of cattle, horses, burros, and buffalo.

c) Safety: The environmental impact study done for the USAF is seriously flawed when it describes Philmont as an "uninhabited" grassland. The smaller portion of Philmont's acreage is prairie. Most of Philmont is mountainous with many peaks in the 10,000 to 12,444' range. Philmont has a tremendous fuel load of dead trees in its forests, and is in the midst of a long term drought. Open fire bans are in effect now. A crashing bomber will create an epic fire of Yellowstone proportions. B-1s and B-52s do not have enviable safety records. The nature of the flights (weaving around mountain peaks and facing violent weather, including frequent, low-level wind shears) dramatically increases the chance of a crash. Unfortunately, Philmont does not have a well-developed highway system for evacuations in case of massive forest fires.

For the above reasons, I seek your help in advocating the selection of a different RBTI route, preferably one that is over a more sparsely populated, less environmentally sensitive area.

There is too much at stake to allow RBTI to overfly Philmont. Please act now -- final route determination starts in June. Thank you for helping to see that alternative D is not selected.

Sincerely,

David Reasoner

Dear Major Adams:

I am opposed to the Air Force's proposed RBTI known as Lancer - Option B in the DEIS.

BR-4 I live in Borden County and have a small holding left to me and my daughters by their father when he died. Since the weather conditions have not been conducive to raising cattle for several years , I have been trying to develop our little spread for hunting. If we start to have the noise factor illustrated at the Snyder meeting, I will not be able to make a living by this means either. In addition to not being able to make a living, my quality of life, namely the peace and solitude we now enjoy, will no longer exist.

I am also concerned that my property values will drop leaving my children with even less opportunity to make a living off this land which has been in our family for four generations.

It bothers me considerably that no studies were actually made on any of the land in question concerning the issues in your DEIS. How can you make an educated decision without being aware of the real impact?

Rather than having a negative impact on the people of eight rural counties, can we not maintain the status quo and let the Air Force continue to train in the place and using the methods which have obviously been very successful in the past? As the old saying goes, "if it isn't broken, don't fix it".

Your attention to this matter is appreciated and I hope that you will not set the RBTI in the Lancer area.

Sincerely,

Pat J. Porter

BR-6 I am writing to request your firm support in opposing the selection of Alternative D under the U.S. Air Force's proposed Realistic Bomber Training Initiative (RBTI). The Air Force is seeking to establish a new training route for low-level B-1 and B-52 bomber flights from bases in Texas and Louisiana. One of the proposed routes, Alternative D, traverses Philmont Scout Ranch in northeastern New Mexico's Colfax County.

Philmont is a 137,000 acre mountain backpacking and high adventure facility of the Boy Scouts of America. Each year, thousands of Scouts and their adult leaders from across the nation participate in two-week wilderness backpacking trips in the mountains of Philmont. Many of them also camp and work on conservation projects in the adjacent Valle Vidal Wilderness of the Carson National Forest.

The Air Force's proposed Alternative D would establish a military training route directly over most of Philmont. More than 2,600 flights each year, some as low as 300 feet above ground level, are proposed for the segment over Philmont. As a Scouter, I have serious concerns about the impact of the Air Force's proposal on the health and safety of Scouts attending Philmont and the potential effects of daily low-level lights on the ranch itself.

On any given day in the summer, as many as 5,000 Scouts and Scouters will be hiking and camping in Philmont's back country. Each day, several hundred of them will be engaging in activities such as rock climbing and rappelling, spar pole climbing, and mountain horseback rides. The sudden roar of jet engines has a high likelihood of distracting an inexperienced climber or causing a horse to bolt on a narrow mountain trail with resulting serious injury (or worse).

Appreciation and protection of the wilderness and our natural resources is a key part of the Philmont program. Scouts from around the world have a unique opportunity to see and experience wildlife in native habitat. Noise and emissions from bombers cannot help but have a damaging effect of that wildlife, as well as on Philmont's herds of buffalo, horses, cattle, and burros. The disruptive effects of noisy bomber overflights on Philmont's famous living history programs, in which Scouts experience the lifestyles of the West's mountain men, homesteaders, lumberers, and cowboys, are obvious.

Most of Philmont is mountainous with many peaks in the 10,000 to 20,000 foot range. Philmont has a tremendous fuel load of dead trees and is in the midst of a long-term drought. Unburned jet fuel finding its way to the ground or being dumped in an emergency over such terrain, with campers using backpacking stoves for cooking, creates the potential for a serious fire that would endanger hundreds of lives. The possibility of a crash, however remote, is simply not acceptable for the safety of these Scouts.

For these reasons, I seek your help in advocating the selection of a different RBTI route. I ask that you express your opposition to Alternative D to the Secretary of the Air Force and other defense officials who may be involved in this decision. Please act now, as the public comment period ends in June and a final decision will be made this year.

Philmont is the largest and most famous Scout camp in the world. It is a national resource that has positively impacted the lives of hundreds of thousands of our nation's youth for more than sixty years. It deserves and demands our protection. Thank you for helping to see that Alternative D is not selected.

Sincerely,

James M. Emery

Dear Sir:

This correspondence is to let you know that I am very much against planes flying over, in or around Snyder and Scurry County, as I'm sure everyone against your plan. (Just hope they will all let you know by taking the time to write.) The people in this small town and surrounding territory never have anything great — in fact, were completely forgotten until something bad — such as your plan — comes along! I could go on and on — but won't.

Just take your plan to the cities and country-side around them.

Ann Lane

Dear Mr. Adams,

This letter is to express my disappointment in the Draft EIS concerning proposed airspace use for RBTI.

BR-4 The studies and data of economic damage to our area is deficient. Wildlife and outdoor nature watching is becoming a major supplement to our economic viability. - The impact of aircraft and noise generation was not addressed.

BI-1 Moreover, White tailed deer, one of our game animals was not even listed as a subject/resident of the area. I can assure you the white tails are here.

BR-1 As best I can read the technical discussion of noise generation - our area (rural and void of industrial development) was analyzed in comparison to an urban area. - This simply isn't a fair or equitable analysis.

Please do a complete credible study before proceeding.

Bobby McGough

Langley AFB, VA 23665 -2769

Dear Major Adams:

My wife has already written to you concerning our feelings about the proposed training of bombers in our area. As she stated, our quality of life will be greatly compromised if this comes about. We left the Houston area to be in a place where when I retire in a few years, we can enjoy our life and live in the peace and quiet of a small town, with small town ideals. Your proposal will not allow any Peace and Quiet, to say the very least, it will totally disrupt everything in this area from basic everyday living, to crops, cattle market, hunting, and water sports, just to mention a few.

BR-4 The bomber training proposal will also greatly effect property values which are already taking a nosedive due to the Oil Business, or lack of.

I think the Air Force should consider using Federal Lands which are uninhabited for their training manuevers and leave small towns of this area to continue in the lifestyle to which they are accustomed. Thank you.

Sincerely yours,

C.R. Tylich

Dear Major Adams:

BR-6 I am writing to request your firm support in opposing the selection of "Alternative D" under the USAF's proposed Realistic Bomber Training Initiative (RBTI) involving low flying B-52s and B-1s (as low as 300'). As one of several proposed southwestern routes, "D" traverses Philmont Scout Ranch in northeastern New Mexico's Colfax County. Philmont, truly a national treasure, is the 137,000 acre backpacking and training facility of the Boy Scouts of America. I do not protest RBTI since it is a valuable program -- my only complaint, as a Philmont alumnus, is with the proposed route over Philmont.

Several years ago, the USAF ceased its low altitude F-16/F-111 flights over the Ranch as a result of Philmont protests. RBTI's multiple daily flights (up to 16) will create much more severe problems:

a) Program: Philmont is a transient community of 25,000 people with over 3,000 campers in Philmont's backcountry every day in the summer. Daily, several hundred of them are engaged in spar pole climbing, rock climbing and rappelling, and horse back riding. The sudden roaring of jet engines will distract climbers and bolt horses thereby creating injuries (or worse).

b) Environmental: Appreciation and protection of the wilderness are key parts of Philmont's program. RBTI is inconsistent with wilderness preservation. RBTI will have a damaging effect upon both the unique western wildlife and Philmont herds of cattle, horses, burros, and buffalo. The effect of the unburned portion of jet fuel in the engine exhaust or dumped fuel itself, vaporizing and falling to ground level is as yet unknown, but believed to be anything but beneficial.

c) Safety: The environmental impact study done for the USAF is seriously flawed when it describes Philmont as an "uninhabited" grassland. The smaller portion of Philmont's acreage is prairie. Most of Philmont is mountainous with many peaks in the 10,000 to 12,444' range. Philmont has a tremendous fuel load of dead trees in its forests and is in the midst of a long term drought. Open fire bans are in effect now. A crashing bomber will create an epic fire of Yellowstone proportions. B-1s and B-52s do not have enviable safety records. The nature of the flights (weaving around mountain peaks and facing violent weather, including frequent, low-level wind shears) dramatically increases the chance of a crash. Unfortunately, Philmont does not have a well-developed highway system for evacuations in case of massive forest fires.

For the above reasons, I seek your help in advocating the selection of a different RBTI route, preferably one that is over a more sparsely populated, less environmentally sensitive area.

There is too much at stake to allow RBTI to overfly Philmont. Please act now -- final route determination starts in June. Thank you for helping to see that alternative D is not selected.

Sincerely,

David W. Liebmann

Maj Brent Adams
RBTI EIS Project Manager
HQ ACC/CEVPP
129 Andrews Street, Suite 102
Langley AFB, VA 23665-2769

Dear Maj Adams,

BR-6 I am writing to request your firm opposition to Alternative D under the Air Force's proposed Realistic Bomber Training Initiative (RBTI). In seeking new low level training routes for B-52s out of Barksdale AFB and B-1s out of Dyess AFB, one of the proposed routes, Alternate D, traverses Philmont Scout Ranch in northeast New Mexico's Colfax County.

Having been both a B-1 instructor pilot and a ranger at Philmont Scout Ranch, I am concerned that Alternative D would establish a military training route directly over most of this 137,000 acre Boy Scouts of America high adventure facility. More than most, I understand the difficulty in surveying routes for bomber low level training and I most certainly understand the need for realistic bomber training. However, I also recognize the unique location of Philmont and its contribution to the BSA's program for youth development. I have serious concerns about this route's impact on health and safety for those attending Philmont and I know first hand the noise hazard and potential effects of daily low level flights on the ranch itself. In my opinion, the convenience of a "backdoor" training route for Dyess and Barksdale does not outweigh the negative impact on Philmont's outdoor training program.

On any given day during the summer, as many as 5000 Scouts and Scouters will be hiking and camping in Philmont's backcountry. Their program contributes immensely to the BSA's aims—character development, citizenship building, and personal fitness—by teaching greater appreciation for serene outdoor places and learning to work together in a challenging wilderness environment. Low level flying over large portions of the ranch detracts from that wilderness experience and presents potential dangers to the Scouts. Sudden distractions to rock climbing and rappelling, spar pole climbing, and mountain horseback rides pose the risk of serious injury or worse.

Appreciation for and protection of the wilderness and our natural resources is a key part of the Philmont program. Even environmental groups, who are sometimes critical of the impact caused by untrained groups of Scouts in other places, have praised Philmont in publications like Backpacker magazine for its outstanding training program in minimum impact methods and wilderness appreciation. Noise and emissions from bombers cannot help but damage the wildlife and wilderness experience. The disruptive effects of low flying aircraft on Philmont's living history programs, in which Scouts experience the lifestyles of the west's mountain men, homesteaders, lumberers, and cowboys, are obvious.

Although I am fully aware of the remote chances of an accident, planning low level training directly over large groups of backcountry Scouts presents an unacceptable risk to safety, both in an impact area and in surrounding areas affected by potential forest fires. Hundreds, who can not easily be evacuated, are at risk.

For these reasons, I ask for your help in advocating a different low level training route for RBTI. Philmont is the largest and most famous Scout camp in the world. It is a national resource that has positively impacted hundreds of thousands of our nation's youth for over sixty years. It deserves and demands our protection. Thank you for helping to see that Alternative D is not selected.

Sincerely,

David E. Kugler, Maj, USAF

Dear Major Brent Adams,

BR-6 I am writing to request your firm support in opposing the selection of "Alternative D" under the USAF's proposed Realistic Bomber Training Initiative (RBTI) involving low flying B-52s and B-1s (as low as 300'). As one of several proposed southwestern routes, "D" traverses Philmont Scout Ranch in northeastern New Mexico's Colfax County. Philmont, truly a national treasure, is the 137,000 acre backpacking and training facility of the Boy Scouts of America. I do not protest RBTI since it is a valuable program -- my only complaint, as a Philmont alumnus, is with the proposed route over Philmont.

Several years ago, the USAF ceased its low altitude F-16/F-111 flights over the Ranch as a result of Philmont protests. RBTI's multiple daily flights (up to 16) will create much more severe problems:

a) Program: Philmont is a transient community of 25,000 people with over 3,000 campers in Philmont's back country every day in the summer. Daily, several hundred of them are engaged in spar pole climbing, rock climbing and rapelling, and horse back riding. The sudden roaring of jet engines will distract climbers and bolt horses thereby creating injuries (or worse).

b) Environmental: Appreciation and protection of the wilderness are key parts of Philmont's program. RBTI is inconsistent with wilderness preservation. RBTI will have a damaging effect upon both the unique western wildlife and Philmont herds of cattle, horses, burros, and buffalo. The effect of the unburned portion of jet fuel in the engine exhaust or dumped fuel itself, vaporizing and falling to ground level is as yet unknown, but believed to be anything but beneficial.

c) Safety: The environmental impact study done for the USAF is seriously flawed when it describes Philmont as an "uninhabited" grassland. The smaller portion of Philmont's acreage is prairie. Most of Philmont is mountainous with many peaks in the 10,000 to 12,444' range. Philmont has a tremendous fuel load of dead trees in its forests, and is in the midst of a long term drought. Open fire bans are in effect now. A crashing bomber will create an epic fire of Yellowstone proportions. B-1s and B-52s do not have enviable safety records. The nature of the flights (weaving around mountain peaks and facing violent weather, including frequent, low-level wind shears) dramatically increases the chance of a crash. Unfortunately, Philmont does not have a well-developed highway system for evacuations in case of massive forest fires.

For the above reasons, I seek your help in advocating the selection of a different RBTI route, preferably one that is over a more sparsely populated, less environmentally sensitive area. You, or a member of your staff may wish to liaise with Rep. Ed Pease's (Indiana) legislative assistant, Greg Good, who has additional information on RBTI.

There is too much at stake to allow RBTI to overfly Philmont. Please act now – final route determination starts in June. Thank you for helping to see that alternative D is not selected.

I've been to Philmont Scout Ranch 6 times – once as a scout and 5 times with my troop. Low level flights would certainly disturb the beauty of the wilderness — We have enough noise pollution in our cities and countryside as it is — Safety is also in jeopardy — Please consider other routes for these flights —

Thank you —
Dr Todd Petzel
Scoutmaster Troop 669
Arcadia Wisconsin —

Langley AFB, Va. 23665-2769

FROM: George E. Willis, D.Ed.
Clara L. Willis, Ph.D.

Alpine, Tx.

SUBJECT: Environmental Impact Statement (EIS), Draft Stage, of the Realistic Bomber Training Initiative

As residents of the Big Bend area of Texas, (Southern Brewster Co.), we feel that the Environmental Impact Statement (EIS), Draft Stage, of the Realistic Bomber Training Initiative (RBTI), is unjust and unfair.

BR-5 We believe that Low Level Realistic Combat Training Flights (LLRCTF's) below 5000 feet A.G.L. are detrimental to our human environment, and especially to our own personal stress levels. These low level flights should not be over Populated Private Property. It is our understanding that the Federal Government owns a tremendous amount of acreage that is not populated. This should be used.

Major Adams:

I want to add my objections to the proposed target practice in Fisher County Texas.

The report yesterdays of bombings in Albania that are not in the target area that sent the press scurrying out of that area adds to the reasons already being considered to not do the target practice in Fisher Co, TX.

Some of the other reasons: property (land) possible loss of life. Farmers and ranchers live on their land in the county. Surely there are areas much less populated – example is

PD-4 White Sands in New Mexico - the area used in the past by our government for similar testing.

Please give this matter careful consideration and look at the situation as if you lived there.

Sincerely,
Sallie Hughes

Dear Major Adams:

I am opposed to the Air Force's proposed RBTI known as Lancer – Option B in the DEIS. My concern(s) about the proposal and the DEIS are as follows:

BR-4 My family has ranched (cattle) in Borden County for four generations and as a rancher and private pilot myself, I am totally against the RBTI. My families livlihood is dependent upon the cattle we produce as well as income we derive from hunting leases. The fact of the matter is that this is our land we paid for and continue work on and Post is our town which we have paid taxes in and contributed to for four generations. The DEIS did not adequately study the impact noise will have on our community and area as a whole. What about the bomber from Dyess that caused damage in Lubbock 6-8 weeks ago?

Several years ago, the USAF ceased its low altitude F-16/F-111 flights over the Ranch as a result of Philmont protests. RBTI's multiple daily flights (up to 16) will create much more severe problems:

a) Program: Philmont is a transient community of 25,000 people with over 3,000 campers in Philmont's back country every day in the summer. Daily, several hundred of them are engaged in spar pole climbing, rock climbing and rapelling, and horse back riding. The sudden roaring of jet engines will distract climbers and bolt horses thereby creating injuries (or worse).

b) Environmental: Appreciation and protection of the wilderness are key parts of Philmont's program. RBTI is inconsistent with wilderness preservation. RBTI will have a damaging effect upon both the unique western wildlife and Philmont herds of cattle, horses, burros, and buffalo. The effect of the unburned portion of jet fuel in the engine exhaust or dumped fuel itself, vaporizing and falling to ground level is as yet unknown, but believed to be anything but beneficial.

c) Safety: The environmental impact study done for the USAF is seriously flawed when it describes Philmont as an "uninhabited" grassland. The smaller portion of Philmont's acreage is prairie. Most of Philmont is mountainous with many peaks in the 10,000 to 12,444' range. Philmont has a tremendous fuel load of dead trees in its forests, and is in the midst of a long term drought. Open fire bans are in effect now. A crashing bomber will create an epic fire of Yellowstone proportions. B-1s and B-52s do not have enviable safety records. The nature of the flights (weaving around mountain peaks and facing violent weather, including frequent, low-level wind shears) dramatically increases the chance of a crash. Unfortunately, Philmont does not have a well-developed highway system for evacuations in case of massive forest fires.

For the above reasons, I seek your help in advocating the selection of a different RBTI route, preferably one that is over a more sparsely populated, less environmentally sensitive area.

There is too much at stake to allow RBTI to overfly Philmont. Please act now -- final route determination starts in June. Thank you for helping to see that alternative D is not selected.

Sincerely,

James Katsaros
Eagan, MN

June 2, 1999

Major Adams,

I am contacting you regarding the Realistic Bomber Training Initiative (RBTI) proposed by the USAF and currently being considered in Washington Alternative D, the one that overflies the Philmont Scout Ranch in northern New Mexico is of personal interest to me. Having been involved in scouting my whole life, including several Philmont High Adventure Treks, I am totally against this proposal. This will truly intrude on the intent of the Philmont experience that was envisioned when Mr. Wade Phillips gave the property to the Boys Scouts of America many years ago. This area is as close to wilderness as one could expect and is a great place for the 18,000-20,000 annual Scouters to enjoy their 12 day trek, work as staff members, visit Villa Philmonte, or just relax in the many camping areas provided. I know for a fact that these young Scouts and their leaders go to Philmont for a unique and sometimes once-in-a-lifetime backpacking adventure. Being in a wilderness setting and having it intruded upon and disturbed by low level high performance aircraft is definitely not desired nor appreciated.

PD-4

I know both sides of this issue since I spent many years in the Strategic Air Command as a B-52 pilot/aircraft commander, but in this instance my interest in scouting and Philmont takes precedence. These low-level overflights are not necessary with today's high-tech aircraft. The avionics, offensive and defensive weapons systems, weapons delivery systems, flight simulators, aircrew training, etc. available to Air Combat Command is the best in the world and is quite sufficient to give combat aircrews the necessary tools and capability to accomplish the mission of today's Air Force. Low level weapons delivery is outdated, is a carryover from our "Cold War" nuclear counterstrike days, and not even needed or desired in a conventional warfare environment due to aircraft and crew vulnerability to high-tech mobile anti-aircraft missile systems. Additionally, these type flights have been proven to disturb various ecosystems and the associated wildlife inhabitants, including humans. One safety consideration that has probably been overlooked is the fact that many Philmont backpacking crews utilize pack mules during their trek. These animals are corralled at several locations throughout Philmont and are in constant use on rocky, mountainside trails. Thus, I would not want to be responsible for what could happen when a low flying B-52, B-1, F-15, or F-16 buzzes over these animals and Scouts on one of these trails. In conclusion, with all these factors thoroughly considered, it should be obvious that there is be no need for Uncle Sam or the Air Force to intrude upon the airspace above Philmont.

Please remove this alternative from consideration and leave Philmont alone. For over 60 years, thousands of Boy Scouts and family members, Scout leaders, Philmont staff personnel, and other volunteers have truly cherished their Philmont experiences and want this to continue to be available for many years to come and to remain undisturbed.

Sincerely,
A Concerned Citizen, Taxpayer, and Scout Leader

Dear Major Adams:

I am opposed to the Air Force's proposed RBTI known as Lancer – Option B in the DEIS. My concern(s) about the proposal and the DEIS are as follows:

TY

Using the air space of the farm land that has been in my family for 3 generations as a bombing training site is completely unacceptable to me!

In 1953 my husband and I took our family to Arizona where my husband worked in a copper mine to save our farming operation during a drought.

During the lifetime of my late husband our farm survived insects, hail, drought, windstorms, in addition to rising fuel costs and declining cotton prices, while not succumbing to corporation

OVER TO BACK

Sincerely yours: _____
(Signature)

Name: _____

Address: _____

City/Sate/Zip _____

000687

farming.

If the Air Force think they can devalue our livelihood, when we successfully fought the forces of nature and other obstacles for 3 generations, the Air Force completely underestimate their opponents.

Making West Texas farmers the "enemy" is unreasonable. The enemy is across the ocean.

Sincerely yours
Dean Pirtle

Major Brent Adams
RBTI EIS Project Manager
HQ ACC/CEVPP
129 Andrews Street, Suite 102
Langley AFB, VA 23655-2769

Dear Major Adams:

BR-6

I am writing to request your firm support in opposing the selection of Alternative D under the U.S. Air Force's proposed Realistic Bomber Training Initiative (RBTI). The Air Force is seeking to establish a new training route for low-level B-1 and B-52 bomber flights from bases in North Texas and Louisiana. One of the proposed routes, Alternative D, traverses Philmont Scout Ranch in northeastern New Mexico.

Philmont is a 137,000 acre mountain backpacking and high adventure facility of the Boy Scouts of America. Each year thousands of Scouts and their adult leaders from across the nation participate in two-week wilderness backpacking trips in the mountains of Philmont. Many of them also camp and work on conservation projects in the adjacent Valle Vidal wilderness of the Carson National Forest.

The Air Force's proposed Alternative D will establish a military training route directly over most of Philmont. More than 2600 flights each year, some as low as 300 feet above ground level. As a former Philmont staff member, I have serious concerns about the impact of the proposal on the health and safety of the Scouts attending the ranch and the potential effects of daily low-level flights on the ranch itself.

On any given day in the summer, as many as 5,000 Scouts and Scouters will be hiking and camping in the ranch's backcountry. Each day several hundred will be engaged in activities such as rock climbing and rapelling and mountain horseback rides. The sudden roar of jet engines has a high likelihood of distracting an inexperienced climber or causing a horse to bolt on a narrow mountain trail, resulting in serious injury.

Appreciation and protection of the wilderness and our natural resources is a key part of the Philmont program. Scouts from around the world have a unique opportunity to see and experience wildlife in native habitat. Noise and emissions from bombers will have a damaging effect on wildlife as well as Philmont's herds of buffalo, horses, cattle and burros. The disruptive effects of noisy flights on the living history programs is most obvious.

Philmont is the largest and most famous Scout camp in the world. The Philmont experience leaves an impression that lasts a lifetime, and deserves your attention. It is a national resource that has positively impacted the lives of hundreds of thousands of youths for more than sixty years.

I urge you to express your opposition to Alternative D to the Secretary of the Air Force and other officials who may be involved in this decision. Please act now, as the public comment period ends in June and a final decision will be made this year. You or a member of your staff may wish to contact Greg Dodd, Chief of Staff for Congressman Ed Pease of Indiana who can provide additional information.

Thank you for your attention.

Sincerely,

Marc R. Koble

Marc R. Koble

000688

TEN POINTS FOR OPPOSITION TO RBTI ALTERNATIVE D (OVER PHILMONT)

1. The EIS (Environmental Impact Statement) incorrectly concludes that very few population centers are affected. On any given day in the summer months, over 5,000 people will be living and camping directly under the flight path at Philmont.

2. Safety of horseback riders will be endangered. Philmont provides trail rides or pack trips for 7500 to 9500 mostly inexperienced riders each summer on steep and narrow mountain trails. As many as 165 inexperienced people may be on horseback on the ranch at various times during the day. The startle effect of a high-decibel low-level flight could easily cause one or more horses to spook and bolt with a novice rider aboard. With the number of flights proposed, it will be only a matter of time before Philmont experiences a serious injury or death due to a rider being thrown from or dragged by a startled horse.

3. Increased noise levels will interfere with staff trying to provide safety instruction to rock climbers, spar pole climbers, and rifle range shooters. The noise level of a B-52 at 300 feet is 117 decibels. Staff trying to teach safety techniques required in climbing rock faces or firing black powder rifles should not have to compete with such noise interference.

4. The high noise levels generated by B-1 and B-52 bombers flying only a few hundred feet above ground level are greater than being near a chain saw or a diesel train. Campers at Philmont will be exposed to such noise levels for more than six hours during a typical 12-day stay based on projected flight operations. This is not a true wilderness experience.

5. The possibility of a crash is very real. The EIS estimates the chances of a "Class A mishap" at one every 15 years for a B-1 on the training route that would include Philmont. Aside from the real risk to Scouts who might be in the path of an errant bomber, a crash on Philmont would have the potential of starting a serious forest fire that could devastate the ranch.

6. The EIS fails to mention any impact of flyovers on Philmont's two National Historic sites, The Kit Carson/Maxwell Abreu houses at Rayado and the Villa Philmonte.

7. The flights can be expected to have serious impacts on Philmont's wildlife and will overfly the habitats of at least three endangered species, the bald eagle, peregrine falcon, and Mexican spotted owl. The U.S. Fish and Wildlife Service has concluded that overflights at less than 1,000 feet will significantly impact these species.

8. No one has investigated the cumulative effects of the planned noise levels and vibrations on the hundreds of abandoned and the two active mines on Philmont.

9. No plane burns all of its fuel. At higher altitudes, unburned fuel dissipates in the atmosphere. At lower altitudes, one must expect that some unburned fuel will find its way to the ground and streams on Philmont. The effects of a plane in trouble at low altitude dumping fuel over Philmont with numerous cook stoves and campfires are easily imagined.

10. Philmont is a national treasure and provides a wilderness camping experience for thousands of Scouts, America's future leaders, every year. That experience should be preserved since alternative training sites exist which do not jeopardize the program experience offered by Philmont and the safety of thousands of young people participating in it each year.

RE: RBTI ALTERNATIVE D, IR-153, Mt. Dora MOA in Northeastern and Northcentral New Mexico

Dear Major Adams,

As a new Taos resident, a Philmont advocate and a concerned citizen, I have great trepidation regarding the bomber training flights over the Taos region.

As an introduction, there is a plaque at Philmont that reads, "John Long built this house". John Long was my grandfather. He built many exceptional places, among them the Nelson Adkins Museum of Fine Arts in Kansas City and the Phillips estate in Tulsa. My father, Marshall Long is the President of International Lift Slab Corporation. The Air Force Academy was built using lift slab by TexStar Construction of San Antonio. My brother, Marshall Long Jr. (an Eagle Scout) is an acoustician and is currently writing the textbook for acoustics. I am Catherine Long, an architect currently in Houston with the firm who has designed and built the Randalls and Tom Thumb stores in Texas. My nephew, Jamie Long (an Eagle Scout) spent his first summer at Philmont last year. It was not only inspiring but also emotional for him. He was able to come home with a rubbing of the plaque of his great grandfather's words.

In speaking with my brother regarding the bomber training I have a better understanding of the devastating effects that this will have on Philmont and the surrounding areas.

Attachment 1 the first paragraph of page **4-81** of the **Draft EIS** states that **"flight operations would not be expected to preclude existing land uses or preempt…. recreational uses, threaten public health and safety, or be inconsistent with applicable regulations".**

In **4-46-G-4 (Appendix)** the noise level of a B-52 at 300 ft. is 117 dB. The maximum allowable dB level for the workplace according to OSHA is 110 dB for 30 minutes with ample recovery time.

115 dB or above is not allowed at any time.

AO-51 This would definitely preclude existing land use and preempt recreational use. Legally the government would have to close Philmont.

000689

AO-51 If OSHA deems 115dB hazardous, how can this not be threatening to health and safety?

How can this be consistent with applicable regulations? OSHA standards apply to all employees.

BI-3 G-13 states that local residents will get used to the overflights. Would this also include animals? Animals could react violently to the extremely high noise levels. It is unclear that there is acclimation to all noise. For people and animals to acclimate it temporarily effects their hearing acuity. Recovery time is important, but there continues to be short term hearing loss just after a noise, which could preclude someone from hearing "watch out for that rock."

AO-52 How can this not be a threat to public safety?

Marshall explained to me that 117 dB will "rattle your teeth and shake houses". The change in dB level from 300 to 1200 ft. is 12 dB (a drop of 60 dB per double the distance) making a 117 dB at 300 ft., 105 dB at 1200 ft. Buildings may be structurally

CU-1 affected by the continued abuse this will generate. High noise levels such as sonic booms (which might be associated with these flights) are focused more when a plane is turning. The building on the inside of the turn has greater sound energy focused on it which he explained could apply more stress.

How can this not be a threat to public safety?

Snow will be greatly affected. Ski resorts use small caliber cannons to start controlled avalanches at controlled hours. A gun, an errant skier or even the clap of ones hands can

AO-27 set off an avalanche. The onset of aircraft-generated-sound could set off avalanches at any time, anywhere.

This could have serious safety and legal ramifications for the ski resorts in New Mexico leading potentially to their closure.

Would this not preclude the existing land use, preempt recreational uses, or threaten public safety?

AF-23 How much money has the Air Force set aside for defense and compensation of lawsuits, which are going to occur when these training flights start?

One child killed at Philmont being thrown from a horse or panicking when hanging on a shear rock-face could cost the government millions of dollars, in addition to the loss of life.

One skier killed in an avalanche could have the same effect.

The government could be exposed to lawsuits. Employers might sue the government because they are opening up themselves to suits from their employees. Employers would

000689

be legally obligated to close their businesses or face OSHA citations, penalties or investigations.

These could be in the billions of dollars which could be saved by simulating these missions as Major John Boyle of Dyess Air Force Base previously stated they were doing, but would like to improve; "Right now we are flying to Utah and Nevada to train," Boyle told the Chronicle. " We could save money, improve training and make better use of air time by bringing training closer to Texas and Louisiana. We could practice simulated missions in real time. It would be more realistic."

So, real time and more realistically there will be a crash. It has happened before and it will happen again. The government is the most likely the loser financially, but we the citizens will lose loved ones. What is most important?

Sincerely,

Catherine Long

Dear Major Adams:

BR-6 I am writing to request your firm support in opposing the selection of "Alternative D" under the USAF's proposed Realistic Bomber Training Initiative (RBTI) involving low flying B-52s and B-1s (as low as 300'). As one of several proposed southwestern routes, "D" traverses Philmont Scout Ranch in northeastern New Mexico's Colfax County. Philmont, truly a national treasure, is the 137,000-acre backpacking and training facility of the Boy Scouts of America. I do not protest RBTI since it is a valuable program -- my only complaint, as a Philmont alumnus, is with the proposed route over Philmont.

Several years ago, the USAF ceased its low altitude F-16/F-111 flights over the Ranch as a result of Philmont protests. RBTI's multiple daily flights (up to 16) will create much more severe problems:

a) Program: Philmont is a transient community of 25,000 people with over 3,000 campers in Philmont's backcountry every day in the summer. Daily, several hundred of them are engaged in spar pole climbing, rock climbing and rappelling, and horse back riding. The sudden roaring of jet engines will distract climbers and bolt horses thereby creating injuries (or worse).

b) Environmental: Appreciation and protection of the wilderness are key parts of Philmont's program. RBTI is inconsistent with wilderness preservation. RBTI will have a damaging effect upon both the unique western wildlife and Philmont herds of cattle, horses, burros, and buffalo. The effect of the unburned portion of jet fuel in the engine exhaust or dumped fuel itself, vaporizing and falling to ground level is as yet unknown, but believed to be anything but beneficial.

L.L.Bert Hofer, Jr., P.C.

000690

c) Safety: The environmental impact study done for the USAF is seriously flawed when it describes Philmont as an "uninhabited" grassland. The smaller portion of Philmont's acreage is prairie. Most of Philmont is mountainous with many peaks in the 10,000 to 12,444' range. Philmont has a tremendous fuel load of dead trees in its forests, and is in the midst of a long term drought. Open fire bans are in effect now. A crashing bomber will create an epic fire of Yellowstone proportions. B-1s and B-52s do not have enviable safety records. The nature of the flights (weaving around mountain peaks and facing violent weather, including frequent, low-level wind shears) dramatically increases the chance of a crash. Unfortunately, Philmont does not have a well-developed highway system for evacuations in case of massive forest fires.

For the above reasons, I seek your help in advocating the selection of a different RBTI route, preferably one that is over a more sparsely populated, less environmentally sensitive area.

There is too much at stake to allow RBTI to overfly Philmont. Please act now – final route determination starts in June. Thank you for helping to see that alternative D is not selected.

Very truly yours,

L.L. Bert Hofer, Jr.

Langley AFT, VA 23665-2769

Dear Major Adams,

BR-6 I am writing to request your firm support in opposing the selection of Alternative D under the U.S. Air Force's proposed Realistic Bomber Training Initiative (RBTI). The Air Force is seeking to establish a new training route for low-level B-1 and B-52 bomber flights from bases in Texas and Louisiana. One of the proposed, Alternative D, traverses Philmont Scout Ranch in northeastern New Mexico's Colfax County.

Philmont is a 137,000-acre mountain backpacking and high adventure facility of the Boy Scouts of America. Each year, thousands of Scouts and their adult leaders from across the nation participate in two-week wilderness backpacking trips in the mountains of Philmont. Many of them also camp and work on conservation projects the adjacent Valle Vidal Wilderness of the Carson National Forest.

The Air Force's proposed Alternative D will establish a military training route directly over most of Philmont. More than 2600 flights each year, some as low as 300 feet above ground level, are proposed for the segment over Philmont. As a former Philmont staff member, I have serious concerns about the impact of the Air Force's proposal on the health and safety of Scouts attending Philmont and the potential effects of daily low-level flights on the ranch itself.

On any given day in the summer, as many as 5,000 Scouts and Scouters will be hiking and camping in Philmont's backcountry. Every day, several hundred of them will be engaged in activities such as rock climbing and rappelling, spar pole climbing and mountain horse back rides. The sudden roar of jet engines has a high likelihood of distracting an experienced climber or causing a horse to bolt on a narrow mountain trail with results serious injury (or worse).

Appreciation and protection of the wilderness and our natural resources is a key part of the Philmont program. Scouts from around the world have a unique opportunity to see and experience wildlife in native habitat. Noise and emissions from bombers cannot help but have a damaging effect on that wildlife, as well as on Philmont's herds of buffalo, horses, cattle and burros. The disruptive effects of noisy bomber overflights on Philmont's famous living history program, in which Scouts experience the lifestyles of the West's mountain men, homesteaders, lumberers and cowboys, are obvious.

000691

Most of Philmont is mountainous with many peaks in the 10,000' to 12,000' range. Philmont has a tremendous fuel load of dead trees in its forests and is in the midst of a long-term drought. Unburned jet fuel finding its way to the ground or being dumped in an emergency over such terrain, with campers using backpacking stoves for cooking, creates the potential for serious fire that would endanger hundreds of lives. The possibility of a crash, however remote, is simply not acceptable for the safety of these Scouts.

For these reasons, I seek your help in advocating the selection of a different RBTI route. I ask that you express your opposition to Alternative D to the Secretary of the Air Force and other defense officials who may be involved in this decision. Please act now, as the public comment period ends in June and a final decision will be made this year. You or a member of your staff may wish to contact Greg Dodd, Chief of Staff for Congressman Ed Pease of Indiana, who can provide additional information.

Philmont is the largest and most famous Scout camp in the world. It is a national resource that has positively impacted the lives of hundreds of thousands of our nation's youth for more than sixty years. It deserves and demands our protection. Thank you for helping to see that Alternative D is not selected.

Langley AFB, VA 23665-2769

Dear Sir:

I am a Senior Citizen and I am also now a resident of Scurry County, just outside of Snyder, Texas. I understand that the Air Force proposes to have a training run for Bombers in our area. I think this is truly a gross error on the part of the Air Force officials in charge. I moved to Snyder 2 years ago to stay with my youngest daughter because she and her husband live in a nice home 2 miles out of town and it is a peaceful, beautiful place. We can see 50 miles in any direction as her house sits on top of a hill. If your pilots use this flight pattern, our peaceful, quiet place will cease to exist. I don't have too many years left on this earth but I hope to spend them in a place where planes don't fly over us four or five times a day and fly so low they will probably knock everything off the wall. The noise will be unbearable and my little dog will likely go crazy as will I. AO-12

I think there must be other places you could consider to fly your planes particularly in areas which are uninhabited and already owned by the government. We, as taxpayers, have to tolerate a lot of what I consider unnecessary stress just because someone in our Government has made a mistake. Kindly leave us to the peace and quiet of small town living as was intended and take your Bombers elsewhere!!!!!! PD-4

Sincerely,

LaVienna Bodry

STOP THE BOMBERS!

HEPA NEWS

June 1999

Your Comment Letters Urgently Needed. Write the Air Force Today!

While the Air Force is continuing in their preparation of the Final Environmental Impact Statement, we need to let them know our concerns. Congressman Stenholm's office has advised us that the Air Force has not been receiving many letters with negative comments on the DEIS. The Air Force is apparently counting these letters and intends to use the low number of comments as evidence that not many people are opposed to the Realistic Bomber Training Initiative (RBTI).

With over 400 people at the public hearing, they couldn't help but notice us. But we need to continue to show our concern by writing letters to the Air Force listing specific concerns that we have with the proposed bomber training site in our eight county area.

Please take a few moments to write a letter to the Air Force expressing your concern. Be specific in your concern.

Some examples include:

1. The effect on your property values and the fact that this has not been adequately addressed in the DEIS.
2. The effect the bomber training will have on your ranching or farming operations and the fact that the DEIS did not provide for any actual study of this impact on your operations or any one else's in the area. No one ever visited the area for the study!
3. The fact that the DEIS did not adequately study the impact that noise will have on our community. Over 2,000 flights at 3,000' or less are currently planned annually,with more on the way. They have said this will not have a noticeable noise impact.
4. Hunting is big business in this area. Yet the DEIS made no attempt to quantify the impact this would have on our economy -- see the recent Texas Wildlife article.

These are just a few examples. You can use these or write your own, but make sure that you include your name and address and sign the letter. Even if you have already sent a letter – send another. Husband and wives should each send one.

ALL LETTERS SHOULD BE MAILED NO LATER THAN JUNE 9th TO ENSURE THAT THEY ARRIVE IN TIME.

Mail letters to:
Major Brent Adams
RBTI EIS Project Mgr.
HQ ACC/CEVP
129 Andrews St., Suite 102
Langley AFB, VA 23665-2769

If you prefer you can use the form letter included with this mailing.

HEPA FACTS

- *H.E.P.A., Inc. is a non-profit corporation and all donations are tax deductible.*
- *Nearly 1,000 people have signed up with HEPA to oppose the Air Force*
- *HEPA depends on contributions of money and time from people throughout the community. Please help!*
- *HEPA is a patriotic organization. We support the military and are grateful for their dedication and effort.*
- *If we do not stop the Air Force now our land will become one of the prime bomber training sites in the country. We suspect that in the future the Air Force will significantly increase the activity over the levels proposed in the DEIS!*

Congressman Larry Combest Opposes RBTI

On April 14, 1999, about one week after the Snyder Hearing, Congressman Combest issued a press release opposing the RBTI. While Combest does not represent any of our eight counties, it is still a very positive development and may influence other politicians in the area to go on record against the RBTI. In his press release, Combest said, "While I understand the Air Force's need for these training missions and requirements, I think they should be realistic in their flying patterns. The Air Force currently enjoys the use a substantial portion of the military airspace in West Texas that can be used for training purposes, and I am concerned that this additional use of airspace will create an unnecessary burden and greater hardship on the already strained landowners in this area." THANK YOU

HEPA NEWS 000694 *STOP THE BOMBERS!*

The EIS Process and the Public Hearings

The Air Force is required under the National Environmental Protection Act (NEPA) to release an Environmental Impact Statements (EIS) on their proposal for the establishment of the Realistic Bomber Training Initiative (RBTI). *Are you beginning to see that the acronyms alone are part of the confusion?*

Prior to issuing the EIS, they must issue a Draft Environmental Impact Statement (DEIS) and conduct public hearings on the DEIS. The public hearings took place in April. For all of our eight county area they held one hearing in Snyder. Through the commitment of the citizens in the area, HEPA notified thousands of people about the hearing, and over 400 attended. To accomplish this hundreds of phone calls were made, 24 newspaper ads were placed, and over 50 radio spots were played. The Air Force, who actually has the responsibility for notifying the public of the hearings ran one newspaper ad in the Snyder paper.

The next step is for the Air Force to gather all of the comments regarding the DEIS and publish the final EIS. We have been informed by the Air Force that this will occur in the fall of 1999. After that they will make their decision on the best alternative and proceed to establish their bombing training ground.

It is interesting to note that the Air Force anticipated only a small group of people to come to the hearing – initially they rented the lunch room at the high school for the meeting. It was only after HEPA protested that the meeting was changed to the larger auditorium.

While there was a good turnout at the Snyder Public Hearing, we need to keep pushing.

TELL YOUR ELECTED OFFICIAL WHAT YOU THINK!

Take a minute and call your congressman, let them know that you are concerned about the RBTI and the process that the Air Force is using.

Stenholm

Combest

Thornberry

GARZA County Lines Up Solidly Against RBTI

HEPA has just received two greatly appreciated resolutions from political bodies in Garza County. The first is a unanimous resolution of the Garza County Commissioners Court, signed by Garza County Judge Giles W. Dalby as well as Commissioners Lee Norman, John Valdez, Mason McClellan and Mike Sanchez. The second is a unanimous resolution of the Post Independent School District, signed by President Alexa Collier, Members Mark W. Kirkpatrick, Jeff S. Lott, Diana Looney, Barbara Hardin, Vice President Rex Cash, Secretary Mark Short and Superintendent Dr. Bobby Bain. Please take every opportunity to thank all of these people for their support.

HEPA Retains Pros – Attorney and Noise Expert

It's hard to know what to do sometimes. In a matter as serious as losing the rights to our land, it is necessary to get the advice of the experts.

To assist in the fight against the Air Force regarding the RBTI over our land, HEPA has retained attorney Frank Bond as counsel. Frank knows about ranching — he is from Santa Fe and comes from a ranching family. He also knows about property rights and fighting the Air Force. Because of this combination of skills and background, he seemed like a natural to help us. Frank has been advising us on legal matters and procedural issues.

Another area we are greatly concerned about is noise. This is something that the Air Force has assumed will have little impact on our lives, however we believe will significantly change our way of life. To help us understand this impact, we have hired noise expert Dr. Bill Weida. Bill is a retired Air Force pilot, former instructor at the Air Force Academy and currently professor at The Colorado College.

JUNE 2, 1999

NO BOMBERS IN TAOS COUNTY, NM, PLEASE !!!

TY

For several winters, I lived in Tucson, Arizona, near the airport and airbase. The bombers flew directly over my house. I wondered if one would ever fall out of the sky into my neighborhood.

The noise from these monsters was intolerable. Conversations had to stop, because you couldn't hear each other. Windows rattled, and occassionally knick knacks fell to the floor + broke. My ears would hurt so bad, I had to cover them.

Sometimes they flew before daybreak. I bolted upright in bed, scared to death. I was told they would never fly before 8 a.m.

The noise pollution created a very low quality of life. When I got pregnant with my first child, I left that part of town, because that is not a very wholesome environment for children to grow up in.

Why did they fly over town, when there was a huge expanse of desert surrounding us? Why ruin our

000695

quality of life when there is an alternative?

I've spent many summers in Taos, and now live here year-round. My two kids breathe clean air and wake up to the sounds of the birds and the irrigation ditch flowing.

We live on a dead end street with breathtaking views of the Sangre de Cristo mountains, specifically the sacred Taos Mountain of Taos Pueblo. The quality of life here is extraordinary and NO ONE can tell me that the bombers won't change that. I try to imagine those noisy, smoky aircraft flying right outside my window and wrecking the views. And the air. And I am sickened.

I can see a ring of black smoke (SMOG) around the mountains never to disappear. Kind of like the perpetual smog cloud hanging over large cities, including Tucson. Taos would never be the same.

Why ruin the quality of life here, when there is an alternative somewhere else? nan fischer

NAN FISCHER

Thankyou.

Snyder, TX.

Heritage-Environmental Preservation Society
"H.E.P.A."

Dear Sir,

TY I've written you twice before on this same situation.

The main concerns is the preservation and protection of life style of this area; economics, environmental and health to all our residents.

The air force is still trying to use our 8 counties (I live in Scurry County) — Scurry, Borden, Dawson, Fisher Garza Kent and Stonewall counties.

Please don't let the Deis of the airforce destroy our land and, their crashes, our children.

2. The DEIS should not be allowed to use our peaceful area for training, that includes Low level flight training By B-1 and B-52 bombers.

Our peace, with our cattle & horses, with our children should be worth some thing. Yes, they have to train some where, but please leave us peaceful people alone.

Maybe the AirForce thinks we people don't care what they do.

But we do care, very much, and there is so Little We can do, to let you know that yes - We do care very much. and have tried very hard, to show We do care. I don't know if you Folks even listen - but yes - we do care to try to show, that we don't want to be used.

Sincerely,

000696 Luella N. Bales

Low Level Realistic Combat Training Flights -

TY The U.S. Military will use the routes established over us. All air traffic. This means using us for target practice.

The U.S. Marine Air Corps in Italy proved the Nature of Low Level Realistic Combat Training Flights several years ago. Two jets were practicing amongst a ski-lift system. Hot-dogging below the cable, one pilot severed the cable, plunging the ski-lift Gondola with 19 innocent young people to their immediate deaths.

The Military Court judgement was above all ethics of Human decency. They pronounce the U.S. Marine pilot <u>not guilty</u> of causing their deaths.

So we can understand that we are to be subjected to hot-dogging by not only B1 Bombers, but all aircraft using the Low Level Realistic Combat Training Flight Routes. Any disasters, NOT GUILTY.

000697 2

The Noise, pollution and disruption of peace and quiet are secondary in light of the U.S. Military's attitude - NOT GUILTY. which means not responsible.

The Pentagon and the U.S. President have usurped the U.S. Constitution. We live subjected to Laws, which if enacted, render us immediately to a Military Dictatorship. We are so now, without the visual enforcement. All pretense to care about us, is visibly recognized. We have an Attorney General whose national policy is execution for all who are deemed enemies of this Military Policy. It all fits into one Mentality. The New World Order.

I oppose expanding air Traffic over us for any reason. Just as I oppose the Military verdict for no responsibility for the deaths of 19 European young people. Senseless! Our world has become proliferated with insane Government policies, no longer with the safety of it's citizens. The U.S. Military is the Leader of this.

000697 3

We really have no say whatsoever on this issue Low Level Realistic Combat Training Flight Routes. We can voice our opinions and put ourselves at risk to be place on U.S. Military Enemies Lists. Enemies of policies of a system of Men that rule by Force. No different from Communism, Facism or any other system which has placed the elite above the rest of humanity. This is a FACT.

I do not bear Arms against any government system. I bear Truth, and so long as Truth exists, I believe in The U.S. Constitution above every National policy established without The populations consent.

Our Founding Fathers sought to end Imperialism Rulership, and this is why the United States of America came to Be. Our own U.S. Government in every respect is Now engaging in the Modern version of this ancient system of Force. Low Level Realistic Combat Training is one more aspect of preparing to kill us, within this aspect of Military Imperialism.

1) 6-2-99

Hi MAJOR, 000698

TY DON'T THROW THIS LETTER IN THE AGAINST pile, BECAUSE I AM FOR THE TRAINING FLIGHT PROPOSAL THE AIR FORCE WOULD LIKE TO CONDUCT HERE WHERE I LIVE IN SOURRY COUNTY TEXAS.

MY WIFE AND I HAVE BECOME SOMEWHAT IRRITATED AT THE NEGATIVE ~~opinions~~ OPINIONS OF A FEW OF OUR NEIGHBORS PRINTED IN THE LOCAL NEWSPAPER. I HOPE YOU DON'T FEEL THESE FOLKS SPEAK FOR EVERYONE. WHEN WE FIRST READ ABOUT THE AIR FORCE PROPOSAL, MY WIFE AND I WERE VERY EXITED ABOUT THE IDEA. WE WOULD ENJOY SEEING THOSE PLANES FLY OVER HERD AND I KNOW OUR GRANDKIDS WOULD

2) CERTAINLY ENJOY IT. 000698

I WOULD LIKE TO TELL YOU A LITTLE STORY, IF I MAY BEND YOUR EAR A LITTLE LONGER.

IN 1975 MYSELF AND MY WIFE AND TWO KIDS GOT TIRED OF THE BIG CITY LIFE ON THE EAST COAST, PACKED UP AND MOVED OUT WEST TO ARIZONA AND LIVED IN TENTS IN THE MIDDLE OF A 160,000 ACRE CATTLE RANCH IN APACHE COUNTY WE WERE DEFINATELY IN THE TULIPS. LAND AND SKY WAS ALL YOU WOULD SEE FOR MILES, NO TREES, JUST ROLLING SAGE GRASS. WEEKS GO BY WITHOUT SEEING ANOTHER PERSON, 27 MILES FROM THE CLOSEST BLACK TOP ROAD. ONE DAY I WAS WALKING AROUND, GOING NOWHERE, FEELING FREE AS A BIRD, WHEN SUDDENLY OUT OF I DON'T KNOW WHERE

3) 000698

CAME THIS AWESOME GIGANTIC FLYING MACHINE RIGHT OVER MY HEAD. I WAS AWE STRUCK MOUTH DROPPED OPEN, HEART POUNDING IN MY CHEST. WHAT A MAGNIFICENT SIGHT AND I NEVER HEARD IT COMING, THIS HUGE BLACK MASS IN THE SKY SEEMED TO BE 200' OVER MY HEAD AND BLOCKED OUT MOST OF MY VISION OF THE SKY AND FLOATED BY VERY SLOWLY AND QUIETLY. I EVENTUALLY COLLECTED MYSELF AND REALIZED IT WAS A B-52, PAINTED BLACK. TILL THIS DAY, SOME 20 YEARS LATER I REMEMBER THAT EXPERIENCE VERY CLEARLY, WHAT A JOY.

I HAVE EXPERIENCED MANY DIFFERENT CIRCUMSTANCES IN AND AROUND AIRCRAFT BEFORE

4) WHEN I WAS AN AIRMAN STATIONED IN THE WAR ZONE DURING THE VIETNAM WAR IN THE 60'S, BUT THIS ONE IN ARIZONA I DON'T WANT TO FORGET.

GOOD LUCK
SINCERELY YOURS
TONY MURPHY
SNYDER TX.

Langley AFB, VA 23665-2769

Dear Major Adams:

I am opposed to the Air Force's proposed RBTI known as Lancer – Option B in the DEIS. My concern(s) about the proposal and the DEIS are as follows:

BR-4 First, deer and quail hunting is a cash crop. Low-flying planes and a 24-hr. guard on our ranch will ruin these leases. We have been in a 4-yr. drought and barely surviving. Now, the USAF wants to ruin this cash crop training planes for Germany. Who invited Germany?

Second, please let us deal with natural disasters such as drought without any added burdens.

Sincerely yours: Sue Branch

May 25, 1999

Dear Major Adams:

BR-6 I am writing to protest against the proposed low level bomber fly over in Colfax County New Mexico, specifically over Philmont Scout Ranch. As a past staff member I had the opportunity to work in Scouting Paradise, for three seasons. I prefer the area without low-level flights of military planes. I had the sad experience to be caught in a canyon once when a fighter plane flew over at about tree top level. It was extremely loud uncomfortable and annoying. I saw the plan first, then felt the wind blast before I heard the roar of the jet engine. I must say it was totally obnoxious and ruined and otherwise fine day. Scouts come from around the world to take part in a unique wilderness setting searching for High Adventure. I currently work near an airport and if I want to be regularly annoyed I will stay home. Instead I choose to go to Philmont. I urge you to please re-consider the low level flights over Philmont. This is totally unnecessary and unwanted.

I have several specific concerns related to this project which I would like to point out. 60% of Philmont is mountainous terrain not grassland and at anyone time up to 5000 people can be using the Ranch. The noise levels created from 300 feet are enough to damage human hearing. The low-level flights create a hazard to the horse riding programs for inexperienced riders. The impact will also be severe on wildlife that live in the wilderness setting. If a plane were to crash it could have sever forest fire impacts to the ranch due the dryness of the area. And crashes are likely due to sudden thunderstorms, low altitude flights with short reaction times. There is a danger from noise vibration on historic buildings and the mineshafts that are used in the program.

The need for well-trained aircrews cannot be denied, however several years ago the airforce discontinued it's low-level operations of F-11's and F-16's because the area is inappropriate. Philmont is a truly unique wilderness setting worth preserving, please therefore oppose the RBTI Alternative D as being inappropriate over Philmont due to major program, safety and land management problems.

Sincerely

Joseph P. Gallagher

Langley AFB, VA 23665-2769

Dear Major Adams:

I am opposed to the Air Force's proposed RBTI known as Lancer – Option B in the DEIS. My concern(s) about the proposal and the DEIS are as follows:

I worked for the Federal Government in Washington and lived in the Villa Nay section of Fairfax County. I returned in 1973 and in 1976, moved back to Texas – settling in Abilene. In 1978, I moved to Stoneware County because of my land holdings and my like of living in a rural area. The military flights in this area have caused some trouble for my farm and ranch operations. On March 30 1999, five low flying helicopters, roaring like a train, flew over. One just low over my barn scaring a pregnancy heifer which I had in the lot. The increase in military flights and type of aircraft

BR-4 will greatly increase the noise level and disruption in our ability to continue our farm and ranch operations. Because of this I am opposed to Lancer. If you think that it won't make much noise, put it over Abilene.

Sincerely yours: Charles V. Peach

June 2, 1999

Dear Major Adams,

BR-6 I am writing to request your firm support in opposing the selection of Alternative D under the U.S. Air Force's proposed Realistic Bomber Training Initiative (RBTI). The Air Force is seeking to establish a new training route for low-level B-1 and B-52 bomber flights from bases in Texas and Louisiana. One of the proposes routes, Alternative D, traverses Philmont Scout Ranch in northeastern New Mexico's Colfax County.

Philmont is a 137,000-acre mountain backpacking and high adventure facility of the Boy Scouts of America. Each year, thousands of Scouts and their adult leaders from across the nation participate in two-week wilderness backpacking trips in the mountains of Philmont. Many of them also camp and work on conservation projects in the adjacent Valle Vidal Wilderness of the Carson National Forest.

The Air Force's proposed Alternative D will establish a military training route directly over most of Philmont. More than 2600 flights each year, some as low as 300 feet above ground level, are proposed for the segment over Philmont. As a former Philmont staff member, I have serious concerns about the impact of the Air Force's proposal on the health and safety of Scouts attending Philmont and the potential effects of daily low-level flights on the ranch itself.

On any given day in the summer, as many as 5,000 Scouts and Scouters will be hiking and camping in Philmont's backcountry. Each day, several hundred of them will be engaged in activities such as rock climbing and rapelling, spar pole climbing, and mountain horseback rides. The sudden roar of jet engines has a high likelihood of distracting an inexperienced climber or causing a horse to bolt on a narrow mountain trail with resulting serious injury (or worse).

Appreciation and protection of the wilderness and our natural resources is a key part of the Philmont program. Scouts from around the world have a unique opportunity to see and experience wildlife in native habitat. Noise and emissions from bombers cannot help but have a damaging effect on that wildlife, as well as on Philmont's herds of buffalo, horses, cattle and burros. The disruptive effects of noisy bomber overflights on Philmont's famous living history programs, in which Scouts experience the lifestyles of the West's mountain men, homesteaders, lumbermen and cowboys, are obvious.

Most of Philmont is mountainous with many peaks in the 10,000' to 12,000' range. Philmont has a tremendous fuel load of dead trees in its forests and is in the midst of a long-term drought. Unburned jet fuel finding its way to the ground or being dumped in an emergency over such terrain, with campers using backpacking stoves for cooking, creates the potential for a serious fire that would endanger hundreds of lives. The possibility of a crash, however remote, is simply not acceptable for the safety of these Scouts.

Philmont is the largest and most famous Scout camp in the world. It is a national resource that has positively impacted the lives of hundreds of thousands of our nation's youth for more than sixty years. It deserves and demands our protection. Thank you for helping to see that Alternative D is not selected..

Sincerely,

John C. Brainerd

Dear Major Adams:

TY I strongly oppose the Realistic Bomber Training Initiative Proposal-D (Northern New Mexico Route).

Sincerely,
Teresa L Burt
Teresa L Burt
Postmaster
Eagle Nest NM

Dear Major Brent Adams, 000709

BR-6 I am writing to request your firm support in opposing the selection of "Alternative D" under the USAF's proposed Realistic Bomber Training Initiative (RBTI) involving low flying B-52s and B-1s (as low as 300'). As one of several proposed southwestern routes, "D" traverses Philmont Scout Ranch in northeastern New Mexico's Colfax County. Philmont, truly a national treasure, is the 137,000 acre backpacking and training facility of the Boy Scouts of America. I do not protest RBTI since it is a valuable program -- my only complaint, as a Philmont alumnus, is with the proposed route over Philmont.

Several years ago, the USAF ceased its low altitude F-16/F-111 flights over the Ranch as a result of Philmont protests. RBTI's multiple daily flights (up to 16) will create much more severe problems:

a) Program: Philmont is a transient community of 25,000 people with over 3,000 campers in Philmont's back country every day in the summer. Daily, several hundred of them are engaged in spar pole climbing, rock climbing and rapelling, and horse back riding. The sudden roaring of jet engines will distract climbers and bolt horses thereby creating injuries (or worse).

b) Environmental: Appreciation and protection of the wilderness are key parts of Philmont's program. RBTI is inconsistent with wilderness preservation. RBTI will have a damaging effect upon both the unique western wildlife and Philmont herds of cattle, horses, burros, and buffalo. The effect of the unburned portion of jet fuel in the engine exhaust or dumped fuel itself, vaporizing and falling to ground level is as yet unknown, but believed to be anything but beneficial.

c) Safety: The environmental impact study done for the USAF is seriously flawed when it describes Philmont as an "uninhabited" grassland. The smaller portion of Philmont's acreage is prairie. Most of Philmont is mountainous with many peaks in the 10,000 to 12,444' range. Philmont has a tremendous fuel load of dead trees in its forests, and is in the midst of a long term drought. Open fire bans are in effect now. A crashing bomber will create an epic fire of Yellowstone proportions. B-1s and B-52s do not have enviable safety records. The nature of the flights (weaving around mountain peaks and facing violent weather, including frequent, low-level wind shears) dramatically increases the chance of a crash. Unfortunately, Philmont does not have a well-developed highway system for evacuations in case of massive forest fires.

For the above reasons, I seek your help in advocating the selection of a different RBTI route, preferably one that is over a more sparsely populated, less environmentally sensitive area. You, or a member of your staff may wish to liaise with Rep. Ed Pease's (Indiana) legislative assistant, Greg Good, who has additional information on RBTI.

There is too much at stake to allow RBTI to overfly Philmont. Please act now -- final route determination starts in June. Thank you for helping to see that alternative D is not selected.

Dear Major Adams:

I am President of J. S. Criswell Land & Cattle Co. which owns 17,500 acres in Fisher and Scurry Counties, Texas.

I am opposed to the Air Force's proposed RBTI known as Lancer-Option B in the DEIS. My concerns about the proposal and the DEIS are as follows:

BR-3 1. I believe the noise will have a negative effect on the people, livestock, and wildlife in that area. It is my understanding a study of the impact in this regard was never done by DEIS.

BR-4 2. I also believe it will lower the value of the land as well as affect the economy in that area.

Sincerely yours,

Kathleen C. Gregory

Dear Major Adams:

I am opposed to the Air Force's proposed RBTI known as Lancer - Option B in the DEIS.

I am engaged in raising cattle in Western Stonewall County, and I live in Aspermont. I have been visiting with my neighbors and the people from my church, and we are most concerned about the noise and disruption of our lives that would be caused by the flyovers. My family has raised cattle for several generations, and it is difficult enough to make a living in today's farm economy without additional problems caused by reduction in calf production and lower weaning weights due to stress on our cattle.

BR-3

One reason we live in this rural area is because we like to live in an area where we have peace and quiet. We appreciate the rural lifestyle, and enjoy looking at coyotes, and deer, and even at the wild hogs. We are concerned about the effect on the bird population - the quail, dove, turkey, and roadrunners. This country is is a delicate balance and if you disrupt one part of Mother Nature it affects the other parts. We already have lost most of our bees because of some imbalance, and the economic effect on the cotton industry is expected to be significant.

BI-4

I strongly object to extending the flight area. Please contact me if you have any questions.

Sincerely,

Dorothy Dickerson

from David English

Questa, NM

I am 100% against the RBTI that would use air space over Northern New Mexico.

First, it is not logical or scientific to pursue conservation and restoration and preservation of wilderness or wildlife and then fly the most destructive and dangerous devices that man has created over these areas of life, training to do missions of the highest possible difficulty.

Second, all the forms of life in these areas exist out of the ability to endure the most extreme conditions and carve out a small niche. Threatened and endangered species are all over the place compared to the rest of our nation. Fragile stream and river environs, that are the only source of water for life from Colorado on down into Mexico, could be wiped out for ever as we know it to be, with just one careless, accidental, or stupid stunt. We have already witnessed these occurrences here in Taos County, as well in other parts of the world.

Third, the RBTI would hurt every aspect of why and how I live here. Areas that appeal to me and my clients are directly under these flight patterns. No one is going to build their home under a training route for low flying plans. Low impact and stress levels would be reversed, changing a healing beautiful space into a toxic and deadly playground or kill zone, as the military might call it. The traffic of military aircraft has already increased in the last twenty years to an unacceptable level here and it should not be increased further. The noise from all flights lasts much longer than the few moments when the craft is directly overhead. There is currently very little time that is silent from these intrusions. As the noise fades the toxic exhaust settles down on the area or mixes with other pollutants in the atmosphere to create another problem. The area is used currently for these same missions and should not continue.

AO-53

Three strikes, you're out, NO RBTI

Mesquite Grove Ranch

Snyder, Texas

May 31, 1999

Major Brent Adams
RBTI EIS Project Manager
HQ ACC/CEVP
129 Andrews Street, Suite 102
Langley AFB, VA 23665-2769

Dear Major Adams:

It is appropriate that these comments be made on this day, Memorial Day, 1999. In our family cemetery here on the ranch, American flags fly today over three graves; graves of men of our family who have served in the armed forces; one from World War I, and two from World War II. I support a strong military for the protection of the United States. It is important that the men and women of our armed forces be well trained and prepared both physically and mentally to defend the United States against a variety of opponents.

Our ranch, located in Kent County, Texas has been in our family for 100 years, this year. Our son represents the fifth generation to live on the ranch. As he clearly stated at the hearings in Snyder, Texas, he hopes that after college he will be able to return to the and make his home here.

With that as a background let me clearly state that I am opposed to the use of private lands for the Realistic Bomber Training Initiative. Most especially I am opposed to the Lancer MOA because of the effect it will have on my home and my community.

Why am I and other landowners so opposed to this RBTI over our lands? Do you want B-1's and B-52's and their escorts flying practice bombing runs over your home at low altitudes? I don't.

Now that we have had time to review the Draft Environmental Impact Statement (DEIS) we find numerous discrepancies and omissions. In fact I am more concerned about what was not addressed in the DEIS than what was covered in it.

GE-24 To my knowledge, no one from the Air Force or the group drafting the DEIS ever visited our land or any of the land in our area. No research was done to determine the potential effects of the RBTI in the area.

000713

BR-1 The first area of concern is that of noise. The DEIS did not study the impact that noise from multiple bombing runs will have in our communities. The studies used in the DEIS were done in very large cities where the noise level is already high. The DEIS states that the flights will not have a noticeable impact. This is incorrect. From inside our home, with the air conditioner running, we can hear the B-1's from Dyess AFB at very high altitudes. What are they going to sound like at the proposed low altitudes? You are well aware that it will be extremely noisy, especially in contrast to the low noise levels in the country.

BR-3 Ok, so the flights will be noisy, so what? Noise and the stress that it will cause will have multiple negative impacts on people, livestock, and wildlife. Animals, both domestic and wildlife, will be subjected to the startling effect of sharp increase in noise levels as the bombers and their escorts fly overhead. Weight gains, reproduction, antler growth, and many other areas of production will be negatively affected. Can you imagine what a startled, scared herd of cattle can do to a fence?

The stress of the continual noise will also affect humans. Most major airports located in populus areas have instituted noise abatement procedures for arriving and departing aircraft. The reason is to reduce the stress on people caused by the high noise levels produced by jet aircraft. This is done even in areas where the noise level in the city is already escalated. The contrast of noise levels in the rural areas will be unbearable.

BR-4 Currently, the only profitable enterprise in agriculture in our area is recreation. Recreation has kept land prices stable and in some cases even caused a slight increase. We have hunters that visit our ranch each winter from New York, New Jersey, North Carolina, Mississippi, Connecticut, Louisiana, Minnesota, California, New Mexico and even Texas. Why do they come all the way to West Texas? Their stated reason is to hunt, but there are lots of deer in their home states. They come to relax, get away from the hustle and bustle and noise of city life. They come for peace and quiet, for the experience. Will they keep coming if they have to deal with Air Force bombers flying directly overhead? Absolutely not! Many of our hunters have read about the proposed RBTI and are concerned. They do not want to contend with the bombers and will go somewhere else. Landowners will and local communities will loose much-needed revenue if the hunters do not return. Hunters spend lots of money for food, housing, supplies, fuel, etc.

How will this loss of recreation revenue affect land values? They will surely decrease. Both landowners and local governments that rely on property values for their tax base will be badly hurt.

This year in Kent County, our local schools and county government suffered a major loss in property values. We took a double hit this year. The past three years have been years of drought. Rainfall in 1998 was about 20% of normal expected amounts. Additionally, the oil and gas industry hit bottom with oil prices dipping to the $8 per barrel range. All things considered our tax base dropped a whopping 58% this year. This was on the heals of a 30% drop in 1997. We cannot fiscally stand the additional reductions in property value that will be caused by the RBTI.

I serve on the local school board, the county tax appraisal district board, and on the soil and water

000713

conservation board. We have contacted officials from other counties and school districts in the area covered by the proposed Lancer MOA. Not one of these community leaders has been able to provide us with an advantage to our area that will be a result of the RBTI. All the jobs and the benefits will go to Abilene and Taylor County, Texas while we out in the country will have to deal with all the disadvantages. According to the Air Force spokesmen, Abilene will get the gold mine and the rural areas will get the shaft.

Again I request that the RBTI not be conducted over private lands. The United States government already owns sufficient land over which the RBTI could be flown without disturbing the people, livestock and wildlife on privately owned lands. Thank you for your consideration.

Sinicerely,

Buddy B Baldridge
President

ROBY, TEXAS

DEAR SIR,

TY OUR LOCAL NEWSPAPER IS ENCOURAGING CITIZENS IN OUR AREA TO CONTACT YOUR AGENCY REGARDING THE REALISTIC BOMBER TRAINING INITIATIVE AND IT'S PROPOSED IMPACT ON OUR AREA. PLEASE WEIGH MY COMMENTS AMONG ALL THE OTHERS.

I KEEP ASKING MYSELF WHAT MAY BE SIMPLE QUESTIONS TO MANY, BUT I WOULD LIKE SOMEONE FROM YOUR AGENCY TO ANSWER IF AT ALL POSSIBLE.

1) WHICH CREATES MORE OF A NUISANCE, A JET BOMBER AT 3,0000 FT. OR AGRICULTURE AIRCRAFT SPRAYING NOXIOUS CHEMICALS AT 4 FT. AND LESS THAN FIFTY YARDS FROM MY BACK DOOR?

2) IF THE RANCHERS ARE SO OPPOSED TO LOW FLYING AIRCRAFT, WHY DIDN'T THEY WAVE THE FORESTRY PLANES OFF THAT WERE PUTTING FIRE RETARDANTS ON THEIR FLAMING ACRES? OR DROPPING FEED TO LIVESTOCK THAT ARE STRANDED IN BAD WEATHER?

3) IF BOMBERS FLYING AT 3,000 FT. BOTHER LIVESTOCK WITH ALL OF THE NOISE, HOW ABOUT THE NOISE OF SMALLER PLANES LESS THAN 72 INCHES FROM THE GROUND NEAR RESIDENCES?

4) WOULD ANY AMERICAN CITIZEN FEEL MORE COMFORTABLE HAVING TRAINED PILOTS FROM HOSTILE COUNTRIES FLYING AT ANY ALTITUDE OVER THEIR PROPERTY?

000714

5) IF AN AMERICAN PLANE DID HAPPEN TO CRASH ON THEIR PROPERTY, HOW MUCH MORE WOULD THEY STAND TO GAIN IN DAMAGE PAYMENTS THAN MONEY GAMBLED ON LIVESTOCK MARKETS?

6) HOW MUCH WOULD THE REGION LOSE IN CASH FLOW IF THE AREA BASES CLOSED DOWN AND MOVED TO AREAS WHERE TRAINING COULD BE DONE CLOSER TO THE NEW BASES?

MAJOR ADAMS, I HAVE TO ADMIT, I DON'T LIKE NOISE ANY MORE THAN THE NEXT PERSON. I JUST FEEL THAT I WOULD RATHER HAVE AMERICAN PILOTS, WELL TRAINED FROM FLYING OVERHEAD, THAN ENEMY PILOTS INTENTIONALLY DROPPING ORDINANCE ON MY HEAD. I SEE A SIGNIFICANT DIFFERENCE BETWEEN OCCASIONAL SONIC BOOMS AND LETHAL WEAPONS EXPLODING IN MY NEIGHBORHOOD.

THANK YOU FOR YOU TIME.

DENNIS KIKER

Major Brent Adams
RBTI EIS Project Mgr.
HQ ACC/CEVP
129 Andrews St., Suite 102
Langley AFB, VA 23665-2769

Dear Major Adams:

My husband and I are opposed to the Air Force's proposed RBTI known as Lancer-Option B in the DEIS. My concerns about the proposal and the DEIS are as follows:

1. The noise level the bombers are definately going to cause will significantly change our way of life. We moved to Snyder (Scurry County) from Houston to escape the noise and hassel of living in the big city. We were in Houston for 30 years and it finally got to be too much. Our home there was in one of the direct paths of Hobby Airport when the passenger jets flew over. Even though they were at a considerablely higher altitude than the proposed bomber runs, the noise was a real nuisance. We chose this area because of the "lack of" an airport of any size, and the peace and quite of country living.

2. I brought my invalid, elderly Mother out here to live with us, telling her that she could spend her last days in the "peace and quiet" of the country as we live 2 miles out of town and our neighbors are not right on top of us. I do not think she will be very happy to find that the Air Force intends to eliminate any thought of PEACE AND QUIET!

BR-4 3. Further, I have no doubt that property values, which by the way are already suffering because of loss of much of the oil business, will hit bottom. No one will ever want to purchase a home or ranch that has bombers flying over it four or five times a day scaring people to death. This really will put the city of Snyder under stress because as people move out, tax money is lost, etc. etc. etc.

000715

4. Of course, there is always the consideration of animals in an area where they are used to quiet being scared out of their wits when these bombers fly over them. The farms and ranches of this area depend on hunting to supplement their incomes and of course, they can kiss that extra income good-bye. Many of our Ranchers are fourth and fifth generation people, as are the Farmers, and I don't think they should have to worry about bombers flying over their property scaring their animals to death, and possibly causing injuries to Ranch hands, family, or children that might be riding horses when these planes go over. I do not think your people have given enough consideration to the noise study of the area because out here noise carries a VERY LONG WAY.....

BR-4

BR-3

PD-7 5. I'm sure if the Air Force would just look around on some of the Government Land that is unoccupied it could find a suitable alternative to train bombers than disrupting the lives of the small towns listed in your training run. Our lives are precious short as it is, and we hope you will reconsider and go ELSEWHERE with your bomber training.

6. I really think if you listened to the people who were at your last meeting you would realize that even though everyone in Snyder was not there, Snyder was represented by MANY PEOPLE who feel as I do and do not want their present type of lifestyle interrupted by PLANES AND NOISE!

Those are MY CONCERNS and I certainly hope the Air Force will take all aspects of this area's problems into making the decision concerning whether or not these bombers will make training runs over OUR PROPERTY AND CITIES.....CHANGING OUR WAY OF LIFE FOREVER.....

Sincerely yours,

Nita Tylich

Major Brent Adams
RBTI EIS Prj. Mgr.
HQ ACC/CEVPP
129 Andrews Street, Ste 102
Langley AFB, VA 23665-2769

Dear Sir:

BR-6 I am writing to request your firm support in opposing the selection of "Alternative D" under the USAF's proposed Realistic Bomber Training Initiative (RBTI) involving low flying B-52s and B-1s (as low as 300'). As one of several proposed southwestern routes, "D" traverses Philmont Scout Ranch in northeastern New Mexico's Colfax County. Philmont, truly a national treasure, is the 137,000 acre backpacking and training facility of the Boy Scouts of America. I do not protest RBTI since it is a valuable program -- my only complaint, as a Philmont alumnus, as the son of a woman who proudly served as a 1stLt in the USAF in New Mexico during the 1960s, and as an Eagle Scout, is with the proposed route over Philmont.

Several years ago, the USAF ceased its low altitude F-16/F-111 flights over the Ranch as a result of Philmont protests. RBTI's multiple daily flights (up to 16) will create much more severe problems:

a) Program: Philmont is a transient community of 25,000 people with over 3,000 campers in Philmont's back country every day in the summer. Daily, several hundred of them are engaged in spar pole climbing, rock climbing and rapelling, and horse back riding. The sudden roaring of jet engines will distract climbers and bolt horses thereby creating injuries (or worse).

b) Environmental: Appreciation and protection of the wilderness are key parts of Philmont's program. RBTI is inconsistent with wilderness preservation. RBTI will have a damaging effect upon both the unique western wildlife and Philmont herds of cattle, horses, burros, and buffalo. The effect of the unburned portion of jet fuel in the engine exhaust or dumped fuel itself, vaporizing and falling to ground level is as yet unknown, but believed to be anything but beneficial.

c) Safety: The environmental impact study done for the USAF is seriously flawed when it describes Philmont as an "uninhabited" grassland. The smaller portion of Philmont's acreage is prairie. Most of Philmont is mountainous with many peaks in the 10,000 to 12,444' range. Philmont has a tremendous fuel load of dead trees in its forests, and is in the midst of a long term drought. Open fire bans are in effect now. A crashing bomber will create an epic fire of Yellowstone proportions. B-1s and B-52s do not have enviable safety records. The nature of the flights (weaving around mountain peaks and facing violent weather, including frequent, low-level wind shears) dramatically increases the chance of a crash. Unfortunately, Philmont does not have a well-developed highway system for evacuations in case of massive forest fires.

000716

For the above reasons, I seek your help in advocating the selection of a different RBTI route, preferably one that is over a more sparsely populated, less environmentally sensitive area.

There is too much at stake to allow RBTI to overfly Philmont. Please act now -- final route determination starts in June. Thank you for helping to see that alternative D is not selected.

Sincerely yours,

James W. Mann

06/04/99

BRENT ADAMS,

000717

TY AS PHILMONT SCOUT RANCH CONTINUES TO GROW IN POPULARITY AS A MAJOR WILDERNESS EXPERIENCE FOR THE YOUTH OF TODAY, THE PARTICIPANTS EXPECT JUST THAT. IF THE ALTERNATIVE D FLIGHT PLAN GOES THROUGH, 20,000 SCOUTS AND [redacted] 350 STAFF MEMBERS WILL BE BUZZED BY LOW LEVEL BOMBERS APPROXIMATELY 10 TIMES A DAY.

IN MY MIND, THE CLOUDS AT PHILMONT ARE THE MOST ESTHETICALLY PLEASING PART. THEY VARY IN SHAPE AND SIZE ALMOST HOURLY. WHEN APPRECIATING THESE CLOUDS, I DO NOT WANT TO SEE A LARGE METAL MONSTROSITY SOARING INTO THE WILD BLUE YONDER, AND INTO MY PHILMONT EXPERIENCE, FOREVER.

ERIC WHITE

MOSCOW, ID

000717

NO BOMBERS OVER PHILMONT!

Dear Major Brent Adams, 000718

TY It has come to my attention that the U.S. Air Force is considering using the airspace over Philmont Scout Ranch for bomber training missions. Each summer thousands of Boy Scout come to Philmont for a unique wilderness experience. In the Air Force's opinion, the training missions would have no impact on the campers experience. This is incorrect. Campers out hiking or horseback riding will have their solitude ruined by low level bombing runs. Please, consider the other sites in Texas for your training missions. I urge you to not ruin the beauty and grandure of this ranch.

Sincerely,

Todd Burton

Philmont Conservationist

000722

To whom it may Concern:

We are most concerned about the proposed RBTI for our area — We are opposed, & believe its known as Lancer-Option B

PD-4 We feel there are other areas to test these planes. Our cattle – wildlife + people are all affected by this type training + we as

BR-4 farm + ranch people dont want it - Hunting in our area has really picked up momentum these past few years + is another means of income for many of our friends.

Dont tell us the noise will not bother - or have little impact on our homes — hog wash! Where have you been when the planes made your windows shake + conversation be quited until they pass over.

I made the meeting in Snyder, Texas where more than 400 or so people met in objection to the proposal. Please hear our voices!

Thanks
Patsy + Harold Sanders
O'Donnell, Tx.

HQ ACC/CEVPP
129 Andrews St., Ste. 102
Langley AFB VA 23665-2769

Dear Major Adams,

BR-6 I have just become aware of a proposed change in route of the Air Force's Realistic Bomber Training Initiative (RBTI). The change would take the route over the Boy Scouts of America's Philmont Scout Ranch. I must ask you to consider an alternative route.

I have four (4) sons and three have been to the Philmont Scout Ranch several times. My husband has been on the trails once and plans on going again in the year 2000. I can not tell you in words how much that ranch means to my family and others who have hiked it, have had sons hike it or have sons who have worked there. There is very little land left in the United States that has been so untouched/reclaimed by "Western Civilization". The first year one of my sons went was just two (2) months after his father had died. Letting him go to Philmont that summer was one of the hardest things I have ever done. It turned out to be a defining time in his life. He came back sure of who he was and what he wanted to do with his life.

All four of my sons and my husband are Eagle Scouts.

Several years ago, the USAF ceased its low altitude F-16/F-111 flights over the Ranch as a result of Philmont protests. Why would you even think of trying this again? RBTI's multiple daily flights (up to 16) will create much more severe problems:

1) Program: Philmont is a transient community of 25,000 people with over 3,000 campers in Philmont's back country every day in the summer. Daily, several hundred of them are engaged in spar pole climbing, rock climbing, and rapelling, and horse back riding. The sudden roaring of jet engines will distract climbers and bolt horses thereby crating injuries (or worse).

Continued...

000724

2) Environment: Appreciation and protection of the wilderness are key parts of Philmont's program. RBTI is inconsistent with wilderness preservation. RBTI will have a damaging effect upon both the unique western wildlife and Philmont herds of cattle, horses, burros, and buffalo. The effect of the unburned portion of jet fuel in the engine exhaust or dumped fuel itself, vaporizing and falling to ground level is as yet unknown, but believed to be anything but beneficial.

3) Safety: The environmental impact study done for the USAF is seriously flawed when it describes Philmont as an "uninhabited" grassland. The smaller portion of Philmont's acreage is prairie. Most of Philmont is mountainous with many peaks in the 10,000 to 12,444' range. Philmont has a tremendous fuel load of dead trees in its forests, and is in the midst of a long term drought. Open fire bans are in effect now. A crashing bomber will create an epic fire of Yellowstone proportions. B-1s and B-52s do not have enviable safety records. The nature of the flights (weaving around mountain peaks and facing violent weather, including frequent, low-level wind shears) dramatically increases the chance of a crash. Unfortunately, Philmont does not have a well-developed highway system for evacuations in case of massive forest fires.

For the above reasons, I seek your help in advocating the selection of a different RBTI route, preferably one that is over a more sparsely populated, less environmentally sensitive area. There is too much at stake to allow RBTI to overfly Philmont.

Thank you for your time.

Mrs. Debra S. Sickmiller

6/4/99

Major Brent Adams,

000725

Dear Sir,

BR-6 It has come to my attention that the United States Air Force is currently discussing plans to begin Realistic Bomber Training Initiative in Northern New Mexico, including Philmont Scout Ranch.

As I sit on a secluded ridge top here at Philmont I am wondering how much damage to our program, safety, and general wilderness experience will occur if this program is implemented. Many of America's Future leaders will learn their skills here at Philmont. R.B.T.I. will disrupt their experience here an average of 6 hours per participant. The safety of the Novice horse riders will also be compromised. Solitude is a gift Philmont offers everyday, however w/ the R.B.T.I. this solitude is dissolved. I believe in America. My brother currently serves w/ the Navy Special Forces, he also was a participant at Philmont. I thank the good Lord everyday that men like him are serving to protect the freedom that can be clearly felt here at Philmont. However part of that freedom is the wilderness experience that can only be felt in complete isolation. Isolation which I am feeling right now on top of this ridge, isolation which can still be saved if another route is chosen. Thank you for your time.

Major Brent Adams
RBTI EIS Prj. Mgr.
HQ ACC / CEVPP
129 Andrews Street, Ste. 102
Langley, AFB, VA 23665-2769

Dear Major Adams:

BR-6 I am writing to express my opposition to the selection of "Alternative D" under the USAF's proposed Realistic Bomber Training Initiative (RBTI) involving low flying B-52s and B-1s (as low as 300'). As one of several proposed southwestern routes, "D" traverses Philmont Scout Ranch in northeastern New Mexico's Colfax County. Philmont, truly a national treasure, is the 137,000 acre backpacking and training facility of the Boy Scouts of America. I do not protest RBTI since it is a valuable program -- my only complaint, as a Philmont alumnus, is with the proposed route over Philmont.

Several years ago, the USAF ceased its low altitude F-16/F-111 flights over the Ranch as a result of Philmont protests. RBTI's multiple daily flights (up to 16) will create much more severe problems:

a) Program: Philmont is a transient community of 25,000 people with over 3,000 campers in Philmont's back country every day in the summer. Daily, several hundred of them are engaged in spar pole climbing, rock climbing and rapelling, and horse back riding. The sudden roaring of jet engines will distract climbers and bolt horses thereby creating injuries (or worse).

b) Environmental: Appreciation and protection of the wilderness are key parts of Philmont's program. RBTI is inconsistent with wilderness preservation. RBTI will have a damaging effect upon both the unique western wildlife and Philmont herds of cattle, horses, burros, and buffalo. The effect of the unburned portion of jet fuel in the engine exhaust or dumped fuel itself, vaporizing and falling to ground level is as yet unknown, but believed to be anything but beneficial.

000726

c) Safety: The environmental impact study done for the USAF is seriously flawed when it describes Philmont as an "uninhabited" grassland. The smaller portion of Philmont's acreage is prairie. Most of Philmont is mountainous with many peaks in the 10,000 to 12,444' range. Philmont has a tremendous fuel load of dead trees in its forests, and is in the midst of a long term drought. Open fire bans are in effect now. A crashing bomber will create an epic fire of Yellowstone proportions. B-1s and B-52s do not have enviable safety records. The nature of the flights (weaving around mountain peaks and facing violent weather, including frequent, low-level wind shears) dramatically increases the chance of a crash. Unfortunately, Philmont does not have a well-developed highway system for evacuations in case of massive forest fires.

For the above reasons, I urge the Air Force to consider the selection of a different RBTI route, preferably one that is over a more sparsely populated, less environmentally sensitive area. Thank you for your consideration.

Sincerely,

Andrew Fulkerson

RE: Realistic Bomber Training Initiative------Alternative D

Dear Major Adams:

We attended the April hearings held in Taos on this proposal and appreciate the efforts your staff made to answer questions as well as to provide us with a copy of the Draft Environmental Impact Statement.

We do not understand the conclusions reached in this Environmental Impact Statement (EIS) especially those reached in the Socioeconomic/Environmental Justice and Cultural Resources sections. This EIS is deficient since it failed to fully acknowledge and assess the impact of these flights on the economic welfare of Northern New Mexico.

The impact on socioeconomics, environment and cultural resources are fundamentally interconnected to the overall economy of Northern New Mexico. This is a remote area of extreme beauty and history none of which is clearly addressed in the EIS. These attributes have made tourism the prime economic engine drawing people from all over the world who enjoy the majesty of our mountains and high deserts, dark night skies, an abundance of wildlife and the peacefulness of the area. The peace and silence of Northern New Mexico are part of what makes this area unique and enhances peoples enjoyment of it.

This is an area of ancient dwellings and ways. As members of the Archaeologist Society, we know that the discussions under 4.5.5, page 131-132 do not convey the wealth of pre-historic and historic sites in this area nor their significance to this land. New sites are discovered yearly. Many significant sites are not recorded on the National Register of Listed Cultural Resources so it is not a realistic indicator.

We have personally experienced the shattering impact of these low flying missions while hiking in the area east of Tierra Amarilla and Chama. There is no way that Appendix G: Noise of the EIS accurately portrayed in human, psychological terms what we experienced. All of the scientific jargon may be technically correct but the section fails to state the impact in terms that describe what Northern New Mexico will experience several times each day and night if Alternative D is adopted. Appendix G: Noise, page G-9 refers to the Federal Committee on Urban Noise guidelines used to evaluate noise impact issues. Those appear to address *urban* noise levels but to be relevant in Northern New Mexico, *rural* guidelines are appropriate. After all, people remain and tourists come here for the quiet of a very rural area and to escape the din of urban life.

AO-54

The EIS failed to correlate the impact of Alternative D to this picture. It failed to calculate how many dollars would be lost to the local economy once the tourist dollar no longer comes into Northern New Mexico if Alternative D were to be selected. The EIS erroneously states that there will be "No

BR-4

000727

disproportionate impacts to minority and low-income populations." Northern New Mexico already experiences a unemployment and percentage of population living below the poverty line many times higher than the national level. If our biggest industry were destroyed by Alternative D, these numbers would skyrocket. Finally, the adverse impact of these loss in jobs as well as the destruction of traditional land and sky features will hit a population that is clearly made up of minorities (many with low incomes). After all, this is an area where national minorities are the majority. The fact these issues were ignored but the economic advantages of new tracking sites was documented (Appendix I) is a serious over-sight resulting in misleading, erroneous conclusions.

We also feel that the EIS does not clearly describe the causes of the current situation. Two factors that are ignored have to do with prior budgeting decisions made by Congress and the Air Force. The first is the failure to increase pilot pay so that staff is retained and the concerns about flight times to existing air space for training is mitigated. The second is that base closures over the years did not consider the impact these closures would have on providing adequate training spaces resulting in the loss of a significant amount of air space suitable for training such as this.

PD-21

It is our opinion that making another error to correct the failure to consider the impact of prior base closures does not make sense. It especially does not make sense to select Alternative D when the EIS has failed to consider so many issues. We believe we need a well trained air force but we do not believe the plans for Alternative D have been carefully considered.

We urge you to recommend rejection of Alternative D.

Yours Truly.

William L. Webster — Diane C. Webster

Maj. Brent Adams

I am a longtime resident and home owner in Taos County near the Rio Grande Gorge Bridge. The vista is beautiful in all directions. Eagles and Hawks fly here. The sounds and silences of this area are great relaxing forces.

This community of Taoseños is an out door culture. Skiing, rafting, rodeos, hiking are just a few activities that residents and tourists enjoy. The gardens and out door areas of life here are gathering areas for Taos families

2. 000728

Our quality of life here is unique and we all feel so fortunate and thankful to be living in such a beautiful and popular place.

With respect for Taos Pueblo - we must remember the age of the Pueblo and the possible harm to these ancient but in fact walls and structures.

CU-2

The wildlife is rich and varied - our children happy and enjoy the space of our County. We implore you to consider an area of less impact for its citizens in your choosing

2.

000728

of Bomber Flight Plans.

You will find us a reliable and appreciative Citizenry when some other route is found to be preferable.

Thanking you in advance

Mrs Joan Bullington

129 Andrews Street, Suite 102
Langley AFB, VA 23665-2769

Dear Major Adams:

BR-6 I am writing to express my concerns regarding the Realistic Bomber Training Initiative flights over Philmont Scout Ranch. My understanding is that there will be 2,660 annual flights of B-1 and B-52 bombers at a base altitude of 400 feet. These would occur 6 days a week, 12 months a year.

From my 3 Philmont treks, 1 as a youth and 2 as an adult advisor, I can say without reservation that this proposal would destroy the experience for the participants at this very important youth program. Aside from the very real safety issues, the quality of the backcountry program would be degraded to the point of being useless.

The 18,000 kids who participate at Philmont each summer are constantly exposed to the sounds of our society. This is for many of them, the only opportunity to see what the world is like without the sounds of traffic, radios, TV and low flying aircraft.

Philmont is a special place. Please don't allow it to be destroyed. The purpose of this, as I understand it, is to save money. I can't believe that the citizens of the United States wouldn't be happy to spend a little extra to save this wonderful place for future generations.

Thank you.

Sincerely,

Bruce D. Remsberg

To whomever it may concern, 000732

TY Right now I am sitting atop Lovers Leap, which is a one hundred and fifty foot cliff at the bottom of a Large Valley. The very Last Thing I want to see is a B 1 Bomber blazing Through at 500 feet.

So Take your bombers and shove em' up your ass!

Sincerely yours,
Jeremy Long.

Major Brent Adams,

BR-6 I am writing to you on behalf of Philmont Scout Ranch, Philmont is a place that many people including myself Love and hold dear to our hearts. I am currently out here for my third time and first as a staff member. One reason I come here is to get peace, quiet, and other things not associated with my city life, including the noise of airplanes. Why Philmont was chosen for these training missions, I do not know, but I ask you to please be considerate of those like me who love this place so much, and also the wildlife. As I write this I am sitting in the Philmont back country with a beautiful views, trying to imagine a bomber in the picture, and I honestly think that it would ruin part of the experience. I urge you to please reconsider this bomber training proposition over Philmont. As a closing remark, I will leave you with this, how would you like low flying planes flying over your home 2,660 time a year?

Sincerely,
Danny Ozment

000734

Dear Major Adams,

BR-6 I am writing in Protest to the proposed use of North Eastern New mexico for the RBTI trainings. I am a staff member of the Philmont Scout Ranch in the Conservation Department. Philmont is a beautiful place, over 25,000 scouts and scout leaders come through here each Summer. The risk is to great, if a bomber flying lower than 1000 feet crashed into Philmont the chance that it could injure or even kill young scouters is too great. Philmont allows people to come out here and enjoy the peace and quite, and to soak in nature. I can assure you that many Scouters would not be happy when a B-1 bomber flew over while sitting in a meadow enjoying nature. I hope you will consider using the routes proposed in Texas rather than North Eastern New Mexico. Major Adams I apologize for the letter being handwritten we Joint many type writers out at Philmont. Thank you for your time.

Sincerely,

Major Brent Adams, 6/4/99

000735

BR-6 Alternative D is unacceptable, I hope you realize that over 20,000 participants come to Philmont each Summer. As a Health Leisure and Excercise Science Major focussing on Recreation Management and Outdoor Experiential Education I can tell you that the effects of your proposed flight training are/will be VERY detrimental to the Philmont Experience. To date over 600,000 Scouts & crews (12-15 scouts per crew) have hiked at Philmont. Do you think you have the right to seriously impact the next 600,000 crews? I don't.

I urge you to remove Philmont Scout Ranch from your list of possible training locations. Anyone w/ any common sense knows that Planes flying at 1,000 feet will physically & emotionally harm the experience of our participants and the wildlife on this Ranch. Choose Wisely.

William D. Yeager
OA Trail Crew Foreman

Boone, NC

000736

Dear, Major Brent Adams

BR-6 The flying of B-1 and B-52 bombers over Northern New Mexico will not only distract from those dream scenty of Philmont but will also ruin the almost extinct complete outdoors experience. 30,000 people each summer use Philamont as an escape from the normalities of our already voiceferous fast paced lives. The constornt interruption of these planes will be just one more reminder of why we as scouts use the land to get away from the noises of objects such as these planes. If 10 runs are preformed each day, with each run lasting 3 minutes, then a total of 30 min. a day will be interrupted by these excessively loud planes. During a campers 10 day trek 5 hours of noise interruption will have made. In short people dont come to the mountains to watch a damn plane fly overhead. Another concern is the refueling over Philmont Property. The wasted and dumped fuel causes permenate damage to the Mountains eco-systems Please consider these flyings as a serious issue, the happiness of many individuals depends on these plans not flying over our precious mountains.

Thankyou,

Jonathon Porter

Langley AFB, VA 23665-2769

000737

Dear Major Adam,

BR-6 I am writing to you concerning Alternative D of the RBTI training. I feel this proposal should be rejected for many reasons. Each year over 20,000 scouts hike through Philmont on 2 week treks and bombers flying at low levels would destroy the scouts wilderness experience. The loud sounds would destroy the solemn and solitude that is part of what makes Philmont the great place it is. It would also ~~destroy~~ ruin the environment for the wildlife and would most likely scare many away. In conclusion, I urge you to reject Alternative D and preserve the Philmont wilderness experience so that scouts can enjoy it in years to come. Thank you for taking the time to read my letter.

Sincerely,
Lesley Young

Major Brent Adams
RBTI EIS Project Manager
HQ ACC/CEVPP
129 Andrews Street, Suite 102
Langley AFB, VA 23665-2769

June 2, 1999

Dear Major Adams:

BR-6 The U.S. Air Force is seeking to establish a new training route for low-level B-1 and B-52 bomber flights from bases in Texas and Louisiana. One of the proposed routes for the Realistic Bomber Training Initiative (RBTI), alternative D, traverses Philmont Scout Ranch in northeastern New Mexico's Colfax County. I am strongly in favor of training for the U.S. Military, however, I am opposed to the proposed route over Philmont Scout Ranch.

Philmont is a 137,000-acre mountain backpacking and high adventure facility of the Boy Scouts of America. Each year over 25,000 Scouts and their adult leaders from across the nation participate in two-week wilderness backpacking trips and training courses in the mountains of Philmont. Many of them also camp and work on conservation projects in the adjacent Valle Vidal Wilderness of the Carson National Forest.

The Air Force's proposed Alternative D will establish a military training route directly over most of Philmont. More than 2600 flights each year, some as low as 300 feet above ground level, are planned for the segment over Philmont. As a former Philmont staff member, I have serious concerns about the impact of the Air Force's proposal on the health and safety of Scouts attending Philmont and the potential effects of daily low-level flights on the ranch itself.

Philmont is the largest and most famous Scout camp in the world. It is a national resource that has positively impacted the lives of hundreds of thousands of our nation's youth for more than sixty years. It deserves and demands our protection. Thank you for helping to see that RBTI Alternative D is not selected.

Sincerely,
Bill J. McKown

Dear Major Adams:

I am opposed to the Air Force's proposed RBTI known as Lancer – Option B in the DEIS. My concern(s) about the proposal and the DEIS are as follows:

BR-4 Property values will go down — no body wants to live with that kind of noise and disturbances. There has not been an impirical study done on the effect of the noise on our community, ranching or farming operations — not to mention the effect to our hunting economy. Hunting has become a substantial boost to our area — it would be devastating to lose it. Please go where there are no resources you could damage — we need ALL our resources out here.

Sincerely yours: Belinda Hecht

BR-6 To whom it may concern. My name is Raymond Tilley 6-4-99 and I am writing on behalf of the security of Philmont Scout Ranch. The employees of Philmont have recently been informed of the RBTI bomber training program. I am writing, urging you to find an alternative training area. This summer 26,000 young scouts will be visiting and participating in the programs at Philmont. Many of these scouts are coming from urban/industrial areas. For most of the kid's this will be a rare opportunity to learn and experience pristine wilderness. I feel as though this program would disturb and hinder the philmont experience for both the employees, participant, and Wildlife. I passionately urge you to find an alternative area. I strongly encourage you to come to philmont and share it this profound experience. Perhaps you would then better understand our passion regarding this matter. I would enjoy hearing the outcome on this matter, Please feel free to contact or write me at.

Dear MAjor Adams,

000743

BR-6 I am a 23 year old Scouter that presently is working at Philmont Scout Ranch. I have been involved with Scouting for over 12 years. Scouting has placed many morals and ethic values in my life. Philmont is a big part of the Scouting experience. Over 23,000 Scouts and Scouters pass through the Camp a year. The Philmont experience is one that I will not even try to write about, but I will say it is the "mecca" of All youth Camps. Scouts & Scouters from all over the World come to enjoy prestine Wilderness and learn environmental ethics. The RBTI project over Northern New Mexico (Philmont) would be a great injustice to the Philmont Experience. I beg you not to fly noisey, unsightly bomers over this still landscape. This will effect MANY, scarring the Ultimate Scouting experience

Yours truly,
Philmont Conservation staff

Anne Pesecan
Claremont, CA

Dear Major Brent Adams,

BR-6 I am writing this letter as a response to the Realistic Bomber Training Initiative that is proposed to take place over the Philmont Scout Ranch. Every summer about 28 thousand scouts set out to hike the wilderness area that Philmont has preserved. For most of these scouts it is their first experience out into the backcountry and the staff is trained to teach them skills in which will give them the skills to preserve the natural resources that still exist. There are very few places left in which people can go to get away from the sounds, pollution, and pace of the city life. If this proposal is passed than scouts will hear 30 min of B1 and B52 Bombers fly over the sky a day. Most scouts are on treks for 10 days so this means they will hear five hours of planes during their whole stay at Philmont. To me and many others this is not what a wilderness experience should entail. I hope you think twice about what this training will mean to the ones who will be effected by the sound pollution that will be created.

Sincerely,
Anne Pesecan

000749

6/4/99

Major Brent Adams
RBTI EIS Project Mgr
HQ ACC/CEVPP
129 Andrews St, Ste 102
Langley AFB, VA 23665

Major Adams,

BR-6 I am writing to urge you not to select the northern New Mexico site for the Air Forces Realistic Bomber Training Initiative. A significant portion of this site extends over Philmont Boy Scout Ranch, a beautiful stretch of wilderness that will this year be visited over by over 25,000 scouts. Scouts come to Philmont marvelled at, and revered by, knowledge of the outdoors, sharpen their survival in areas of 12, eager to expand their skills, and explore a rugged world that differs drastically from the suburbs cities, and highways that so many of them know.

I have spent three summers working at Philmont and have both witnessed and facilitated the deeply moving personal experience that people - including Boy Scouts, Girl Scouts, Venture Scouts, adult leaders, and staff - enjoy at Philmont. A major portion of the experience arises from the solitude and natural beauty found here. The simplicity of the peaceful setting guide all who come here into personal reflection and evaluation of morals, ethics, and career direction, and priorities.

RBTI would seriously disrupt the atmosphere, the very magic of Philmont. Thousands of young teenagers and adults travel here every year along trails that lead them through many twists and turns of personal development as through astonishing woodland and mountains. The disturbance of this amazing resource would incur a loss for all of these scouts as well as the family and friends they return home to influence.

Sincerely,
Nancy Virgin

000750

To Whome it May concern,

BR-6 I am writting this letter regarding the RBTI proposal over northeastern New Mexico. As an employe of the Boy Scouts of America at Philmont scout ranch I urge you to choose one of the alternative sites in texas for the training missions. As you may already know Philmont is a national High adventure base for the BSA, where thousands of participants come each Summer for a Wilderness Experience. Low flying Military aircraft does not fit the definition of wilderness. I hope that this letter and the letters from everyone will be read and considered. Thank you for your time and consideration.

Major Adams

BR-6 Thank you for taking the time to read my letter. I'm deeply concerned about upcoming plan to fly bomber training over Northern New Mexico This area contains the 114,000 acres known as Philmont. It is a Boy Scout High Adventure camp where over 22,000 scouts and advisors come to experience a wilderness adventure. This experience would be distroyed if the proposed RBTI training route "Alternate 0" is inacted. These fly overs would endanger the fragile wildlife and ecosystem. Not to mention endangering over 22,000 peoples lives each summer. In closing please do not allow this plan to happen, it would be a huge lose to the Boy Scouts of America.

Your Truley

000752

June 4, 1999

Major Adams:

BR-6 I would like to voice my concern over the Air Force's Realistic Bomber Training Initiative, Alternative D. This alternative would have B-1's and B-52's flying over Philmont Scout Ranch in northeastern New Mexico ten times a day. Philmont is here to provide outdoor and leadership training in a wilderness setting. We see over 20,000 scouts every summer and feel that low altitude bombers passing overhead would greatly detract from our program and the scouts' experience. We beg you to keep in mind the impact RBTI will have on this area and to choose another alternative for your training. Thank you for your time and concern.

Dear Major Adams:

BR-6 I recently read that the Air Force is considering a proposed route for the Realistic Bomber Training Initiative (RBTI) which passes over the Philmont Scout Ranch. As a concerned Scouter and a leader who has led an expedition at Philmont, I a writing to recommend that you consider other alternative routes.

At any given time during the summer, there are more than 5000 Scouts and Scouters in the mountains of Philmont hiking, camping and participating in horseback expeditions. The very thought of having a B1 or B52 bomber hugging the mountain terrain at 300 feet above the ground while these activities are going on is enough to scare me. I can just picture spooked horses with inexperienced riders aboard tumbling off steep mountain trails. Or, for an alternative picture, imagine a 14 year-old rappelling down the face of a cliff when a B1 comes roaring through the valley.

Not only would RBTI missions threaten the safety of campers and Philmont staff members, it would also impact negatively on the environment. Such flights would terrify wildlife as well as pose obvious threats of pollution.

I realize that the Philmont area is attractive for these missions because of its remote location and because of its mountainous terrain, however, I believe that the safety of Scouts and Scouters coupled with the negative environmental impact more than counterbalance these considerations. I strongly urge you to consider other alternative routes above Alternative D, the route over Philmont.

Sincerely yours,

Larry G. Sherman

Major Brent Adams
RBTI EIS Project Manager
HQ ACC / CEVPP
129 Andrews Street, Suite 102
Langley AFB, VA 23665-2769

Dear Major Adams:

BR-6 I am writing to request your firm support in opposing the selection of Alternative D under the U.S. Air Force's proposed Realistic Bomber Training Initiative (RBTI). The Air Force is seeking to establish a new training route for low-level B-1 and B-52 bomber flights from bases in Texas and Louisiana. One of the proposed routes, Alternative D, traverses Philmont Scout Ranch in northeastern New Mexico's Colfax County.

Philmont is a 137,000-acre mountain backpacking and high adventure facility of the Boy Scouts of America. Each year, thousands of Scouts and their adult leaders from across the nation participate in two-week wilderness backpacking trips in the mountains of Philmont. Many of them also camp and work on conservation projects in the adjacent Valle Vidal Wilderness of the Carson National Forest.

The Air Force's proposed Alternative D will establish a military training route directly over most of Philmont. More than 2600 flights each year, some as low as 300 feet above ground level, are proposed for the segment over Philmont. As a former Philmont staff member, I have serious concerns about the impact of the Air Force's proposal on the health and safety of Scouts attending Philmont and the potential effects of daily low-level flights on the ranch itself.

On any given day in the summer, as many as 5,000 Scouts and Scoters will be hiking and camping in Philmont's backcountry. Each day, several hundred of them will be engaged in activities such as rock climbing and rappelling, spar pole climbing, and mountain horseback rides. The sudden roar of jet engines has a high likelihood of distracting an inexperienced climber or causing a horse to bolt on a narrow mountain trail with resulting serious injury (or worse).

Appreciation and protection of the wilderness and our natural resources is a key part of the Philmont program. Scouts from around the world have a unique opportunity to see and experience wildlife in native habitat. Noise and emissions from bombers cannot help but have a damaging effect on that wildlife, as well as on Philmont's herds of buffalo, horses, cattle and burros. The disruptive effects of noisy bomber overflights on Philmont's famous living history programs, in which Scouts experience the lifestyles of the West's mountain men, homesteaders, lumberers and cowboys are obvious.

Most of Philmont is mountainous with many peaks in the 10,000' to 12,000' range. Philmont has a tremendous fuel load of dead trees in its forests and is in the midst of a long-term drought. Unburned jet fuel finding its way to the ground or being dumped in an emergency over such terrain, with campers using backpacking stoves for cooking, creates the potential for a serious fire that would endanger hundreds of lives. The possibility of a crash, however remote, is simply not acceptable for the safety of these Scouts.

Philmont is the largest and most famous Scout camp in the world. It is a national resource that has positively impacted the lives of hundreds of thousands of our nation's youth for more than sixty years. It deserves and demands our protection. Thank you for helping to see that Alternative D is not selected.

Sincerely

Greg Oehrtman

Dear Major Adams:

As a citizen of Scurry County for 42 years, I want to voice my opposition to the bomber training flights that the Air Force has proposed.

BR-4 It is my opinion that the noise level caused by such low level flights will decrease the property values of our nearby ranches.

I respectfully request that the situation be thoroughly studied before you force a decision on our area.

Cordially,

Marida R. Watlington
Marida R. Watlington

Snyder, TX

June 4, 1999

000756

Dear Major Brent Adams,

BR-6 Flying airplanes over the Philmont area would not only be frustrating for camp activities and dangerous for wranglers and livestock, but also completely disrespectful to the Boy Scouts of America. The Boy Scouts give so much to the community through service and Eagle Scout projects.

At Philmont, scouts learn to respect and maintain a healthy environment which I believe is infinitesimally more important than the Realistic Bomber Training Initiative.

RBTI must not take place over the Philmont area. This action would be a disheartening injustice to the Boy Scouts of America, our nations future social and governmental leaders.

Sincerely,
Ryan King

Major Adams,

BR-6 This letter is in regards to the proposal to run RBTI exercises over Philmont Scout Ranch in North East New Mexico. I urge you to reconsider this option. Each summer, more than 26,000 scouts and advisors pass through this ranch. For many, this is the only chance they will get to have a real wilderness experience. They come from urban areas and may never again get this sort of experience. It would be tragic for them to lose the mystique of these mountains to bombers flying directly over their heads. As a staff member and a former participant, I urge you to reconsider alternative D. Thank you.

Sincerely,
Greg Russell

Major Adams
RBTI EIS Project Manager
HQ ACC/CEVPP
129 Andrews St, Suite 102
Langley AFB, VA 23665-2769

Dear Major Adams,

BR-6 I am writing in concern over the proposed Airforce fly-by's at Philmont Scout Ranch in Cimarron, NM. As I sit here in the backcountry of Philmont, I cannot imagine how this wilderness would be like if B-2 bombers flew over sixteen times a day. Besides the noise of the planes, there are many other activities that go on at Philmont that would be effected by the flying exercises. Activities such as rock climbing, pole climbing could cause some injuries to scouts if they fell because of the noise from the planes. When we come to the outdoors, we expected to get away from the noise of the city, It would be ashamed If that noise was brought to Philmont.

This kind of destruction to a wilderness area should not happen. This is one of the few places Scouts can come from all over the world to learn, and experience a true outdoor adventure. Why should one of the great organizations of America Suffer so that the Airforce can train to kill people. I believe there are other places where they can practice, places that would not destroy the silence of a pristine wilderness. Your help in this will be much appreciated.

With concern,

000759

Major Brent Adams
RBTI EIS Prj. Mgr.
HQ ACC/CEVPP

Langley AFB, VA 23665-2769

Dear Major Adams:

BR-6 I am writing to request your firm support in opposing the selection of "Alternative D" under the USAF's proposed Realistic Bomber Training Initiative (RBTI) involving low flying B-52s and B-1s (as low as 300'). As one of several proposed southwestern routes, "D" traverses Philmont Scout Ranch in northeastern New Mexico's Colfax County. Philmont, truly a national treasure, is the 137,000 acre backpacking and training facility of the Boy Scouts of America. I do not protest RBTI since it is a valuable program -- my only complaint, as a Philmont alumnus, is with the proposed route over Philmont.

Several years ago, the USAF ceased its low altitude F-16/F-111 flights over the Ranch as a result of Philmont protests. RBTI's multiple daily flights (up to 16) will create much more severe problems:

a) Program: Philmont is a transient community of 25,000 people with over 3,000 campers in Philmont's back country every day in the summer. Daily, several hundred of them are engaged in spar pole climbing, rock climbing and rappelling, and horse back riding. The sudden roaring of jet engines will distract climbers and bolt horses thereby creating injuries (or worse).

b) Environmental: Appreciation and protection of the wilderness are key parts of Philmont's program. RBTI is inconsistent with wilderness preservation. RBTI will have a damaging effect upon both the unique western wildlife and Philmont herds of cattle, horses, burros, and buffalo. The effect of the unburned portion of jet fuel in the engine exhaust or dumped fuel itself, vaporizing and falling to ground level is as yet unknown, but believed to be anything but beneficial.

c) Safety: The environmental impact study done for the USAF is seriously flawed when it describes Philmont as an "uninhabited" grassland. The smaller portion of Philmont's acreage is prairie. Most of Philmont is mountainous with many peaks in the 10,000 to 12,444' range. Philmont has a tremendous fuel load of dead trees in its forests, and is in the midst of a long term drought. Open fire bans are in effect now. A crashing bomber will create an epic fire of Yellowstone proportions. B-1s and B-52s do not have enviable safety records. The nature of the flights (weaving around mountain peaks and facing violent weather, including frequent, low-level wind shears) dramatically increases the chance of a crash. Unfortunately, Philmont does not have a well-developed highway system for evacuations in case of massive forest fires.

For the above reasons, I seek your help in advocating the selection of a different RBTI route, preferably one that is over a more sparsely populated, less environmentally sensitive area. You, or a member of your staff may wish to liaise with Rep. Ed Pease's (Indiana) legislative assistant, Greg Good, who has additional information on RBTI.

There is too much at stake to allow RBTI to overfly Philmont. Please act now -- final route determination starts in June. Thank you for helping to see that alternative D is not selected.

Sincerely,

W. Andrew Grubbs

RE: Low Altitude Bomber Flights
Northern New Mexico

Dear Major Adams,

There are many good and compelling reasons not to employ low-altitude bomber training flights over Taos County in Northern New Mexico.

Here are two that you probably have not heard, but should be convincing:

1. A movement has been started to have the Federal Government designate Taos Valley a National Historic Park. Please see the attached correspondence.

AO-16 2. Sooner or later there will be a fatal and costly accident at such low altitudes and high speeds – involving trainees!

PD-8 The enclosed video tape of an Air Force hearing in Taos last year asks the well-received question: "Why not use virtual reality training much like astronauts use?" Have the bombers fly out over the Gulf of Mexico with projected mountain images and fixed monitoring sensors mounted on buoys or platforms. Then when a pilot does err and "hits" a "mountain" no lives or equipment are lost. And the Land of the Free is fully protected and not desecrated by noise and fumes; and, the precious wildlife and the beautiful Northern New Mexico environment are not disturbed.

Sincerely,

Richard and Marcia Kuska

Sir,

We need your help and leadership. Our purpose is to save the unique adobe look and mystical spirit of Taos while at the same time significantly boosting tourism to this traditionally hard-scrabble economic area.

We are a local citizens Task Force that is dedicated to achieving "National Historic Park" designation for that remaining part of the visually magnificent Taos Valley that is not already under Federal or Pueblo protection.

Before, any bomber flights and before any more developers and opportunists destroy this peaceful valley, we urgently request that your office ask the National Park Service to begin a feasibility study to determine how National Historic Park status can be accomplished before it is too late.

Taos Valley is unique in America in its successful coming-together of three very different and colorful Southwest cultures. Each was drawn here by the spectacular yet tranquil mountain setting. First came the ancient Pueblo Indians. Then 400 years ago the Hispanic community began. Finally came the Anglo traders and the famous Taos Art Colony founders. All stayed, enchanted by the indigenous adobe architecture and the magical spirit of North Central New Mexico. They continue in an unusual tri-cultural harmony today.

The enclosed map outlines the area that desperately requires protective Park Service oversight now. It requires protection from any unplanned, thoughtless, ill-advised or selfish development and construction. To achieve this end -- considering private property and local governance involved -- may well require new thinking in the Park System to properly manage the remaining precious few living historic areas in America. These are specifically significant communities that deserve preservation for the education and enjoyment of all the American people. Let Taos be the first in this new "Living Historical Park" category.

000760

Our Task Force is ready now to work with representatives from the National Park Service providing any necessary information, pictures, history, even escorted tours of the Taos Valley National Historic Park (In Waiting)!

Sincerely,

Richard Kuska

Dear Major Adams:

I am opposed to the Air Force's proposed RBTI known as Lancer – Option B in the DEIS. My concern(s) about the proposal and the DEIS are as follows:

BR-4 A. The effect on property values. Cattle prices and oil prices are still low. This will run the land values. We have worked our hole lives and payed taxes for nothing!

AO-12 B. You did no studies on the noise. It would break out windows and water lines which could kill our cattle. If we are checking cattle or gathering them on horseback; which we do all the time, it would scare the livestock causing great danger to everyone.

C. You already have substantial air space in West Texas. Why are you wanting to take away from American citizens to train foreign air force men who have never paid taxes or supported the USA? Why are you punishing us?

Why has my family fought in every war; so you can take away our rights and private property? I don't thank so.

Major Brent Adams
RBTI EIS Project Manager
HQ ACC/CEVP
129 Andrews Street, Suite 102
Langley AFB, VA 23665-2769

Dear Major Adams:

I am opposed to the Air Force's proposed RBTI known as Lancer – Option B in the DEIS. My concern(s) about the proposal and the DEIS are as follows:

Dear Sir:

Much of the proposed "Lancer" area is involved in a multi-year boll weevil eradication

BR-2 program. This requires many flights for the crop dusting planes. For west Texas you fly chemicals when the wind velocity allows, so you can't always set specific times or schedules. The Air Force has said that their flights would be above 3000'. This information is incorrect. Just this past wednesday I witnes Air Force aircraft flying under 500' on the Scurry Co – Howard Co. line. Due to the danger for the Spray pilots + the necessity of the weevil eradicate program I say "no!"

Sincerely yours: Ted Cervenka

Dear Major Adams:

I am opposed to the Air Force's proposed RBTI known as Lancer – Option B in the DEIS. My concern(s) about the proposal and the DEIS are as follows:

BR-4 I fear our property would be dev-
devalued. I am concerned about the

BR-3 farm & ranch animals that would be disturbed by the noise. The noise will be a terrible nusance to everyone who lives here & under-

PD-7 stand the Government has grant of other places for this Training that wouldn't bother anyone.

I know our service men have to be trained, but please do it over some of our waste lands where no one lives

Sincerely yours: Mrs. Elmer H. Owens

LETTER OF OPPOSITION

Dear Major Adams,

This epistle is in support of the Heritage Environmental Preservation Society's (HEPA) OPPOSITION to the US Air Force's "Realistic Bomber Training Initiative (RBTI).

This is not to down play the importance of training of the Air Force's Pilots, nor is it a "down sizing" of Patriotism. It is in behalf of a way of life that is in jeopardy if the USAF saturates the West Texas skies with low level flights, especially in the air space that is over Scurry, Borden, Dawson, Fisher, Garza, Kent, Lynn, and Stonewall Counties of Texas.

Being a Veteran of thirty (33) years combined military service to this Great Country, I can attest to the "beauty" of seeing the "belly" of those Tactical Air Support AirCraft...but there is few needs of sorties in the area just mentioned, and the same view would become ugly and hated!

I am not being wishy-washy, as I began this epistle by declaring the recognition of bomber pilot training, but the USAF already has bomber training areas and are already training these bomber pilots

PD-4 without the need of destroying a way of life, the peace and tranquility, of the area already named.

As well, consider the fact of the millions of dollars being spent to prevent this very type occurrence, by extending the perimeter of the glide and landing zones at DFW between the Metroplex (Ft Worth-Dallas). Not only are mega bucks being spent to condemn and vacate the area to be subjected to "low level flights," but entire communities are being re-constructed to eliminate such massive condemnation of people's homes and property, that would occur after opening new runways.

The West Texas area of concern consists of conditions that include low rainfall, dry humidity, seasonal dust storms, and is the anchor for "tornado alley," but the main thing this area has going for it is its "Heritage" which is simply defined as "Man against Elements" with the only reward being the "peace and tranquility" for nurturing life, both human and animal (domestic & wild).

The only difference between this area, and continuing to use the present site is the "misguided" claim of $'s to be saved (of course millions is the category-always) of the use of JP4, or what ever the designation of the "Aviation Fuel" is currently titled. But Major, Sir, you and I both know that USAF Regulations require these pilots to acquire a mandatory number of flight hours in each phase of training, so does it really matter if fuel dollars are spent flying on further to the Low Level Site, or should they do a few circles closer in

000772

before heading to the "O-Club?"

And your reaction to this might be that with close in sites there could be more bombing runs made without having to return for refueling

PD-1 of the aircraft, but why not have the KC-97 (and other refueling tanker aircraft) pilots, and crew, being trained by sending the flying "fuel tanks" to refuel them over the current site, already approved and being used, and apparently everyone accepting the situation. And after all, the refueling crews are also required by USAF Regulations to "log" the required hours, so why not missions, instead of circles?

Regardless of which site, the hours of fuel will be burned, so why "burn" the way of life of many many West Texans while doing this?

Plus when factoring in the "Environmental Damage Control" Investigations...the now in use sites are much more economical for the tax payers of the United States of America!

As you know, the data is available for such damages as will occur...Europe, Korea, Viet Nam, Falklands, Panama, Africa, Iraq, and soon to be Yugeslavia.... and West Texas if USAF "Messes with Texas."

That brings to mind...why not be exploring budgetary measures to "Retain" these pilots being trained around the clock as the Commander in Chief saturates the Balkans with USAF Technology and skills! Offer incentives to keep these trained pilots, instead of sending them to fly for United, SW, and other Airlines!

But of course that is getting into politics, but isn't everything politics, even the court system is controlled by politics and greed for the Ol' Greenback Dollars!

Major, remember the Ranchers, Farmers, Business Owners and Residents of the specified eight (8) County area, and all areas of West Texas, as well as the entire State as far as this goes.

Recruit your pilots for tomorrow by illustrating that the USAF is for the people of the United States, not to "bully" the people of the United States of America, and especially West Texas. As West Texas seems a long way out into the "wilderness" when you are sitting in the area near the Potomac!

May the Word of God, and Jesus Christ, guide you in the preparation of your findings from your study, and the powers and principalities, as they make their decisions based on input provided by sources such as yourself.

I thank you, My Family thanks you, and the many that are also in opposition to what the USAF is planning to do to our/their way of life THANKS YOU, though you will not hear from the majority of them!

In His Name,

CECIL DON VINEYARD

Dear Major Adams:

BR-6 We recently read that the Air Force is considering a proposed route for the Realistic Bomber Training Initiative (RBTI) which passes over the Philmont Scout Reservation. As a concerned Scouters and parents, we are writing to recommend that you consider other alternative routes.

At any given time during the summer there are more than 5000 Scouts and Scouters in the mountains of Philmont hiking, camping and participating in horseback expeditions. The very thought of having a B1 or B52 bomber hugging the mountain terrain at 300 feet above the ground while these activities are going on is enough to scare me. I can just picture spooked horses with inexperienced riders aboard tumbling off steep mountain trails. Or, for an alternative picture, imagine a 14 year-old rappelling down the face of a cliff when a B1 comes roaring through the valley.

Not only would RBTI missions threaten the safety of campers and Philmont staff members, it would also impact negatively on the environment. Such flights would terrify wildlife as well as pose obvious threats of pollution.

I realize that the Philmont area is attractive for these missions because of its remote location and because of its mountainous terrain, however, I believe that the safety of Scouts and Scouters coupled with the negative environmental impact more than counterbalance these considerations. I strongly urge you to consider other alternative routes above Alternative D, the route over Philmont.

Sincerely yours,

Concerned Adult Leaders

Dear Sir: RE: Lancer Site, Option B in DEIS

With respect to the armed forces, I object strenuously to the proposed reference low-level flight training activity in the area covering Scurry, Borden, Dawson, Fisher, Garza, Kent, Lynn and Stonewall counties, Texas.

I spoke in opposition at the public hearing held in Snyder, Texas, on April 7, 1999. A copy of my remarks is attached.

BR-3 **BR-4** In the counties involved, ranching and stock farming are major means by which people make a living for themselves and also contribute to the local economies. It is clear to us that the noises associated with the flight plans will be damaging to the livestock business and to commercial hunting on leases for wild life.

I have considerable experience first hand in economic development. We live in a fairly sparse populated area. Local oil fields are in advanced stages of depletion. The oil field future is bleak with regard to being a principal contributor to local economies either as sources of income or an activity to provide jobs. It is already tough enough to create economic development. We certainly do not need the Air Force training activity that brings virtually no jobs but does scare off opportunities we might otherwise have.

We wish the Air Force success in its training efforts. However, we urge you to do that training elsewhere. The USG already owns vast acreage; use those areas, even if such does cost more expense money.

As information to you, I sense that area people are so upset over the training proposal, that if the Air Force pushes ahead in Lancer area, you will be met aggressively in court.

Yours truly,

Roy A Baze

To: US Air Force
Re: Statement, Public Hearing, Snyder, Scurry County, Texas, on Realistic Bomber Training Initiative, Lancer Area, Texas.

My name is Roy A. Baze. I appreciate the opportunity to speak and to enter one page of comments in this hearing. I am a long time resident of Snyder, appearing here as an individual citizen interested in economic development of this area and also interested in maintaining strong capabilities of the armed forces. For the record, I love this country and take pride in the American flag. After four years of ROTC, I graduated from Officer Candidate School at Ft. Sill, served in the Field Artillery in Europe during WWII, was discharged as a captain, and remained in the Army Reserves for years. Usually, I am a strong supporter of the military.

However, today, I speak in opposition to the Bomber Training Initiative for Lancer Area. I do not see this as a political matter. Nor do I see this as an operation where the Initiative can take place only in the Lancer Area.

I have had considerable experience in economic development, both as an officer in a very large international corporation and also, after retirement, in development projects here in Scurry County. I am keenly aware of economic development needs of this area.

I am an experienced petroleum engineer. I understand the oil business very well. Starting about 50 years ago, some of the Lancer counties were blessed with discoveries of major oil fields. Local economies then shifted predominantly from agricultural base to oil base. Oil fields, like people, get old, they get tired and they wear out. Without question, that is happening to area oil fields. In Scurry County, the ad valorem tax base has eroded by 80% in the approximate last 15 years due to depletion of mineral resources, dropping from $2.7 billion to about $500 million. Erosion of oil tax basis is not going to get better: dependence on agriculture is increasing.

Unfortunately, the Bomber Initiative will not help property values or economic development here.

I have heard the argument that Lancer Area is a less costly area in which to conduct air training operations. However, in my view, national economic savings come out second best when I size up potential environmental and economic harm to this area, the adverse effects on property values , the adverse effects on people living here and trying to make a living here, and weigh those factors against the fact that flight training reasonably can be conducted elsewhere. The Federal Government controls vast acreage better suited than Lancer private property.

In conclusion, I very much appreciate the Air Force. Respectfully, I enter opposition to the Lancer operation. Apparently the Air Force considers the Lancer Proposal is a Win proposition. Locally, many of us believe it is a Loser for us. Apparently the Air Force considers that Bomber Incentive is a good title for the script it is reading. Locally, many of us think Bomber Disincentive better fits the scenario we see. It is already challenging enough here to cope with Nature's forces of wind, sparse rainfall and declining oil base. This area does not need or want addition of a man-made disincentive.

I do wish the Air Force success in its training mission. But, I urge you -- conduct the training elsewhere.

Again, thank you for this public hearing. I hereby submit for the record a copy of my remarks.

Roy A Baze

Dear Major Adams:

I am opposed to the Air Force's proposed RBTI known as Lancer – Option B in the DEIS. My concern(s) about the proposal and the DEIS are as follows:

1. The east double Mountain is on our ranch and this landmark has been a flying target in years past. These past flights have been an infringement on our peace and tranquility. If operations is carried out these flights will increase to an intolerable number.

CU-1 2. Parts of our ranch house are a hundred years old. The vibration from low flying jets will deteriorate our house.

BR-3 3. We have some high strung horses which will not do well with low flying planes.

4. I am a taxpayer and I don't mind my taxes being used for repair, maintence and new airplanes. Keep the training area where it is now located. Please don't use West Texas.

Sincerely yours: (Signature) David Baugh

Dear Major Adams:

BR-6 We are writing to inform you of our opposition to the selection of Alternative D under the U.S. Air Force's proposed Realistic Bomber Training Initiative (RBTI). Proposed Alternative D traverses Philmont Scout Ranch in northeastern New Mexico's Colfax County.

Philmont is a 137,000-acre mountain backpacking and high adventure facility of the Boy Scouts of America. Each year, thousands of Scouts and their adult leaders from across the nation participate in two-week wilderness backpacking trips in the mountains of Philmont.

On any given day in the summer, as many as 5,000 Scouts and adult leaders will be hiking and camping in Philmont's backcounty. Each day, several hundred of them will be engaged in activities such as rock climbing and mountain horseback riding. The sudden roar of jet engines has a startle effect which could easily cause inexperienced rock climbers to be distracted or a horse to spook and bolt on a narrow mountain trail with resulting serious injury (or worse).

B-1 and B-52 bombers flying only a few hundred feet above ground level generate a high noise level greater than being near a a diesel train. Campers at Philmont will be exposed to such noise levels for more than six hours during a typical 12-day stay based on projected flight operations. This is not a true wilderness experience.

The flights can be expected to have serious impacts on Philmont's wildlife and will overfly the habitats of at least three endangered species: the bald eagle, peregrine falcon, and Mexican spotted owl. The U.S. Fish and Wildlife Service has concluded that overflights at less than 1,00 feet will significantly impact these species.

Most of Philmont is mountainous with many peaks in the 10,000' to 12,000' range. Philmont has a tremendous fuel load of dead trees in its forests. Unburned jet fuel being dumped in an emergency over such terrain, with campers using backpacking stoves for cooking, creates the potential for a serious fire that would endanger hundreds of lives and devastate Philmont. Also, the possibility of a crash is simply not acceptable for the safety of the Scouts.

000776

Philmont is a national treasure and provides a wilderness camping experience for thousands of Scouts, America's future leaders, every year. That experience should be preserved and the safety of thousands of young people who attend Philmont annually should not be jeopardized. For these reasons, we request that you advocate the selection of a different RBTI route.

Philmont is the largest and most famous Scout camp in the world. It is a national resource that has positively impacted the lives of hundreds of thousands of our nation's youth for more than sixty years. It deserves our protection. Thank you for your assistance to ensure that Alternative D is not selected.

Sincerely,

Mark G. Hodgeson
Eagle Scout

June 4, 1999

Major Brent Adams
RBTI EIS Project Manager
HQ ACC/CEVPP
129 Andrews Street, Suite 102
Langley AFB, VA 23665-2769

Dear Major Adams,

BR-6 I am writing to you to ask that you oppose the selection of Alternative D under the proposed RBTI. This route traverses Philmont Scout Ranch in northeastern New Mexico's Colfax County.

Philmont is a 137,000-acre mountain backpacking and high adventure facility of the Boy Scouts of America. Each summer, about 25,000 Scouts and their adult leaders from all over the country come to Philmont for two week wilderness backpacking trips in the mountains of Philmont and the adjacent Valle Vidal Wilderness of the Carson National Forest.

The proposed Alternative D would establish a military training route directly over most of Philmont. As a former Scout camper, staff member, and adult leader of Philmont expeditions, I have serious concerns about the impact of the Air Force's proposal on health and safety of Scouts attending Philmont, and the potential effects of daily low-level flights on the ranch itself.

On any given day in the summer, as many as 5,000 Scouts and Scouters will be hiking and camping in Philmont's backcountry. Each day, hundreds of them will be engaged in activities such as rock climbing, spar pole climbing, and mountain horseback rides. The sudden roar of a jet at low altitude could easily cause a dangerous distraction to an inexperienced climber, or cause a horse to bolt on a narrow mountain trail, resulting in serious injury (or worse).

Appreciation and protection of the wilderness and our natural resources is a key part of the Philmont program. Scouts from around the world have a unique opportunity to see and experience wildlife in native habitat. Noise and emissions from bombers cannot help but have a damaging effect on that wildlife, as well as Philmont's herds of buffalo, horses, cattle, and burros. The disruptive effects of noisy bomber overflights on Philmont's famous living history programs, in which Scouts experience the lifestyles of the West's mountain men, homesteaders, lumberers, and cowboys, are obvious.

Most of Philmont is mountainous with many peaks in the 10,000' to 12,000' range. Philmont has a tremendous fuel load of dead trees in its forests and is in the midst of a long-term drought. Unburned jet fuel finding its way to the ground or being dumped in an emergency over such terrain, with campers using over 1,000 backpacking stoves for cooking, creates the potential for a serious fire that would endanger hundreds of lives. The possibility of a crash, however remote, is simply not acceptable for the safety of those Scouts.

For these reasons, I ask your help in advocating for the selection of a different RBTI route.

Philmont is the largest and most famous Scout camp in the world. It is a natural resource that has positively impacted the lives of hundreds of thousands of our nation's youth for more than sixty years. It deserves and demands our protection. Thank you for helping to see that Alternative D is not selected.

Sincerely,

Thomas A. Stalnaker

San Antonio, Texas

Major Brent Adams
RBTI EIS Project Manager
HQ ACC/CEVPP
129 Andrews Street, Suite 102
Langley AFB, VA 23665-2769

Dear Major Adams:

BR-6 I am writing to request your firm support in opposing the selection of Alternative D under the US Air Force's proposal Realistic Bomber Training Initiative (RBTI). The Air Force is seeking to establish a new training route for low-level B-1 And B-52 bomber Flights from bases in Texas and Louisiana. One of the proposed routes, Alternative D, transverses Philmont Scout Ranch in northeastern New Mexico's Colfax County.

Philmont is a 137,000 acre mountain backpacking and high adventure facility of the Boy Scouts of America. Each year, thousands of Scouts and their adult leaders from across the nation participate in two-week wilderness backpacking trips in the mountains of Philmont. Many of them also camp and work on conservation projects in the adjacent Valle Vidal Wilderness of the Carson National Forest.

The Air Force's proposed Alternative D will establish a military training route directly over most of Philmont. More than 2600 flight each year, some as low as 300 feet above ground level, are proposed for the segment over Philmont. As an active Scouter who has attend Philmont several times, I have serious concern about the impact of the Air Force's proposal on the health and safety of Scouts attending Philmont and the potential effects of daily low-level flights over the ranch.

On any given day in the summer as many as 5,000 Scouts and Scouters will be hiking and camping in Philmont's backcountry. Each day, several hundred of them will be engaged in activities such as rock climbing and rappelling, spar pole climbing, and mountain horseback rides. The sudden roar of jet engines has a high likelihood of distracting an inexperienced climber or causing a horse to bolt on a narrow mountain trial resulting in serious injury or worse.

Appreciation and protection of the wilderness and our natural resources is a key part of the Philmont program. Scouts from around the World have a unique opportunity to see and experience wildlife in native habitat. Noise and emissions from bombers cannot help but have a damaging effect on that wildlife, as well as on Philmont's herds of buffalo, horses, cattle and burros. The disruptive effects of noisy bomber overflights on Philmonts famous living history programs, in which Scouts experience the lifestyles of the West's mountain men, homesteaders, lumberers and cowboys, are obvious.

000779

The Environmental Impact Study(EIS) fails in several areas to mention any impact of flyovers on Philmont's two National Historic sites, The Kit Carson/Maxwell Arbeu houses at Rayado and the Villa Philmonte. The EIS incorrectly concludes that very few population centers are affected. On any given day in the summer months, over 5,000 people will be living and camping directly under the flight path at Philmont.

For these reasons, I seek your help in advocating the selection of a different RBTI route. I ask that you express your opposition to Alternative D to the Secretary of the Air Force and other defense officials who may be involved in this decision. Please act now, as the public comment period ends in June and a final decision will be made this year. You or a member of your staff may with to contact Greg Dodd, Chief of Staff for Congressman Ed Pease of Indiana, who can provide additional information.

Philmont is the largest and most famous Scout camp in the world. It is a national resource that has positively impacted the lives of hundreds of thousands of our nation's youth for more than sixty years. It deserves and demands our protection. Thank you for helping to see that RBTI Alternative D is not selected.

Sincerely,

Tom Dillington

RE: Comments to RBTI Draft EIS

Dear Major Adams,

The Nature Conservancy of Texas is in receipt of your Draft Environmental Impact Statement with respect to the Realistic Bomber Training Initiative dated March 1999. This report is indeed well researched and organized; however, we feel it is lacking not only in key ecological data and information, but makes unfair and unjust conclusions as it relates to the impacts on our natural and cultural world in the Trans-Pecos region.

We feel the EIS fails to address the values and well-being of the citizens of West Texas and downplays the negative impacts to our rural communities and landowners. The Nature Conservancy owns more than 17,000 acres in nature preserves in the Davis Mountains and has partnerships with private landowners to preserve another 52,000 acres for their rare and special animals and plants. These special places were not identified on EIS resource maps. These lands and the public lands that you did identify represent a mere fraction of the biodiversity and natural treasures that exist in West Texas on private lands.

LU-4

The single greatest threat to wildlife and biodiversity protection in the Trans-Pecos region is land fragmentation through subdivision and incompatible development. This issue equally threatens the traditions of West Texas' ranching culture and way of life. It is private landowners who make the difference in wildlife conservation, and the RBTI will without a doubt lead to negative impacts to our natural world. Capitalizing on the presence of unique wildlife and natural beauty

000780

has opened up diverse uses such as nature tourism, hunting and outdoor recreation on private lands that help landowners develop a broader economy, thus stabilizing their ownership and focusing on wise stewardship. These activities are entirely incompatible with the tremendous disruption to the quietude and natural processes of the wilderness that will result from repeated fly-overs.

The Nature Conservancy of Texas has worked for more than 20 years on various conservation initiatives in West Texas, both public and private, and has concluded that keeping family ranches intact and well managed is the best, most efficient, most economically and ecologically advantageous way to preserve our wild lands. The RBTI is not compatible with these uses.

If we are to succeed in protecting our natural resources, we must find ways to maintain the agricultural and ranching uses and the cultural heritage that have preserved these other private lands. To conclude that the Realistic Bomber Training Initiative would not negatively affect the serene, remote beauty and rich natural resources that support the people and wildlife of this region is unreasonable. Such activities will permanently damage and possibly destroy the culture, economy and rare ecological value of this land.

The Nature Conservancy values greatly our partnership with a variety of government entities, including the Department of Defense, in working at specific sites all over the state. The Realistic Bomber Training Initiative is not compatible with our work in West Texas, where the proposed impacts threaten the livelihood of the ranching community. If we are to succeed in our respective missions – both of which revolve around maintaining America's strength and health – we must find ways to better understand our natural heritage and work together to protect the valuable resources preserved on Texas' public *and* private lands. Our quality of life is at stake.

Sincerely,

James King
Director of Land Protection/West Texas Program Manager
The Nature Conservancy of Texas
Fort Davis, Texas

The Davis Mountains and the Chihuahuan Desert

Known as the land of "mountain islands and desert seas," the Chihuahuan Desert is the easternmost of the American deserts. Stretching from southern New Mexico down through West Texas and into the Mexican central plateau, the desert gives rise to a series of isolated mountain "islands," where hundreds of rare plants and animals are found.

The mountains form a biological lifeline, especially for migratory birds such as the zone-tailed hawk, painted redstart, and Grace's warbler, which fly hundreds of miles from one mountain range to another during migrations to and from montane nesting areas.

The Nature Conservancy is helping to permanently conserve the heart of one of these mountain islands. About 175 miles east of El Paso, the Davis Mountains rise above 8,000 feet and encompass an area of more than 1,500 square miles. The southernmost tip of the Rocky Mountains, they support cool, moist pine-oak woodlands and stand in dramatic contrast to the desert grasslands below. Ponderosa pines, several oak species and even relict stands of aspen occur along the northern slopes.

Shaded springs in the canyons and seeps in rock crevices provide habitat for plants and animals found nowhere else in Texas, such as the Livermore sandwort and Davis Mountains threeband snail. Mountain lions and black bears wander here, and at the headwaters of nearby Limpia Creek, the only grizzly bear ever recorded in Texas was found in 1901.

"The very existence of the Davis Mountains in West Texas is a thrill to a New Englander or to one who comes from the Pacific West," Supreme Court Justice William O. Douglas once observed. "To have a high mountain mass in a desert environment for exploration is a treat."

Indeed, the Davis Mountains provide a rich setting for both natural and human history. With the discovery of gold in California in 1849, hundreds of immigrants took advantage of a southern route to the West Coast that passed near the Davis Mountains. Many paused here to water their animals at natural springs adjacent to the mountains. Later, U.S. mail carriers, too, took advantage of the abundance of water here on their way to San Francisco. Yet, because the mountains themselves were such an obstacle to travel, they were not settled by pioneers until relatively late in Texas history.

The Nature Conservancy owns more than 17,000 acres in preserve lands here and is working with private landowners to conserve a contiguous and ecologically viable landscape while respecting the ranching way of life. Such conservation efforts will play a vital role for the entire Chihuahuan Desert region: the Davis Mountains serve as an important link to other conservation areas including the Guadalupe Mountains National Park to the north, as well as the Chisos Mountains of Big Bend National Park and the Sierra Madre of Mexico to the south.

The Nature Conservancy is a private, non-profit, international conservation organization with more than a million members worldwide. The mission of The Nature Conservancy is to preserve the plants, animals and natural communities that represent the diversity of life on Earth by protecting the lands and waters they need to survive. The Nature Conservancy of Texas is the state chapter of the organization, with more than 35 nature preserves throughout Texas. The Texas chapter uses cooperative methods and science-based research to protect native animals and plants in partnership with communities, businesses, individuals and public and private organizations.

Dear Major Adams:

BR-6 I am writing to request your firm support in opposing the selection of "Alternative D" under the USAF's proposed Realistic Bomber Training Initiative (RBTI) involving low flying B-52s and B-1s (as low as 300'). As one of several proposed southwestern routes, "D" traverses Philmont Scout Ranch in northeastern New Mexico's Colfax County. Philmont, truly a national treasure, is the 137,000 acre backpacking and training facility of the Boy Scouts of America. I do not protest RBTI since it is a valuable program – my only complaint, as a Philmont alumnus, is with the proposed route over Philmont.

Several years ago, the USAF ceased its low altitude F-16/F-111 flights over the Ranch as a result of Philmont protests. RBTI's multiple daily flights (up to 16) will create much more severe problems:

a) Program: Philmont is a transient community of 25,000 people with over 3,000 campers in Philmont's back country every day in the summer. Daily, several hundred of them are engaged in spar pole climbing, rock climbing and rappelling, and horse back riding. The sudden roaring of jet engines will distract climbers and bolt horses thereby creating injuries (or worse).

b) Environmental: Appreciation and protection of the wilderness are key parts of Philmont's program. RBTI is inconsistent with wilderness preservation. RBTI will have a damaging effect upon both the unique western wildlife and Philmont herds of cattle, horses, burros, and buffalo. The effect of the unburned portion of jet fuel in the engine exhaust or dumped fuel itself, vaporizing and falling to ground level is as yet unknown, but believed to be anything but beneficial.

c) Safety: The environmental impact study done for the USAF is seriously flawed when it describes Philmont as an "uninhabited" grassland. The smaller portion of Philmont's acreage is prairie. Most of Philmont is mountainous with many peaks in the 10,000 to 12,444' range. Philmont has a tremendous fuel load of dead trees in its forests, and is in the midst of a long term drought. Open fire bans are in effect now. A crashing bomber will create an epic fire of Yellowstone proportions. B-1s and B-52s do not have enviable safety records. The nature of the flights (weaving around mountain peaks and facing violent weather, including frequent, low-level wind sheers) dramatically increases the chance of a crash. Unfortunately, Philmont does not have a well-developed highway system for evacuations in case of massive forest fires.

For the above reasons, I seek your help in advocating the selection of a different RBTI route, preferably one that is over a more sparsely populated, less environmentally sensitive area. You, or a member of your staff may wish to liaise with Rep. Ed Pease's (Indiana) legislative assistant, Greg Good, who has additional information on RBTI.

There is too much at stake to allow RBTI to overfly Philmont. Please act now – final route determination starts in June. Thank you for helping to see that alternative D is not selected.

Sincerely,

Adam Compton

RE: Comment on RBTI Draft Environmental Impact Statement

Dear Major Adams:

I am writing to provide feedback on the RBTI Draft Environmental Impact Statement dated March 1999. In particular, I write to comment on some of the Draft EIS's methods, findings and conclusions regarding the socioeconomic impact of low level bomber training flights on the communities potentially affected by **Alternative D: IR-153/Mt. Dora MOA.**

The Draft EIS concludes, as summarized in Table 4.4.1 that there will be "no measurable impacts to socioeconimics" if Alternative D is selected. It appears from the discussion of socioeconomic impacts in Section 4.4.5 that the drafters have taken into consideration only such impacts as can be expected from the expenditure of federal funds to construct the Tucumcari scoring site and associated emitter sites, and that these are expected to affect primarily only Quay, Union or Haring County, with possible minor affects on Colfax, Guadalupe, Harding and Mora Counties. These effects, the report concludes, would be "relatively small revenue and job increases."

The Draft's findings and conclusions entirely overlook the major potential adverse impacts on the local economy of Northern New Mexico, including Rio Arriba and Taos Counties, which are not even mentioned in the relevant sections of the draft, despite the fact that IR-153 is partly in, or over, those counties. While the "Methods and Approach" section of the draft regarding socioeconomics and environmental justice (Section 4.4.1) acknowledge that during the public scoping period "Concerns were expressed that aircraft overflights could affect land values or economic pursuits such as ranching and tourism," the draft basically ignores these critically important concerns, dismissing them on the ground that they are "difficult to quantify" and "difficult to predict." Therefore, the report says, "no significant adverse consequences to economic activities are expected."

BR-4

The conclusion that no significant adverse consequences to economic activities are

OFFICE LOCATION: TAOS, NEW MEXICO

000782

Major Brent Adams
June 8, 1999
Page 2

BR-4 expected does not follow from the fact that potential decreases in land values and economic activities may be "difficult" to assess or predict. The difficulty in assessing these potentially enormous impacts should cause the drafters of the final EIS to probe more deeply, rather than to sweep the issues under the rug, pretending they do not exist. The conclusion is inescapable that the writers of the Draft EIS dismissed the "difficult" economic issues because they wanted to justify a foregone conclusion that adverse economic consequences are not expected.

The fact is that a huge proportion of the people who live in and visit the mountains of northern New Mexico rely on the peace and tranquility of the beautiful mountain areas, and that is a large part of why they are here, hence a major factor in the local economy. This is true of tourists who come here to escape the noise of the big cities. It is true of Boy Scouts who go to Philmont Scout Ranch for a wilderness experience. It is true of the many fishermen, hunters, backpackers, and campers who come here to get away. It is true of the artists and writers who need the quiet beauty of the of the high country to do their creative production. All in all, these activities – art, recreation, tourism – account for a large proportion of the economic activity in Northern New Mexico, especially in Taos County, where they are among the chief income-producing activities. There are estimated to be 1000 artists in Taos County alone. Many, I believe, would be unable or unwilling to produce their works in this vicinity if their creative concentration were interrupted by the noise of low level bomber flights.

In order to truly assess the potential economic impacts of Alternative D, the Air Force should do an intensive analysis of the proportion of the dollars in the local economy generated by recreation, tourism, and art, and carefully assess the likely impact of low level bomber flights on each of those economic activities. Potential economic impacts on art, recreation and tourism could be assessed in part by well designed surveys directed to artists, recreationalists and tourists. Also, it might be possible to do comparative studies. As it stands, the Draft EIS simply ignores these important considerations critical to the economy and life style of Northern New Mexico. Because this a "difficult" task, as the Draft EIS acknowledges, does not mean it isn't an essential task. The Air Force is not known for shrinking from important tasks just because they are difficult.

Thank you for your consideration of these comments.

Very truly yours,

Allen R. Ferguson, Jr.

Major Brent Adams
RBTI EIS Project Manager
HQ ACC/CEVPP
129 Andrews Street Suite #102
Langley AFB, VA 23665-2769

Dear Major Adams:

BR-6 My name Lee Shaver. I am a resident of Overland Park, KS who spent 5 summers working at Philmont Scout Ranch in Cimarron, New Mexico during my college years. I am writing to share my opinion about the Realistic Bomber Training Initiative (RBTI) that is being contemplated by the Air Force. As it has been explained to me, the Air Force is currently discussing flying B-52 bombers and other aircraft as low as 1000 feet above the terrain over Philmont.

As you may know, Philmont is the largest youth camp in the world and the flagship of Scouting's High Adventure program, hosting over 25,000 young people and their adult advisors every summer. Scouts travel from as far away as Japan to experience Philmont. It is my personal belief, as well as the belief of the management and Ranch Committee (oversight board) of Philmont, that this proposed RBTI flyover program would be a serious threat to the health and safety of the campers at Philmont.

Each day, hundreds of campers ride horses as part of Philmont's program. Many of these young people have never been on a horse before, and even though the horses are relatively docile, a B-52 at 1000 feet could have a disastrous effect on a trail ride – to say nothing of the effect it would have on the wilderness aesthetic of the Ranch.

Congressman Ed Pease of Indiana is a member of the Ranch Committee and is completely "up-to-speed" on this issue. I am sure that he would be pleased to share with you the Ranch's perspective on all of the issues involved.

Major Adams, Philmont is a truly special place and holds deep meaning in the hearts of many people around the country. The New Mexico congressional delegation and literally thousands of Scouts and Scouters from around the country think the RBTI overflights of Philmont are a bad idea and will damage a national treasure. I agree with them and want to encourage the Air Force to consider alternative locations where the impact will not effect such a special place.

Thank you for letting me have my say on this issue.

Cordially yours,

Lee S. Shaver

Richard C. Garigen

Grand Junction, CO

Dear Major Adams:

BR-6 I am writing to request your firm support in opposing the selection of Alternative D under the U.S. Air Force's proposed Realistic Bomber Training Initiative (RBTI). The Air Force is seeking to establish a new training route for low-level B-1 and B-52 bomber flights from bases in Texas and Louisiana. One of the proposed routes, Alternative D, traverses Philmont Scout Ranch in northeastern New Mexico's Colfax County.

Philmont is a 137,000-acre mountain backpacking and high adventure facility of the Boy Scouts of America. Each year, thousands of Scouts and their adult leaders from around the world participate in two-week wilderness backpacking trips in the mountains of Philmont. Many of them also camp and work on conservation projects in the adjacent Valle Vidal Wilderness of the Carson National Forest.

The Air Force's proposed Alternative D would establish a military training route directly over most of Philmont. More than 2,600 flights each year, some as low as 500 feet above ground level, are proposed for the segment over Philmont. As a former Philmont staff member, I have serious concerns about the impact of the Air Force's proposal on the health and safety of Scouts attending Philmont and the potential effects of daily low-level flights on the ranch itself.

On any given day in the summer, as many as 5,000 Scouts and Scouters will be hiking and camping in Philmont's backcountry. Each day, several hundred of them will be engaged in activities such as rock climbing and rappelling, spar pole climbing and mountain horseback rides. The sudden roar of jet engines will be a major distraction to an inexperienced climber or causing a horse to bolt on a narrow mountain trail with resulting serious injury or death.

Appreciation and protection of the wilderness and our natural resources is a key part of the Philmont program. Scouts from around the world have a unique opportunity to see and experience wildlife in native habitat. Noise and emissions from bombers will have a damaging effect on that wildlife, as well as on Philmont's herds of buffalo, horses, cattle and burros. The disruptive effects of noisy bomber overflights on Philmont's famous living history programs, in which Scouts experience the lifestyles of the West's mountain men, homesteaders, lumberjacks and cowboys are obvious.

Most of Philmont is mountainous with many peaks in the 10,000' to 12,000' range. Philmont has a tremendous fuel load of dead trees in its forests and is in the midst of a long-term drought. Unburned jet fuel finding its way to the ground or being dumped in an emergency over such terrain, with campers using backpacking stoves for cooking, creates the potential for a serious fire that would endanger hundreds of lives. The possibility of a crash, however remote, is simply not acceptable for the safety of these Scouts.

Philmont is the largest and most famous Scout camp in the world. It is a national resource that has positively impacted the lives of hundreds of thousands of our nation's youth for more than sixty years. It deserves and demands our protection. Thank you for helping to see that Alternative D is not selected.

Yours in Scouting,

Richard C. Garigen

Major Brent Adams
HQ ACC/CEVPP
129 Andrew Street, Suite 102
Langley AFB, VA 23665-2769

Dear Sir:

I support RBTI Alternative A – No Action. As Executive Director of HEPA, a not-for-profit organization formed to oppose the use of the area known as Lancer for bomber training, I have the following concerns about the EIS process and the DEIS in particular:

GE-25 1. The Air Force originally arranged to use the Snyder High School lunch room for the public hearing even after they were told that the arrangement would be inadequate. High school officials told the Air Force that seating was limited and that the location was difficult to find.

GE-22 2. HEPA was concerned that the people be informed of the upcoming hearing. Lt. Kerr at Dyess assured us that the public would be notified. In fact, for the whole eight county area, only one newspaper ad was placed. There was no other attempt made to notify the citizens of the public hearing. HEPA placed three ads in six local newspapers and ran over 50 radio spots.

GE-26 3. The official date of release for the DEIS was March 19, 1999. A significant number of people who had requested copies of the DEIS had not received it by the time of the public hearing on April 7th – nearly three weeks later. In fact the purpose of the public hearings is to let people respond to the DEIS. How can they effectively do this if they haven't had a chance to review the DEIS?

GE-26 4. The Air Force was able to find only two libraries as repositories for the DEIS. HEPA protested and requested that additional copies be provided to the six other libraries in the eight county area. HEPA obtained the locations of these libraries from the Texas Almanac.

GE-24 5. No one from the EIS study team ever visited the site other than to review the land for the potential emitter sites. How can an impact study have any merit if the area impacted is never visited? The study was based on global assumptions and historical studies – it had nothing to do with the eight county area.

GE-27 6. The Air Force was very quick in contacting land-owners, such as Cindy Spires, to obtain permission to begin evaluating sites for emitters, without fully explaining what these sites were part of.

000786

GE-22 7. The Air Force made little attempt to communicate with the citizens about the RBTI. By the time the DEIS was released, they had only 1,000 names on their mailing list. Hundreds of thousands of people live in the areas impacted by the alternatives, yet they made no attempt to obtain mailing lists, such as those maintained by elected officials or tax rolls. HEPA readily obtained some of these mailing lists – why couldn't the Air Force have asked officials such as Congressmen Stenholm and Thornberry to mail information to all of his constituents about the proposed RBTI. This seems like the intent of NEPA is not being followed?

8. At the public hearing in Snyder there were over 400 people present. Nearly 50 spoke out against the proposed Lancer RBTI, including over 20 local officials. These men and women included mayors, school board representatives, chambers of commerce members, economic development committees, judges, and other well-informed citizens. Not one person supported the proposal. This is an indication of the strong opposition to the Lancer RBTI.

Before the RBTI EIS goes forward we would ask that the Air Force address these concerns and seek to rectify the injustice that they have brought to the whole NEPA process. The Air Force has not done a good job of doing their work to inform the public and study the impact that the RBTI will have on the area known as Lancer.

Sincerely yours,

Douglas E. Thompson

Insurance Agency, Inc.

Dear Major Adams:

BR-6 I am writing to request your firm support in opposing the selection of Alternative D under the U.S. Air Force's proposed Realistic Bomber Training Initiative (RBTI). the Air Force is seeking to establish a new training route for low-level B-1 and B-52 bomber flights from bases in Texas and Louisiana. One of the proposed routes. Alternative D, traverses Philmont Scout Ranch in northeastern New Mexico's Colfax County.

Philmont is a 137,000-acre mountain backpacking and high adventure facility of the Boy Scouts of America. Each year, thousands of Scouts and their adult leaders from across the nation participate in two-week wilderness backpacking trips in the mountains of Philmont. Many of them also camp and work on conservation projects in the adjacent Valle Vidal Wilderness of the Carson National Forest.

The Air Force's proposed Alternative D will establish a military training route directly over most of Philmont. More than 2600 flights each year, some as low as 300 feet above ground level, are proposed for the segment over Philmont. As a former Philmonter, I have serious concerns about the impact of the Air Force's proposal on the health and safety of Scouts attending Philmont and the potential effects of daily low-level flights on the ranch itself.

On any given day in the summer, as many as 5,000 Scouts and Scouters will be hiking and camping in Philmont's backcountry. Each day, several hundred of them will be engaged in activities such as rock climbing and rappelling, spar pole climbing and mountain horseback rides. The sudden roar of jet engines has a high likelihood of distracting an inexperienced climber or causing a horse to bolt on a narrow mountain trail with resulting serious injury (or worse).

Appreciation and protection of the wilderness and our natural resources is a key part of the Philmont program. Scouts from around the world have a unique opportunity to see and experience wildlife in native habitat. Noise and emissions from bombers cannot help but have a damaging effect on that wildlife, as well as on Philmont's herds of buffalo, horses, cattle and burros. The disruptive effects of noisy bomber overflights on Philmont's famous living history programs, in which Scouts experience the lifestyles of the West's mountain men, homesteaders, lumberers and cowboys, are obvious.

Most of Philmont is mountainous with many peaks in the 10,000 ft to 12,000 ft range. Philmont has a tremendous fuel load of dead trees in its forests and is in the midst of a long-term drought. Unburned jet fuel finding its way to the ground or being dumped in an emergency over such terrain, with campers using backpacking stoves for cooking, creates the potential for a serious fire that would endanger hundreds of lives. The possibility of a crash, however remote, is simply not acceptable for the safety of these Scouts.

For these reasons, I seek your help in advocating the selection of a different RBTI route. I ask that you express your opposition to Alternative D to the Secretary of the Air Force and other defense officials who may be involved in this decision. Please act now, as the public comment period ends in June and a final decision will be made this year. You or a member of your staff may wish to contact Gregg Dodd, Chief of Staff for Congressman Ed Pease of Indiana, who can provide additional information.

Philmont is the largest and most famous Scout camp in the world. It is a national resource that has positively impacted the lives of hundreds of thousands of our nation's youth for more than sixty years. It deserves and demands our protection. Thank you for helping to see that Alternative D is not selected.

Sincerely,

Fred Mellick

Langley AFB, VA 23665-2769

Dear Major Brent Adams,

BR-6 I am writing to request your firm support in opposing the selection of "Alternative D" under the USAF's proposed Realistic Bomber Training Initiative (RBTI) involving low flying B-52s and B-1s (as low as 300'). As one of several proposed southwestern routes, "D" traverses Philmont Scout Ranch in northeastern New Mexico's Colfax County. Philmont, truly a national treasure, is the 137,000-acre backpacking and training facility of the Boy Scouts of America. I do not protest RBTI since it is a valuable program – my only complaint, is with the proposed route over Philmont.

Several years ago, the USAF ceased its low altitude F-16/F-111 flights over the Ranch as a result of Philmont protests. RBTI's multiple daily flights (up to 16) will create much more severe problems:

a) Program: Philmont is a transient community of 25,000 people with over 3,000 campers in Philmont's back country every day in the summer. Daily, several hundred of them are engaged in spar pole climbing, rock climbing and rappelling, and horse back riding. The sudden roaring of jet engines will distract climbers and bolt horses thereby creating injuries (or worse).

b) Environmental: Appreciation and protection of the wilderness are key parts of Philmont's program. RBTI is inconsistent with wilderness preservation. RBTI will have a damaging effect upon both the unique western wildlife and Philmont herds of cattle, horses, burros, and buffalo. The effect of the unburned portion of the jet fuel in the engine exhaust or dumped fuel itself, vaporizing and falling to ground level is as yet unknown, but believed to be anything but beneficial.

c) Safety: The environmental impact study done for the USAF is seriously flawed when it describes Philmont as an "uninhabited" grassland. The smaller portion of Philmont's acreage is prairie. Most of Philmont is mountainous with many peaks in the 10,000 to 12,444' range. Philmont has a tremendous fuel load of dead trees in its forests, and is in the midst of a long-term drought. Open fire bans are in effect now. A crashing bomber will create an epic fire of

000797

Yellowstone proportions. B-1s and B-52s do not have enviable safety records. The nature of the flights (weaving around mountain peaks and facing violent weather, including frequent, low-level wind shears) dramatically increases the chance of a crash. Unfortunately, Philmont does not have a well-developed highway system for evacuations in case of massive forest fires.

There is too much at stake to allow RBTI to overfly Philmont. Please act now – final route determination starts in June. Thank you for helping to see that alternative D is not selected.

Sincerely,

Scott A. Laraway

Dear Major Adams,

BR-6

I am writing to request your firm support in opposing the selection of Alternative D under the U.S. Air Force's proposed Realistic Bomber Training Initiative (RBTI). The Air Force is seeking to establish a new training route for low-level B-1 and B-52 bomber flights from bases in Texas and Louisiana. One of the proposed routes, Alternative D, traverses Philmont Scout Ranch in northeastern New Mexico's Colfax County.

Philmont is a 137,000-acre mountain backpacking and high adventure facility of the Boy Scouts of America. Each year, thousands of Scouts and their adult leaders from across the nation participate in two-week wilderness backpacking trips in the mountains of Philmont. Many of them also camp and work on conservation projects in the adjacent Valle Vidal Wilderness of the Carson National Forest.

The Air Force's proposed Alternative D will establish a military training route directly over most of Philmont. More than 2600 flights each year, some as low as 300 feet above ground level, are proposed for the segment over Philmont. As a former Philmont staff member, I have serious concerns about the impact of the Air Force's proposal on the health and safety of Scouts attending Philmont and the potential effects of daily low-level flights on the ranch itself.

On any given day in the summer, as many as 5,000 Scouts and Scouters will be hiking and camping in Philmont's backcountry. Each day, several hundred of them will be engaged in activities such as rock climbing and rappelling, spar pole climbing, and mountain horseback rides. The sudden roar of jet engines has a high likelihood of distracting an inexperienced climber or causing a horse to bolt on a narrow mountain trail with resulting serious injury (or worse).

Appreciation and protection of the wilderness and our natural resources is a key part of the Philmont program. Scouts from around the world have a unique opportunity to see and experience wildlife in native habitat. Noise and emissions from bombers cannot help

000798

but have a damaging effect on that wildlife, as well as on Philmont's herds of buffalo, horses, cattle and burros. The disruptive effects of noisy bomber overflights on Philmont's famous living history programs, in which Scouts experience the lifestyles of the West's mountain men, homesteaders, lumberers and cowboys, are obvious.

Most of Philmont is mountainous with many peaks in the 10,000f to 12,000f range. Philmont has a tremendous fuel load of dead trees in its forests and is in the midst of a long-term drought. Unburned jet fuel finding its way to the ground or being dumped in an emergency over such terrain, with campers using backpacking stoves for cooking, creates the potential for a serious fire that would endanger hundreds of lives. The possibility of a crash, however remote, is simply not acceptable for the safety of these Scouts.

For these reasons, I seek your help in advocating the selection of a different RBTI route. I ask that you express your opposition to Alternative D to the Secretary of the Air Force and other defense officials who may be involved in this decision. Please act now, as the public comment period ends in June and a final decision will be made this year. You or a member of your staff may wish to contact Greg Dodd, Chief of Staff for Congressman Ed Pease of Indiana, who can provide additional information.

Philmont is the largest and most famous Scout camp in the world. It is a national resource that has positively impacted the lives of hundreds of thousands of our nation's youth for more than sixty years. It deserves and demands our protection. Thank you for helping to see that Alternative D is not selected.

Sincerely,

Mary Dailey

Major Adams,

BR-6

I am writing with regards to the proposed realistic bomber training initiative Alternative D (New Mexico). As a member of Philmont Scout Ranch staff I am saddened to learn that the wilderness experience of myself and fellow Scouts may be in jeopardy as that bomber pilots can learn. This ranch and the programming exceeded because has a profound effect on the lives of participants who will be the leaders of tomorrow. To minimize the value of this experience by flying bombers over will cost this country more than you may realize. Philmont is a place where people's lives are changed for the better. Anything that can deter from the experience and safety, equally as important, should be avoided at all cost. As I write to you I hear birds chirping in a cloudless sky. My ranch is a rock called Lovers Leap where myself and fellow staff went to grow & hear them laughing, the wind sings through evergreens making them dance. Please don't take this away from me, I gave up [redacted] four years of drug & alcohol addiction to be here now. Philmont changes lives for the better. The high decibel levels of B-1 & B-52 bombers (117 decibels @ 300ft) will disrupt what we are trying to do there, we want youth to listen to the sounds of the wild, the screaming of one another, and the voice of our maker. Please find an alternative route for our planes to fly over. The high noise levels will compromise safety of human victims (almost all with no experience), rock climbing instruction, and riding. The sites of black bear, elk, and bald eagles will be tampered. My sincere hope is that you will select an alternative site for our planes operation. There will be a tremendous impact now & for years to come if this is not changed. As Scouts we are taught to value our citizenship and our country, I will lose faith in this institute if RBTI Alternative D is selected. I urge you to talk to the Eagle Scouts on your staff (I'm sure there are some) and see what they have to say about Philmont, Please find an alternative route for your training. Thank you for your consideration.

Sincerely,

000800

Dear Major Adams:

I am opposed to the Air Force's proposed RBTI known as Lancer – Option B in the DEIS. My concern(s) about the proposal and the DEIS are as follows:

PD-4 1. Elsie, a area more suitable for this project.
BR-3 2. Livestock will be stressed by the noise.
AO-17 3. People who work out-doors will be stressed by the noise.
AO-18 4. Noise will effect schools, Church, hospitals, Care Centers, Nursing Homes, and other out-side activities.
BR-4 5. Land values will decrease.
6. New businesses will not come into the area.
7. Some people in our area can move to other areas, but some of us can not.
8. Our Nation ceases to be "Land of the Free and Home of the Brave" when such a project is forced upon us.

Dear Major Adams,

BR-6 I am writing to request your firm support in opposing the selection of Alternative D under the U.S. Air Force's proposed Realistic Bomber Training Initiative (RBTI). The Air Force is seeking to establish a new training route for low-level B-1 and B-52 bomber flights from bases in Texas and Louisiana. One of the proposed routes, Alternative D, traverses Philmont Scout Ranch in northeastern New Mexico's Colfax County.

Philmont is a 137,000 acre mountain backpacking and high adventure facility of the Boy Scouts of America. Each year for more than sixty years, thousands of Scouts and their adult leaders from across the nation participate in two-week wilderness backpacking trips in the mountains of Philmont. I understand that Alternative D will affect 114,000 acres of Philmont.

The Air Force's proposed Alternative D will establish a military training route directly over most of Philmont. More than 2600 flights each year, some as low as 300 feet above ground level, are proposed for over Philmont. I am a Eagle scout and I was a member of the Philmont staff from 1948 through 1955. My Philmont wilderness experience has been an influence on me for all my life. I have very serious concerns about how this will affect the wilderness experiences of future Scouts going to Philmont. There are also concerns about the impact of the Air Force's proposal on the health and safety of Scouts attending Philmont and the potential effects of daily low-level flights on the ranch itself.

On any given day in the summer, as many as 5,000 Scouts and Scouters will be hiking and camping in Philmont's backcountry. Each day, several hundred of them will be engaged in activities such as rock climbing and rapelling, spar pole climbing, and mountain horseback rides. The sudden roar of jet engines has a high likelihood of distracting an inexperienced climber or causing a horse to bolt on a narrow mountain trail, resulting in serious injury or death.

Most of Philmont is mountainous with many peaks in the 10,000 to 12,000 foot range. Appreciation and protection of the wilderness and our natural resources is a key part of the Philmont program. Scouts from around the world have a unique opportunity to see and experience wildlife in native habitat. Noise emissions from bombers cannot help but have a damaging effect on the wildlife and Philmont's herds of buffalo, horses, cattle and burros. The disruptive effects of noisy bomber overflights on Philmont's famous living history programs, in which Scouts experience the lifestyles of the West's mountain men, homesteaders, lumberers and cowboys, are obvious.

For these reasons, I seek your help in advocating the selection of a different RBTI route. I ask that you express your opposition to Alternative D to the Secretary of the Air Force and other defense officials who may be involved in this decision. Please act now, as the public comment period ends in June and a final decision will be made this year. You or a member of your staff may wish to contact Greg Dodd, Chief of Staff for Congressman Ed Pease of Indiana, who can provide additional information.

Philmont is the largest and most famous Scout camp in the world. It is a national resource that has positively impacted the lives of hundreds of thousands of our nation's youth for many years. It deserves and demands our protection. Thank you for helping to see that Alternative D is not selected.

Dear Major Adams,

BR-6 I am writing to request your assistance in opposing Alternative D under USAF's proposed Realistic Bomber Training Initiative (RBTI).

As a Pennsylvania resident I have spent the last four summers in New Mexico's Colfax County, first as a participant in Philmont Scout Ranch, and then as a staff member. Colfax County, NM is a beautiful part of the country who's hospitable residents have opened their arms to 25,000 young men and women each summer who come from every part of the country to seek challenge, community and a true wilderness experience in the 137,500 beautiful acres that are Philmont.

One of the questions that is so prevalent on all of our minds recently has been what to do with our nation's young people, how to reach them, how to steer them from violence as a course of action. I know you've felt the impact in seeing the incredible number of copycat across the United States since the tragedy in Littelton, Co.

Philmont is one of most amazing programs I have witnessed that works with youth. Through challenging outdoor wilderness experiences, and backpacking treks from 6 days to 21days, from 60 miles to several hundred, and with participation in rock climbing opportunities,

000802

group initiatives, and physical challenges these young people learn to find strength in themselves, respect for one another and also respect for this Earth.

In addition to the importance of offering these 25,000 participants per summer encouragement to grow, and opportunities to find new strength within themselves, there is another very important lesson that is taught. The foundation upon which Philmont rests is a program stressing low impact, and in some areas no trace camping. A ranger spends 3 days with each crew teaching them the principles of how to enjoy the incredible backcountry that is Philmont without scarring the land. We teach them in the Philmont Pledge a respect for the environment that they carry back to their hometowns all across the United States and beyond. Imagine one of our rangers attempting to stress the importance of handling the environment delicately while B-52's and B-1's practice bombing missions at as low as 300 feet overhead. By allowing Alternative D of the RBTI initiative to be passed, we are not only disturbing this learning process but saying that supporting a place for youth to grow is low on our agenda. I do not contest that the mission of the Air Force to train young pilots is an equally valid one. I however, would like to assert that although there may be Alternatives A, B, and C for their training routes, there is no A, B or C place in the world that has an impact of the lives of so many young people as does Philmont.

Please make a choice for our youth and oppose Alternative D under the USAF's proposed Realistic Bomber Training Initiative. Thank you very much for your time and consideration.

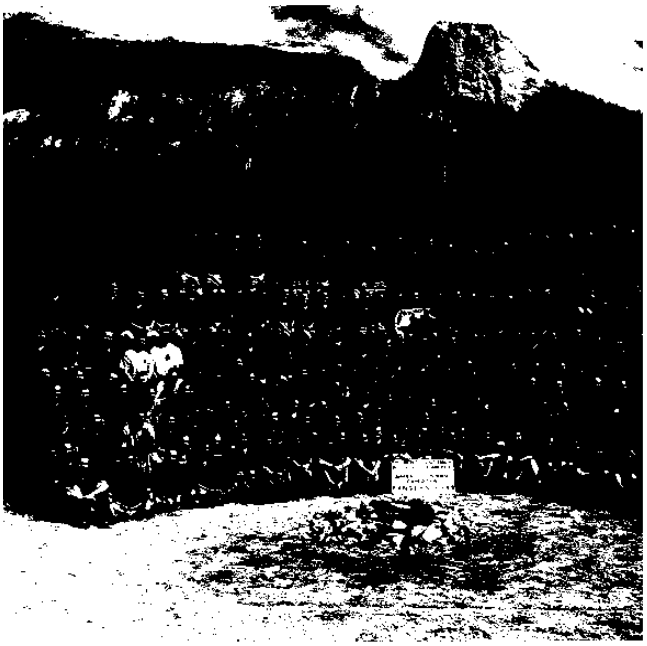
Respectfully,

Karen E. Hall

Karen E. Hall

000802

Philmont Ranger Training Crew on Baldy Mt. Saddle 98
Over 800 staff members are trained to work with the 300 scouts that arrive per day to Philmont in New Mexico's Colfax County. Youth come from all over the world looking for a true wilderness experience.



Alternative "D" is far from uninhabited! This photo just represents the staff of one department that works with the over 300 youth per day who arrive at Philmont Scout Ranch in New Mexico's Colfax County, in search of a wilderness experience.

Dear Major Adams:

I am opposed to the Air Force's proposed RBTI known as Lancer – Option B in the DEIS. My concern(s) about the proposal and the DEIS are as follows:

BR-4 A. The effect on property values. Cattle prices are still real low. The weather has hit us hard. This will ruin the land values. We have worked our hole lives and payed taxes for nothing!!

AO-12 B. You did no studies on the noise. It could break our water lines which would kill our cattle. If we are checking or gathering cattle on horseback; which we do half the time, it would cause the livestock causing someone to get hurt.

C. You already have substantial air space in West Texas. Why are you wanting to take away from American Citizens to train foreign air force men who have never paid taxes or supported the USA. Why are you punishing us?

This will take away our rights and private property.

Sincerely yours: Anna Neubaum

TY To Major Brent Adams:

This letter is expressing our concern of the Lancer Site the U.S.A.F. is proposing. I know every American wants our pilots to have the best training. They deserve the very best of everything.

The U.S. Government has federally owned land fairly close to Dyess Air Force Base. We strongly believe that is where the training should be done.

Although our population is small in number, let me ask you a question. If the Lancer Site was going to be right over your home, how would you feel about it then?

Is it right for Abilene to want the site as long as the training is done in some other county and not disturb their way of life?

Again, I ask you to please think of our homes, livestock, wildlife, our way of life and keep the training on Federal land.

Sincerely,
Sidney and Kerry Johnson

Suit 102
Langley, AFT VA 23665-2769

Dear Major Adams,

I would like to voice my opposition to the Realistic Bomber Training Initiative in Scurry County. I am a farm wife and am concerned about the economy of this county. We often use airplanes to spray crop pests and defoliate our cotton. We spray the pastures for mesquites and weeds. We have a state supported program that pays part of the expense of insect control. This requires that the spray planes be in the air from early summer until fall harvest. Many of the ranchers use airplanes to keep track of their cattle. I do not believe that we can share the low level flight space with the airforce.

BR-2

This county has many rural residents and the noise of the low-level flight of the B-1s even outside of the city limits of Snyder is disturbing. My son's family experienced this one night a few months ago when they were all awaken by the thundering roar of heavy aircraft at very low level. They had not been concerned about RBTI until that time.

As a pilot I am also concerned about our local airport that depends on cross country planes that land here to get fuel. The revenue from the fuel is used to help support our airport.

I believe that you can find a more suitable area for your low level MOA.

Sincerely yours,

Doris Fay Blackard

Langley AFB, VA 23665-2769

Dear Major Adams:

I am opposed to the Air Force's proposed RBTI known as Lancer – Option B in the DEIS. My concern(s) about the proposal and the DEIS are as follows:

BR-4 1. The effect on my property values and the fact that this has not been adequately addressed in the DEIS.

2. The effect the bomber training will have on my ranching and farming operations and the fact that the DEIS did not provide for any actual study of this impact on my operations or anyone else's in the Area. No **GE-24** one ever visited the area for the study!

AO-28 3. The fact that the DEIS did not adequately study the impact that noise will have on our community. Over 2,000 flights at 3,000 feet or less are currently planned annually, with more on the way. They have said this will not have a noticeable noise impact.

BR-4 4. Hunting is big business in this area. Yet the DEIS made no attempt to quantify the impact this would have on our economy- see the recent Texas Wildlife article.

Dear Major Adams:

BR-6 I am writing to request your firm support in **opposing the selection of "Alternative D" under the USAF's proposed Realistic Bomber Training Initiative (RBTI)** involving low flying B-52s and B-1s (as low as 300'). As one of several proposed southwestern routes, "D" traverses Philmont Scout Ranch in northeastern New Mexico's Colfax County. Philmont, truly a national treasure, is the 137,000 acre backpacking and training facility of the Boy Scouts of America.

Several years ago, the USAF ceased its low altitude F-16/F-111 flights over the Ranch as a result of Philmont protests. RBTI's multiple daily flights (up to 16) will create much more severe problems:

a) Program: Philmont is a transient community of 25,000 people with over 3,000 campers in Philmont's back country every day in the summer. Daily, several hundred of them are engaged in spar pole climbing, rock climbing and rapelling, and horse back riding. The sudden roaring of jet engines will distract climbers and bolt horses thereby creating injuries (or worse).

b) Environmental: Appreciation and protection of the wilderness are key parts of Philmont's program. RBTI is inconsistent with wilderness preservation. RBTI will have a damaging effect upon both the unique western wildlife and Philmont herds of cattle, horses, burros, and buffalo. The effect of the unburned portion of jet fuel in the engine exhaust or dumped fuel itself, vaporizing and falling to ground level is as yet unknown, but believed to be anything but beneficial.

c) Safety: The environmental impact study done for the USAF is seriously flawed when it describes Philmont as an "uninhabited" grassland. The smaller portion of Philmont's acreage is prairie. Most of Philmont is mountainous with many peaks in the 10,000 to 12,444' range. Philmont has a tremendous fuel load of dead trees in its forests, and is in the midst of a long term drought. Open fire bans are in effect now. A crashing bomber will create an epic fire of Yellowstone proportions. B-1s and B-52s do not have enviable safety records. The nature of the flights (weaving around mountain peaks and facing violent weather, including frequent, low-level wind shears) dramatically increases the chance of a crash. Unfortunately, Philmont does not have a well-developed highway system for evacuations in case of massive forest fires.

For the above reasons, I seek your help in advocating the selection of a different RBTI route, preferably one that is over a more sparsely populated, less environmentally sensitive area. You, or a member of your staff may wish to liaise with Rep. Ed Pease's (Indiana) legislative assistant, Greg Good, who has additional information on RBTI.

There is too much at stake to allow RBTI to overfly Philmont. Please act now -- final route determination starts in June. Thank you for helping to see that alternative D is not selected.

Sincerely,

Jeff Belden

Major Adams:

BR-6 I am writing you concerning the proposed idea surrounding Alternative D, the establishment of training routes for B-1 and B-52 bombers of the Air Force. These routes would be conducted over approximately 114,000 acres of Philmont Scout Ranch. I feel that the establishment of this sort of training over this particular part of the country would be a grave mistake.

The Air Force has determined "that selection of Alternative D would have no likely effects to land use, recreation resource, or visual settings." That, to me, seems to be a grievously wrong conclusion. Philmont Scout Ranch is a piece of country that is utilized by approximately 22,000 people each summer and many more year round. Should this proposal go through, those thousands of people would not have the wilderness experience we as a staff at Philmont provide. Individuals come to Philmont to experience the unique land, vast recreation Philmont and the community provides, and the extraordinary views most people who come here do not get to see. To subject this land to low-level bomber training; extremely high, sudden, and disruptive noise levels; and unburned jet fuel soaking into this land would be a travesty. Please understand that this is only a small portion of the proposed training route, yet it is extremely representative of much of the land Alternative D is over. To go ahead and approve this plan would be a grave mistake. It would damage not only our piece of land but also some of the most beautiful parts of the Land of Enchantment, New Mexico.

This is a stretch but I believe that, if you were to come out and personally view this land, you would agree that the conclusions the Air Force has reached in recommending Alternative D would be flawed as far as this New Mexican society is concerned. The natural and human resources of this area would, in my opinion, be too adversely affected to use northeastern New Mexico for B-1 and B-52 training routes.

Sincerely,

Cortland Bolles

Langley AFB, VA 23665-2769

Dear Major Adams:

I am opposed to the Air Force's proposed RBTI known as Lancer – Option B in the DEIS. My concern(s) about the proposal and the DEIS are as follows:

BR-4 A. The effect on property values. Cattle prices are still real low. The weather has hit us hard. This will ruin the land values. We have worked our hole lives and payed taxes for nothing!!

AO-12 B. You did no studies on the noise. It could break our water lines which would kill our cattle. If we are checking or gathering cattle on horseback; which we do half the time, it would scare the livestock causing someone to get hurt.

C. You already have substantial air space in West Texas. Why are you wanting to take away from American Citizens to train foreign air force men who have never paid taxes or supported the USA. Why are you punishing us?

This will take away our rights and private property.

Sincerely yours: Clifford L Neubaum

Dear Major Adams:

I am opposed to the Air Force's proposed RBTI known as Lancer – Option B in the DEIS. My Concern(s) about the proposal and the DEIS are as follows:

As a CPA I have had the opportunity of meeting many clients in the farming and ranching business, some of whom have ranches in the area of your proposed project. These hardworking people suffer many hardships. Drought, disease, severe weather, and unstable market prices to name a few. Your proposal only adds to their burden and should be carefully reconsidered. It is my understanding that there are government

PD-7 lands nearby that could be used for your project. Farming and ranching in west Texas is a heritage that we are proud of and a way of lively hood for so many. Your project will only diminish this important industry.

Sincerely,

Kent Kilpatrick

Dear Major Adams:

BR-4 I am opposed to the Air Force's Lancer project. The threat of the over flights has already negatively impacted the value of our Fisher County properties. If the flights are implemented it is generally assumed that there will be a further negative impact on the land because it will be less productive for grazing and hunting – our two principal sources of income.

Sincerely,

Henry M. Turley
President

Dear Major Adams:

BR-6 I am writing to request your firm support in opposing the selection of Alternative D under the U.S. Air Force's proposed Realistic Bomber Training Initiative (RBTI). The Air Force is seeking to establish a new training route for low level B-1 and B-52 bomber flights from bases in Texas and Louisiana. One of the proposed routes, Alternative D, traverses Philmont Scout Ranch in northeastern New Mexico's Colfax County.

I am a Distinguished Military Graduate of Texas A&M University and through its ROTC program I received my commission upon graduation. I was discharged after eight years as a captain. Almost always I side with the military on just about any issue. However, this is an important exception for me.

Philmont is a 137,000 acre mountain backpacking and high adventure facility of the Boy Scouts of America. Each year, thousands of Scouts and their adult leaders from across the nation participate in two week wilderness backpacking trips in the mountains of Philmont. Many of them also camp and work on conservation projects in the adjacent Valle Vidal Wilderness of the Carson National Forest.

The Air Force's proposed Alternative D will establish a military training route directly over most of Philmont. More than 2,600 flights each year, some as low as 300 feet, are proposed for the segment over Philmont. As a former Philmont staff member (1965-67), I have serious concerns about the impact of the Air Force's proposal on the health and safety of Scouts attending Philmont and the potential effects of daily low level flights on the ranch itself.

On any given day in the summer, as many as 5,000 Scouts and Scouters are hiking and camping Philmont's back country. Each day, several hundred of them will be engaged in activities such as rock climbing and rapelling, spar pole climbing, and mountain horseback rides. The sudden roar of jet engines has a high likelihood of distracting an inexperienced climber or ;causing a horse to bolt on a narrow mountain trail with resulting serious injury or worse.

Appreciation and protection of the wilderness and our natural resources is a key part of the Philmont program. Scouts from around the world have a unique opportunity to see and experience

000816

wildlife in native habitat. Noise and emissions from bombers cannot help but have a damaging effect on that wildlife, as well as on Philmont's herds of buffalo, horses, cattle and burros. The disruptive effects of noisy bomber overflights on Philmont's famous living history programs, in which Scouts experience the lifestyles of the West's mountain men, homesteaders, lumberers and cowboys, are obvious.

Most of Philmont is mountainous with many peaks in the 10,000' to 12,000' range. Philmont has a tremendous fuel load of dead trees in its forests and is in the midst of a long term drought. Unburned jet fuel finding its way to the ground or being dumped in an emergency over such terrain, with campers using backpacking stoves for cooking, creates the potential for a serious fire that would endanger hundreds of lives. The possibility of a crash, however remote, is simply not acceptable for the safety of these Scouts.

For these reasons, I seek your help in advocating the selection of a different RBTI route. I ask that you express your opposition to Alternative D to the Secretary of the Air Force and other defense officials who may be involved in this decision. Please act now, as the public comment period ends in June and a final decision will be made this year. You or a member of your staff may wish to contact Greg Dodd, Chief of Staff for Congressman Ed Pease of Indiana, who can provide additional information.

Philmont is the largest and most famous Scout camp in the world. It is a national resource that has positively impacted the lives of hundreds of thousands of our nation's youth for more than sixty years. It deserves and demands our protection. Thank you for helping to see that Alternative D is not selected.

Sincerely,

Richard H. Rau

Langley AFB, VA 23665-2769

Dear Major Adams,

BR-6 I am writing to request your firm support in opposing the selection of Alternative D under the U.S. Air Force's proposed Realistic Bomber Training Initiative. This would traverse Philmont National Boy Scout Ranch in northeastern New Mexico.

Philmont is a 137,000 acre mountain backpacking and high adventure facility for Boy Scouts. During the summer, up to 5,000 boys and adults hike and camp in this backcountry daily. The noise of jets as low as 300 feet overhead would greatly disrupt the program and possibly be a hazard to scouts. Activities such as rockclimbing, rappelling and horseback riding could become extremely dangerous.

Please let anyone involved in the decision making for this project know how important this facility is to the development of our nation's youth and has been for more than sixty years. A Philmont expedition is the ultimate experience for anyone involved in Scouting. It deserves and demands our protection. Thank you for helping to see that Alternative D is not selected.

Sincerely,

Sally Hamilton

Major Brent Adams
RBTI EIS Prj. Mgr.
HQ ACC/CEVPP
129 Andrews Street, Ste 102
Langley AFB, VA 23665-2769

Dear Major Adams,

BR-6 I am writing to request your firm support in opposing the selection of "Alternative D" under the USAF's proposed Realistic Bomber Training Initiative (RBTI) involving low flying B-52s and B-1s (as low as 300'). As one of several proposed southwestern routes, "D" traverses Philmont Scout Ranch in northeastern New Mexico's Colfax County. Philmont, truly a national treasure, is the 137,000 acre backpacking and training facility of the Boy Scouts of America. I do not protest RBTI since it is a valuable program – my only complaint, as a Philmont alumnus, is with the proposed route over Philmont.

Several years ago, the USAF ceased its low altitude F-16/F-111 flights over the Ranch as a result of Philmont protests. RBTI's multiple daily flights (up to 16) will create much more severe problems:

a) Program: Philmont is a transient community of 25,000 people with over 3,000 campers in Philmont's back country every day in the summer. Daily, several hundred of them are engaged in spar pole climbing, rock climbing and rapelling, and horse back riding. The sudden roaring of jet engines will distract climbers and bolt horses thereby creating injuries (or worse).

b) Environmental: Appreciation and protection of the wilderness are key parts of Philmont's program. RBTI is inconsistent with wilderness preservation. RBTI will have a damaging effect upon both the unique western wildlife and Philmont herds of cattle, horses, burros, and buffalo. The effect of the unburned portion of jet fuel in the engine exhaust or dumped fuel itself, vaporizing and falling to ground level is as yet unknown, but believed to be anything but beneficial.

c) Safety: The environmental impact study done for the USAF is seriously flawed when it describes Philmont as an "uninhabited" grassland. The smaller portion of Philmont's acreage is prairie. Most of Philmont is mountainous with many peaks in the 10,000 to 12,444' range. Philmont has a tremendous fuel load of dead trees in its forests, and is in the midst of a long term drought. Open fire bans are in effect now. A crashing

000818

bomber will create an epic fire of Yellowstone proportions. B-1s and B-52s do not have enviable safety records. The nature of the flights (weaving around mountain peaks and facing violent weather, including frequent, low-level wind shears) dramatically increases the chance of a crash. Unfortunately, Philmont does not have a well-developed highway system for evacuations in case of massive forest fires.

For the above reasons, I seek your help in advocating the selection of a different RBTI route, preferably one that is over a more sparsely populated, less environmentally sensitive area. You, or a member of your staff may wish to liaise with Rep. Ed Pease's (Indiana) legislative assistant, Greg Good, who has additional information on RBTI.

There is too much at stake to allow RBTI to overfly Philmont. Please act now – final route determination starts in June. Thank you for helping to see that alternative D is not selected.

Respectfully

Donald J Vandamme
District Camping Chairman
Lakeshore District
Detroit Area Council
Boy Scouts of America

Re: Public Comment RBTI Alternative D
Conflict with Philmont Scout Reservation
Cimarron, New Mexico
Colfax County, New Mexico

Dear Major Adams:

BR-6 I understand that one of the routes, alternative D, for the Air Force's Realistic Bomber Training Initiative (RBTI) will traverse Philmont Scout Reservation. It has come to my attention that the Environmental Impact Study (EIS) concludes that very few population centers will be affected and that the Air Force has received very little response from the villages around Philmont which likely has lead you to conclude that the residents are indifferent about the proposed flights.

It is true that the area around Philmont Scout Reservation is not heavily populated. However, every summer the population of Philmont swells to a total of 25,000 Boy Scouts and their leaders. On any given day about 5,000 Scouts are in the back country enjoying The Peak Scouting Experience in a wilderness environment. None of these summer residents have had a chance to comment regarding your proposed alternative D.

Philmont is so popular that it takes a competitive telephone calls in to get a reservation. Last year, using continuous speed dialing with my computer it took 3 hours of to get through and we did not get a reservation for 2000. Our troop is 453rd on the waiting list for a trek in 2000. This year the Boy Scouts doubled the number of operators to 48. Four of us manned different telephones using continuous speed dialing. It took us a little over an hour to get through and all of the dates before July 19 had already been taken. But Troop 84 will be going back to Philmont in 2001. Due to its popularity we are not eligible to call in for the 2002 reservations, but must wait for the 2003 reservations.

Philmont Scout Reservation is a 137,000-acre mountain backpacking and high adventure facility of the Boy Scouts of America. Many of the Air Forces' current and future officers and enlisted men either have had or will have a Philmont experience. Philmont employs a staff of 500 college aged men and women. They are dedicated to the spirit of Philmont and choose to work at Philmont for considerably less money that they could make elsewhere because they believe in the Philmont experience. I know. My daughter worked there one summer. My oldest son is in his 5th on staff and my youngest son is in his 2nd year.

000819

Major Brent Adams
June 4, 1999
Page 2

Last year my wife and I attended the Philmont training Center for a week long seminar about Scouting in the Catholic Church. There were about 50 participants from all over America. All of them brought a spouse and most brought children. Those that were not directly involved in the conference enjoyed the Philmont treasures every day. It was an exciting conference and a wonderful place to have it. It was far from the noise of the city and hum drum of modern work day life. There were magpies in the trees, eagles in the air along with falcons and other wildlife. Bombers screaming overhead would have ruined our experience.

I have taken Scout crews to Philmont in the summers of 1991, 1994 and 1995 and also in the winter of 1995-96. The experience would have been ruined if B-1 and B-52 bombers flew over at 300 feet. Hiking with a 40 pound pack on your back up steep terrain on a 60 to 70 mile backpacking adventure is the thrill of a life time for the Scouts and for their leaders. I can attest to that. The idea of enduring all of the hardship to get to a high peak to to a secluded canyon only to have it spoiled by a B-1 or B-52 bomber screaming in low over my head would make me want to scream or cry. I do not know which until it happens. In either event you will have ruined a national treasure.

I understand that no plane burns all of its fuel. At lower altitudes the unburned fuel will impact the ground level environment, including the air being breathed by hikers. Many of us, myself included, are allergic to diesel and jet fuel. It gives me an asthmatic reaction. I try to avoid exhaust from diesel and jet engines. There is a very real chance that the unburned fuel falling into Philmont's air will trigger a severe asthmatic attack for someone on a trail far from a doctor or hospital. This is a risk that I do not believe is acceptable and doubt that it has been considered at all.

Furthermore, there have been two plane crashes at or near Philmont over the years. I believe one was a B-17 or other WWII era bomber and the other was a private plane. Neither one was attempting low level bombing runs. A crash by a low flying B-1 or B-52 is very real concern. I recall a B-1 that flew right into a cliff near Van Horn, Texas a few years ago and expect that it would be a likely event at Philmont. I understand that the EIS estimates that there is a chance a "Class A mishap" once out of every 15 years for a B-1 bomber on its training route. That route includes Philmont.

I am also concerned about the effect that the noise will have on livestock. About 7500 to 9500 Scouts participate in the horse riding program, called Cavalcade. Most of them are inexperienced. They are riding on steep and narrow mountain trails. The noise from a B-1 or B-52 will likely spook the horse with an inexperienced rider aboard. Very serious accidents, including deaths, are bound to happen due to the low level flights.

Also, most of the 5,000 Scouts in the back country will be be repelling on shear cliffs sometime on their two week trek. I have repelled twice and it is scary enough without bombers screaming over head. I fear that some Scouts will not participate or else some of the rock program will have to canceled.

000819

Major Brent Adams
June 4, 1999
Page 3

I am also concerned that Scouts will not be able to adequately hear the safety precautions given at the the program camps, i.e. rock climbing, black powder riflery, spar pole climbing, skeet shooting, obstacle courses, Indian tomahawk throwing and others.

I understand that the EIS fails to consider the effect on the fragile historical sites. Philmont has two National Historic sites, i.e. The Kit Carson/Maxwell Abreu Houses at Rayado and the Villa Philmonte. It also does not consider what the cumulative effects of vibrations from the high noise levels would be on the hundreds of abandoned mines and the two active mines located on Philmont. Scouts tour the two active mines. It would be a shame to have to close the tours because of the increased risk of cave ins.

Philmont is the largest and most famous Scout camp in the world. It is a national treasure that is shared by thousands of Scouts and Scouters each year. Scouts have been positively impacted by their Philmont experience for the past 60 years. It is a true wilderness experience that must be preserved. There are no alternative sites available for the Boy Scouts, but there are alternatives for the RBTI.

Please do not jeopardize the successful program at Philmont and do not endanger the safety of the thousand of young people who participate at Philmont each year.

Very truly yours,

Robert G. Elliott

Langley AFB, VA 23665-2769

Dear Major Adams:

BR-6

I am writing to request your firm support in opposing the selection of Alternative D under the US Air Force's proposal Realistic Bomber Training Initiative (RBTI). The Air Force is seeking to establish a new training route for low-level B-1 And B-52 bomber Flights from bases in Texas and Louisiana. One of the proposed routes, Alternative D, transverses Philmont Scout Ranch in northeastern New Mexico's Colfax County.

Philmont is a 137,000 acre mountain backpacking and high adventure facility of the Boy Scouts of America. Each year, thousands of Scouts and their adult leaders from across the nation participate in two-week wilderness backpacking trips in the mountains of Philmont. Many of them also camp and work on conservation projects in the adjacent Valle Vidal Wilderness of the Carson National Forest.

The Air Force's proposed Alternative D will establish a military training route directly over most of Philmont. More than 2600 flight each year, some as low as 300 feet above ground level, are proposed for the segment over Philmont. As an active Scouter interested in wilderness backpacking, I have serious concern about the impact of the Air Force's proposal on the health and safety of Scouts attending Philmont and the potential effects of daily low-level flights over the ranch.

On any given day in the summer as many as 5,000 Scouts and Scouters will be hiking and camping in Philmont's backcountry. Each day, several hundred of them will be engaged in activities such as rock climbing and rappelling, spar pole climbing, and mountain horseback rides. The sudden roar of jet engines has a high likelihood of distracting an inexperienced climber or causing a horse to bolt on a narrow mountain trial resulting in serious injury or worse.

Appreciation and protection of the wilderness and our natural resources is a key part of the Philmont program. Scouts from around the World have a unique opportunity to see and experience wildlife in native habitat. Noise and emissions from bombers cannot help but have a damaging effect on that wildlife, as well as on Philmont's herds of buffalo, horses, cattle and burros. The disruptive effects of noisy bomber overflights on Philmonts famous living history programs, in which Scouts experience the lifestyles of the West's mountain men, homesteaders, lumberers and cowboys, are obvious.

000821

The Environmental Impact Study(EIS) fails in several areas to mention any impact of flyovers on Philmont's two National Historic sites, The Kit Carson/Maxwell Arbeu houses at Rayado and the Villa Philmonte. The EIS incorrectly concludes that very few population centers are affected. On any given day in the summer months, over 5,000 people will be living and camping directly under the flight path at Philmont.

For these reasons, I seek your help in advocating the selection of a different RBTI route. I ask that you express your opposition to Alternative D to the Secretary of the Air Force and other defense officials who may be involved in this decision. Please act now, as the public comment period ends in June and a final decision will be made this year. You or a member of your staff may with to contact Greg Dodd, Chief of Staff for Congressman Ed Pease of Indiana, who can provide additional information.

Philmont is the largest and most famous Scout camp in the world. It is a national resource that has positively impacted the lives of hundreds of thousands of our nation's youth for more than sixty years. It deserves and demands our protection. Thank you for helping to see that RBTI Alternative D is not selected.

Alpine says no to flights by Air Force

■ Military officials say they will make the best choice as to where pilots train, despite negative civilian responses.

By Greg Harman
Odessa American

ALPINE — West Texans continued their protest Saturday of an Air Force proposal to train more than 1,000 additional bombing missions as low as 300 feet over the region as part of a "realistic" bomber training initiative.

Even as allied NATO forces began unveiling tens of low-altitude fighters in Serbia and Kosovo, West Texans attending a series of Air Force hearings this week were urging officials to take the B-52 and B-1B bomber training flights to federally owned lands far beyond the Texas state line.

"The Air Force's low-level training is over populated, public property when there is 8 million acres of federally owned land available."

Bryan Kelley a spokesperson for the Trans-Pecos Protection Group, a non-profit, property rights organization, told the crowd of 25 spectators in Alpine.

"There is no reason not to move these planes" to federal properties."

The hearing was the fourth this week, following public meetings in Big Spring, Midland and Fort Stockton where disapproval of the proposal was evident.

Lt. Dan Kerr said that training on federal lands already taken place, but other military branches place great demands on the land.

He said that the contrary public opinions on the Air Force proposal would not deter the Air Force from making the best decision for its needs.

"Because we go to a traveling and busy, the direct result this is not going to deter us from providing the best training available for our pilots," Kerr said.

A severe decline in funding for the Air Force has resulted in fewer training hours for pilots and led the way for an exodus of military pilots

Major Adams Sir,

I just how do you come about deciding that you can violate Tax-paying citizen rights & property by selecting our property & air space with your smack-buckly jack-booted Nazi decisions? Just who & what in our constitution gives you the right to make such Nazi-communist

000822

may I remind you that there is a government - "of" the people "by" the people & not as people "to" you not your dog-poo smelling jack-booted shit the Tax payers that finance all the planes, give you a job & also Good living generation, while you take it and the master; us & our children & destroy the very life & freedom that you are there to protect us.

May be you should take lessons from the air force that won't

Philmont, truly a national treasure, is the 137,000 acre backpacking and training facility of the Boy Scouts of America. I do not protest RBTI since it is a valuable program – my only complaint, as a Philmont alumnus, is with the proposed route over Philmont.

Several years ago, the USAF ceased its low altitude F-16/F-111 flights over the Ranch as a result of Philmont protests. RBTI's multiple daily flights (up to 16) will create much more severe problems:

a) Program: Philmont is a transient community of 25,000 people with over 3,000 campers in Philmont's back country every day in the summer. Daily, several hundred of them are engaged in spar pole climbing, rock climbing and rappelling, and horse back riding. The sudden roaring of jet engines will distract climbers and bolt horses thereby creating injuries (or worse).

b) Environmental: Appreciation and protection of the wilderness are key parts of Philmont's program. RBTI is inconsistent with wilderness preservation. RBTI will have a damaging effect upon both the unique western wildlife and Philmont herds of cattle, horses, burros, and buffalo. The effect of the unburned portion of jet fuel in the engine exhaust or dumped fuel itself, vaporizing and falling to ground level is as yet unknown, but believed to be anything but beneficial.

c) Safety: The environmental impact study done for the USAF is seriously flawed when it describes Philmont as an "uninhabited" grassland. The smaller portion of Philmont's acreage is prairie. Most of Philmont is mountainous with many peaks in the 10,000 to 12,444' range. Philmont has a tremendous fuel load of dead trees in its forests, and is in the midst of a long term drought. Open fire bans are in effect now. A crashing bomber will create an epic fire of Yellowstone proportions. B-1s and B-52s do not have enviable safety records. The nature of the flights (weaving around mountain peaks and facing violent weather, including frequent, low-level wind sheers) dramatically increases the chance of a crash. Unfortunately, Philmont does not have a well-developed highway system for evacuations in case of massive forest fires.

For the above reasons, I seek your help in advocating the selection of a different RBTI route, preferably one that is over a more sparsely populated, less environmentally sensitive area. You, or a member of your staff may wish to liaise with Rep. Ed Pease's (Indiana) legislative assistant, Greg Good, who has additional information on RBTI.

There is too much at stake to allow RBTI to overfly Philmont. Please act now – final route determination starts in June. Thank you for helping to see that alternative D is not selected.

Sincerely,

[illegible]
Hillsborough NC

Major Brent Adams
RBTI EIS Project Manager
HQ ACC/CEVP
129 Andrews Street, Suite 102
Langley AFB, VA 23665-2769

Dear Major Adams:

I am opposed to the Air Force's proposed RBTI known as Lancer-Option B in the DEIS. Some of my concerns about the proposal and the DEIS are as follows:

Our area is suffering while the rest of the country beeks in economic upturn. Our oil industry and agricultural markets have plummeted leaving many without jobs. Our only hope is the potential to attract new industry, tourists who are attracted to the natural quiet and beauty of the area, and income from hunting in the rural surroundings. The area is not as sparse as it seems. The land here is populated though out with individuals actively struggling to make a living in an already difficult environment: townspeople, oilfield workers, ranchers and farmers with livestock.

AO-18 **Unexpected noise interruptions in the schools**
I serve as the district elementary art specialist. I see 1,650 children a year. There is an acute problem in our schools with children who have attention deficit disorder and emotional disorders. A quiet and orderly learning atmosphere is essential for these children to succeed and learn.

BR-2 **Interference with existing low-level air traffic:**
*Farm and ranch: pest control and crop defoliation flights, helicopter livestock management
*Oilfield pipeline check flights
*Flight - for -Life helicopter service to the hospital in Lubbock (90 miles away)
*Commercial flights for Lorber industries and possible future industry

BI-2 **Sandhill Crane migrations:**
We are in the pathway of the sandhill crane migrations all through the winter. Hundreds fly overhead every day during the winter months.

Emotional toll of constant unexpected noise interference into a virtually silent living environment outside of the sounds of nature.

Economic damage to an already suffering area due to noise, pollution, discouragement of future settlement in the area by investors of businesses, tourism, and hunting.

000826

I plead with you not to come to our area. It would do irreparable damage to an already suffering community. Our area in dire straits right now.

Sincerely,

Carol C. Bullard

Carol C. Bullard, MAE
District-wide Elementary Art Specialist and Program Coordinator
Snyder ISD

Snyder, Texas

Comment #000827 is a replacement for the original May 6th, 1999 submittal per Mr. Weida's request.

000827

To: Major Brent Adams
RBTI Project Manager
HQ ACC/CEVP, 129 Andrews Street
Suite 102, Langley AFB, VA 23665-2769

From: William J. Weida

McCall, Idaho

Date: June 14, 1999

Please enter the attached document dated May 6, 1999 in place of my April 7, 1999 testimony on noise modeling submitted at the public hearing on the RBTI in Snyder, Texas.

I have also submitted a second document on the potential costs of the RBTI to tourism. That document will be forwarded to you by the Western Environmental Law Center of Taos, NM. The tourism document is not replaced by the May 6 document attached to this note and it should be answered separately by the Air Force.

Thank you,

William J. Weida

Comments on the Analysis of Noise and Route Structures in the Realistic Bomber Training Initiative (RBTI) Draft Environmental Impact Statement

William J. Weida
Professor of Economics,
The Colorado College
Colorado Springs, Colorado

May 6, 1999

000827

My name is William J. Weida. I live in Colorado Springs, Colorado and I am employed as a Professor in the Economics and Business Department of The Colorado College where I specialize in defense economics, statistics, and econometric modeling. I received a BS in engineering from the US Air Force Academy, an MBA from UCLA, and a Doctorate in Econometrics and Operations Research from the University of Colorado. I was a member of the Economics Department at the US Air Force Academy for 11 years, the last two of which I was chair. I was an economist in the Office of the Secretary of Defense for three years, and I retired from the Air Force as a Colonel in 1985.

While serving in the Air Force, I was a combat pilot in Vietnam with 200 combat missions. Later, working as an economist, I developed a method of modeling research and development costs that I successfully applied to a variety of projects ranging from the B-1 bomber to nuclear warheads. This model provided the first forecast of overruns on the B-1 bomber, and it is now used to forecast and monitor development costs for laser projects associated with the SDI. I also served as the director of the in-house Air Force team that reviewed the Environmental Impact Statement for the racetrack deployment of the MX missile in Utah. I have authored four books on defense economic issues and have contributed chapters to numerous other books on the same topic.

000827

Summary Comments

This report finds the Realistic Bomber Training Initiative Draft Environmental Impact Statement (RBTI DEIS) has major shortcomings and fails to consider relevant factors in the following areas:

AO-75 I. Critical Requirements for Theory

Violation of three critical modeling assumptions renders the Air Force noise analysis seriously deficient in terms of internal scientific integrity and external validity.

PD-33 II. The Scope and Foundation of the RBTI DEIS

The DEIS inflates the baseline condition by including operations that are proposed to occur in the future. This, in turn, understates the differences that will occur if Alternative D is chosen.

The DEIS study area is clearly connected to a large number of other areas that have resulted or will result from other EISs and EAs. Consequently, the RBTI is more properly the subject of a programmatic EIS that could adequately consider the regional implications of this proposal.

BR-1 III. Sacrificing Reality for Computational Efficiency in Air Force Noise Models

The Air Force has used a significant number of simplifying assumptions in order the increase the computational efficiency of its models.

Assumptions made by the Air Force

- Concerning the vertical distribution of flights
- Concerning the lateral distribution of flights in MTRs
- Concerning the lateral distribution of flights in MOAs
- Concerning the actual noise generated by aircraft in MTRs and MOAs

do not fit the actual state of nature and invariably act to depress the noise annoyance calculated by the models.

AO-54 IV. The Air Force's failure to consider the difference between urban and rural/wilderness conditions

The Air Force failed to properly account for noise annoyance over rural and wilderness areas in spite of clear evidence that it has known since at least 1990 that its models are deficient in this area.

The noise modeling in this DEIS fails to consider relevant factors, and the Air Force did not take the necessary steps to ensure the scientific integrity, including external validity, of the DEIS analysis predicted on its noise modeling efforts.

BR-1 V. What the Air Force Knew About Its Noise Analysis From Its Own Research Reports

Of the many scholarly documents, reviews, critiques and studies by eminent researchers available to the Air Force over the last 20 years that provide evidence that noise modeling done by the Air Force was not applicable to MTR and MOA applications, not a single one of these documents was seriously reviewed, cited, or considered in this DEIS.

Appendix 1 of this report lists 59 articles and reports, all by respected noise researchers, that could have been used by the Air Force to provide an alternative and more widely accepted approach to noise modeling in both urban and rural settings.

Noise/annoyance models done for other government agencies since 1990 by the same noise researchers used by the USAF were successfully modified to reflect the differences between rural/wilderness aircraft noise and community noise. This modeling directly contradicted the claims about rural/wilderness noise/annoyance made in Air Force EISs.

Claims about the percentage of population highly annoyed by aircraft activity in rural and wilderness areas grossly understate the actual percentage of the population who would be highly annoyed.

000827

Assuming that the Air Force monitors its own research contracts, it must be well aware that this understatement is taking place.

AO-75 VI. What the open literature says about the methodologies, assumptions, and results of Air Force Noise Modeling

The literature of noise/annoyance modeling overwhelmingly states that the Schultz curve significantly underestimates community noise annoyance.

There is no credible research that indicates the Schultz curve, its updated version by Fidell *et al.*, or the Air Force/Finegold model are applicable to the rural and wilderness sites that are the subject of this DEIS.

AO-75 VII. What the Air Force Did In The RBTI DEIS

The Air Force simply copied old, often erroneous information from other EISs and EAs.

The Air Force used these outdated sources to construct this DEIS for almost all principle areas of its noise evaluation.

The Air Force chose to disregard a large body of evidence--of which it was fully aware at the time this DEIS was written--that showed this noise analysis did not apply to the rural and wilderness areas that are the subject of this DEIS.

AO-60 VIII. Problems with the 1978 Schultz Community Noise Annoyance Model

A point-by-point analysis of the central model used by the Air Force demonstrates:

Failure to properly generate the curve used in the 1978 Schultz study.

Failure to use the appropriate data to analyze aircraft noise.

Failure to develop an aircraft-only model.

Failure to properly apply land use and the noise/annoyance models.

Failure to consider the difference between urban and rural/wilderness conditions.

AO-56 IX. The Costs of Noise

Solid noise research on the effect of aircraft noise on urban property values has been available for years and has been made known to the Air Force.

The results of this noise research are unambiguous--noise from aircraft operations lowers property values.

The Air Force performed no cost benefit analysis of its choice of options or of any alternatives. This section of this report also provides an indication of the costs to those affected by the MTRs and MOAs.

000827

Introduction

The primary focus of the RBTI DEIS is on the effects of noise on the environment. The DEIS itself states that "[c]oncerns about the effects of aircraft noise on humans, livestock, wildlife, recreation, and general quality of life were the most numerous comments received through the public scoping process."[1] However, Appendix G, the major noise section in the DEIS appears to have simply been copied from previous EISs and the noise discussions in the remainder of the DEIS are merely explanations of output from various Air Force noise models that are based on urban noise/annoyance relationships.

The acknowledged authors of this DEIS appear to have neither the education, experience nor ability to do noise modeling, and since none of these authors takes credit for Appendix G, the section upon which all noise analysis in the DEIS is based, one must presume that the most important areas of analysis in this DEIS were either copied from other sources or adopted from Air Force models without the critical review necessary to take a 'hard look' at the noise issues involved. This is unfortunate because the Air Force's view of the impact of aircraft noise on rural environments--as presented in this DEIS--is very much a minority opinion. A large amount of readily available research indicates that noise/annoyance relationships for rural and wilderness areas are substantially different than those depicted by the Air Force, and yet this DEIS cites none of those sources. The NEPA is clear about the obligations of those who construct an EIS:

> When facts contrary to the conclusions advanced by agency are known to agency or its sister agencies of government, it is necessary to disclose them in EIS in order to meet disclosure requirements of 42 USCS § 4332, otherwise persons removed from decision-making process will have no way of knowing adverse effects that have been found in similar proposals.[2]

Instead, those works that the authors of this DEIS have chosen to copy or adopt all involve noise modeling that is favorable to the Air Force's point of view. For these reasons, any critique of the core elements of this DEIS must concentrate specifically on the noise/annoyance areas of the RBTI DEIS document. This is the purpose of the sections that follow.

AO-75 **I. Three Critical Requirements for Modeling and Theory**

Requirement 1.

Every valid noise model must satisfy one critical requirement. In a 1990 paper specifically cited by Brooks AFB noise researchers in 1996, Ronald deJong, one of the most respected European noise researchers described this requirement in the following way:

> The population is rarely exposed to one single noise source. Within the last ten years, several researchers have dealt with the problem of noise annoyance arising from multiple sources. Several models have been proposed, however most of these had to be rejected...because of the implication that the annoyance from the combination of two sources may be less than the annoyance from the most annoying type, when heard alone...Intrinsically, a total noise situation can never be less annoying than the most annoying component, no matter what the verbal reports may be.[3]

[3] deJong, Ronald G., "Community Response to Noise: A Review of Recent Developments," Environmental International, Vol. 16, 1990, p. 520.

000827

The models on which this DEIS is based--the Schultz model, and the Fidell and Finegold revisions of this model--all commit the fatal error of predicting that the annoyance to a mixture of aircraft and transportation noise is less than the annoyance from the aircraft noise alone.

Requirement 2.

Any model using the Day-Night Average Sound Level (DNL) must satisfy a second requirement concerning the equal energy hypothesis. In 1990, Dr. Sanford Fidell, a leading Air Force noise researcher, described this requirement in the following way:

> Use of ...DNL to predict annoyance hinges upon acceptance of the equal-energy hypothesis: the notion that people are indifferent between the annoyance of exposure to sounds of short duration but high level and sounds of long duration but compensatingly lower level.[4]
>
> [This is an] assumption that the ambient noise environment on which aircraft operations intrude may be ignored; that the world is locally flat; and that aircraft flight profiles and flight tracks can be specified with precision."
>
> The differences between residential and outdoor recreational exposure to aircraft noise, as well as the differences in purposes for characterizing aircraft noise exposure, are sufficiently great to suggest the need for an alternative approach to preparing aircraft noise contours.[5]

As Dr. Fidell notes, the noise models used in this DEIS are applied to situations that do not satisfy the conditions necessary for applying the equal energy hypothesis. Thus, the noise modeling done in this DEIS is also flawed in this fundamental area.

Requirement 3.

Finally, any valid noise/annoyance model must exhibit one additional trait--it must reflect the real world.[6] To do this, the model must take into account all known facts and it must generate predictions that can be tested by any unbiased and independent observer.[7] Further, the adequacy of such a model must be tested by determining how well it fits the world it describes and how well it can predict changes in this world.[8] The Air Force noise/annoyance model has done very poorly in all these areas.

From the very start, the use of A-weighted sound levels as the basis for the Ldn figures in the Air Force Model introduced problems in depicting the real world noise environment. As Goodfriend states,

> "Prior to the development of the A-weighted sound level...it was common to evaluate noise based upon some type of frequency analysis of the signal in question. A very early community noise evaluation technique, the Composite Noise Rating (CNR), was based upon octave band measurements of source and ambient, and proved an effective

000827

> gauge of community responses...Pressure by the international market prompted the International Standardization Organization [ISO], to recommend, in the early 1960's, the use of the A-weighted sound level for 'noisiness' measurements. They did so reluctantly, but noted that *its use was only proper for sounds below 60 dB(A), and could provide inadequate and misleading results*. This note was given little attention and the added momentum for A-weighted sound levels made it the clearly preferred method of achieving a measure of noise loudness."[9] [Author's emphasis]
>
> ...A-weighting was an early and simplified attempt at measuring loudness. It does not, however, tell the whole story...By using an A-weighted Leq, we have succeeded in describing a complex signal with spectral, amplitude, and temporal variations, by a single number; but the signal remains complex, only the description is simple, and often too simple. In recent years, these deficiencies have been recognized by many, and the reliance on Ldn has been questioned. This is especially true when the noise being evaluated is not due to free-flowing vehicular traffic or aircraft operations near airports."[10]

In addition, partially because of the equal energy hypotheses discussed above, the use of LDN metrics causes further problems in representing reality. A 1995 paper on noise metric observations related to an aircraft-only noise model by Burn, Stusnick, and Ehrlich stated that :

> ...since DNL accounts for the loudness of individual events and the number of operations, and equivalent DNL value can result from a few very loud overflights or a larger number of quieter ones. DNL is considered useful in predicting the average response of communities but not of individuals.[11]

And in a 1995 study of noise-induced sleep disturbance that was centered around urban airports, Fidell *et al.* found that

> The failure of analyses based on "entire night" noise measurements (that is, total noise exposure from retiring to last awakening) to account for appreciable variance in awakening data indicates that cumulative noise exposure metrics such as DNL are ill suited to prediction of noise-induced sleep disturbance.
>
> The ability of sounds to awaken people is clearly sensitive to the temporal distribution of noise energy: small amounts of noise distributed over longer periods of time are far less likely to awaken people than large amounts of noise energy concentrated within short periods of time (i.e., discrete noise events). The present findings do not support meaningful characterization of sleep interference in terms of DNL values of community noise environments.[12]

For these and other reasons, the Ldn noise/annoyance model used by the Air Force has had a very poor record. The Air Force itself acknowledges that

000827

> "...despite the fact that the Air Force routinely has about $10 million in claims pending relating to aircraft overflight issues, *these claims have never been found to be related to non-compliance situations*. Nevertheless, the claims typically result in disbursements of about $5.3 million each year."[13] [author's emphasis]

In other words, even in situations where the Air Force model predicts there should be little or no annoyance to noise, claims are routinely made for noise damage. For example:

- A 1988 court case involved an Air Force estimate, based on the Schultz curve, that 700 people around Westover Air Force Base would be highly annoyed by aircraft noise. A local group gathered the signatures of 1535 citizens who were highly annoyed--more than double the amount the Schultz curve forecast.[14]
- In 1987/1988, Mayor Fredrico Pena of Denver claimed that "not a single residence will lie within the Federally designated 65 Ldn and be impacted by noise like we now have at Stapleton." But in the first 12 months of DIA operation over 84,000 complaint calls arrived at the DIA Noise Office from over 3000 individual residences.[15]

The faith the federal government itself places in this noise/annoyance model is evident in the following reference to the validity of the NOISEMAP/ROUTEMAP computer programs used by the Air Force. Title 49 of the US Code states that

> "No part of a noise exposure map or related information described in section 47503 of this title that is submitted to, or prepared by, the Secretary of Transportation and no part of a list of land uses the Secretary identifies as normally compatible with various exposures of individuals to noise may be admitted into evidence or used for any other purpose in a civil action asking for relief for noise resulting from the operation of an airport."[16]

Noise researchers have long known about these problems and several alternative methods of calculating noise annoyance relationships have been suggested. For example, Beranek relates how Kryter was able to solve this problem in 1956:

> ...BBN[BBN Systems and Technologies Corporation, Canoga Park, California--a government consultant on noise issues] was engaged by the Port of New York Authority (PNYA) to assist them in planning for the advent of jet aircraft... [by] determinin[ing] a physical measurement...that would equate the noise annoyance produced by jet aircraft with that produced by the largest propeller-driven aircraft.
>
> Kryter's annoyance judgments showed that, when judged equally disturbing, the C-weighted overall noise level of the 707-120 Boeing jet airliner...had to be about 9 dB less than that of the largest propeller aircraft. Kryter devised a single-number measurement, 'Perceived Noise Level' (in units of PNdB), which would yield the same magnitudes when the noise of the two types of aircraft were made equally annoying. The 707-120, at the same altitude, was 15 PNdB more annoying than the largest propeller aircraft.[17]

000827

Goodfriend and Martin discuss the Community Noise Rating, first proposed in 1952, as another alternative that provides better annoyance measures than the Ldn scale used by the Air Force:

> In light of the limitations of the A-weighted Leq, especially for evaluating non-traffic or aircraft related noise, what better descriptors are available for describing or evaluating environmental noise impact? The Community Noise Rating, first proposed by Rosenblith and Stevens in 1952, is such a descriptor...A correction for the percentage of time the source noise is present was included in the original model...[18]
>
> A scenario was developed based upon measurements made in the western area of New Jersey where the FAA East Coast Air Traffic plan has resulted in widespread complaints. Measurements of several aircraft overflights (takeoff) in the Branchburg area were used to develop a CNR based prediction of community response. Using only ten flights per hour, a Level Rank of g to h was determined. A correction of -1 to -2 was applied to adjust for the background noise levels in the area (also based upon octave band sound level measurements made in the area); and additional correction of -1 was applied to adjust for duration of the signal (assuming that the overflights are present for about 17% of the time, or 10 minutes per hour. The result was a CNR of 'E', corresponding to 'Widespread Complaints', which is exactly what has resulted since the institution of the new flight plan. In contrast the Ldn analysis carried out by FAA predicted little or no impact.[19]

In sum, even in urban environments the current Air Force noise/annoyance model has significant problems that have, in many situations, caused it under predict the number of people annoyed with aircraft noise. Alternatives to this model have been widely known and discussed in the noise research community since the 1950's, and these alternative models generally find that jet aircraft noise is more annoying than the model used by the Air Force. However, the Air Force has made no attempt to incorporate the results of these alternative models, or to acknowledged their existence, in the noise sections of its EISs and EAs. This has created a third fundamental error in the Air Force model.

PD-33 **II. The Scope and Foundation of the RBTI DEIS**

One requirement for analysis in an EIS is the inclusion of a valid baseline against which proposed changes in operations may measured so that one may accurately calculate the impacts of those changes. In this respect, it is clearly the intent of the NEPA that the baseline represent present, observable conditions in the impact (study) area. However, in the RBTI DEIS the baseline contains a large number of sorties that are conditioned on "current and approved inpending actions in the study area"--changes in MTRs and MOAs that may not take place for another year or more.[20] As a result, the sortie numbers in the baseline totals in Table 2.2-1 are significantly inflated and do not represent the noise levels currently experienced by those living under the existing MTRs and MOAs. As a consequence, the noise changes calculated in the DEIS are correspondingly deflated, making the changes proposed in the DEIS look smaller than they actually are.

According to the Air Force, both baseline and alternative uses of the MTRs and MOAs proposed in the RBTI DEIS are directly linked to

[18] Goodfriend and Alexander, Op. Cit., pp. 519, 521.
[19] Ibid., p. 521.
[20] Draft Environmental Impact Statement, *Realistic Bomber Training Initiative*, Vol. 1, Op. Cit., pp. 2-12 to 2-17.

000827

- Stationing 60 F-16's at Cannon AFB in 1995.
- The pending conversion of six ALCM routes to MTRs.
- The pending approval of the Talon MOA.
- Establishment of the Bronco MOA in 1998.
- Relocation and revision of MTR VR-1174/1574 and VR-1175/1176 in 1998.
- Establishing training programs for the Republic of Singapore in 1998.
- Creating expanded German Air Force training activities at Holloman AFB in 1999.
- The establishment of the 13th Bomb Squadron at Dyess AFB in 1997-2000.[21]

Further, according to Figures 2.2-1a, b, and 2.2-2, the study area is connected to exterior areas on all sides by a web of aircraft routes (IR-154, 110,107, 174, 592, 150, 501, 178, 128, 180, 192, 194, 102, 141, etc.) which connect to other MTRs and MOAs in New Mexico, Colorado, Kansas, Missouri, Arkansas, and Oklahoma.[22] As the DEIS states, Alternative D: IR-153/Mt. Dora "interacts with numerous airspace units in that region."[23] These linkages between the RBTI DEIS and areas that have been or are the subject of a number of other EAs, EISs, and reviews imply that the RBTI DEIS does not represent a single, specific proposal. Instead, it is one of a number of piecemeal proposals that, when approved, will all result in a combined training area covering areas of seven western states with additional linkages to even more states and training areas to the north and west.

Under the National Environmental Protection Act, these kinds of actions require a programmatic EIS to account for the synergies and cumulative impacts caused by combining individual actions into joint operations. The courts have held that

> ...several proposals for related action that have cumulative or synergistic environmental impact upon region ...must be considered together; such "programmatic" impact statements are particularly appropriate where agency has ongoing program that continues to have significant effect on environment."[24]

BR-1 **III. Sacrificing Reality for Computational Efficiency in Air Force Noise Models**

All models are simplified representations of reality, and the models the Air Force uses to compute noise levels for the noise/annoyance analysis in its EISs are no different. However, a good researcher must always keep two precepts in mind: First, when the model is constructed the modeler must balance the desire for simplicity with sufficient complexity to adequately represent reality. When a model is constructed to calculate people's annoyance with aircraft noise, sacrificing reality for computational efficiency should be very much a second order consideration. Second, when assumptions are used in modeling, they must be employed so as to add no bias to the output of the model. While any assumption introduces error into a model, this error must always be random, tending to raise estimates made by the model about as many times as estimates are lowered.

The extent to which a modeler may validly employ as assumptions any of a number of possible approximations depends, among other things, on the purpose of the model being

constructed. If the purpose of the model is to predict noise, as is the case in this DEIS, one would expect the modeler to limit, to the maximum extent possible, assumptions about noise levels that would limit or predetermine the noise output forecast by the model. However, Air Force noise models employ a large number of simplifying assumptions, such as the equivalent acoustical altitude, that predetermine the levels of noise calculated by the model and hence, the amounts of annoyance forecast. In the process of doing this, every simplifying assumption (and indeed, every statistical technique) used in the models appears to lower forecast noise levels. That such an outcome could occur by chance is highly unlikely.

Assumptions concerning altitude

As the Air Force has simplified its models, it has resorted to the use of statistical distributions and averages that are, in reality, assumptions about the true state of nature. Among other things, these assumptions are statements about the terrain over which the aircraft will fly and the manner the aircraft will distribute themselves within MTRs and MOAs. For example, when modeling noise in MTRs, Cook and Lucas state that "the flight track dispersion in the vertical plane is modeled by using an equivalent acoustical altitude that is determined from an altitude distribution of time spent at selected altitude ranges."[25]

A research report from Wyle Labs states that this is accomplished in the following manner:

> Calculating the EAA in MRNMAP is done as a two-step process. The first step sums the noise level directly under the aircraft using the altitude distribution appearing under the MISSION keyword. The summing process begins at the floor of the airspace and continues up to the ceiling. The result is a total noise level under the aircraft. In the second step, the program uses this noise level to look up the equivalent altitude from the SEL tables. This becomes the equivalent acoustical altitude and its value replaces the altitude distribution in subsequent calculations.

These noise levels are not calculated from actual data gather at the site of the proposed MTR or MOA. As the AICUZ Program Manager's Guide states ,

> The noise data collection team does not use sound measuring devices to create the noise contours. Instead, they use a computerized noise model called NOISEMAP which has an internal database of noise characteristics for each aircraft type built into the program. Based on information gathered from representatives of the flying community...the information is encoded into the computer program to graphically produce noise contours...[26]

In fact, even without gathering site-specific data, it is apparent that accurately representing the noise impact on the area under study is a secondary consideration to getting the job done quickly. As the Manager's Guide goes on to state:

> The goal of a data collection team is to complete the task within a 10-day visit (excluding weekends). The interview, documentation and verification processes, and noise contour generation will normally be completed during this time. Providing the user an accurate final product at the conclusion of the visit is the goal of the data collection team.[27]

[25] Cook, Brenda W., and Lucas, Michael J., "A Review of Air Force Policy and Noise Models Pertaining to the Noise Environment Under Low-Altitude, High-Speed Training Areas," NOISE-CON 93, Williamsburg, Virginia, May 2-5, 1993, pp. 374-375.
[26] "AICUZ Data Collection for Aircraft Noise," AICUZ Program Manager's Guide, Air Force Handbook 32-7084, 30 April, 1996, p. 2.
[27] Ibid., p. 30.

As a result of these simplifying assumptions and the lack of actual data gathered in the area to be overflown, the more the terrain varies from being flat, the more likely these assumptions will do a poor job of matching reality. Further, the Air Force's use of averages for the altitude flown (the equivalent acoustical altitude) is only valid when the averages that are calculated can sometimes approximate the actual altitude flown. For example, if an aircraft could legally fly anywhere between 100 feet and 1000 feet, a mean altitude of 550 feet may be defensible. However, if an aircraft must be at 100 feet during visual flight conditions, and 200 feet during instrument flight, an average altitude of 168 feet (used in Tornado calculations) is meaningless because even though the aircraft spends a substantial amount of time at an altitude of 100 feet the model never records it as flying at less than the EAA of 168 feet. Thus, any place over which the aircraft flies at 100 feet has its noise impact artificially lowered.

This type of departure from reality is even more pronounced if the aircraft is flying at an altitude that is less than the floor of an airspace. As Wyle labs states,

> when the altitude distribution is below the floor of the airspace, the equivalent acoustical altitude is set equal to the airspace floor. For example, suppose the altitude...has all the operations assigned between 50 and 100 feet AGL, and floor of a track segment is 500 feet AGL. The equivalent acoustical altitude is then calculated to be equal to 500 feet AGL. This rule applies for MOAs, Ranges, Tracks and MTRs.[28]

Thus, aircraft that are actually flying at 100 feet altitude can have their altitude artificially raised to 500 feet and, as a result, the impact of their noise is significantly (and artificially) lowered. For example, in the RBTI DEIS, the Air Force claims that "

> In all the primary MOAs, except the Mt. Dora MOA, bombers conduct sortie-operations above 3,000 feet AGL all the time. The floors (lower altitude limits) of the primary airspace MOAs are higher than 3000 feet AGL. In the Mt. Dora MOA, F-16 aircraft use altitudes from 1,500 to 3,000 AGL an average of 45 percent of the time. The few (11) annual bomber sortie-operations in the Mt. Dora MOA also use the full range of altitudes.[29]

If the Air Force follows the standard modeling procedure outlined by Wyle Labs, those F-16 flights and B-1 flights that occur below the 3000 foot floor of the MOA will have equivalent acoustical altitudes calculated at 3000 feet AGL and the noise levels calculated for these flights will in no way represent the actual noise generated under the MOA.

In the RBTI DEIS, the Air Force has diluted this process even further by combining its MOAs with ATCAA areas. This extends the upper ceiling of the available airspace from 18,000 feet MSL to 40,000 feet MSL and allows the Air Force to average sound over a vertical distance of 37,000 feet instead of 15,000 feet.[30] The result is to further raise the equivalent acoustical altitude (EAA) through mathematical averaging and thus, to further downplay the effects of the low altitude noise that occurs in the MOA.

According to Wyle labs, the advantage of using the EAA to calculate noise is that using "the EAA in place of the altitude profile in the noise calculations significantly increases the

[28] Lucas, Michael J., Calamia, Paul T., Wyle Research Report WR 94-12-R: Military Operating Area and Range Noise Model, MR_NMAP, Wyle Laboratories, Wyle Research, 2001 Jefferson Davis Highway, Arlington, Virginia, May, 1994, revised March 1997, p. 4-13, Bates number 000009.

[30] Draft Environmental Impact Statement, *Realistic Bomber Training Initiative*, Vol. 1, Op. Cit., pp. 1-12, 2-3, 2-7, 4-33.

computational speed by reducing the number of calculations MRNMAP makes."[31] It is fair to point out that the object of noise modeling is to calculate the impact of noise on the receptors (people) over whom the aircraft fly. It is not to increase the computational efficiency of Air Force computer programs.

Assumptions concerning the horizontal distribution of flights: MTRs

Cook and Lucas claim that the Air Force computer modeling program

> "calculates the noise environment under low-altitude high-speed military aircraft training routes...by treating an individual flight track as a point source moving along a line, which becomes a line source when time-averaged. Since flight tracks along an MTR seldom follow the same trajectory, the MTR is treated as a Gaussian distribution of line sources in the horizontal plane."[32]

Air Force statements to the contrary, there is no valid statistical reason to believe flights are spread across a MTR as a normal [Gaussian] distribution nor is there reason to believe, as the Air Force claims, that this distribution has three standard deviations from the centerline of the MTR to the edge. For example, instead of using a normal distribution, a 1995 paper by Flynn found that cluster analysis could be used to determine the set of mean aircraft paths around an airport.[33] This is because pilots are generally navigating from point to point, not proceeding in the random manner that would generate a Gaussian distribution. The MTR itself frequently bends, curves, and changes width, and flight tracks are not even centered in the airspace.[34] In addition, the RBTI DEIS notes that "bomber crews can practice maneuvers (only turns of less than 90 degrees are permitted in MTRs.)"[35]

For conditions where pilots are actively correcting their aircraft, a Gaussian distribution does not apply and a better statistical estimate of the distribution of aircraft would be Cauche in nature--where both the mean and the standard distribution are so ill defined that they can only be assumed to be between plus and minus infinity. As in the previous case with altitude averaging, the Gaussian distribution chosen by the Air Force is much more efficient computationally--it just doesn't appear to represent reality. The Air Force then uses this questionable Gaussian distribution of aircraft to

> "[compute] the onset rate-adjusted monthly day-night average A-weighted sound level, Ldnmr, in dB for ground positions located perpendicular to the route centerline."[36]

In other words, instead of plotting specific flight paths and the noise each of these would generate, ROUTEMAP assumes a normal distribution of aircraft across the MTR. Since it is likely that the actual distribution of aircraft has much fatter tails than the Gaussian distribution (i.e., many more aircraft are located toward the edges of the MTR than the Air Force model predicts), noise levels at points removed from the centerline of the route are underestimated because the Air Force model assumes noise is concentrated toward the centerline and then calculates noise levels based on how far one is removed from this centerline. In fact, the Air Force noise calculation program specifically "identifies receptors closest to the route centerline with the greatest impact."[37]

[35] Ibid., p. 2-4.
[36] Cook and Lucas, Op. Cit., p. 375.
[37] Ibid., p. 376.

These bad assumptions concerning dispersion are further degraded when the number of people annoyed by aircraft noise in a MTR are calculated. The Air Force takes noise figures that underestimate the amount of noise away from the center of the MTR and "using the relationship for annoyance described in [Schultz, 1978 for community noise annoyance] the annoyance level is integrated across each route appearing in the EIS and plotted verses the route centerline noise level."[38] This calculation technique starts at a 1-to-1 relationship at the route centerline and then decreases the amount of annoyance as one moves further away from the centerline of the route.

The model then assumes people are evenly spread over the entire route instead of looking at impacts where people actually are--i.e. it averages annoyance by randomly scattering the receptors (people) under the route. This assumption of randomly scattered individuals is simply wrong--no study has ever shown that people live in random patterns. In fact, patterns of habitation determined by size of family unit, availability of water, transportation networks, etc. are well known, easily plotted from available maps, and not random.

Assumptions concerning the horizontal distribution of flights: MOAs

Cook and Lucas state that MOACALC is used when looking at aircraft activity inside a military operations area (MOA).

> "MOACALC is a computer program that calculates the noise exposure under a Military Operating Area (MOA). Generally the USAF provides information on the number of sorties per month and the altitude distribution of the aircraft using the MOA.[39]

In other words, the same altitude averaging methods described in the previous section on altitude averaging are used in MOA calculations. The only difference being that the aircraft in a MOA have a better chance of occasionally flying at the average altitude assumed for the sortie. Then, based on this average altitude (equivalent acoustical altitude) and the assumption

> that once the aircraft enter the MOA, they fly randomly within the airspace...[the Air Force assumes] a uniform distribution of the aircraft operations around the MOA. MOACALC is formulated on this principle and calculates an energy-average noise level under the MOA."[40]

In fact, aside from the assumption of random scattering within the MOA, there is no difference between these calculations and those in the previous sections. As the Air Force states:

> The algorithms formulated in MOACALC are the same as those used in ROUTEMAP. The difference between ROUTEMAP and MOACALC is the adaptation of a uniform distribution over the entire area occupied by the MOA.[41]

As a result of these assumptions noise calculations are averaged both vertically and horizontally. This reduces the calculated impact of the noise in two ways. First, all noise impacts from aircraft operations below the equivalent acoustical altitude are understated by the model--even though these are precisely the impacts that are of greatest concern to an individual on the ground. Second, aircraft noise is spread uniformly over the entire MOA, greatly depressing its effect in any one place and adding the additional computational quirk that if the MOA is expanded, the noise will decrease since it is spread over a larger area.

[38] Ibid.
[39] Ibid., p. 375.
[40] Ibid.
[41] Ibid.

ssumption of a uniform distribution of activity across the MOA is invalid since aircraft rning back toward the center of the MOA to avoid violating the boundary of the as, noise is not uniformly distributed, it is concentrated toward the center of the and Calamia (Wyle Labs) state that there is a procedure

tapering operations near a MOA edge. The noise models...assume operations in s and ranges are uniformly distributed. Near a MOA edge, where the operations are ted to drop off, experimental studies have shown that the number of operations ase linearly as the MOA edge is approached...In most situations, the user will choose doff distance of 1 NM (TAPER 1) or 2 NM (TAPER 2).[42]

EIS acknowledges that these taper distances are not sufficient and specifies a distance ts MOAs.[43] If these procedures are used they would partially solve the problems zontal dispersion assumptions. However, there is no indication that there are hard sing any taper distance; there is no reason, from the evidence presented, that tapers NM might not be more appropriate; and finally, there is the obvious incentive for the e model to depress noise predictions simply by choosing a smaller taper and thus rger flight area in the MOA. All of these conditions make the use of the TAPER ikely to yield a result that approximates real operations in a MOA. Further, even if rogram was adjusted by an impartial model operator to yield better results, problems ith the use of equivalent acoustical altitude (EAA) which depresses noise levels th low altitude aircraft operations.

concerning the actual noise generated by aircraft

AOA power levels and noise generation:

M the Air Force wrote that

ws operate aircraft differently under varying training conditions. Along a Military ng Route (MTR), speeds are relatively constant, and there is less maneuvering than in tary Operations Area (MOA). Conversely, in a MOA, aircraft are maneuvering, and and throttle settings vary... Within MTRs, normal throttle settings are approximately cent, producing a speed of approximately 450 knots. The SELs...reflect these flight eters. In MOAs, for brief periods (20 to 30 seconds), higher power settings and s may be experienced. Although these higher performance parameters are used only ef periods, they are shown and assessed to present a worst-case situation. Actual evels experienced within areas of military training airspace may be reasonably ed to fall between these two conditions."[44]

s, since power settings are lower in MTRs than they are in MOAs, noise levels are rther, noise levels are clearly higher in MOAs because power settings are higher. he Draft Environmental Impact Statement for the Pennsylvania Air National Guard ion has a table that shows NOISEMAP NOISEFILE data (OMEGA) of SELs for a F- ltitudes in a MTR and in a MOA. According to these Air Force data, SELs for a dB to 18.5 dB higher than they are for a MTR, with greater differences occurring as r to the ground.[45]

Air Force documents that record how MTR and MOA noise calculations for the Holloman EA were made show that MTR noise levels, not the higher MOA noise levels, were used when noise calculations were made for MOA activities.[46] There is no documentation of how the MOA noise calculations were made in the RBTI DEIS, but a table of noise levels on page 4-8 shows SEL levels for the F-16 that are almost identical to those given by the Air Force in 1994 for MTR activity.[47] As a result, it is probable that the RBTI DEIS uses MTR noise levels for its MOA calculations and thus significantly understates the noise levels expected under the Lancer and Mt. Dora MOAs.

The amount of this understatement can be roughly calculated based on the Air Force's own statement that "[t]he noise generated by a Tornado is about the same level as an F-16. It is less loud than an F-4 or a B-1 at the same altitude, but a Tornado at 100 feet is similar to an F-4 or B-1 at 500 feet."[48] Based on this information, and interpolating from Figure 4.1-3, on page 4-8 of the RBTI DEIS, the MOA SEL for a B-1 at 500 feet would be about 127 dBA, not 113 as shown in Table 4.1-3 of the DEIS. At 3000 feet, the SEL for a B-1 in a MOA would be about 112 dBA, not 98 dBA as shown in Table 4.1-3 of the RBTI DEIS.

It should noted that Table 4.1-3 claims it represents "average sound levels. These levels may vary by 1/2 dB depending on the application of power and speed."[49] Of course, sound levels always vary as power and speed change, but averaging sound levels (based on a formula that, while not disclosed in the RBTI, puts almost all the emphasis on MTR noise levels) makes no more sense than averaging sound levels during taxi operations with sound levels during takeoff. The RBTI DEIS is supposed to calculate the actual noise that will be encountered by a person under a MOA. Instead, it has once again used every possible means to lower the sound levels predicted by its noise models.

2. Use of erroneous noise/annoyance projections and calculations

The noise calculations in the RBTI DEIS for Alternative D: IR-153/Mt. Dora MOA demonstrate how a second level of errors are made in Air Force calculations. First, because Air Force sound models evidently do not calculate DNL levels below 45 dB, the baseline noise levels for 27 of 38 segments of the proposed IR-153 and the Mt. Dora MOA are all listed in Table 4.1-19 as being less than 45 dB. Similarly, thirteen different route segments and the proposed Lancer MOA are all listed in Table 4.1-9 as having noise levels of less than 45 dB. Since IR-153 is a new route, Mt. Dora is currently subjected to much different use than that which is proposed, and the Lancer MOA is newly constructed, many of these segments obviously have noise levels that are significantly less than 45 dB. However, when the change from baseline noise levels is calculated in Tables 4.1-9 and 4.1-18 for the proposed MTRs and the MOAs, 'less than 45 dB' becomes a hard figure of 45 dB and, for example, changes in both the Mt. Dora MOA and Lancer MOA from <45 to 46 are recorded as a change of only 1 dB.[50] This is simply wrong.

Next, the Air Force uses a model for annoyance with general transportation noise in urban, residential areas to forecast annoyance from aircraft noise likely to be encountered in the area under Alternatives B and D where the land overflown is almost 100% rural.[51] This results in a gross understatement of the percentage of people likely to be annoyed by aircraft noise. For example, for

[46] Probability of Exposure to Sound Levels of 75 dBA or Greater Along MTRs and MOAs, New Index, Volume II, Bates number 000073.
[47] Draft Environmental Impact Statement, *Realistic Bomber Training Initiative*, Vol. 1, Op. Cit., p. 4-8.
[48] Impact Information for TAC/CM meetings, Vol. 1, book 1, Bates number 000987.
[49] Draft Environmental Impact Statement, *Realistic Bomber Training Initiative*, Vol. 1, Op. Cit., p. 4-8.
[50] Ibid., pp. 4-50, 4-47 to 4-49.
[51] Ibid., pp. 4-33, 4-76.

a DNL of 63-64 in segment BC of proposed IR-153, the RBTI DEIS claims that 10 to 11 percent of people would be annoyed by aircraft noise. A 1996 model by Fidell *et al.* that was available to the Air Force three years prior to the release of the RBTI DEIS, and that was constructed from data gathered in wilderness (not residential) areas, suggests that about 32 percent of people would be highly annoyed by this level of aircraft noise.[52]

Finally, the Air Force further compounds this series of errors by using the percentage of people annoyed at 45 dB as a baseline for areas where the noise level is recorded by the Air Force as being less than 45 dB. This has the effect of inflating the baseline annoyance numbers. These inflated numbers are then subtracted from the (incorrectly depressed) percentage of people annoyed by Alternative D aircraft noise to arrive at the "percentage change from baseline" in Table 4.1-20.[53] For all the reasons listed above, these figures grossly understate the percentage change from baseline in people who will be annoyed by the noise generated under both Alternative B and Alternative D.

Conclusion

Instead of accurately representing the noise levels generated by its aircraft and accurately recording the terrain and receptors overflown, the Air Force first averages the number of sortie-operations across a year.[54] Then, as this section of this report has demonstrated, Air Force noise models use these averaged noise levels in a further invalid averaging technique to calculate Equivalent Acoustical Altitude. These EAA figures are then arrayed across a MTR using a distribution form that is inapplicable to the process described. The resulting arrayed noise levels are then applied to receptors under the MTR that are incorrectly assumed to be randomly scattered.

During this entire exercise the Air Force uses SEL figures that either represent lower MTR power settings or are averaged across two entirely different mission profiles. And they incorrectly inflate baseline annoyance levels while deflating annoyance levels under the proposed alternative training areas. The result is an invalid and misleading set of noise predictions that always appear to err on the side of underestimating the noise impact on receptors on the ground. Even given all these methods of depressing the noise levels predicted by Air Force models, the effects on those under the areas such as those covered by Alternatives B and, and specifically under IR-178 and IR-153 are still forecast to be very significant. Noise levels in four communities under Alternative D would be two to three times as loud as the baseline which, itself, has been inflated. And noise levels under other portions of IR-153 will increase by up to 17 dB--a noise level that would be about three and one-half times louder to a receptor on the ground.[55]

As the next section shows, the Air Force is fully aware that these models do not adequately predict the effect of aircraft noise and it is particularly aware that this is a problem in rural and wilderness areas.

AO-54 **IV. The Air Force's failure to consider the difference between urban and rural/wilderness conditions**

Aside from one or two passing references, this DEIS is strangely silent on the likely impacts of aircraft noise on wilderness or wildland (hereinafter collectively referred to as

[52] Fidell, Sanford, Silvati, Laura, Howe, Richard, Pearsons, Karl S., Tabachnick, Barbara, Knopf, Richard C., Gramann, James, and Buchanan, Thomas, "Short Term Effects of Aircraft Overflights on Recreationists", Journal of the Acoustic Society of America, Vol. 100, No. 5, November, 1996, p. 2912.
[53] Draft Environmental Impact Statement, *Realistic Bomber Training Initiative*, Vol. 1, Op. Cit., pp. 4-33, 4-49.
[54] Lucas and Calamia, Op. Cit., p. 4-9.
[55] Draft Environmental Impact Statement, *Realistic Bomber Training Initiative*, Vol. 1, Op. Cit., p. 4-83.

"wilderness") users and inhabitants. The RBTI DEIS attempts to justify the compatibility of aircraft noise and recreation activities by citing the FAA land-use compatibility guidelines. However, these guidelines are for urban environments only and they often assume individuals are protected from the ambient sound environment by buildings that lower the dB levels to the 20 dB to 35 dB range.[56] Obviously, these figures were never meant to apply to someone in rural or wilderness settings. Similarly, neither the 1978 Schultz paper, the 1991 Fidell, Barber and Schultz paper, nor the 1994 USAF/Finegold study applies to wilderness noise experiences. All the data for these studies were gathered in urban locations. The DEIS itself states on numerous occasions that the data it uses depict "the noise impact in airport communities..." or on communities in general.

In its 1996 Requirements for Noise Analysis, the Air Force stated it had no firm idea what the effect of aircraft noise is on wilderness areas. The Air Force also stated that it had no ability to model this effect and that it

> requires the ability to predict the effects of aircraft noise on the outdoor recreationist...today, no quantitative dosage-response relationship has been developed for predicting annoyance in these circumstances, and information on which such a relationship could be based is in short supply."[57]

This statement is not completely true. As the following sections will show, a model for predicting noise/annoyance for outdoor recreationists has been available since the National Park Study was competed in 1992. The 1992 NPS study showed that not only were outdoor recreationists far more annoyed by noise than people in communities, but of those recreationists, "visitors engaged in water- or stock-related activities tended to be more annoyed by aircraft overflights than visitors who did not engage in these activities."[58] These stock-related activities correlate closely with the kinds of activities engaged in by the residents of most rural areas over which the Air Force's RBTI proposes to fly. However, in the presence of a significant amount of evidence that its noise/annoyance models underestimate annoyance with aircraft noise alone and further underestimate annoyance with aircraft noise in rural and wilderness areas, the Air Force has chosen to make the one claim that makes absolutely no sense--that aircraft noise will have no significant adverse effect on a wilderness experience or outdoor recreation.

The RBTI DEIS does admit that rural/wilderness noise calculations are different than urban ones. In the Noise Appendix, the Air Force states:

> Aircraft operations in military airspaces generate a noise environment somewhat different from other community noise environments. Overflights are sporadic, occurring at random times and varying from day to day and week to week. This situation differs from most community noise environments, in which noise tends to be continuous or patterned. Individual military overflight events also differ from typical community noise events: noise from a low-altitude, high airspeed flyover can have a rather sudden onset.
>
> To represent these differences the conventional Day-Night Average Sound Level metric is adjusted to account for the "surprise effect of the sudden onset of aircraft noise events on humans.[59]

[56] Ibid., p. G-10, See footnotes for Table G-1.
[57] Requirements Analysis for Noise, Op. Cit., p. 6.
[58] Fidell, Sanford, Silvati, Laura, Tabachnick, Barbara G., Howe, Richard R., Pearsons, Karl S., Knopf, Richard C., Gramann, James, and Buchanan, Thomas, Short Term Effects of Aircraft Overflights on Outdoor Recreationists in Three Wildernesses, NPOA Report No. 92-2, BBN Report No. 7502, National Park Service, Denver Service Center, Contract No. CX-2000-9-0026, April, 1992, p. 4.
[59] Draft Environmental Impact Statement, *Realistic Bomber Training Initiative*, Vol. 2, Op. Cit., p. G-5.

However, the second paragraph in this statement is both untrue and disingenuous. The onset rate correction only attempts to correct for sudden onset. None of the other reasons mentioned in the first paragraph for the difference in military airspace operations--sporadic, random flights, varying from day to day, in a non-patterned manner, etc.--are accounted for by the onset rate correction.

The RBTI DEIS also states that, based on 1992 and 1994 studies by Stusnick *et al.*, its DNL calculations apply "to rural populations exposed to sporadic aircraft noise."[60] However, the description of the studies and their applicability is also disingenuous. A conversation with Stusnick himself revealed that the studies were done in houses and a laboratory in southern Virginia in an area where many homes existed and where streets and aircraft contributed to background levels of noise.[61] This environment clearly has little relevance to the actual noise onset levels someone in the rural Texas or New Mexico would experience. The DEIS also claims that "[w]hile these FICON recommendations are most often applied to areas around airports, they can be helpful in understanding the potential effects of aircraft noise in MTRs and MOAs."[62] However, the DEIS also states that

> Questions regarding land values near airports have been asked in many US communities over the years and research has been conducted determining and quantifying the economic effect of noise around airports in urban settings. However, RBTI involves aircraft noise in a rural setting. The variability of land value due to the diversity of land uses, locations, and improvements makes it difficult to quantify potential impacts, if any, that might be associated with aircraft overflights.[63]

In other words, when it is convenient or has the potential to show Air Force operations in a good light, the experience around airport areas is "helpful", but when it is not convenient or has the potential to show adverse impacts from Air Force operations "[t]he variability ...due to the diversity of land uses, locations, and improvements makes it difficult to quantify potential impacts..."[64]

Thus, this entire RBTI DEIS is based on noise/annoyance measures for community noise annoyance. And in spite of the fact that 97% of the territory in option B is rural/wilderness, the DEIS never presents a model capable of calculating noise/annoyance effects in rural/wilderness areas, stating only that "studies of *community annoyance* to numerous types of environmental noise show...a consistent relationship between noise levels and annoyance."[65] In a further narrowing this definition, the DEIS claims that this kind of analysis "correlates well with *community response* and is consistent with *controlled laboratory studies*..."[66].[authors italics]

As this section will show, the Air Force has known about alternative methods for calculating noise/annoyance in rural/wilderness areas since 1992--and these same methods have been used by the Air Force's contract researchers to construct a model to predict noise/annoyance for the National Park Service. However, none of the noise models presented by the RBTI DEIS--the 1978 Schultz paper, the 1991 Fidell, Barber and Schultz paper, nor the 1994 Finegold study--applies to wilderness noise experiences and none applies to the rural MTR and MOA environments

described above by the Air Force itself. This is because all the data for the studies used by the Air Force were gathered in urban locations in spite of the fact that the 1997 Holloman EA states that:

> The nature of aircraft operations along low-level Military Training Routes (MTRs) generates a noise environment somewhat different from other community noise environments. Overflights are highly sporadic, ranging from five or ten per day to less than five per week.
>
> This situation differs from most community noise environments, which tend to be continuous or patterned. Individual military noise events also differ from typical community noise events because of the low altitude and high airspeed with which military aircraft operate along the MTRs.[67]

The RBTI DEIS also claims that "a study conducted by the US Forest Service ...indicates that aircraft noise intrusions were not generally noticed by wilderness area visitors."[68] This statement is taken out of context and fundamentally misinterprets the findings of the 1992 NPS and NPS studies which found that persons in wilderness settings are at least ten times more sensitive to aircraft noise than those in urban settings.[69] The study also found that "low-altitude, high-speed aircraft, such as those operating along MTRs, were reported as the most annoying type of aircraft to hear or see [and].....annoyance associated with over flights was more strongly related to noise exposure than to the visibility of aircraft..."[70]

Further, the 1992 NPS study and a follow-on paper by the same authors (Fidell *et al.*) in 1996 found that the DNL value above which people described themselves as being highly annoyed with aircraft noise was 7 dB lower (in the 1996 Fidell *et al.* paper) and 10 dB lower (in the 1992 NPS study) in wilderness areas than it was in residential communities. As the authors stated:

> "This suggests that respondents engaged in outdoor recreation...described themselves as highly annoyed by 7 dB less aircraft noise exposure than would be tolerable in a residential setting."[71]

It is worth noting that under Alternative D: IR-153/Mt. Dora MOA in the RBTI DEIS, Table 4.2-12 shows that noise levels (DNL) in parts of the Carson National Forest, the Rio Grande Wild and Scenic River, the Urraca Wildlife Area, the Elliot Barker Wildlife Area, the Philmont Scout Ranch, the Colin Neblett Wildlife Area/Cimmaron Canyon State Park, the Santa Fe National Forest, the Villanueva State Park, and the Sumner Lake State Park are all projected to be 60 dB or greater.[72] Further, Alternative B shows DNL noise levels of 60 dB or greater under much of IR-178.[73] Based on the 7 dB adjustment recommended by Fidell *et al.*, these rural, wilderness and scenic areas would not even be suitable for residential housing. In spite of this, the RBTI DEIS goes on to state that "[f]light operations would not likely affect land use, recreation resources, or visual settings under the airspace..."[74]

The Air Force is fully aware that its MOA and MTR noise studies do not apply to the areas that are being overflown. A 1990 paper on annoyance from overflights in wilderness areas by

Harrison, Hartmann, and Makel which was specifically cited by Brooks AFB noise researchers in 1996 states:

> The basis for assessing the probable reaction of populations which are impacted is, in most cases, the 'Schultz curve'. (Schultz, 1978, 1982) The effect of the aircraft noise is measured in terms of percentage of the population highly annoyed. The ambient background in which the affected population is submerged is assumed not to be an important determinant of this effect. For reasons to be discussed, these assumptions and methodologies are not appropriate to the assessment of the impact of aircraft overflights on wilderness visitors.[75]
>
> ...aircraft intrusions presented enough of a perceived problem, at least, that Congress was motivated to instruct land management agencies to investigate this question. So it would seem that previously established criteria are, in the wilderness situation, not applicable.[76]

This finding should be contrasted with the RBTI DEIS's statement that "[f]light operation would not likely affect land use, recreation resources, or visual setting in the areas under the airspace."[77] In addition, it should be contrasted with another 1990 paper by one of the Air Force's top noise researchers, Dr. Sanford Fidell, which states that:

> The well-known dosage-response relationship developed by Schultz (1978) for general transportation noise experienced in high population density areas, cannot be directly applied to the outdoor recreational case for the following reasons, among others:
> (1) since most visits to parks and Wildernesses last considerably less than a week, it makes little sense to quantify noise exposure in terms of an annualized measure such as Day-Night Average Sound Level;
> (2) the original Schultz relationship predicts no impact whatever at DNL = 45 dB, largely for the sake of consistency with the finding of EPA's Levels Document (EPA, 1974) that indoor exposure at this level poses no threat to public health and welfare. Noise produced by aircraft operations in the low ambient noise environments may disturb people at even lower exposure levels;
> (3) there is no community per se in the case of present interest, only individuals or small groups of outdoor recreationists; and
> (4) like all other empirically developed dosage-response relationships, the one developed by Schultz (1978) can be challenged on the grounds that it is not influenced by information collected under circumstances similar to those to which it is to be applied."
>
> ...One impediment to direct application of the Schultz relationship to predict reactions to aircraft noise exposure in Parks and Wildernesses is the sporadic nature of overflights...The sporadic nature of exposure, coupled with the short duration of most visits to Wildernesses, strains the equal-energy hypothesis on which the use of Day-Night Average Sound Level as a predictor of annoyance is predicted.
>
> ...The fact that outdoor recreationists are exposed to aircraft noise without the benefit of the insertion loss of residential structures suggests the likelihood of a leftward shift of the X-intercept of the dosage-response relationship by 10 dB or more. The fact that ambient noise levels are often lower in uninhabited places than in urban neighborhoods increases both the audibility and effective duration of noise intrusions caused by overflights, suggesting a yet further leftward shift of in the X intercept."[78]

[76] Ibid., p. 330.
[77] Draft Environmental Impact Statement, *Realistic Bomber Training Initiative*, Op. Cit., p. 4-66.
[78] Fidell, Sanford, "An Historical Perspective on Predicting the Annoyance of Noise Exposure," Op. Cit., p. 340.

> Noise modeling techniques and assumptions originally developed for military airfield and urban airport planning are not readily adapted to Park and Wilderness settings...The differences between residential and outdoor recreational exposure to aircraft noise, as well as the differences in purposes for characterizing aircraft noise exposure, are sufficiently great to suggest the need for an alternative approach to preparing aircraft noise contours. The alternative approach should provide the basis for answering the question 'How far from here must an airplane fly if it is not to impact the area of interest?' rather than "How much noise does an aircraft flying here produce there?"
>
> In other words, the preferred means of modeling aircraft noise impacts in Park and Wilderness setting is from the perspective of the observer, not the source. Furthermore, since audibility is the issue of primary concern in low ambient noise conditions, explicit consideration must be given to signal to noise ratios rather than absolute sound pressure levels. These considerations suggest that observer-based audibility contours are more useful than source-based emission contours for use in analyses of aircraft noise impacts in Park and Wilderness settings.[79]

Officials in the field have also constantly reminded the Air Force of these problems. In 1995, the National Park Service prepared a report based only on tour aircraft in level flight, virtually all of which are light propeller or helicopter aircraft. This report noted that while its "results may be applied to similar conditions [light aircraft]...their applicability to jet aircraft, very large aircraft, or to areas where aircraft are noticeably climbing or descending has not been tested."[80] This report concluded that, among other things:

- Enjoying the natural quiet is about as important as viewing natural scenery as a reason for visiting national parks.
- About one fifth of all visitors to the National Parks (about 80 million visitors a year) remember seeing or hearing aircraft during their visit to the park.[81]
- Visitors report negative reaction to the sound of aircraft at specific sites, and these negative reports increase as exposure to aircraft sounds increase [sic].[82]

In fact, at an hourly equivalent sound level (Leq 1 hr) of 40 dB, from 8% to 48% of all visitors were annoyed by light aircraft noise according to actual survey data.[83] This should be contrasted with the Air Forces' claim in the RBTI DEIS that "at 65 DNL, approximately 12 percent of the people would be highly annoyed by noise."[84]

Further, in its 1978 Guidelines for Preparing Environmental Impact Statements on Noise, the National Research Council set "specific noise criteria for various...land uses" and went on to state that:

> Even in areas where no people are presently living, a significant increase in noise over the existing conditions will constitute a noise impact. The environment may be degraded either because the increased noise affects wildlife or monuments, or because it destroys the tranquillity of a wilderness area to which urban dwellers wish to go for an escape from city noise, or because it makes the area unsuitable for future residential or

> other noise sensitive development. In each case, some of the value of our national resources is lost: the quality of the environment is lowered. As a supplement to any numeric quantification, a word description of the environmental impact should be stated in terms of the expected change from the present conditions... even though no significant health or welfare effects are considered to exist below 55 decibels...the small, but finite percent of population highly annoyed is considered a measure of environmental degradation.[85]

As additional examples, letters from the Superintendents of two New Mexico parks to the Air Force stated that "noise levels produced by low altitude aircraft over and adjacent to park lands and designated wilderness would be incompatible with the purposes of these land use areas."[86] One of these letters went on to state that

> ...we raised what we perceived to be significant issues which we will expect to be addressed in the Holloman 2 EIS. To dismiss those issues as of 'little concern' only serves to reinforce the point we tried to make, that being that impacts on White Sands National Monument have been universally trivialized in the US Air Force planning documents affecting Holloman Air Force Base...In general, we expect that the Monument will no longer be dismissed as 'government owned land' or 'undeveloped open rangeland' and instead will be recognized for the purposes for which Congress has established units of the National Park system.[87]

In sum, the Air Force was aware, at least as early as 1990 and probably as early as the 1970's, that the noise modeling they were doing was not applicable to rural or wilderness situations. Because of this, and because of the serious shortcomings in the use of their models, the noise modeling in this DEIS fails to consider relevant factors, and the Air Force did not take the necessary steps to ensure the scientific integrity , including external validity, of the DEIS analysis predicted on its noise modeling efforts.

BR-1 **V. What the Air Force Knew About Its Noise Analysis From Research Done Under Its Own and Other Federal Government Contracts**

The 1978 Schultz study, a 1991 update of the Schultz study by Fidell *et al.*, and a 1994 study by Finegold *et al.* are all cited in the RBTI DEIS as the evidence that Air Force noise modeling is both adequate and accurate.[88] In addition, over the last ten years, whenever it has been criticized for not including valid noise studies in its EISs, the Air Force has claimed it used the "only known and accepted method for predicting noise impact" in its models.[89] These statements are not true and they have not been true since at least 1989. In fact, the Air Force itself published the following statement in 1996:

> Federal and state agencies which control the areas largely utilized by the outdoor recreationist have recently made the attempt to exert greater control over the airspace above

the resources for which they are responsible, including that utilized by military aircraft. Today, no quantitative dosage-response relationship has been developed for predicting annoyance in these circumstances, and information on which such a relationship could be based is in short supply.[90]

In 1986 the US Air Force Noise and Sonic Boom Impact Technology (NSBIT) program directed by Major Robert Krull at Wright Patterson Air Force Base awarded contract number F33615-86-C-0530 for the study of noise-annoyance relationships. This contract was monitored for the Air Force by Lawrence Finegold and was awarded to BBN Systems and Technologies Corporation, 21120 Vanowen Street, Canoga Park, California, 91303.[91]

The research from this study resulted in at least two reports, both of which were submitted to the USAF by 1989 and both of which were published in the Journal of the Acoustical Society of America in January, 1991. The first report, written by Fidell, Barber and Schultz (and assisted by Green) was an update of the 1978 Schultz study that underlies the noise/annoyance relationships used by the Air Force. This report has been used by the Air Force since its completion, and it has been cited repeatedly in EIS documents as justification for using the Schultz curve. However, the second report was intended as a companion piece to the first report, and it is alluded to in the first report in the following paragraph:

> Another limitation of both the 1978 polynomial approximation [the curve developed in Schultz's 1978 report] and the current quadratic fitting function [the curve developed in the 1991 Fidell, Barber and Schultz paper] is that they are both simply convenient data fitting functions, devoid of physical meaning...Care is therefore necessary to avoid using these relationships outside their intended ranges...*The next article in this issue develops a theoretically based alternative approach to the purely empirical curve fitting described above.* [Emphasis added][92]

The 'next article'--a second report generated under the same USAF contract (number F33615-86-C-0530) was published immediately following the Fidell, Barber and Schultz article in the same Journal of the Acoustical Society of America. It was also completed in 1989 and was also monitored for the Air Force by Lawrence Finegold and it had virtually the same authors--this report was written by Green and Fidell and this time Barber assisted in performing the calculations and analyses. In addition, this second report was published in 1989 as Air Force Technical Report HSD-TR-89-008.[93]

This report dealt with a persistent problem with the data in the 1978 Schultz model and the 1991 Fidell, Barber and Schultz model: people in different communities exhibited different levels of annoyance to the same decibel levels of sound and people in the same community exhibited different levels of annoyance to sounds from different sources with the same decibel ratings. Thus, one could never be sure that the annoyance forecast by either the 1978 and 1991 models would actually be exhibited by any given population. The authors were aware that this was a significant problem--in 1992, Tabachnick, Howe and Fidell, in a report written for the National Park Service [Contract No. CX-2000-9-0026], noted that field studies of overflight noise "must be able to produce reliable and valid findings" and went on to define the criteria for reliability as "[t]he

[90] Requirements Analysis for Noise, Op. Cit., p. 6.
[91] Fidell, Sanford, Barber, David S., and Schultz, Theodore J., "Updating a dosage-effect relationship for the prevalence of annoyance due to general transportation noise," Journal of the Acoustical Society of America, vol. 89, no. 1, January, 1991.
[92] Ibid., p. 233.
[93] Green, David M., and Fidell, Sanford, "Variability in the criterion for reporting annoyance in community noise surveys," Journal of the Acoustical Society of America, vol. 89, no. 1, January, 1991, p. 243.

dependent variable(s) (that is, measure(s) of visitor reactions) must produce responses which are consistent over repeated overflight exposures of the same level."[96]

The second study by Green and Fidell made three significant findings that related to the issue of community annoyance with aircraft noise:

1. Aircraft noise was found to be more annoying than other kinds of noise at a 98% level of certainty. This additional annoyance could be accounted for by a correction factor of 5.2 dB to the DNL scale. As the authors noted:

> ...the mean value...in surface transportation studies [for a given level of annoyance] is about 75.4 dB, whereas the mean value for aircraft sources [for the same level of annoyance] is 70.2 dB, with a difference of 5.2 dB. Thus people are on average more willing to report annoyance due to aircraft noise exposure than to report annoyance due to street and rail traffic. A t test ($t_{320} = -2.47$, $p<0.02$) indicates that a difference of this size is unlikely to arise by chance alone.
>
> This analysis suggests an alternative interpretation of the observation that aircraft noise exposure is likely to produce greater proportion of self-reported annoyance than the same level of street traffic or railroad noise exposure. It is not necessary to conclude that such differences are produced by intrinsic differences in the annoyance of the noise sources themselves, nor (as Kryter argues) by differences in the pervasiveness of noise exposure produced by different sources. The present model suggests people adopt different annoyance criteria for different noise sources...[and] the DNL scale is equally good at predicting annoyance caused by either kind of noise source.[95]

2. The variability of noise/annoyance ratings for aircraft was about 18% smaller that than for street traffic/noise annoyance and thus, aircraft noise/annoyance data produced a slightly more accurate curve relating annoyance to noise did than traffic/noise.[96]

3. The methodology developed for modeling in this study was better able to predict noise/annoyance relationships than the methodology used in the Schultz curve.

> ...as [previously] noted by Fidell et al., three decades of community noise studies have identified numerous nonacoustic factors that might arguably affect the criterion for reporting annoyance."
>
> [The models developed in this study] demonstrate a substantial improvement in the ability to predict prevalence of annoyance by considering such reaction to be based on two separate components. One [component] is acoustically produced and...the second component of annoyance may be expressed in terms of a criterion value..."[97]

In sum, by 1989 the Air Force knew, based on its own contract's report, that aircraft noise was more annoying to a community than other kinds of noise and, as a result, that a model based on a mix of aircraft and automobile noise would underestimate community annoyance. The Air Force also knew that a modeling technique existed that would allow it to more accurately predict this noise in an urban setting. It also knew that it should be correcting its urban annoyance calculations by at least 5 dB. Instead of incorporating these findings in its EISs, or at least

[96] Tabachnick, Barbara G., Howe, Richard R., and Fidell, Sanford, Estimation of Aircraft Overflight Exposure in National Parks and Forest Service Wildernesses, NPOA Report No. 92-1, BBN Report No. 7259, National Park Service, Denver Service Center, Contract No. CX-2000-9-0026, August, 1992, p. 21.
[95] Ibid., p. 241.
[96] Ibid.
[97] Ibid., p. 243.

reporting them as alternative views, the Air Force disregarded this information and continued to base EISs dealing with aircraft noise in rural and wilderness areas on the Schultz curve.

This was not the approach taken by Fidell and the other researchers at BBN on other noise/annoyance reports for non-DOD federal agencies. In April, 1992 Fidell *et al.* released a report on the "Short Term Effects of Aircraft Overflights on Outdoor Recreationists in Three Wildernesses" that had been prepared for the US Department of Agriculture and the US Department of the Interior under contract number NPS-DSC CX-2000-9-0026 [commonly known as the 1992 National Park Service (NPS) report]. In this report, the BBN researchers stated that

> (1) The 1991 noise/annoyance curve developed by Fidell *et al.* didn't fit the noise/annoyance data developed in the National Park Service study. (This curve, based on community noise, forecast that at 65 Ldn, about 18 percent of all people would be highly annoyed by noise.) As a result, the 1991 curve by Fidell *et al.* was replaced by a curve generated in the later, Green and Fidell (1992) study discussed above.
> (2) The theoretical dosage response curve developed by Green and Fidell (1992) (which forecast a higher level of annoyance with community noise--about 27 percent of all people are highly annoyed at 65 Ldn) could be modified by shifting the curve by 10 dB to represent people's annoyance with aircraft noise in wilderness.
> (3) This new curve accounted for the significant levels of annoyance that were registered at levels as low as 52 Ldn (where 12 percent of those in the Golden Trout area were annoyed) and it showed that at 65 Ldn, about 47 percent of all people would be annoyed by aircraft noise.[98]

Thus, a better method of calculating noise/annoyance in rural/wilderness areas was available by about 1990. And by 1992, an application of this method had been published in response to contracts from two federal agencies that were generated in response to Public Law 100-91, "an act requiring *inter alia* 'the Secretary of the Interior to conduct a study to determine the appropriate minimum altitude for aircraft flying over national park system units.'"[99] Further, the results of these studies and the published application directly contradicted statements in Air Force EIS throughout the 1990s that the Schultz curve and the 1991 curve by Fidell *et al.* adequately represented people's annoyance with aircraft noise in rural and wilderness settings.

The results of these new studies also apparently stood the test of time--the same problems and solutions were published in 1996 in the Journal of the Acoustic Society of America by the same authors as the 1992 NPS study just discussed. Again they rejected the Schultz Curve and the 1991 Fidell *et al.* curve and again they used an adjusted curve from the Green and Fidell (1992) study. However, in this case the adjustment was by 7 dB and not 10 dB.[100]

In 1993, three Air Force researchers, Lawrence Finegold (who had been the contract monitor on the aforementioned Air Force studies) and C. Stanley Harris, both research psychologists with the USAF Armstrong Laboratory, and Henning E. von Gierke, a retired director of the Biodynamics and Bioengineering Division of the USAF Aerospace Medical Research Laboratory reassessed the impact of transportation noise on annoyance and on sleep disturbance. The authors claimed that "this project was initiated as part of a long-term US Air

[98] Fidell *et al.*, Short Term Effects of Aircraft Overflights on Outdoor Recreationists in Three Wildernesses,Op. Cit., 1992, pp. 39-43.
[99] Ibid., p. 5.
[100] Fidell *et al.*, Op. Cit., 1996, p. 2912.

Force research program on the effects of aircraft noise on humans."[101] Their work built upon the studies cited above and it contained a total of 400 data points. These Air Force researchers also found that aircraft noise was more annoying than other kinds of transportation noise. Their report, published in 1994, and cited as one of the central models in the RBTI DEIS, includes a section labeled '4. Aircraft Noise Versus Other Transportation Noise Sources' that contains the following statements:

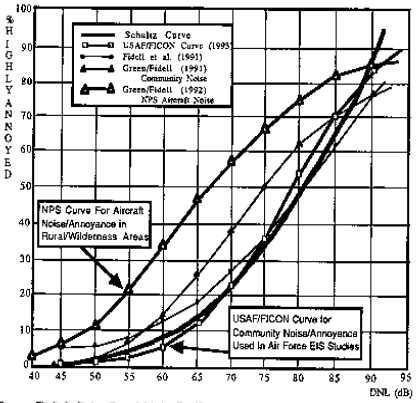
> ...since Schultz published his exposure-response relationship in 1978, controversy has continued over whether all types of transportation noise should be combined under the rubric of "general transportation noise." Many researchers see evidence that aircraft noise is rated as being more annoying than other types of transportation noise, such as railroad and highway noise.
>
> ...One reason why it is difficult to compare published data on human responses to noise exposure levels from various sound sources is that there are, typically, large differences in sound exposure for living and sleeping areas in a home from aircraft overflight noise compared with the sound exposure from road traffic noise. Noise from an aircraft overflight virtually surrounds a home, entering the living and sleeping areas through the roof and two or more sides of the dwelling, while street traffic noise enters predominantly through only one or two sides of the dwelling. This difference in sound exposure within a home is, typically, not accounted for, or discussed, in social surveys when researchers estimate the noise exposure of subjects.
>
> The analysis by Miedema [1993] of data recompiled from selected social surveys shows a higher level of community annoyance in response to aircraft noise than to noise from ground transportation sources. Miedema chose to use separate curves for aircraft, highway, road traffic, and rail noise. The considerably expanded database developed by Fidell *et al.* also provides evidence that there is a slightly stronger annoyance reaction to aircraft noise than to other transportation noise sources [note: the 5.2 decibel correction recommended by Fidell *et al.* means that noise from aircraft is perceived as being 50 percent louder with over 300% more noise energy than traffic/rail noise]. In the analysis reported here of that database, for the 400 final data points from a total of 22 different international community annoyance surveys, 173 data points were for aircraft noise, 170 were for traffic noise, and 57 were for railway noise. Figure 3 shows logistic fits to each of the three data sets. As can be seen from this figure, the percent highly annoyed for traffic and railway noise is not as high as the percent highly annoyed predicted for aircraft noise at the higher values of day-night average sound level. However, these differences must be viewed with caution because of the relatively few data points available at the higher day-night average sound levels for the traffic and railroad conditions. The magnitude of the difference in annoyance in response to the three different transportation noise sources should be addressed in future annoyance studies.[102]

Thus:

- in spite of the fact this research project was part of an Air Force project to investigate annoyance with aircraft noise and
- in spite of the fact that the researchers found, as previous studies of the same data had found, that annoyance with aircraft noise was higher than annoyance with road and rail noise, and
- in spite of the fact that virtually all other respected noise researchers have also found that annoyance with aircraft noise is higher (see the sections that follow),

[101] Finegold, Lawrence S. Harris, C. Stanley, and von Gierke, Henning E., "Community Annoyance and Sleep Disturbance: Updated Criteria for Assessing the Impacts of General Transportation Noise on People," Noise Control Engineering Journal, No. 42, No. 1, January-February, 1994, p. 25.
[102] Ibid., pp. 27, 28.

these three Air Force researchers chose to disregard both this evidence and also the superior techniques for noise/annoyance curve fitting described in Green and Fidell (1992) and, based on the single issue that few data points are available for road and rail traffic at higher DNL sound levels, they developed a curve that again used lower annoyance levels for road and rail noise to depress the annoyance data from aircraft noise. The result, shown in Figure 1, is the *USAF updated community annoyance curve* [called the Finegold curve in the RBTI DEIS and the USAF/FICON curve in most other EISs] which predicts even fewer people will be annoyed by



Sources: Fidell, S., Barber, D., and Schultz, T., "Updating a dosage-effect relationship for the prevalence of annoyance due to general transportation noise," Journal of the Acoustic Society Of America, Vol. 89, No. 1, January 1991, p. 224 and Finegold, L., Harris, C.; von Gierke, H., "Community annoyance with sleep disturbance," Noise Control Engineering Journal, Vol. 42, No. 1, January-February, 1994; and Fidell, Sanford, Silvati, Laura, Tabachnick, Barbara, Howe, Richard, Pearsons, Karl S., Knopf, Richard C., Garmann, James, and Buchanan, Thomas, Socl Term Effects of Aircraft Overflights on Outdoor Recreationists in Three Wildernesses, NPCA Report No. 91-2, BBN Report No. 7502, US Department of Agriculture/US Department of the Interior, April, 1992, pp. 39-43.

Figure 1
Community Noise/Annoyance Curves And 1992 NPS Aircraft Noise Curve

aircraft noise than either the 1978 Schultz or the 1989 Fidell *et al.* curves predicted at 75 DNL and below. The findings about higher aircraft noise annoyance from the 1993 Finegold study have never been mentioned in Air Force EISs or reported as alternative views. In fact, as Figure 1 shows, the Air Force had a sizable collection of noise/annoyance curves for calculating the noise/annoyance in rural areas after 1993. Of all these available curves, only one (Green/Fidell

1992) attempted to adjust community noise/annoyance to reflect the different conditions in rural and wilderness areas. However, the Air Force chose instead a curve based on community noise/annoyance that gave the lowest annoyance readings below 75 dB--precisely the area in which most aircraft would be expected to operate due to the Air Force's method of calculating overflight noise.

The Air Force's choice of the Finegold curve is curious because of the next-to-last sentence quoted from Finegold *et al.*: "...these differences must be viewed with caution because of the relatively few data points available at the higher day-night average sound levels for the traffic and railroad conditions."[103] If this is indeed the case, and if the data points in the road/railroad data set are significantly different from those in the aircraft data set, the appropriate modeling technique would be to separate the two data sets and model each by itself--something Finegold *et al.* initially did. In fact, it was this model that led the authors to conclude that annoyance with aircraft noise was greater than annoyance with road/rail noise.

If, instead, the data sets are not significantly different, one must find compelling the studies cited by Finegold *et al.* themselves and again come to the conclusion that aircraft noise is more annoying than road/railroad noise. The only conclusion one cannot reach from the data as described in the quoted sentence--and this is particularly true when the authors claim to be participating in a study of the effects of aircraft noise, not transportation noise, on humans --is the conclusion the authors reached: that one should use the lower annoyance/noise data associated with roads and railroads to depress the annoyance data curve in the manner that was done with the *USAF updated community annoyance* (USAF/FICON) curve.

Whatever the reason for the actions of these Air Force researchers, selected parts of the study they completed have been widely quoted by the Air Force in EISs since the study was completed, and the *USAF updated community annoyance* (USAF/FICON) curve has frequently been used to justify EIS studies of noise/annoyance--just as it has been in this DEIS. However, the parts of the study that showed that annoyance with aircraft noise was higher than annoyance with road/railroad noise--and higher than that predicted by the *USAF updated community annoyance curve*--are never mentioned or referenced in any EIS either as a potential impact from aircraft noise or as an alternative point of view.

As a result of all these factors, claims in the RBTI DEIS about the percentage of population highly annoyed by aircraft activity--see, for example, Table 4.1-11, and paragraphs on the effects of noise on DEIS page 4-68[104]--grossly understate the actual percentage of the population who would be highly annoyed. Further, assuming that the Air Force monitors its own research contracts, it must be well aware that this understatement is taking place.

AO-75 VI. What the open literature says about the methodologies, assumptions, and results of Air Force Noise Modeling

There are a number of other reasons to believe the Air Force has long been aware its noise studies were not adequate. The 1996 USAF Requirements Analysis for Noise states that the Air Force needs "(1) a better understanding of the environmental impacts of noise on humans, animals, and/or structures and (2) a better ability to model and predict accurately and defensibly, the potential changes in noise impacts from changes in aircraft movement."[105] This statement should be compared with the following statement by the Air Force from Chapter 4 of the DEIS concerning

[103] Ibid.
[104] Draft Environmental Impact Statement, *Realistic Bomber Training Initiative*, Vol. 1, Op. Cit., pp. 4-33, 4-68.
[105] Requirements Analysis for Noise, Op. Cit., p. 9.

sound level calculations based on Day-Night Average Sound Levels: "Studies...have validated the reliability of aircraft noise models down to 55 DNL."[106] And this assurance from the Air Force should also be compared with a section of the 1997 Final Environmental Impact Statement for the Colorado Airspace Initiative, which states:

> Many reviewers of the Draft EIS [on the Colorado Airspace Initiative], including some members of the Federal regulatory community, felt that the application to a rural setting of the widely used 'FICON standards,' and its 65 dB Ldnmr threshold for acceptable levels of public annoyance, was inappropriate for such rural area with more quiet ambient noise conditions. Consequently, the use of the 65 dB threshold as the sole means to assess relative impacts or the acceptability of noise levels associated with military aircraft operations addressed in the EIS was modified.[107]
>
> The Final EIS now does not use a single criterion of 65 dB. Potential impact is evaluated based on the noise in each affected area. Values of Ldnmr, other than 65 dB, which are of interest are 55 dB, a level identified by the US Environmental Protection Agency as a level 'requisite to protect the public health and welfare with an adequate margin of safety' (usually interpreted as a level below which there is no adverse impact), 45 dB (10 dB below the EPA's guideline), and 75 dB (threshold above which effects other than annoyance may occur).[108]

According to Brooks AFB, the Air Force uses the following 'key organizations' for noise study:

> "...BBN Systems and Technologies and Wyle Laboratories...[and] several NASA facilities, particularly the Langley Research Center, are heavily involved in noise research issues, particularly those related to sonic booms. Addresses and key contacts for each of these organizations are as follows:
>
> 1. Armstrong Labs
> AL/OEBN
> Dr. Robert Lee
>
> 2. NASA, Langley Research Center
> Hampton, VA
> Mr. Kevin Shepherd
>
> 3. BBN Systems and Technologies
> Canoga Park, CA
> Dr. Sanford Fidell
>
> 4. Wyle Laboratories
> Arlington, VA
> Dr. Kenneth Plotkin[109]

Two of the heads of these facilities, Fidell and Plotkin have consistently published in academic journals on noise over the last two decades. The following list of publications contains writings by these individuals as well as most of the other major researchers in the field. All of these publications are available to the Air Force. Many are papers given at Air Force-sponsored noise conferences and, where noted, some have been specifically cited by the Air Force in noise related publications.

The following publications are listed in chronological order with a short quote or summary accompanying each citation. These quotes or summaries are not meant to encapsulate the entire article--just the portion dealing with those topics that are the subject of this report. A number of these publications are papers that were given at various NOISE-CONs, conferences on noise that had heavy Air Force participation. In some instances, such as NOISE-CON 96, the conference organizing committee arranged with the US Department of Defense for parallel sessions relating to

noise problems of concern to the military. Several of the following publications have also been cited by the Air Force to show that it needs more noise research.

1. von Gierke, 1973:
   A paper done for the EPA showed aircraft noise/annoyance levels that are roughly twice as high as those predicted by the Schultz curve.[110]

2. Fidell and Jones, 1975:
   Developed a curve for aircraft annoyance at Los Angeles International Airport that shows about thirty percent of the respondents were highly annoyed at a DNL of 65--much higher than the Schultz curve would forecast..[111]

3. Grandjean, 1976:
   A Swiss study found it took a DNL of 10 to 15 dB higher for road traffic noise to cause an equal disturbance to aircraft noise.[112]

4. Otterhead, 1978:
   "[T]hat in terms of its capacity to induce dissatisfaction, aircraft noise is effectively some 9.45 dB(A) noisier than road traffic noises at the same physical level."[113]

5. Rylander, Bjorkman and Ahrin et al, 1980:
   "The extend of annoyance within each category of exposure events was related to the noise levels from the noisiest type of aircraft...The equation that developed the Lmax level and the number of aircraft overflights explains almost all the variation in annoyance. By contrast, an index based upon the equal energy principle [Schultz's Curve] explained only 68-9% of the variation...It is obvious that a very low number of overflights at an extremely high dB(A) level would be experienced as very annoying by the population."[114]

6. Hall, Birnie, Taylor and Palmer, 1981:
   This paper, showed that the percentage of those highly annoyed with aircraft noise was higher than that for "grouped road traffic data" at every DNL level. Further, the authors stated that "on the basis of the preceding discussion, only one conclusion appears possible: There is a difference between the community responses to aircraft noise and to road traffic noise when each is measured by L_{dn}. The difference in annoyance is equivalent to roughly 8 dB at an Ldn of 55 dB, increasing to roughly 15 dB at an Ldn of 65 dB. For the same noise level, a greater percentage of people are highly annoyed by aircraft noise. The difference in annoyance at the two sources is not constant, but instead, increases as L_{dn} increases."[115] Although this result contradicts the conclusion of Schultz's synthesis, it is

[115] Hall, Fred L., Birnie, Susan E., Taylor, S. Martin, and Palmer, John E., "Direct Comparison of Community Response to Road Traffic Noise and to Aircraft Noise," Journal of the Acoustic Society of America, Vol. 70, No. 6, December, 1981, pp. 1693, 1697.

not the first time a difference has been reported in the responses to road traffic and aircraft noise. Ollerhead reports results which imply 'that in terms of its capacity to induce dissatisfaction, aircraft noise is effectively some 9.45 dB(A) noisier than road traffic noises at the same physical level."[116]

7. Kryter, 1982:
Because aircraft noise falls over a structure, like a house, equally, as opposed to passing through interfering structures such as traffic noise would do, the "effective noise exposure" would be greater than that of traffic noise. Thus, aircraft noise should be considered separately from other transportation noise.[117]

8. Fidell, Horonjeff, Mills, Baldwin, Teffeteller and Pearsons, 1985:
Short term annoyance and long term annoyance with aircraft noise were both significantly higher than that forecast by the 1978 Schultz curve. "The prevalence of aircraft noise-induced annoyance was assessed at three mixed-use airports in a total 40 neighborhood/interviewing rounds. Dosage-response relationships for these data do not agree well with that synthesized by Schultz for general transportation noise."[118]

9. deJong, 1990: cited by Brooks AFB in a request for research--31 October 1996
"...many other impulsive sounds produce an equivalent noise level resulting in serious annoyance which is approximately 12 dB(A) lower than the equivalent noise level of road traffic causing and equal amount of annoyance...This would indicate that the 5 dB(A) ISO-correction factor for impulsive sounds (ISO.R 1996 1971) is too low, which would be in agreement with the results of the...analysis...referred to in this paper...This is equivalent to a difference between aircraft and highway noise of about 12 dB."[119]
"The population is rarely exposed to one single noise source. Within the last ten years, several researchers have dealt with the problem of noise annoyance arising from multiple sources. Several models have been proposed, however most of these had to be rejected as they did not meet theoretical requirements. [A model] has to be rejected because of the implication that the annoyance from the combination of two sources may be less than the annoyance from the most annoying type, when heard alone...Intrinsically, a total noise situation can never be less annoying than the most annoying component, no matter what the verbal reports may be."[120]

10. Fidell, Barber, and Schultz, 1990:
As was the case in the 1978 paper, this paper again noted that the Schultz curve represents "a relationship between transportation noise exposure and the prevalence of annoyance in communities." The paper also stated that there was a fear that "agencies which fund such studies [as Schultz's] might erroneously conclude that the synthesis [Schultz's Curve] represented a definitive solution to many of the problems assessing effects of noise exposure on communities."[121]

[121] Fidell, Barber, and Schultz, Op. Cit., p. 221.

11. Fidell, 1990, delivered at NOISE-CON 90:
"Use of [the Day-Night Average Sound Level (DNL) to predict annoyance hinges upon acceptance of the equal-energy hypothesis: the notion that people are indifferent between the annoyance of exposure to sounds of short duration but high level and sounds of long duration but compensatingly lower level. Although this hypothesis proved useful in most of the circumstances of concern in the 1970's, its implication and limits are still being explored today."[122]
Commenting on the use of various metrics such as DNL: "a search for a single, purely physical metric that can serve as a universal predictor of the annoyance of noise exposure is unlikely to succeed."[123]
Commenting on the period when Schultz's study gained prominence: "1980 marked the start of a Mass Extinction in the United States; the scarcity of funding and reduced federal interest led to a substantial diminution in the volume of research on noise effects."[124]

12. Wesler (Wyle Laboratories), 1990, delivered at NOISE-CON 90:
"[The agreement to use DNL] is being called into question, largely as a result of dissatisfaction with its use in areas of low ambient noise level."[125]
"...metrics have been developed to represent overall community reaction, based on the physical parameters, and are not considered reliable in representing the reactions of individual members of that community."[126]
"Cumulative noise metrics were primarily of value in attempting to measure the long-term annoyance of communities (not individuals) to environmental noise..."[127]

13. Fields, 1990, delivered at NOISE-CON 90:
"[W]hile social survey evidence is presently weak, it may be that simple annualized noise measures (Ldn or Leq) may not correctly represent the annoyance potential of infrequent loud noise events which evoke public action (i.e. low altitude flights along military training routes)...The amount of community action is also observed to be increased by changes, even small changes, in intrusive noise levels and by a contrast between an intrusive noise and low ambient noise levels."[128]

14. Zusman (FICON Chairman), 1990, delivered at NOISE-CON 90:
"No guidelines exist for application in rural or sparsely populated areas."[129]
"The problem of land use compatibility is particularly exacerbated in rural or sparsely populated areas where ambient noise levels are low and people are concerned with the intrusion of aircraft noise."[130]
"The arguments raised suggest that the 55 dB Ldn noise contours should be used for planning purposes since the area is rural, previous exposure to aircraft noise is minimal, and the background noise levels are low. More important than the absolute noise level

appears to be the difference between existing noise levels and actual aircraft noise levels."[131]

"In spite of the size of the operating area and sparse population [around Fallon NAS], the Navy was subjected to numerous lawsuits challenging the environmental documentation and alleging potential health effects. Although the Navy offered to purchase the residences in Dixie Valley as part of mitigation efforts, negotiations were difficult. People who had come to live in this area of Nevada and enjoy the peaceful and quiet lifestyle were alarmed at the potential increase in noise levels associated with the Navy's operations."[132]
"For the time being, the Navy's approach has been to acknowledge the potential impacts and to generate Ldn 55 and 60 noise contours."[133]

15. deJong and Groenveld, 1990, delivered at NOISE-CON 90:
"The nationwide survey in which the incidence of and annoyance from 95 noise sources was studied...also included regular civil aviation, general aviation, military aviation and helicopters. Military aviation caused the most annoyance by far."[134]

16. Harris, 1990, delivered at NOISE-CON 90:
On MTR noise: "The highest onset rate within a SEL level was rated as more annoying, in most cases it was rated significantly more annoying than at least one of the lower onset rates levels....A penalty for onset rate is needed and it should be applied throughout the range of onset rates. We are not sure exactly where one would begin applying the penalty but experiment 3 suggests that the value of 15 dB/sec may not be too far off since a significant differences [sic] was found between onset rates of 2.23 and 11 dB/sec."[135]

17. Harrison, Hartmann, and Makel, 1990, delivered at NOISE-CON 90, cited by Brooks AFB--31 October 1996:
On annoyance from overflights in wilderness areas: "The basis for assessing the probable reaction of populations which are impacted is, in most cases, the 'Schultz curve'. (Schultz, 1978, 1982) The effect of the aircraft noise is measured in terms of percentage of the population highly annoyed. The ambient background in which the affected population is submerged is assumed not to be an important determinant of this effect. For reasons to be discussed, these assumptions and methodologies are not appropriate in the assessment of the impact of aircraft overflights on wilderness visitors."[136]
"The US EPA has identified a day/night level of 45 dBA as that which is requisite to protect health and welfare with an adequate margin of safety. (EPA 1974) Work to date has shown that intrusive aircraft sound in wilderness rarely if ever even approaches, much less exceeds, this level. Yet, aircraft intrusions presented enough of a perceived problem, at least, that Congress was motivated to instruct land management agencies to investigate this question. So it would seem that previously established criteria are, in the wilderness situation, not applicable."[137]

[137] Harrison, Hartmann, Makel, Op. Cit., p. 330.

"...the background sound is critically important in determining detectability. It has been shown (Fidell, et al, 1988) that annoyance, under several different situations, is correlated with [detectability]."[138]

18. Fidell and Silvati, 1990, delivered at NOISE-CON 90:
A paper relating annoyance with aircraft flights to outdoor recreationists: "The well-known dosage-response relationship developed by Schultz (1978) for general transportation noise experienced in high population density areas, cannot be directly applied to the outdoor recreational case for the following reasons, among others:
(1) since most visits to parks and Wildernesses last considerably less than a week, it makes little sense to quantify noise exposure in terms of an annualized measure such as Day-Night Average Sound Level;
(2) the original Schultz relationship predicts no impact whatever at DNL = 45 dB, largely for the sake of consistency with the finding of EPA's Levels Document (EPA, 1974) that indoor exposure at this level poses no threat to public health and welfare. Noise produced by aircraft operations in the low ambient noise environments may disturb people at even lower exposure levels;
(3) there is no community per se in the case of present interest, only individuals or small groups of outdoor recreationists; and
(4) like all other empirically developed dosage-response relationships, the one developed by Schultz (1978) can be challenged on the grounds that it is not influenced by information collected under circumstances similar to those to which it is to be applied."
...One impediment to direct application of the Schultz relationship to predict reactions to aircraft noise exposure in Parks and Wildernesses is the sporadic nature of overflights...The sporadic nature of exposure, coupled with the short duration of most visits to Wildernesses, strains the equal-energy hypothesis on which the use of Day-Night Average Sound Level as a predictor of annoyance is predicted.
...The fact that outdoor recreationists are exposed to aircraft noise without the benefit of the insertion loss of residential structures suggests the likelihood of a leftward shift of the X-intercept of the dosage-response relationship by 10 dB or more. The fact that ambient noise levels are often lower in uninhabited places than in urban neighborhoods increases both the audibility and effective duration of noise intrusions caused by overflights, suggesting a yet further leftward shift of in the X intercept."[139]
"Construction and interpretation of source-based emission contours relies upon a number of simplifying assumptions adopted to permit tractable calculations and straightforward application. These include most importantly the "equal energy hypothesis: (the notion that effects of aircraft noise on people in residential neighborhoods can be predicted from the product of the duration and intensity of exposure without regard for its temporal distribution; the assumption that the ambient noise environment on which aircraft operations intrude may be ignored; that the world is locally flat; and that aircraft flight profiles and flight tracks can be specified with precision."
"A fundamental purpose for constructing aircraft noise contours in urban areas is to support analyses of means of making airports and communities more compatible. This is not the purpose for modeling aircraft noise exposure in Parks, however; purchase of navigation easements, alteration of land use policies to increase compatibility with aircraft operations, and installation of acoustic insulation are not viable options in areas Congress has set aside for other purposes. The fundamental purpose for characterizing aircraft noise exposure in Park and Wilderness settings is to support analyses of ways to make aircraft operations more compatible with existing land uses.
Noise modeling techniques and assumptions originally developed for military airfield and urban airport planning are not readily adapted to Park and Wilderness

[138] Ibid., p. 331.
[139] Fidell and Silvati, Op. Cit., p. 340.

settings...The differences between residential and outdoor recreational exposure to aircraft noise, as well as the differences in purposes for characterizing aircraft noise exposure, are sufficiently great to suggest the need for an alternative approach to preparing aircraft noise contours. The alternative approach should provide the basis for answering the question 'How far from here must an airplane fly if it is not to impact the area of interest?' rather than "How much noise does an aircraft flying here produce there?'

In other words, the preferred means of modeling aircraft noise impacts in Park and Wilderness setting is from the perspective of the observer, not the source. Furthermore, since audibility is the issue of primary concern in low ambient noise conditions, explicit consideration must be given to signal to noise ratios rather than absolute sound pressure levels. These considerations suggest that observer-based audibility contours are more useful than source-based emission contours for use in analyses of aircraft noise impacts in Park and Wilderness settings."[140]

19. Green and Fidell, 1991, Cited By Brooks AFB--31 October 1996:

D* expresses an annoyance criterion in decibel-like units equivalent to some level of DNL exposure.

"...it is sometimes claimed that aircraft noise exposure is for one reason or another more annoying than noise exposure produced by other sources.

The claim is based for the most part on the observation that the findings of social surveys of annoyance of aircraft noise tend to cluster a greater levels of annoyance for similar levels of noise exposure than other transportation noise...the mean value for D* in surface transportation studies is about 75.4 dB whereas the mean value for aircraft sources is 70.2 dB, a difference of 5.2 dB. Thus people are on average more willing to report annoyance due to aircraft noise exposure than to report annoyance due to street and rail traffic. A *t* test t_{stat} = -2.47, p<0.02 indicates that a difference of this size is unlikely to arise by chance alone."[141]

20. Kryter, 1991, Distinguished Lecture delivered at NOISE-CON 91:

Three types of annoyance related to exposure to noise have been studied:

1. Noisiness (annoyance) as a sensation:...Inherent in this definition is that the sound is immediately perceived by the listener as being annoying and unwanted independently of any meaning or information conveyed by the sound.

2. Annoyance from behavior interference: emotional annoyance experienced...because of [a sounds] interference with auditory or other behavior.

3. Effects of annoyance on health: the effects on health due to emotional reactions of anger and fear related to the annoyance that ensues during and after exposures to noises and noise environments over long periods of time.[142]

...jet aircraft noise with its pure-tone compressor whine and larger amounts of energy in the higher frequencies would naturally be heard as more 'annoying' than the noise from propeller driven aircraft. [Thus] it was suggested [in 1959] that the phrase 'perceived noisiness' should be used to identify the immediate sensation of annoyance or unwantedness elicited by sounds.

It appears that people can perceive a sensation, called annoyance (defined as obnoxiousness, unwantedness, noisiness) that is related to an increase in the frequency of a tone or very narrow bands of sound in a somewhat different way than is loudness [A-weighting]."[143]

[140] Ibid., p. 341-342.
[141] Green and Fidell, Op. Cit., p. 241.
[142] Kryter, Karl D., Distinguished Lecture on "Perception of Noisiness," NOISE-CON 91, Tarrytown, New York, July 14-16, 1991, p. 29.
[143] Ibid., p. 31.

21. Ollerhead, 1993, Distinguished Lecture delivered at NOISE-CON 93:

Although there is a substantial amount of variation in the amount of annoyance at any particular level of aircraft noise exposure, there is a distinct upturn between 55 and 60 dB(A) Leq(16-hour). Below about 57 dB(A) there is little or no correlation between noise exposure and average annoyance; above this level, annoyance increases markedly with average noise exposures.

These observations support the conclusion of the [1980 study of the] World Health Organization that a general outdoor noise level of around 55 dB(A) Leq (24-hour)--equivalent to approximately 57 dB(A) Leq (16-hr)--is a desirable noise limit in residential areas.[144]

22. Stusnick *et al.*, 1993, delivered at NOISE-CON 93:

The Ldnmr metric adds onset rate adjustments to the individual aircraft overflight sound exposure levels (SEL-s) that are used to compute the busiest month, day-night average sound level (Ldnm). Apart from the addition of this adjustment, the Ldnmr is computed in the same manner as is Ldnm. The [currently] recommended onset rate adjustment...varies from 0 decibels (dB) for onset rates below 15 dB per second to 5 dB at onset rates above 30 dB per second.

This paper reports on two programs which have recently been completed to more accurately assess human annoyance to noise from low-altitude military training flight operations...Both studies confirmed the existence of an onset rate effect and...each indicated that the interim onset rate correction could be extended beyond 5 dB to at least 11 dB at the an onset rate of 150 dB per second.[145]

It was found that onset rates faster than 30 dB per second caused increased annoyance beyond that due to level alone.[146]

23. Kugler *et al.*, 1993, Delivered at NOISE-CON 93:

When fielded, [the Assessment System for Aircraft Noise] ASAN will provide USAF route and environmental planners the capability to produce technically and legally defensible aircraft noise-related environmental impact analyses.[147] [Note: As of the March, 1999, ASAN is still not implemented and NOISEMAP/ROUTEMAP are still being used to do Air Force noise/annoyance modeling.]

One of the innovations in noise impact analysis methodology being implemented in ASAN is the concept of a Region of Influence (ROI). The ROI concept allows the user to limit the analysis to only those receivers whose environment is affected by the proposed actions, as required by NEPA.[148]

[144] Ollerhead, J. B., Distinguished Lecture on "Past and Present UK Research on Aircraft Noise Effects," NOISE-CON 93, Williamsburg, Virginia, May 2-5, 1993, p. 11.
[145] Stusnick, Eric, Plotkin, Kenneth J., Bradley, Kevin A., and Molino, John A., "The Effect Of Onset Rate on Annoyance to Military Aircraft Noise," NOISE-CON 93, Williamsburg, Virginia, May 2-5, 1993, pp. 379-381.
[146] Stusnick, Plotkin, Bradley and Molino, Op. Cit., p. 381.
[147] Kugler, B. Andrew, Sharp, Paul A. and Finegold, Lawrence, "Development and Field Test of the Beta Version of the USAF Assessment System for Aircraft Noise," NOISE-CON 93, Williamsburg, Virginia, May 2-5, 1993, p. 393.
[148] Ibid., p. 394.

Hence, it appears this NEPA requirement has not been met in the past and will not be met until ASAN is implemented.

24. Sneddon and Finegold, 1993, Delivered at NOISE-CON 93:

Accurate prediction of the effects of sporadic aircraft noise exposure on sparse populations is hampered by incomplete understanding of the effects of such aircraft noise and by lack of detailed empirical evidence about such effects.[149]

"The methods typically used to collect and interpret data in most community response studies are conditioned on assumptions about the nature of noise exposure and human attitudes and behavioral responses that are appropriate for airport environments. The applicability of some of these assumptions (e.g. the ability of place-oriented measurements to represent individual noise exposure, the insensitivity of human response to time of interviewing, annualization of exposure estimates, and the utility of the equal energy hypothesis') to other environs has not been established. Furthermore, there is reason to believe that the long delayed self-reports of reactions to aircraft noise exposure sought by standard social surveys may not adequately represent the effects of sporadic aircraft overflights.[150]

The equal-energy hypothesis expresses the notion that the number, level and duration of noise events are fully interchangeable determinants of annoyance as long as their product (energy summation) remains constant. In other words, quantification of noise exposure in units of DNL for purposes of predicting annoyance is based on the belief that people are indifferent between the annoyance of small numbers of very high level noise events of short duration and the annoyance of large numbers of compensatingly lower level and/or longer duration noise events.[151]

25. Lee, 1996, delivered at NOISE-CON 96:

The military installations have used short term monitoring in cases of litigation to verify their predicted noise contours...Often times, these predictions of the long term noise exposure don't agree with the measurements acquired from the noise monitors... [This] test showed that site 2 and 3 had almost no agreement with the predicted values and yet site 4, which was less than 1000 ft from these sites, had a very high agreement.

Lee then noted that they changed the standard deviation figures from energy levels to dB to try to correct this inconsistency.[152]

26. Lee, Plotkin, Kare and Svane, 1996, NOISE-CON 96:

Previous airport noise models [prior to 1995-1996] assumed land conditions of flat terrain and acoustically soft surfaces for sound propagation...The results of these measurements confirm that the shielding from hills and propagation across acoustically hard surfaces like water can significantly effect the noise exposure contours...[and that] topography had a significant effect on the propagating acoustical signal. This could make significant differences in the prediction of total noise exposure that is routinely done around all major

airports and airbases. Each of the four participating countries have used this data base to modify their noise models.[153]

AO-75 VII. What the Air Force Did In The RBTI DEIS

Instead of properly considering and addressing the range of respected scientific thought and knowledge addressed in the sources covered in the prior sections, and instead of tailoring a noise analysis to the specific requirements of the regions underlying the MTRs and MOAs in the RBTI DEIS, the Air Force chose to copy large portions of its noise analysis sections out of old EISs and EAs. This indicates that the Air Force chose not to take a hard look at any material that might contradict what was claimed in earlier EISs and EAs.

The courts have held that "NEPA imposes affirmative obligations on agency to seek out information concerning environmental consequences..."[154] and that "Agency charged with preparing environmental impact statement must demonstrate that it has taken 'hard look' at environmental consequences of project..."[155] In addition, the Air Force also chose to disregard specific criticisms it had received as early as 1996 from critics of its EISs--criticisms that specifically listed the citations for the documents it had failed to include.

Citations Used in the RBTI DEIS

The actual sources and references chosen by the Air Force for the DEIS provide additional evidence of an unwillingness to consider new or contradictory information. Appendix G, Noise, in the DEIS has 15 sources related to noise/annoyance--only one is less than five years old and it deals with sleep interference. Only four others are less than ten year old and of those, two are Air Force sponsored studies from 1991 and 1994, one is an operations manual for an Air Force Model, and one is the 1992 Forest Service study that was mischaracterized in the DEIS. The remaining 10 references are over ten years old. No critical studies were cited.

The bibliography for sections 1 through 6 of the DEIS is presented in section 7. This bibliography contains 33 citations related to noise. 23 of these were written after 1988, demonstrating that the Air Force has been following noise research developments since that time. However, of the 33 citations, 10 concern archeological impacts or wildlife/animal responses and another 11 are FAA or USAF reports or research projects. Of the 12 remaining documents which actually deal with human responses to noise, 7 were written since 1990. Of those, four have to do with sleep disturbance or health effects and only the remaining 3 reports deal with the Air Force noise/annoyance model. No critical studies were cited and no attempt to provide a hard look at the core issue in this DEIS--the relationship between noise/annoyance in rural areas--was made.

In sum, the Air Force chose to disregard a large body of evidence--of which it was fully aware at the time this DEIS was written--that showed its noise analysis was faulty. Instead, it simply copied an earlier noise analysis appendix into the RBTI DEIS that is based on the 1978 Schultz curve.

000827

Appendix 1 of this report lists 59 articles and reports, all by respected noise researchers, that could have been used by the Air Force to provide an alternative and more widely accepted approach to noise modeling in both urban and rural settings.

AO-60 **VIII. Problems with the 1978 Schultz Community Noise Annoyance Model**

1. Methodology

The methodology chosen for generating the data points used in the construction of the models I will develop in this section was used by the researcher most frequently cited by the Air Force--Theodore J. Schultz--and it is the methodology specifically cited in the article by Fidell, Barber and Schultz in 1991 when they revised Schultz's original 1978 study. In their 1991 study, Fidell, Barber and Schultz state that:

> A grid was overlaid on Figure 1 of Andersen et al. (1983) to estimate values of pairs of noise exposure levels and percentages of highly annoyed respondents. Figure 12 shows a 95% confidence intervals [SIC] for the 26 points from this study.[156]

Since the data points I will use came from the studies chosen by both Schultz and then Fidell, Barber and Schultz as being adequate, the data itself has been held to the same level of validity as either the 1978 Schultz study or the 1991 Fidell, Barber and Schultz study--both of which are used by the Air Force in the RBTI DEIS. This methodology is also essentially the same as that used by Fidell and Green in their 1989 study of noise annoyance and it uses many of the same points used by Finegold in the 1994 study also cited in this DEIS.[157]

It should be noted that the Air Force methodology that is duplicated in this section of the paper is not appropriate for modeling rural, wilderness or wildland noise impacts. As Fidell has stated:

> ...the preferred means of modeling aircraft noise impacts in Park and Wilderness setting is from the perspective of the observer, not the source. Furthermore, since audibility is the issue of primary concern in low ambient noise conditions, explicit consideration must be given to signal to noise ratios rather than absolute sound pressure levels. These considerations suggest that observer-based audibility contours are more useful than source-based emission contours for use in analyses of aircraft noise impacts in Park and Wilderness settings.[158]

Thus, any results developed from models such as those employed by the Air Force or by this author in the section that follows are only applicable to urban settings.

2. Analysis of Existing Models

The following sections provide a detailed analysis of the noise model that forms the heart of the DNL/annoyance analysis in this DEIS. This model comes from a 1978 study by Schultz that was then linked to a land use compatibility study which will be addressed in the following sections of this paper.

Table 1
Study Areas For The 1978 Schultz Paper

Failure to properly generate the curve used in the 1978 Schultz study:

The 1978 study by Schultz that forms the heart of the DEIS analysis generated a 'synthesis' curve based on the noise surveys in Table 1.[159] Using Schultz's study to analyze current military aircraft noise in rural or wilderness settings causes two important problems. First, this study mixed aircraft and non-aircraft noise--five of twelve studies covered only street or rail noise. This caused the study to underestimate the annoyance levels associated with aircraft noise alone. Second, the study covered urban communities, not rural or wilderness areas. Even in urban areas, these problems were apparent as early as the first Schultz paper. A 1973 study at Los Angeles International Airport had significantly higher annoyance ratings in the 55 to 75 DNL range than the rest of the studies in the Schultz paper.[160] These higher ratings were never accounted for by Schultz and the 1978 Schultz paper had other problems. For example, Kryter argued that Schultz's use of only those who were 'highly annoyed' missed large numbers of people who were also bothered by noise.[161]

It is also apparent that Schultz's efforts to fit a 'synthesis curve' to his data were flawed both in the functional form chosen for the curve and in its failure to correct for the influence of 'outliers'--data points that exert undue influence on the model because they lie so far away from the majority of the data points. Page G-7 of the DEIS presents Schultz's data and his curve. A number of 'outlier points' lie along the horizontal axis, recording annoyance/DNL readings of 0/54, 0/61, 0/68, etc. These points deformed the curve and caused it to give lower annoyance readings in the 50 to 75 DNL range--precisely the range in which Schultz's own study underestimated the annoyance effects of Los Angeles International Airport.

Schultz's inability to deal with these problems was partially due to the primitive methods of modeling available to him in the mid-1970s. There are now a number of possible methods for

correctly fitting Schultz's curve to the data. For example, an advanced econometric method using higher powered functions can properly fit a curve to Schultz's data as shown in Figure 2.

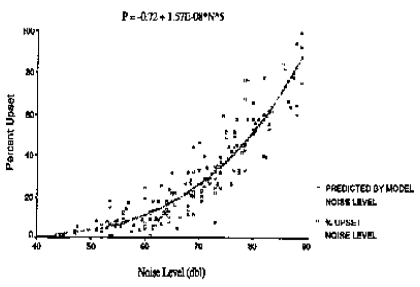

Figure 2
Plot of Schultz's Data Using a Higher Powered Function

Both the statistics accompanying the model in Figure 1 and an inspection of the curve itself show that the curve is a better fit of the data than the curve generated by Schultz. The equation for this model indicates that the Schultz curve underestimates the percentage of people who are highly annoyed at the 65 DNL level by about 13 percent.

This model confirms what Schultz's own data for Los Angeles International Airport indicated--the Schultz curve underestimates the number of people who are highly annoyed with various aircraft DNL levels. Further, in a 1991 paper written by Schultz, Fidell, and Barber, Figures 14 and 15 show that Schultz's original curve systematically underestimated annoyance in the 50 to 75 decibel range.[162]

The 1978 Schultz model and the new model presented above both use the 1978 Schultz data set and, thus, they are models of community transportation noise annoyance, not models of annoyance from aircraft noise. The 1978 Schultz model and the 1993 USAF/FICON [Finegold] curve that are shown in Figure 3, as well as the enhanced curve fit model presented in this section are all incorrectly specified to estimate aircraft noise because they include auto, train and tram noise.

Figure 3
Comparison Of The Schultz And USAF/FICON Curves

Failure to use the appropriate data to analyze aircraft noise:

In 1990, Schultz jointly authored a paper with Fidell and Barber updating his 1978 study. The result was the Schultz curve shown in Figure 3. This paper, known as the Fidell paper, was published in the Journal of the Acoustic Society of America in 1991. As was the case in the 1978 paper, this paper again noted that the Schultz curve represents "a relationship between transportation noise exposure and the prevalence of annoyance in communities."[163] Hence, the study concerns communities, not wilderness or open space, and it concerns transportation noise, not aircraft noise. Data on transportation noise was generated by Schultz by averaging together traffic noise, tram noise, train noise, and aircraft noise.

Table 2
Updated Studies On Transportation Noise

The Fidell paper also stated that there was a fear that "agencies which fund such studies [as Schultz's] might erroneously conclude that the synthesis [Schultz's Curve] represented a definitive solution to many of the problems assessing effects of noise exposure on communities." The paper then compared Schultz's original curve with 15 new studies, all of which were completed after Schultz's original research. These studies are shown in Table 2.

These new studies cover (with one exception) either aircraft noise or ground transportation noise, but not both. Figure 4 compares two representative aircraft noise/annoyance data sets from the 1991 Fidell paper with the 1978 Schultz curve while Figure 5 compares two representative tram/traffic noise/annoyance data sets from the same paper with the 1978 Schultz curve. Each of the new studies in the Fidell paper yields the same results: annoyance with aircraft noise is consistently higher than the 1978 Schultz curve forecasts while annoyance with road, tram and railway noise is consistently below that indicated by the curve. Only when the studies of aircraft noise are combined with those of road, tram and rail noise is the Schultz curve approximated.[164] This creates the illogical premise on which the Schultz model is based: auto, tram and railroad noise depress the levels of annoyance associated with aircraft noise. This is analogous to claiming that someone who is highly annoyed at a given level of aircraft noise will become less annoyed if additional noise is created by automobiles, trains or trams.

It is interesting to note that section 4 of the Holloman EA defines cumulative noise exposure as "the sum of all noise exposure from all sources."[165] In addition, the RBTI DEIS claims that "the total sound level produced by two sounds of different levels is usually only slightly more than the higher of the two."[166] Given these definitions, the noise exposure in any area subjected to aircraft, auto, tram and train noise sources could not be less than the exposure from the loudest source--aircraft noise. This contradicts the results generated by the Schultz curve since

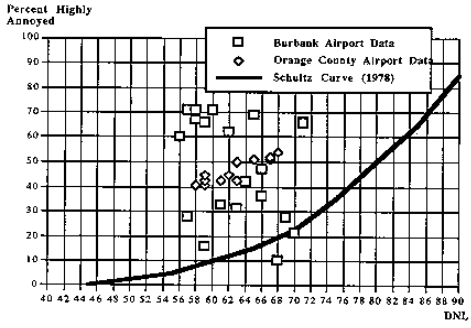
000827

the Schultz curve averages higher aircraft noise levels with lower ground transportation noise levels.[167]



Source: Fidell, Sanford, Barber, David, S. and Schultz, Theodore, "Updating a dosage-effect relationship for the prevalence of annoyance due to general transportation noise," Journal of the Acoustic Society Of America, Vol. 89, No. 1, January 1991, p. 224.

Figure 4
Comparison Of Aircraft Annoyance Data To The Schultz Curve

The Air Force/Finegold model:

The Air Force/Finegold compounded Schultz's error with their 1994 model (also shown in Figure 3) by fitting Schultz's mixed aircraft and train/tram/auto data with an S-shaped logistics curve. This improperly depresses the percentage of highly annoyed people in the 40 to 70 dB range by an even larger amount--about 20%--and the S-shaped curve requires one to believe that annoyance with noise grows less and less as noise increases above 75 dB--a concept supported by no acoustics research. The Air Force has claimed that this model "does not differ substantially from the original [Schultz model], [and] is the current preferred form."[168] This is true. The data used in the Air Force model have the same problems as those used in the Schultz model while the curve form chosen by the Air Force introduces additional fitting problems.

Figure 5
Comparison Of Traffic/Tram Annoyance Data To The Schultz Curve

An aircraft only model:

Data for all 15 studies in Table 2 were included in the 1991 Fidell paper. Using data from studies 1, 4, 8, 9, 10, 12, and 14, one can constructed a new percent highly annoyed/DNL graph for aircraft noise alone. The rationale for building (and using) this new curve is as follows:

1. A study such as this DEIS, which purports to investigate the effects of aircraft noise, should base its models on aircraft noise, not on train, tram or auto noise.
2. Among the many noise researchers [including the Air Force itself] who have already been listed in sections IV and V of this report, the following findings relating annoyance with aircraft noise compared to train, tram or auto noise are representative:
   a. Grandjean, in a Swiss study, found it took road traffic noise with a DNL of 10 to 15 dB higher than aircraft noise to cause an equal level of annoyance.[169]
   b. Kryter argued that because aircraft noise falls over a structure, like a house, equally, as opposed to passing through interfering structures such as traffic noise would do, the "effective noise exposure" would be greater than that of traffic noise. Thus, Kryter found that aircraft noise should be considered separately from other transportation noise.[170]

Constant	-50.54	20.62	-2.44	0.016
DNL	1.2343	0.3273	3.77	0.000

Figure 6
Aircraft Noise/Annoyance Model Using Aircraft Data Only

Figure 6 shows the result of modeling annoyance with aircraft noise only, based on the data in Fidell, Barber and Schultz's 1991 paper. The resulting model is simpler and also more logical than Schultz's model--it says that there is a direct relationship between increasing DNL levels and annoyance in the 50 to 75 DNL range.

The equation for this Aircraft Noise/Annoyance Model is also simpler:

Percentage Annoyed = - 50.3 + 1.23 DNL

The Aircraft Noise/Annoyance Model predicts that at the 65 DNL point used by this DEIS, about 30 percent of people will be highly annoyed by aircraft noise. This should be contrasted with the RBTI DEIS which states that at "65 DNL about 12% of people would be highly annoyed by noise."[171] The aircraft-only noise model also gives annoyance rates more than double the level of annoyance forecast by either the 1978 Schultz curve (13.6%) or the USAF model (12.3%), and there is ample evidence--provided over the years to the Air Force in hearings-- that this model, and not the Schultz or Air Force curves, more closely estimates true aircraft annoyance levels. For example:

1. A 1988 court case involved an Air Force estimate, based on the Schultz curve, that 700 people around Westover Air Force Base would be highly annoyed by aircraft noise. A local group gathered the signatures of 1535 citizens who were highly annoyed--more than double the amount the Schultz curve forecast, but close to the number the aircraft annoyance model generated in this paper would predict.[172]

[172]Valley Citizens for a Safe Environment v Aldridge (1988 DC Mass) 695 F Supp 605, 19 ELR 20497.

000827

2. von Gierke, in a paper done in 1973 for the EPA, showed Aircraft Noise/Annoyance levels that agree with the Aircraft Noise/Annoyance Model and are roughly twice as high as those predicted by the Schultz curve.[173]

3. A 1975 paper by Fidell and Jones developed a curve for aircraft annoyance at Los Angeles International Airport that shows about thirty percent of the respondents were highly annoyed at a DNL of 65.[174] The rest of this curve also agrees closely with the Aircraft Noise/Annoyance Model developed above.

4. Hall, Birnie, Taylor and Palmer, in a 1981 paper, showed that the percentage of those highly annoyed with aircraft noise was higher than that for "grouped road traffic data" at every DNL level. Further, the authors stated that "On the basis of the preceding discussion, only one conclusion appears possible: There is a difference between the community responses to aircraft noise and to road traffic noise when each is measured by L_{dn}. For the same noise level, a greater percentage of people are highly annoyed by aircraft noise. The difference in annoyance at the two sources is not constant, but instead, increases as L_{dn} increases."[175]

5. In a 1985 paper, Fidell, Horonjeff, Mills, Baldwin, Teffeteller and Pearsons found short term annoyance and long term annoyance with aircraft noise were both significantly higher than that forecast by the 1978 Schultz curve. These authors state that "The prevalence of aircraft noise-induced annoyance was assessed at three mixed-use airports in a total 40 neighborhood/interviewing rounds. Dosage-response relationships for these data do not agree well with that synthesized by Schultz for general transportation noise."[176]

None of these studies was included in this DEIS in spite of the fact that there has been abundant evidence for the last twenty years that a higher level of annoyance exists when aircraft alone are considered. In fact, the Requirements Analysis for Noise published by the Air Force in 1996 includes a bibliography of 15 additional sources that are also critical of the type of noise study presented by the Air Force in Appendix G of this DEIS.[177] None of these sources is cited in this DEIS.

Land use and the noise/annoyance models:

In June, 1980, a Federal Interagency Committee on Urban Noise used Schultz's curve linking DNL and annoyance, along with other studies, to publish guidelines relating DNL and land--the FAA Part 150 Land Use Compatibility Table.[178] Since the sound levels considered by the Interagency Committee were, in the main, those that cause physical damage neither to structures nor to people, land use compatibility was linked instead to the annoyance with noise those who inhabited the land would experience. As Table 3 shows, the divisions between the six DNL/land use columns confirms the importance of annoyance in establishing the breaks between the columns of compatible activities--each of the breaks is at a logical increment of increased annoyance and each (with the exception of the 65-70 column which represents a 50% annoyance increase from the previous column) is denominated in tens or five's:

Table 3
Linkages Between Annoyance DNL and Land Use Compatibility

Given these relationships between annoyance and land use, one can apply the Aircraft Noise/Annoyance Model from Figure 5 to the land use compatibility table. For example, at the threshold DNL level of 65, the Aircraft Noise/Annoyance Model predicts that about 30 percent of people will be annoyed. This corresponds to land use compatibility category 3, where residential use should not be attempted and where schools, outdoor amphitheaters, nature exhibits and zoos should not be built. The land use compatibility category of less than 65 DNL corresponds to an annoyance level of about 15 percent highly annoyed. This, in turn, corresponds to a 53 DNL level when aircraft noise alone is considered. Table 4 shows these relationships in the critical under 65 to 75 dB ranges. This demonstrates that the kinds of operations proposed by the Air Force for rural and wilderness areas of New Mexico and Texas are incompatible with column one of the FAA Part 150 Land Use Compatibility Table guidelines and the 15 percent highly annoyed level used in this table.

Column DNL Range Schultz Curve	Column DNL Range Aircraft Noise/Annoyance Model	Percentage Annoyed--Start of Next Land Use Category
Less than 65	Less than 53	15
65-70	53-59	22.5
70-75	59-69	35

Table 4
Comparison Of DNL Ranges for the Schultz/Air Force Model and the Aircraft Only Noise/Annoyance Model

This section has shown that it is possible to build an urban aircraft noise annoyance model that is not degraded by the inclusion of other, irrelevant data. Based on this model, the operations contemplated by the RBTI DEIS would leave about 20% of the people under any MOA or MTR highly annoyed if they were living in an urban setting. One can safely assume that a much larger percentage would be highly annoyed in a rural setting.

The Aircraft Noise/Annoyance Model developed in this section still includes one major weakness: it is based on data collected in various urban settings. Thus, this model may only be appropriately used to determine annoyance of urban populations with aircraft noise. Section II of this paper discusses the failure of the Air Force to consider the rural and wilderness regions over which their MTRs and MOAs have been routed.

000827

AO-56 **IX. The Costs of Noise**

One underlying assumption in the RBTI DEIS is that any inconvenience or cost is too high for the Air Force to bear, but inconveniences or costs should be happily borne by the citizens that are subjected to the noise from activities that originate at Dyess and Barksdale Air Force Bases. Further, the DEIS states that

> Questions regarding land values near airports have been asked in many US communities over the years and research has been conducted determining and quantifying the economic effect of noise around airports in urban settings. However, RBTI involves aircraft noise in a rural setting. The variability of land value due to the diversity of land uses, locations, and improvements makes it difficult to quantify potential impacts, if any, that might be associated with aircraft overflights.[179]

This statement is false. The research cited below has been available for years and has been made known to the Air Force. And the results of the research are unambiguous--noise from aircraft operations lowers property values.

According to the Tier One DEIS for Mountain Home AFB, the cost to deploy an entire squadron to another US site for 1 year would only be about $2,500,000 above normal operating costs in 1996 dollars.[180] Costs like this ought to be compared with costs that might be incurred by those who will have to live with the noise from the activities resulting from the RBTI. Absent such comparisons, an implied cost benefit analysis is made: the cost of overflights to the residents of the region is less than the benefits accruing to the Air Force from not having to wait for range space or of not having to perform a complete and proper DEIS. There are no data to support this contention and the costs on those who are unfortunate enough to live under MOAs and MTRs can be substantial compared to the benefits.

For example, assume that operating the proposed MTRs or MOAs would increase the overall value of US security by $10 billion. This figure, which represents about 4 percent of total US spending for security, vastly exceeds any claims made for the value of this Air Force training. However, if such an increase could be realized, the value to every citizen of the United States would only be about $40, and the total value that would accrue to residents of the area under the proposed MTRs or MOAs would be dwarfed by the costs these same residents will incur due to the noise generated by Air Force activities. Some of these costs, in terms of depreciation of property value, are the subject of the remainder of this section.

Nelson found that higher noise levels lower the value of property by .5 to 1.9% of the market value per decibel of acoustic measurement.[181] And, in a 1993 paper, Nickell found that the first year costs to three rural Colorado counties of proposed Air National Guard flying activities would be $4,200,000 in lost real estate values and $2,000,000 in lost recreation values in 1991 dollars.[182] That losses in real estate values do occur because of aircraft noise was recently confirmed by the courts in the decision on Valley Citizens for a Safe Environment v Aldridge et al.,

US District Court, District of Massachusetts, which awarded monetary judgments to the appellates for depreciated real estate values due to low level aircraft traffic from Westover Air Force Base.[183]

The Air Force claims that existing noise metrics accurately represent the affect of aircraft noise on the civilian population and that noise of 65 Ldn or less has no real affect on the those living under the noise plumes. Appendix G of the RBTI DEIS implies that noise below the 65 Ldn level--where 20% of the people are annoyed in an aircraft-only noise model--has no socioeconomic impact. (As the previous sections demonstrated, problems with the Schultz and FICON curves used by the Air Force mean that 15% of people are actually annoyed at noise levels of about 53 Ldn for aircraft noise only.) If this is true, one should be able to observe the behavior of consumers in real estate markets in areas where aircraft noise of 60 to 65 Ldn is present and one should see no change in housing prices when these areas are compared to areas with no aircraft noise. Instead, when one observes consumer behavior there is abundant economic evidence that the noise models used by the Air Force do not accurately account for people's annoyance with aircraft noise. Homes that are subject to aircraft noise do incur a reduction in property values due to noise pollution. [Note: All of the studies that follow were completed before the RBTI DEIS was written, but none were included in the DEIS. While some of these studies are for areas around airports, all noise/annoyance modeling on which the DEIS is based is also for areas around airports.]

In 1991, Frankel found that ninety percent of all home buyers occasionally or frequently indicated a desire to avoid homes that were subject to aircraft noise and sixty percent occasionally or frequently used aircraft noise to demand lower-than-listed prices for the housing where aircraft noise was a factor.[184] In addition, the amount of time on the market for housing subjected to significant aircraft noise was somewhat to appreciably increased in over 75% of all sales.[185] These factors resulted in reduced values for single family properties by the following mean percentages:[186] (For this study, 60 Ldn was the level at which noise disturbance began.)

Disturbance	Ldn Level	Midpoint	Property Value Decrease
Low:	60-65 Ldn	62.5 Ldn	1.4%
Moderate:	65-70 Ldn	67.5 Ldn	4.3%
Substantial:	70-75 Ldn	72.5 Ldn	7.2%
Severe:	75-80 Ldn	77.5 Ldn	10.2%

Table 5
Ldn Levels and Property Depreciation

Similar discount values for noise pollution have been confirmed by a large number of other, independent studies. For example, a Minnesota Tax Court "place[d] some weight upon Mr. Kirch's testimony regarding noise pollution and conclude[d] that the fair market value of the property on January 2, 1992, was $114,300."[187] This represented a decrease in value of 3.95%.

And in 1972, Emerson found that "Implied reductions in (nuisance free) prices for residences exposed to a CNR of 125 were 9.8% in the full sample..."[188]

In 1978 Mieszkowski and Saper found that "the results ...all imply significant discounts of house values as a result of being located in areas impacted by airport noise....the discount remaining fixed at about 4.5%."[189] They also found "...systematic evidence that houses located in various noise contours do sell at a discount. The estimates of the magnitude of this discount vary, but it might be as high as 15%..."[190]

In 1979, Abelson found that "aircraft noise was a significant determinant of house prices.."[191] He also determined that there was a total price difference of about 6% between quiet and noisy houses and that noisy higher priced houses experienced a 10% depreciation compared to quiet higher prices houses[192] Abelson "found that 80% of households underestimated aircraft noise before they moved into the area and 20% positively regretted buying their house because of the noise..."[193]

In 1985 O'Byrne, et. al., found "a reduction in the sales value of about .67% per decibel..."[194] Thus, a rise from 60 to 70 Ldn would decrease home sales values by about 6.7%. When these results were calculated for six other airports using data parallel to those used in the O'Byrne study, noise discounts ranged from .29% per decibel for Cleveland to .74% per decibel in San Diego with a weighted mean of .5%.[195]

In sum, these studies show what common sense would dictate. Aircraft noise is a form of pollution that has the ability to lower real estate values just as any other form of pollution would. How much property value decreases will depend on location and alternatives to prospective purchasers. However, it is clear that among two pieces of property that are similar in all respects except for the presence of noise pollution, noise will cause a loss of property value.

Bell Ranch
, New Mexico

June 15, 1999

Major Brent Adams
RBTI EIS Project Manager
HQ ACC/CEVP
Suite 102
129 Andrews Street
Langley AFB, Virginia 23665-2769

Re: Draft Environmental Impact Statement, Realistic Bomber Training Initiative

Dear Major Adams:

The Bell Ranch appreciates this opportunity to comment upon the Draft Environmental Impact Statement ("EIS") issued in March, 1999 and prepared with respect to the Department of the Air Force's Realistic Bomber Training Initiative ("RBTI"). The Bell Ranch participated in the public hearings held in Abilene, Texas and Roy and Taos, New Mexico, and these comments further and supplement those presentations.

The Bell Ranch has limited the scope of its comments to Alternative D, Mt. Mora. If there is a theme to these comments, it is that certain of the assumptions underlying the EIS are not supported by fact. Northeastern New Mexico may appear barren and unproductive. This area's stark landscape camouflages, however, a complex and vibrant economic, social and environmental system that would be fundamentally altered and eventually destroyed by the Mt. Mora alternative. The Bell Ranch believes that further study of issues such as those discussed below will evidence to the Department of the Air Force and, specifically, the Air Combat Command Alternative D's true and unavoidable cost.

The Bell Ranch

Before proceeding to the specifics of the EIS, it is important to understand the leading cultural and economic role of the Bell Ranch in Northeast New Mexico. Ranching operations have been continuous at the Bell Ranch since at least 1824, when Don Pablo Montoya petitioned the then newly formed Mexican government for a grant of title. By virtue of the Treaty of Guadalupe Hidalgo, it is upon this grant that today's ownership rests. Archeological evidence indicates that the lands of the Bell Ranch have been occupied for the greater part of this millennium and fossil remains on Bell Mountain demonstrate that mastodons and other ancient mammals inhabited the land in earlier, and wetter, geologic periods.

000828

The Bell Ranch is a vibrant and living 286,000 acre example of the endangered western cattle culture. The breeding, branding and management of cattle and horses take place in much the same manner as they have since the first Spanish settlers ventured east of Santa Fe. The Bell Ranch is a land of cowboys and chuck wagons, of rattlesnakes and mountain lions, of fiddles and guitars around a mesquite fire. In 1982, photographer Martin Schreiber captured the spirit of the Bell Ranch and its cowboys in his aptly named "Last of a Breed - Portrait of Working Cowboys" (Texas Monthly Press, Inc., 1982). Sadly, the EIS neglected to study the effect of RBTI on this unique American institution and opened the possibility to Schreiber's magnificent photographs being relegated to "history" rather than current western culture.

While maintaining its historic associations, the Bell Ranch has also stepped firmly into the 21st century. Today's cattle operations utilize complex computer programs assessing the myriad of variables affecting beef production including feeding, breeding and marketing. The competition is no longer simply an adjacent ranch but sophisticated corporate producers on every continent. Margins are slim and the need to operate efficiently and profitably is more pressing now than at any time in the past. Recognizing these trends the Bell Ranch developed and maintains two superb recreational and retreat facilities. The old colonial hacienda with its adjacent "casino" hosts unique corporate meetings. The Hacienda complex boasts a large swimming pool, tennis court, stables, meeting space and a 9,000 foot landing strip accessible to all but the largest commercial aircraft. The Lake House, situated adjacent to the clear waters of Conchas Lake, provides western luxury in an intimate setting. Visitors to the Bell Ranch arrive in hopes of experiencing the peace, the quiet and the solitude of the high desert. It is a land where the loudest noise after the sun falls may well be the distant moo of a cow.

The Lane family, owner of the Bell Ranch, is also aware of their obligation to future generations. In connection with Chicago's Brookfield Zoo and endangered species preservationists throughout the world, the Bell Ranch has since 1986 been home to one of the more exciting species preservation programs ever undertaken. The North African Addax is classified as "Critically Endangered" by the IUCN. However, for more than ten years, this species has thrived on the Bell Ranch and has expanded into ever larger grazing areas. The "Species Survival Plan" developed for the Bell Ranch herd envisions the possible reintroduction of the species into North Africa after the sufficient "hardening" of at least several more generations on the Bell Ranch's mesas.

The Bell Ranch and Alternative D, Mt. Mora

Low level aircraft, primarily F-16's, currently over fly the Bell Ranch on both IR-107and VR-108. At most times, military aircraft operate within the guidelines for these training routes, including the specific admonition to avoid by not less than one mile and 2,000 feet of altitude the Bell Ranch Headquarters Complex. However, the RBTI opens the door to ***a nearly ten fold*** increase in overflights as well as a change from relatively quiet F-16's to the loudest aircraft operated by the Air Combat Command. Consider the following impacts upon the Bell Ranch of Alternative D:

000828

- The reconfigured Mt. Dora MOA overlays the northern portion of the Bell Ranch. The current Mt. Dora MOA does not affect the ranch.
- Alternative D segment TATB cuts a six mile wide swath north to south across the length of the Bell Ranch. Lying in the path are the Headquarter's Complex, including Bell Ranch Headquarters Airport (NM33), and the grazing site for the *critically endangered* North African Addax.
- Alternative D segments ACAD and ADAE overlay the eastern portion of the Bell Ranch. The extremely low level operations contemplated in these segments would be feet above the Hacienda Complex and Bell Ranch Waggoner Airport (NM32).

In summary, the Alternative D training route overlays most of the Bell Ranch's 286,000 acres. No portion of the ranch is more than several miles distance from these routes. For the residents of the Bell Ranch, nearly sixty children and adults, greater than 10,000 cattle and approximately fifteen *critically endangered* North African Addax, there will be no where to go, no where to hide.

The Assumptions of the EIS

"Creation of IR-153 and modification of the Mt. Dora MOA/ATCAA would have little effect on airspace management." (Page 4-45)

While this assumption may, in some sense, be applicable to Alternative D as a whole, it certainly does not apply to the Bell Ranch. The Bell Ranch would see a potential ten fold increase in overflights and the ranch's primary airport, Bell Ranch Waggoner Airport, lies directly beneath an IFR route segment. Civil aviation to and from the Bell Ranch would be a virtual impossibility under Alternative D.

"Flight operations would not likely affect land use, recreation resources, or visual settings under the airspace" (Page 4-81)

BR-3 Domestic animals respond to sudden noise as a potential threat. The instinct of the animal is to run. Run far. Run fast. It can be expected that the 10,000 head of cattle on the Bell Ranch would be at risk with each overflight from:

- Impact trauma from collision with fences, stockades and canyon floors.
- Injury and possible death from cardiac events occasioned by over exertion in the thin air and high heat of Northeastern New Mexico.
- Loss of body weight due to exertion.

000828

Thin, injured or dead cattle have little market value. Given the razor thin operating margins in the cattle business the loss of even a small percentage of the Bell Ranch herd due to over flight would have a potentially catastrophic on continued ranching. Grass fed cattle require 65 acres each for proper growth and nourishment. Grass must be equally grazed, however, and the cattle must be rotated over all of the ranches grazable acres. Isolating cattle in order to avoid the adverse impact of sudden noise is not feasible. **Ranch use would be precluded.**

BI-1 Non-domestic hoofed animals are considerably more sensitive to sudden noise than domestic horses or cattle. In both oral and written testimony at the Taos, New Mexico, hearing the Brookfield Zoo stated uncategorically that if Alternative D were to be adopted it would have no choice but to remove the North African Addax from the Bell Ranch. **The preservation, breeding and preparation for reintroduction to the native environment of *highly endangered* species would be precluded.**

The guests of the Bell Ranch at the Hacienda Complex and the Lake House come to New Mexico in search of peace, quiet and the opportunity to observe first-hand this uniquely American lifestyle. Without either cattle or quiet these multi-million dollar recreation facilities will be simply and quickly avoided. The Bell Ranch is a four hour drive from the nearest metropolitan area (Albuquerque). Stripped of its unique and endangered attributes it is too far off the beaten path. **Recreation and commercial activity would be precluded.**

The Bell Ranch is the only employer in its area. The adults living on the ranch will have no alternative source of employment and the Lane family will no longer be able to subsidize their housing. To find employment they and their children will relocate. **Residential use will be precluded.**

"An adverse impact on land use, including recreation, occurs when a proposed action precludes an existing land use activity; preempts a recreational use; precludes use or occupation of an area; is incompatible with adjacent or vicinity land use to the extent that public health or safety is threatened; or is inconsistent or in noncompliance with applicable land use plans or policies." (Page 4-55)

Most direct and indirect socioeconomic effects associated with the implementation of any of the action alternatives (Alternative B, C, or D) would occur in the immediate vicinity of where Electronic Scoring Sites and emitter sites would be constructed and operated. [material deleted] In the present instance, given the rural nature of the region and the history of military use of the associated airspace [reference omitted], changes in the numbers or types of overflights are not expected to produce measurable impacts on the economic value of the underlying land. (Page 4-109)

The economics of ranching and recreational activities share two attributes, intense competition and razor thin margins. Slight changes at the margins of the demand curve or minor increases in the cost of goods sold or service provided can mean the difference between success and failure. A few

000828

Major Brent Adams
June 15, 1999
Page 5

dead cows, several disgruntled conference attendees and the cost of overflights is the loss of an historic piece of a distinctly American way of life.

The EIS notes the difficulty of assessing the economic impact of over flight on a rural economy. (Page 4-109) However, difficulty in assessment does not excuse an absence of analysis.

The failure to properly analyze the adverse economic impact of the RBTI contaminates the Environmental Justice analysis. Harding and San Miguel Counties, New Mexico, are not robust economically. Life is difficult and wages are low, reflective of the already poor economics of cattle ranching. The Bell Ranch suggests that the economic impact of the RBTI will fall disproportionately on minority and low-income populations and that a more refined analysis of the economic impact of Alternative D would show a gross miscarriage of economic justice.

SE-5

"For areas under affected airspace, only cultural resources listed in the National Register were considered. The Air Force recognizes that hundreds of other cultural resources – some documented and some not yet discovered – exist under the airspace. However, aircraft operations are most likely to affect historic structures and districts where setting is an important criterion for significance." (Page 4-120)

Cultural resources are of little value in a depopulated wasteland. If the surrounding areas cannot support self-sustaining economic activity access to, appreciation for and support of important cultural artifacts will be lost. Over time they will disappear, indirect victims of noise and annoyance.

The EIS does not recognize any potential affect from consistent over flight, relying on the width of the training routes for the proposition that even within the most highly trafficked segment over flights would only be "occasional." It is axiomatic that averages are simply that, averages. An average is a mathematical leveling of what is in real life peaks and valleys of experience. If the average number of flight operations increase *on average* by eight to ten flights per day then it is likely that on some days the increase may be as many as fifteen, eighteen or twenty flights. Poor, rural economies teeter on a knife's edge. Shift the weight too far and the economies fall and with the economies fall the cultural treasures of more than one thousand years of continuous habitation may be lost.

BR-1

Summary

The EIS represents a good faith attempt by the Department of the Air Force to forecast the environmental impact of the RBTI project. However, assessed against the complexity of the real world situation it seeks to model, this draft fails. As written, those portions of the EIS relative to Alternative D do not afford the Secretary of the Air Force with a reasonable basis upon which to reach an determination as to the impact of the RBTI on Northeastern New Mexico.

The Bell Ranch has played an important role in the development of Northeastern New Mexico. Under the stewardship of the Lane family, the Bell Ranch looks forward to meeting successfully the

5

000828

Major Brent Adams
June 15, 1999
Page 6

challenges of the new millennium as they affect cattle ranching, natural resource management and recreational development of the high desert.

The Lane family has fought to promote the continued economic vitality of the Bell Ranch. Recognizing the government's right to impose upon the land the burden of military training flights, the Lane family respectfully requests that the Department of the Air Force take seriously the goals of the National Environmental Policy Act and undertake the serious scientific and socio-economic study necessary to properly assess the environmental impact of the RBTI. The EIS assumes away difficult issues and skirts important issues affecting the social and economic fabric of the rural Southwest. The EIS does not *consider all appropriate environmental factors* (inside front cover) affecting the RBTI in Northeastern New Mexico and does not do justice to the Bell Ranch, to the people of Northeastern New Mexico or to the Department of the Air Force itself.

Again, the Bell Ranch appreciates this opportunity to again present our comments on the EIS. As we expressed at the previous public hearings, we look forward to continued dialog with the Air Force and remain available to discuss any of these matters with you further at your convenience.

Very truly yours,

Arthur J. Schiller
Vice President, Secretary and General Counsel
Lane Industries, Inc.

Major Brent Adams, RBTI EIS Project Manager
Hq ACC/CEVPR 129 Andrews Sr. Suite 102
Langley AFB, Va 23665-2769

Dear Major Adams:

BR-6

I am writing to ask for your firm opposition to the selection of Alternative D under the U.S. Air Force's Realistic Bomber Training Initiative. (RBTI) The Air Force is seeking to establish a new training route for low level B-1 and B-52 bomber flights from bases in Texas and Louisiana. One of the proposed routes, Alternative D, traverses Philmont Scout Ranch, a 97,000 acre mountain backpacking and high adventure facility of the Boy Scouts of America, located in northeastern New Mexico's Colfax County.

Due to the very high noise levels of B-1 and B-52 bombers flying only a few hundred feet above the ground, I have serious concerns about the impact of the Air Force's proposal on the health and safety of the Scouts attending Philmont. In addition, since no plane burns all of its fuel, one must expect that some unburned fuel will find its way to the ground and streams. This fact poses the real danger of fire in an area with a tremendous load of dead trees.

Please use your influence to help us the choice of a different RBTI route. Please act now. The public comment period ends in June, and the decision will be made this year.

Sincerely
Cynthia J. Yandell
(Mrs. Hays R.)

Major Brent Adams
RBTI EIS Prj. Mgr.
HQ ACC/CEVPP
129 Andrews Street, Ste 102
Langley AFB, VA 23665-2769

Dear Major Adams:

BR-6

I am writing to request your firm support in opposing the selection of "Alternative D" under the USAF's proposed Realistic Bomber Training Initiative (RBTI) involving low flying B-52s and B-1s (as low as 300'). As one of several proposed southwestern routes, "D" traverses Philmont Scout Ranch in northeastern New Mexico's Colfax County. Philmont, truly a national treasure, is the 137,900 acre backpacking and training facility of the Boy Scouts of America. I do not protest RBTI since it is a valuable program -- my only complaint, as a Philmont alumnus, is with the proposed route over Philmont.

Several years ago, the USAF ceased its low altitude F-16/F-111 flights over the Ranch as a result of Philmont protests. RBTI's multiple daily flights (up to 16) will create much more severe problems:

a) Program: Philmont is a transient community of 25,000 people with over 3,000 campers in Philmont's back country every day in the summer. Daily, several hundred of them are engaged in spar pole climbing, rock climbing and rappelling, and horse back riding. The sudden roaring of jet engines will distract climbers and bolt horses thereby creating injuries (or worse).

b) Environmental: Appreciation and protection of the wilderness are key parts of Philmont's program. RBTI is inconsistent with wilderness preservation. RBTI will have a damaging effect upon both the unique western wildlife and Philmont herds of cattle, horses, burros, and buffalo. The effect of the unburned portion of jet fuel in the engine exhaust or dumped fuel itself, vaporizing and falling to ground level is as yet unknown, but believed to be anything but beneficial.

c) Safety: The environmental impact study done for the USAF is seriously flawed when it describes Philmont as an "uninhabited" grassland. The smaller portion of Philmont's acreage is prairie. Most of Philmont is mountainous with many peaks in the 10,000 to 12,444' range. Philmont has a tremendous fuel load of dead trees in its forests, and is in the midst of a long term drought. Open fire bans are in effect now. A crashing bomber will create an epic fire of Yellowstone proportions. B-1s and B-52s do not have enviable safety records. The nature of the flights (weaving around mountain peaks and facing violent weather, including frequent, low-level wind shears) dramatically increases the chance of a crash. Unfortunately, Philmont does not have a well-developed highway system for evacuations in case of massive forest fires.

For the above reasons, I seek your help in advocating the selection of a different RBTI route, preferably one that is over a more sparsely populated, less environmentally sensitive area. You, or a member of your staff may wish to liaise with Rep. Ed Pease's (Indiana) legislative assistant, Greg Good, who has additional information on RBTI.

There is too much at stake to allow RBTI to overfly Philmont. Please act now -- final route determination starts in June. Thank you for helping to see that alternative D is not selected.

Sincerely,

Michael B. Bell
President
Bradmont Incorporated
Eagle Scout 1968
Philmont Ranger 1997

TEN POINTS FOR OPPOSITION TO RBTI ALTERNATIVE D (OVER PHILMONT)

1. The EIS (Environmental Impact Statement) incorrectly concludes that very few population centers are affected. On any given day in the summer months, over 5,000 people will be living and camping directly under the flight path at Philmont.

2. Safety of horseback riders will be endangered. Philmont provides trail rides or pack trips for 7500 to 9500 mostly inexperienced riders each summer on steep and narrow mountain trails. As many as 165 inexperienced people may be on horseback on the ranch at various times during the day. The startle effect of a high-decibel low-level flight could easily cause one or more horses to spook and bolt with a novice rider aboard. With the number of flights proposed, it will be only a matter of time before Philmont experiences a serious injury or death due to a rider being thrown from or dragged by a startled horse.

3. Increased noise levels will interfere with staff trying to provide safety instruction to rock climbers, spar pole climbers, and rifle range shooters. The noise level of a B-52 at 300 feet is 117 decibels. Staff trying to teach safety techniques required in climbing rock faces or firing black powder rifles should not have to compete with such noise interference.

4. The high noise levels generated by B-1 and B-52 bombers flying only a few hundred feet above ground level are greater than being near a chain saw or a diesel train. Campers at Philmont will be exposed to such noise levels for more than six hours during a typical 12-day stay based on projected flight operations. This is not a true wilderness experience.

5. The possibility of a crash is very real. The EIS estimates the chances of a "Class A mishap" at one every 15 years for a B-1 on the training route that would include Philmont. Aside from the real risk to Scouts who might be in the path of an errant bomber, a crash on Philmont would have the potential of starting a serious forest fire that could devastate the ranch.

6. The EIS fails to mention any impact of flyovers on Philmont's two National Historic sites, The Kit Carson/Maxwell Abreu houses at Rayado and the Villa Philmonte.

7. The flights can be expected to have serious impacts on Philmont's wildlife and will overfly the habitats of at least three endangered species, the bald eagle, peregrine falcon, and Mexican spotted owl. The U.S. Fish and Wildlife Service has concluded that overflights at less than 1,000 feet will significantly impact these species.

8. No one has investigated the cumulative effects of the planned noise levels and vibrations on the hundreds of abandoned and the two active mines on Philmont.

9. No plane burns all of its fuel. At higher altitudes, unburned fuel dissipates in the atmosphere. At lower altitudes, one must expect that some unburned fuel will find its way to the ground and streams on Philmont. The effects of a plane in trouble at low altitude dumping fuel over Philmont with numerous cook stoves and campfires are easily imagined.

10. Philmont is a national treasure and provides a wilderness camping experience for thousands of Scouts, America's future leaders, every year. That experience should be preserved since alternative training sites exist which do not jeopardize the program experience offered by Philmont and the safety of thousands of young people participating in it each year.

000831

June 9, 1999

Sheridan, IL

Major Adams:

BR-6 I strongly urge you to oppose the New Mexico site including Philmont as the site for Air Force training (RBTI). We both know the issues of safety, noise level, possible crashes, etc. I speak of Philmont as the place where on any given summer thousands of young people are involved in a unique wilderness camping experience on a scale not available anywhere else in our country.

My three sons have spent a total of 12 summers on staff, one went on a backpacking trek, and one took a wilderness education course there. I, too, have been there and hope to have grandchildren someday experience the same Philmont - the mountains and deserts, the trails, the nights under the open sky, the history, the sounds and the silences of wilderness.

So it is, I urge you to support a different site for RBTI leaving Philmont, New Mexico, to be the wilderness resource that it now is for our youth.

Sincerely,
Mrs. Rosalie Wick

Langley AFB, VA 23665-2769

Reference: USAF's proposed Realistic Bomber Training Initiative (RBTI) – "Alternate D" - involving low flying B-52s and B-1s (as low as 300').

Gentlemen:

BR-6 I am writing to request that the USAF limit flights and especially not add any more over Philmont Scout Ranch in New Mexico as proposed in the RBTI - Alt "D".

Backpacking at Philmont is one of the premier experiences that our young men and women can experience in their lifetimes. The one to two weeks spent in the wilderness working as a patrol in their traverse of some of America's greatest scenery will be greatly impacted by noisy intrusive low-level flyovers of Philmont.

I have had the opportunity of a trek at Philmont with my oldest son and hope to repeat the adventure with my other two sons. On my first trip we encountered wildlife and spectacular scenery and felt like we were away from civilization. I am certain that the proposed flights will negate much of the advantages of the large reserve and will probably disturb the wildlife. The hikers can never get used to the noise, the animal might, or they just might leave the area.

Also, I can't imagine the impact of having a large jet flying over our heads at 3-400' elevation while backpacking in the mountains (or we may be on horseback). Thousands of scouts are scattered throughout the 137,000 acres of Philmont each day during the summer. Let's don't put their lives in danger.

Please reconsider and send your flights elsewhere.

Dyess AFB, TX 79607

Dear Sirs,

TY I wish to assure the United States Air Force and all the military personnel in this country of my eternal gratitude for their efforts and the personal endangerment to which they submit themselves in order to protect all the generations of my family. Without these selfless endeavors I would not be able to enjoy the freedom I presently own to live in peaceful retirement on the remainder of unspoiled acreage so carefully husbanded by Grandad May through the early years of this century. Much of the surrounding area has been ravaged by injudicious management and greed but we hope to be able to protect what we have left in order to enjoy it in peace through the remainder of our years.

I dread having these rewards denied us by the actions proposed by the United States Air Force. I have felt fortunate that one of the positive by products of the closure of Reese Air Force Base was the cessation of "buzzes" over Tahoka Lake. Apparently Tahoka Lake is a geographic anomaly conspicuous from above. While that base was still functioning what I speculate were young fighter pilot trainees would swoop down from the north end of the lake, dive toward the middle and screech back to the heavens just feet above our son's rooftop. Any similar behavior now would have the planes at almost eye level with my home. An occasional joy ride like this is understandable but the prospect of multiple, daily intrusions is a horror to contemplate.

I am sure there are many individuals with statistical and informative data and with greater erudition than this writer concerning the impact of your proposed program of training flights over our homes. Please listen to their logic. I implore and beg you most humbly that in your efforts to protect our freedom to live peacefully you do not, simply because you have the power to do so, destroy that which you have been intrusted to protect.

In all sincerity,

Mrs. Clyde S. May

REF: Flyover Program USAF, Proposed Realistic Bomber Initiative

Dear Major Adams:

I am writing to express my opposition to this proposed program. I have lived in the SE part of Garza County, Block 5, all my life and do not wish to quietly accept a major interruption in the way of life that is very precious to me and to all of us who live in that part of the country.

CU-1
AO-12
BR-3 To have the noise level that would be associated with the planes would cause potential damage to our homes and outbuildings, not to mention what it does to the people and the cattle. The windows rattle in their frames now when planes are flying over at high altitudes and break the sound barrier. You must realize that it is unbearable at lower altitudes, which we have already experienced, and with more frequency, we will be unable to conduct our usual business, which translates into dollars.

If you were in our part of the country when this noise occurs, you would not possibly recommend continuation of this project.

Sincerely,

Donna Ethridge

Dear Major Adams:

I am opposed to the Air Force's proposed RBTI known as Lancer – Option B in the DEIS. My concern(s) about the proposal and the DEIS are as follows:

We are greatly concerned about the many bad effects of aircraft training over our homes and land. Also, it would definitely

BR-4 lower our property values. We are mostly ranchers and farmers in the area - raising cattle, cotton, peanuts and wheat. Our communities depend on this land and its resources for our survival. Old production is gone. Many of us benefit from leasing to hunters from Austin, Metroplex, etc.

Our area has been falsely depicted as desolate and barren, it is not! The air force should go out in our area and see what we have to

We personally own land in Stonewall, Kent and Dickens counties

BR-3 from past experiences we know that aircraft disturbs cattle and wildlife. We do not need this! It should be studied in regard to those of us that live here.

Please reconsider our plea - and leave us free of training maneuvers.

Sincerely yours: Billye J. Metcalf

Dear Major Adams:

I am opposed to the Air Force's proposed RBTI known as Lancer – Option B in the DEIS. My concern(s) about the proposal and the DEIS are as follows:

BR-4 A. The effect on property values. Cattle prices are still real low. The weather has hit us hard. This will ruin the land values. We have worked our whole lives and payed taxes for nothing!

AO-37 B. You did no studies on the noise. It could break our water lines which would kill our cattle. If we are checking or gathering cattle on horseback; which we do half the time; it would scare the livestock causing someone to get hurt.

C. You already have substantial air space in West Texas. Why are you wanting to take away from American Citizens to train foreign air force men. Who have never paid taxes or supported the USA. Why are you punishing us?

This will take away our sights and private property.

Dear Major Adams:

I am opposed to the Air Force's proposed RBTI known as Lancer – Option B in the DEIS. My concern(s) about the proposal and the DEIS are as follows:

I own 7,200 acres of land in the western part of Stonewall County, Texas. We have already experienced the low flying of the C130 over our ranches. This is very disruptive to cow working now, the proposed excersises will be even more disruptive.

BR-4

The value of the land will decrease because of the effect on our cattle. I lease my land for Hunting. These people enjoy coming to the peace and quiet country living, away from all of the noise and attractions of the City. If we have the bombers flying at a low altitude, this will discourage them and they will go somewhere else to find a Hunting Lease.

I ask that you take this into consideration when making your decision.

Sincerely yours:

Major Brent Adams
RBTI EIS Project Manager
HQ ACC/CEVPP
129 Andrews Street, Suite 102
Langley AFB, VA 23665-2769

Dear Major Adams:

BR-6

I am writing to request your firm support in opposing the selection of Alternative D under the US Air Force's proposal for Realistic Bomber Training Initiative (RBTI). The Air Force is seeking to establish a new training route for low-level B-1 and B-52 bomber flights from bases in Texas and Louisiana. One of the proposed routes, Alternative D, transverses Philmont Scout Ranch in New Mexico's Colfax County.

Philmont is a 137,000-acre mountain backpacking and high adventure facility of the Boy Scouts of America. Each year, thousands of Scouts and their adult leaders fror across the nation participate in two-week wilderness backpacking trips in the mountains of Philmont. Many of them also camp and work on conservation projects in the adjacent Valle Vidal Wilderness of the Carson National Forest.

The Air Force's Proposed Alternative D will establish a military training route directly over most of Philmont. More than 2600 flights each year, some as low as 300 feet above ground level, are proposed for the segment over Philmont. As an active Scout who enjoys wilderness backpacking, I have serious concerns about the impact of the Air Force's proposal on the health and safety of Scouts attending Philmont and the potential effects of daily low-level flights over the ranch.

On any given day in the summer as many as 5,000 Scouts and Scouters will be hiking and camping in Philmont's backcountry. Each day, several hundred of them will be engaged in activities such as rock climbing and rappelling, spar pole climbing, and mountain horseback rides. The sudden roar of jet engines has a high likelihood of distracting an inexperienced climber or causing a horse to bolt on a narrow mountain trial resulting in serious injury or worse.

Appreciation and protection of the wilderness and our natural resources is a key part of the Philmont program. Scouts from around the World have a unique opportunity to see and experience wildlife in native habitat. Noise and emissions from bombers cannot help but have a damaging effect on that wildlife, as well as on Philmont's herds of buffalo, horses, cattle and burros. The disruptive effects of noisy bomber overflights on Philmont's famous living history programs, in which Scouts experience the lifestyles of the West's mountain men, homesteaders, lumber jacks and cowboys are obvious.

000844

The Environmental Impact Study(EIS) fails in several areas to mention any impact of flyovers on Philmont's two National Historic sites, The Kit Carson/Maxwell Arbeu houses at Rayado and the Villa Philmonte. The EIS incorrectly concludes that very few population centers are affected. On any given day in the summer months, over 5,000 people will be living and camping directly under the flight path at Philmont.

For these reasons, I seek your help in advocating the selection of a different RBTI route. I ask that you express your opposition to Alternative D to the Secretary of the Air Force and other defense officials who may be involved in this decision. Please act now, as the public comment period ends in June and a final decision will be made this year. You or a member of your staff may with to contact Greg Dodd, Chief of Staff for Congressman Ed Pease of Indiana, who can provide additional information.

Philmont is the largest and most famous Scout camp in the world. It is a national resource that has positively impacted the lives of hundreds of thousands of our nation's youth for more than sixty years. It deserves and demands our protection. Thank you for helping to see that RBTI Alternative D is not selected.

Sincerely,

Ann Specht

Langley AFB, VA 23665-2769

Dear Major Adams:

I am opposed to the Air Force's proposed RBTI known as Lancer – Option B in the DEIS. My concern(s) about the proposal and the DEIS are as follows:

BR-4 A. The effect on property values. Cattle prices are still real low. The weather has hit us hard. This will hurt the land values. We have worked our hole lives and payed taxes for nothing!.

AO-12 B. You did no studies on the noise. It could break our water lines which would kill our cattle. If we are checking or gathering cattle on horseback; which we do half the time; it would scare the livestock causing someone to get hurt.

C. You already have substantial air space in West Texas. Why are you wanting to take away from American Citizens to train foreign air force men who have never paid taxes or supported the USA. Why are you punishing us?

This will take away our rights and private property.

Sincerely yours:
(Signature) Bob R Miller

Major Brent Adams, RBTI EIS, Project Manager
HQ ACC/CEVPP
129 Andrews Street, Suite 102
Langley AFB, VA 23665-2769

Dear Sir:

The Big Bend Regional Sierra Club believes that the Environmental Impact Statement (EIS), Draft Stage, of the Realistic Bomber Training Initiative (RBTI), is unfair and unjust. We believe it reflects serious flaws in the process followed in creating the EIS, the presentation of the report, and the proposals contained in it.

The Process

GE-24 We are concerned that the draft EIS ignores several major environmental problems now receiving attention from state and national governmental agencies. The Draft Statement gives little evidence of consulting with environmentalists or county, state, or national agencies in the region, who could have given you information about current environmental issues. Indeed, despite Air Force acknowledgment that two of the three proposed routes under consideration are "almost wholly in West Texas", only 11 Texas citations are listed as "Persons and Agencies contacted, compared to 49 in New Mexico. None of the Texas citations are to Air Quality experts and more than half (7) occurred in Dec. 1997, 15 months before the Draft Statement was made public.

GE-22 In addition, the entire hearing process seemed to have been conducted as a public relations exercise. There was little advance notice of the Scoping and Public Hearing of the Draft meetings. The open house format discouraged media participation, and the "one on one" discussions with Air Force personnel did not permit environmental concerns to be addressed in a format which ensured they would become part of the official record. Indeed, in an April 12 article in the *Odessa American* (two days after the Alpine, TX hearing), Lt. Don Kerr said that the contrary public opinions on the Air Force proposal would not deter the Air Force from making the best decision for its needs.

The Presentation

Members of the Big Bend Regional Sierra Club, and other people with an interest in environmental issues and experience in reading documents about them, have expressed great frustration with the presentation of the report. It is difficult to figure out what many of the charts mean, and virtually impossible to draw a comprehensive picture of what the cumulative effects of the proposed flyovers will be.

000846

2

Also, the document contains vague maps, which make it impossible to ascertain exactly how close to any particular place flyovers will occur. And those of us who have lived permanently in this region find it hard to take Air Force route claims seriously. Planes have often been seen where, according the Air Force, they do not currently fly. Citizen complaints about being followed on highways, livestock frightened, and planes approaching homes and people are routinely dismissed.

The Proposals

AF-24 Most surprising, and disappointing to those with a long-term interest in the environment of the Trans-Pecos, the draft statement contains no provisions for continuing monitoring or dialogue on the issues. This is particularly surprising since the Air Force has set up innovative programs to do this in other areas, such as the Keystone Dialogue around Nellis Air Force Base, a year-long process involving Pentagon officials and representatives from federal land management areas, the state of Nevada, environmentalists, Native Americans and military watchdog organizations. At Arizona's Goldwater Range, an executive committee including the Bureau of Land Management, the Fish and Wildlife Service, the State of Arizona and other major landowners meets regularly to address and monitor environmental issues. Perhaps the representatives from Langley Air Force Base are unaware of these initiatives, or do not have enough authority to implement them in the Trans-Pecos.

Some specific areas where the Air Force Statement disregards the needs of the people and the wildlife of our unique region follow. Most of these comments refer to Alternatives B and C, which encircle the areas where our members live, and skirt by several of the state and national parks and wildlife areas that enrich the Trans-Pecos. These areas are dedicated to the preservation of wildlife and the enjoyment of people who visit them.

The Big Bend National Park is rated as a "class 1" area, meriting special protection from pollution. Proposed flight plans simply claim that they "avoid Big Bend National Park." Noise, poor visibility, and inadequate air quality can damage the park, its wildlife, and its human visitors even if flights do not go directly over the National Park. Apparently the Air Force is unaware that, according to the Texas National Resource Conservation Commission (TNRCC), the National Park Service (NPS) already "considers the Big Bend to have the dirtiest air among all western parks and has made it a top priority to improve air quality in the area. NPS data reveal that Big Bend air has sulfur concentrations that are approximately two times higher than other Class I areas in the western United States, three times higher than those in the Rocky Mountains, and five times higher than sites in Northern California and Oregon." Virtually all the air pollution in the Big Bend comes from sources outside the Park. Those of us who live here are well aware that "avoiding the Park" does not keep pollution out of it.

Also, the Air Force is apparently unaware that the Environmental Protection Agency—Region Six (EPA), TNRCC, and the NPS are about to begin a cross-border study of the sources of air pollution in the area. There is no mention of the BRAVO study in the Draft Statement, no offer to cooperate by presenting data to the agencies involved, and most importantly, no proposal on what to do if this study finds that the Air Force

000846

AO-1 contribution is significant. According to the Air Force, the results from burning thousands of gallons of jet fuel in this environment will be negligible, although independent evidence about the burning of fuel and about refueling exercises make this difficult to believe.

Guadalupe National Park, the only other class 1 area in Texas, and which is upwind of much of the flight path, is not even mentioned in the Air Force Environmental Statement. State parks and wildlife refuges in the region are barely mentioned. Of particular concern are the major wildlife reintroductions taking place at Elephant Mountain (Big Horn sheep) and Black Gap (black bear). Apparently the Air Force believes that a highly generalized map showing these areas marginally outside the proposed route adequately

BI-1 addresses the effects of low-level flights on these projects. Air and noise pollution have great potential for harming the reproductive rates of shy Big Horn sheep, and driving bear to other habitats. This is not addressed in the statement.

We are not only concerned about the preservation of wildlife in our region and the quality of life for those of us who live here. The quality of our environment is a major contributor to much of the tourism to our area. Quietness and clear air are among our greatest attractions for those who live most of their lives in urban regions. While it is impossible to see exactly where the flights will cross major transportation routes, it is clear that they must do so. No mention is made of the effects of low-flying aircraft on travelers by car, horseback, or on foot.

In conclusion, the Air Force has worked hard to sell its proposal to local residents, while stating that their objections do not matter in the final decision. It seems that because our population is relatively sparse, our comments do not matter. But contrary to its stance, the Air Force is not the only governmental agency that cares about this region. At the very least, we need evidence that the Air Force is cooperating with the EPA, the NPS, and the TNRCC over air pollution. Not everyone is as willing as the Air Force to ignore the people and the wildlife of the region and the visitors who come here to enjoy them.

Sincerely yours,

Fran Sage

Re: Realistic Bomber Training Initiative low altitude flyover
Alternative Route D, northern New Mexico

Major Adams:

TY As an adult leader of Boy Scouts of America Troop 861 I must voice my opposition to the proposed RBTI low altitude flyover Alternative D. The use of this route concerns me not only because of the location of the Philmont Scout Ranch but also the location of the adjacent Cimarroncita Youth Camp that at one time was run by my wife's cousin. Simply put, there will be thousands of young people subjected to the disruption of normal camp activities from the flyovers. Any alternative route that avoids these two enclaves of youth learning and growth is desirable.

This is not to say that I don't support the important task of training of our country's pilots. Indeed, my son's Cub Scout Den went to Dyess Air Force Base in Midland to get a look at the B-1 bombers stationed there. Everyone thoroughly enjoyed the trip and the boys obtained a new understanding and respect for what it takes to keep military aircraft prepared for our nation's defense.

I think we have two valuable considerations here. The United States Air Force needs skilled pilots and crews. The United States needs young men who are leaders shaped by positive programs such as the Boy Scouts of America. These young men will become those pilots and crews. On a backpack campout at Philmont, the design of which is to teach the Scouts respect for nature, survival in the wilderness and an awareness of the actions of those who lived on the land, a low altitude flyover may be awe inspiring once but would soon become a distraction and an annoyance. Let's protect what Philmont is all about and send the planes over another route. Thanks.

Very truly yours,

Thomas Aldredge

Langley AFB, VA 23665-2769

Dear Major Adams:

BR-6

I am writing to request your firm support in opposing the selection of Alternative D under the US Air Force's proposal for Realistic Bomber Training Initiative (RBTI). The Air Force is seeking to establish a new training route for low-level B-1 and B-52 bomber flights from bases in Texas and Louisiana. One of the proposed routes, Alternative D, transverses Philmont Scout Ranch in New Mexico's Colfax County.

Philmont is a 137,000-acre mountain backpacking and high adventure facility of the Boy Scouts of America. Each year, thousands of Scouts and their adult leaders fror across the nation participate in two-week wilderness backpacking trips in the mountains of Philmont. Many of them also camp and work on conservation projects in the adjacent Valle Vidal Wilderness of the Carson National Forest.

The Air Force's Proposed Alternative D will establish a military training route directly over most of Philmont. More than 2600 flights each year, some as low as 300 feet above ground level, are proposed for the segment over Philmont. As an active Scout who enjoys wilderness backpacking, I have serious concerns about the impact of the Air Force's proposal on the health and safety of Scouts attending Philmont and the potential effects of daily low-level flights over the ranch.

On any given day in the summer as many as 5,000 Scouts and Scouters will be hiking and camping in Philmont's backcountry. Each day, several hundred of them will be engaged in activities such as rock climbing and rappelling, spar pole climbing, and mountain horseback rides. The sudden roar of jet engines has a high likelihood of distracting an inexperienced climber or causing a horse to bolt on a narrow mountain trial resulting in serious injury or worse.

Appreciation and protection of the wilderness and our natural resources is a key part of the Philmont program. Scouts from around the World have a unique opportunity to see and experience wildlife in native habitat. Noise and emissions from bombers cannot help but have a damaging effect on that wildlife, as well as on Philmont's herds of buffalo, horses, cattle and burros. The disruptive effects of noisy bomber overflights on Philmont's famous living history programs, in which Scouts experience the lifestyles of the West's mountain men, homesteaders, lumber jacks and cowboys are obvious.

000849

The Environmental Impact Study(EIS) fails in several areas to mention any impact of flyovers on Philmont's two National Historic sites, The Kit Carson/Maxwell Arbeu houses at Rayado and the Villa Philmonte. The EIS incorrectly concludes that very few population centers are affected. On any given day in the summer months, over 5,000 people will be living and camping directly under the flight path at Philmont.

For these reasons, I seek your help in advocating the selection of a different RBTI route. I ask that you express your opposition to Alternative D to the Secretary of the Air Force and other defense officials who may be involved in this decision. Please act now, as the public comment period ends in June and a final decision will be made this year. You or a member of your staff may with to contact Greg Dodd, Chief of Staff for Congressman Ed Pease of Indiana, who can provide additional information

Philmont is the largest and most famous Scout camp in the world. It is a national resource that has positively impacted the lives of hundreds of thousands of our nation's youth for more than sixty years. It deserves and demands our protection. Thank you for helping to see that RBTI Alternative D is not selected.

Sincerely,

Ondey Specht

Dear Major Adams:

TY Only another military pilot can understand and appreciate the need for Military Training Routes, or *Oil Burner Routes* as we used to call them.

Perhaps by accident, but more likely an intention, the Air Force is charting a new route near the national Boy Scout Ranch, Philmont, which is located in northeastern New Mexico.

You now have half of New Mexico covered with dozens of prohibited, restricted, warning, and alert areas, and that's just those listed on the Albuquerque Sectional Aeronautical Chart. Holy mackerel! And you need to chart still another route, across Philmont? I don't think so.

Philmont makes use of the soul of peace and quiet. Lay out your noisy, smelly, nerve shattering route somewhere else.

Sincerely,

Haskell Böring

Re: Opposition to Realistic Bomber Training Initiative Alternative D (Philmont)

Dear Major Adams,

TY I am writing to register my opposition to Air Force bombing training missions whose flight path would traverse the Philmont Scout Ranch.

As far as I am concerned, this would be like running such missions over Yosemite or any of our other outdoor national treasures. The unique opportunity that Philmont affords Boys Scouts and Explorers (male and female) from all over the US would be substantially degraded by repeated B-1 overflights.

I have taken 2 groups of Scouts to Philmont. I know these kids will remember this experience as one of the formative experiences of their lives. A key to these treks was the feeling of being on their own, in the wilderness. The proposed training initiative would repeatedly dispell the sense of being away from it all that is so central the whole experience.

I am sure others have written about the obvious safety and environmental problems associated with these flights. I will close by noting that of the 12 boys that went on the two treks I accompanied, two of them applied to the Air Force Academy. One got in, the other was awarded a ROTC scholarship. It is my belief that their time at Philmont had a significant impact on developing their confidence in their leadership ability. Philmont is a resource that supports the maturation of both military and community leaders of tommorrow. It needs to be preserved.

Sincerely,

Michael K. Smith

Dear Sir:

Re: The United States Air Force wanting to train in our area.
Draft Environmental Impact Study (DEIS).

TY I understand there was a hearing in regard to this held in Snyder, Texas April 7, 1999. More than 400 persons attended the hearing including several from Lynn County. Approximately ten percent of the attendees spoke in response to the proposal by the Air Force to train over our area and also in response to the DEIS. There was not a single speaker in favor of the proposal. Everyone spoke very well and made it clear to the Air Force that because the federal government owns so much land to train over, there is no need to train here. If there was no other location, that would be a different matter.

As I travel over this nation, there are lots and lots of places where you can drive for hours and hours without seeing a house or barn. So please don't train in our area where it is heavily populated. In our countryside, there is a house every mile or two.

Thank you for picking some place where it is sparsely populated.

Sincerely,

Lenda Wood

Dear Major Adams:

BR-6 I am writing to request your firm support in opposing the selection of Alternative D under the U.S. Air Force's proposed Realistic Bomber Training Initiative (RBTI). The Air Force is seeking to establish a new training route for low-level B-1 and B-52 bomber flights from bases in Texas and Louisiana. One of the proposed routes, Alternative D, traverses Philmont Scout Ranch in northeastern New Mexico's Colfax County.

Philmont is a 137,000-acre mountain backpacking and high adventure facility of the Boy Scouts of America. Each year, thousand of Scouts and their adult leaders from across the nation participate in two-week wilderness backpacking trips in the mountains of Philmont. Many of them also camp and work on conservation projects in the adjacent Valle Vidal Wilderness of the Carson National Forest.

The Air Forces proposed Alternative D would establish a military training route directly over most of Philmont. More than 2,600 flights each year, some as low as 300 feet above ground level, are proposed for the segment over Philmont. As a former Philmont staff member, I have serious concerns about the impact of the Air Force's proposal on the health and safety of Scouts attending Philmont and the potential effects of daily low-level flights on the ranch itself.

On any given day in the summer, as many as 5,000 Scouts will be hiking and camping in Philmont's backcountry. Each day, several hundred of them will be engaged in activities such as rock climbing and rappelling, spar pole climbing, and mountain horseback rides. The sudden roar of jet engines has a high likelihood of distracting an inexperienced climber or causing a horse to bolt on a narrow mountain trail with resulting serious injury (or worse).

000857

Appreciation and protection of the wilderness and our natural resources is a key part of the Philmont program. Scouts from around the world have a unique opportunity to see and experience wildlife in native habitat. Noise and emissions from bombers cannot help but have a damaging effect on that wildlife, as well as on Philmon'ts herds of buffalo, horses, cattle and burros. The disruptive effects of noisy bomber overflights on Philmon'ts famous living history programs, in which Scouts experience the lifestyles of the West's mountain men, homesteaders, lumberers and cowboys, are obvious.

Most of Philmont is mountainous with many peaks in the 10,000' to 12,000' range. Philmont has a tremendous fuel load of dead trees in its forests and is in the midst of a long-term drought. Unburned jet6 fuel finding its way to the ground or being dumped in an emergency over such terrain, with campers using backpacking stoves for cooking, creates the potential for a serious fire that would endanger hundreds of lives. The possibility of a crash, however remote, is simply not acceptable for the safety of the Scouts.

For these reasons, I seek your help in advocating the selection of a different RBTI route. I ask that you express your opposition to Alternative D to the Secretary of the Air Force and other defense officials who may be involved in this decision. Please act now, as the public comment period ends this month and a final decision will be made this year.

Philmont is the largest and most famous Scout camp in the world. It is a national resource that has positively impacted the lives of hundreds of thousands of our nation's youth for more than sixty years. It deserves and demands our protection. Thank you for helping to see that Alternative D is not selected.

TEN POINTS FOR OPPOSITION TO RBTI ALTERNATIVE D (OVER PHILMONT)

The EIS (Environmental Impact Statement) incorrectly concludes that very few population centers are affected. On any given day in the summer months, over 5,000 people will be living and camping directly under the flight path at Philmont.

Safety of horseback riders will be endangered. Philmont provides trail rides or pack trips for 7500 to 9500 mostly inexperienced riders each summer on steep and narrow mountain trails. As many as 165 inexperienced people may be on horseback on the ranch at various times during the day. The startle effect of a high-decibel low-level flight could easily cause one or more horses to spook and bolt with a novice rider aboard. With the number of flights proposed, it will be only a matter of time before Philmont experiences a serious injury or death due to a rider being thrown from or dragged by a startled horse.

Increased noise levels will interfere with staff trying to provide safety instruction to rock climbers, spar pole climbers, and rifle range shooters. The noise level of a B-52 at 300 feet is 117 decibels. Staff trying to teach safety techniques required in climbing rock faces or firing black powder rifles should not have to compete with such noise interference.

The high noise levels generated by B-1 and B-52 bombers flying only a few hundred feet above ground level are greater than being near a chain saw or a diesel train. Campers at Philmont will be exposed to such noise levels for more than six hours during a typical 12-day stay based on projected flight operations. This is not a true wilderness experience.

The possibility of a crash is very real. The EIS estimates the chances of a "Class A mishap" at one every 15 years for a B-1 on the training route that would include Philmont. Aside from the real risk to Scouts who might be in the path of an errant bomber, a crash on Philmont would have the potential of starting a serious forest fire that could devastate the ranch.

The EIS fails to mention any impact of flyovers on Philmont's two National Historic sites, The Kit Carson/Maxwell Abreu houses at Rayado and the Villa Philmonte.

The flights can be expected to have serious impacts on Philmont's wildlife and will overfly the habitats of at least three endangered species, the bald eagle, peregrine falcon, and Mexican spotted owl. The US Fish and Wildlife Service has concluded that overflights at less than 1,000 feet will significantly impact these species.

No one has investigated the cumulative effects of the planned noise levels and vibrations on the hundreds of abandoned and the two active mines on Philmont.

No plane burns all of its fuel. At higher altitudes, unburned fuel dissipates in the atmosphere. At lower altitudes, one must expect that some unburned fuel will find its way to the ground and streams on Philmont. The effects of a plane in trouble at low altitude dumping fuel over Philmont with numerous cook stoves and campfires are easily imagined.

Philmont is a national treasure and provides a wilderness camping experience for thousands of Scouts, America's future leaders, every year. That experience should be preserved since alternative training sites exist which do not jeopardize the program experience offered by Philmont and the safety of thousands of young people participating in it each year.

Langley, AFT VA 23665-2769

Dear Major Adams,

I am a farmer in Scurry County and wish to express my objections to the Lancer low level MOA that you plan to establish here. We have a boll weevil eradication program and it requires spray planes to be in the air most every day from early summer until frost. Farmers and ranchers use airplanes to check their crops and cattle. Planes must check pipelines.

BR-2 As a pilot and former board member of our county airport I am concerned about the economic impact on the local airport. We sele fuel cheaper here to get cross-country pilots to stop for fuel. This helps to support our airport and also keeps some of the air traffic away from the larger, busier airports.

BR-4 The noise from the heavy aircraft at low level is very objectionable. We have ranchers and farmers who have hunting leases for people who like to hunt game and get away from the city. I don't believe they will want to come here with the disturbing noise because I do not like it myself.

Please consider my objections and do not make this a Realistic Bomber Training Initiative area.

Sincerely yours,

Rodger Blackard

BR-6 I strongly oppose the institution of RBTI Alternative D over our route over Chilcrest Ranch. Base Commander RM. I have been with cranes in Europe along low level flight routes.

On the summer 5000 hops per day, utilize the area. The level runs would not only ruin the subsistence experience but in case of an accident seriously endanger a very sparsed out population. Furthermore it could cause serious injury for livestock. The wildlife, including endangered species would also be adversely affected. I would agree, the boys would be elated the first few times they saw the planes but an overview of repeated flights would erode teaching classes and possibly could lead to serious situations due to the noise and proximity. Please change this route.

Sincerely

James L. Evans

Langley, AFT VA 23665-2769

Dea Major Adams:

I am writing in response to the Realistic Bomber Training Iniative (RBTI). The proposed flight training plan covers eight West Texas counties one of which is my county of residence (Scurry).

AO-18 I am superintendent of a small school in Scurry County and I do not believe the DEIS accurately or adequately covers the effect this training will have on the people, especially children, of this area. It is my opinion that the study is flawed and out of date. At one of the hearings I was given information on this proposal. Among other things this information stated the noise from a bomber was one half that of a gas powered lawn mower. This I cannot accept or believe.

Please register my opposition to this proposal and to the DEIS the Air Force is using.

Sincerely,

Jerry Chyech

SIR:

I oppose RBTI LANCER option as presented in your Draft Environmental Statement issued last March. In 33 years working for Westinghouse Electric Corp (supplier of airborne radars for F4, F/6 and B1B) I never saw such a sloppy slipshod document (either government or contractor) as that DEIS you issued.

BI-1 It did not mention white tail deer - the only big game around here (Stonewall County).

As to AF operating ranges (MOA's) - a T38 at 6000 feet is a heck of a lot quieter than a B/B at 6000 — or 2000 feet.

In the mid 1950's I got tossed off a horse when a jerk from Dyess came over the corral at 300 feet in a F/05.

The only B/B's Ive heard come over here at low level — a few hundred feet - around this county was at night in solid cloud and fog. the last time was last winter, and the airplane came directly over Aspermont at very low level — and then lit (it sounded like) the afterburnes directly over town).

that level of noise is unacceptable to a civilian community — ask any airline or commercial plane manufacturer. It will put cattle thru fences and drive deer away.

BR-3 Please do not proceed with LANCER RBTI — leave your bombing/training ranges where they are.

Sincerely,
Bobbie McDaugh
Rancher
(formerly tech rep @ Dyess & Tinker ON B1B offensive radar)

Re: Lancer Site (Option B in the DEIS)

Dear Major Adams:

TY Because I was unable to attend one of the meetings regarding Realistic Bomber Training Initiative, I wish to take this opportunity to express my OPPOSITION to this flight training over my County of residence, Scurry. I have lived here nearly all my 54 years, own a home along with my husband, and own a 10+ section ranch just South of Snyder along with several family members. We're here to stay.

Please know I support the USAF whole heartedly but believe that the above sited ("B" option) is not the best one.

Sincerely,
Mrs. Travis (Helen) Hatter

Major Brent Adams
RBTI EIS Project Manager
HQ ACC/CEVP
129 Andrews Street, Suite 102
Langley AFB, VA 23665-2769

Dear Major Adams:

I am opposed to the Air Force's proposed RBTI known as Lancer – Option B in the DEIS. My concern(s) about the proposal and the DEIS are as follows:

BR-4 1. The effect on property values. It would ruin them.
2. The effect the training will have on the ranching and farming operations.

AO-55 3. The fact you did not adequately study the impact that noise will have.

BR-4 4. The impact this would have on the hunting. This could really hurt the already strained economy.

5. The DEIS did not provide for any actual study of this impact on any operations in the area.

6. The fact you already have substantial portions of air space in West Texas. Why not use it to

BR-5 train foreign airmen? This would take away our rights and our private property.

Sincerely yours: C. Mark Harrington

Major Brent Adams
RBTI EIS Prj. Mgr.
HQ ACC/CEVPP
129 Andrews Street, Suite 102
Langley AFB, VA 23665-2769

Dear Major Adams:

BR-6 I am writing to request your firm support in opposing the selection of "Alternative D" under the USAF's proposed Realistic Bomber Training Initiative (RBTI) involving low flying B-52s and B-1s (as low as 300'). As one of several proposed southwestern routes, "D" traverses Philmont Scout Ranch in northeastern New Mexico's Colfax County. Philmont, truly a national treasure, is the 137,000 acre backpacking and training facility of the Boy Scouts of America. I do not protest RBTI since it is a valuable program – my only complaint, as a Philmont alumnus, is with the proposed route over Philmont.

Several years ago, the USAF ceased its low altitude F-16/F-111 flights over the Ranch as a result of Philmont protests. RBTI's multiple daily flights (up to 16) will create much more severe problems:

a) Program: Philmont is a transient community of 25,000 people with over 3,000 campers in Philmont's back country every day in the summer. Daily, several hundred of them are engaged in spar pole climbing, rock climbing and rappelling, and horse back riding. The sudden roaring of jet engines will distract climbers and bolt horses thereby creating injuries (or worse).

b) Environmental: Appreciation and protection of the wilderness are key parts of Philmont's program. RBTI is inconsistent with wilderness preservation. RBTI will have a damaging effect upon both the unique western wildlife and Philmont herds of cattle, horses, burros, and buffalo. The effect of the unburned portion of jet fuel in the engine exhaust or dumped fuel itself, vaporizing and falling to ground level is as yet unknown, but believed to be anything but beneficial.

c) Safety: The environmental impact study done for the USAF is seriously flawed when it describes Philmont as an "uninhabited" grassland. The smaller portion of Philmont's acreage is prairie. Most of Philmont is mountainous with many peaks in the 10,000 to 12,444' range. Philmont has a tremendous fuel load of dead trees in its forests, and is in the midst of a long term drought. Open fire bans are in effect now. A crashing bomber will create an epic fire of Yellowstone proportions. B-1s and B-52s do not have enviable safety records. The nature of the flights (weaving around mountain peaks and facing violent weather, including frequent, low-level wind shears) dramatically increases the chance of a crash. Unfortunately, Philmont does not have a well-developed highway system for evacuations in case of massive forest fires.

For the above reasons, I seek your help in advocating the selection of a different RBTI route, preferably one that is over a more sparsely populated, less environmentally sensitive area. You, or a member of your staff may wish to liaise with Rep. Ed Pease's (Indiana) legislative assistant, Greg Good, who has additional information on RBTI.

There is too much at stake to allow RBTI to overfly Philmont. Please act now – final route determination starts in June. Thank you for helping to see that alternative D is not selected.

Sincerely,

Marcia B Compton
Marcia B. Compton

Langley AFB, VA 23665-2769

Dear Major Adams:

I am opposed to the Air Force's proposed RBTI known as Lancer – Option B in the DEIS. My concern(s) about the proposal and the DEIS are as follows:

I believe that our quality of life will be destroyed by the constant noise of airplanes flying overhead. It is quiet and peaceful here and we prefer it that way. We also have many

BR-4 hunters come to this area. I believe the roar of planes will be detrimental to the recreational use of our property. I am completely against the Lancer proposal. Let the planes fly over land the government owns and leave ours alone.

Sincerely yours: David Boyd

11 June 1999

Major Brent Adams
RBTI EIS Project Manager
HQ ACC/CEVPP
129 Andrews Street
Langley Air Force Base, VA 23665-2769

Dear Major Brent:

I am a senior natural resource professional with extensive experience in the environmental consulting field. I have worked on a variety of projects, including environmental compliance documents for military activities. I have a Bachelor of Arts degree in Biology-Mathematics and a Masters of Science degree in Botany. I am also currently a part owner of an ecotour company based in the Southwest.

I am writing to comment on the Draft Environmental Impact Statement (EIS) on the proposed Realistic Bomber Training Initiative. Overall, this document has serious flaws, shortcomings and omissions that render it inadequate for the purposes of the National Environmental Policy Act.

AO-57 The first problem I found with the document was the floor for low-level military flights. The text of the document reads that this will be 300 feet above ground level, yet in the appendices an altitude of 200-ft AGL is used for several of the calculations. Which is it?

The impacts that this EIS attempts to disclose are mostly related to noise. Noise impacts to animals (domestic and wildlife) are discussed in the text, yet the research cited is one side of the story, and even articles cited by the document do not agree with your conclusions. First, the Air Force has consistently left out of this document any studies that indicate the potential for negative impacts. On page 4-93, the Air Force states that numerous studies have been done since the late 1950s on the effects of aircraft overflights on domestic animals. No studies are cited, however, and the claim is unsupported. The literature has many examples of studies of noise

BR-3 impacts that demonstrate significant effects to domestic livestock. Jet noise was found to lower milk production in goats (Sugawara *et al.*, 1979). Egg production in domestic chickens decreases in the presence of military overflights (Okamoto *et al.*, 1963). The hatchability of eggs fertilized by roosters exposed to simulated overflights was also found to be significantly lower (Kosin, 1958). The failure to disclose negative impacts and all the relevant scientific research on this subject renders the EIS an inadequate document. Since much of the lands under the proposed flight paths are used for agriculture (ranching and/or farming), the proposed action could have a serious socioeconomic impact to the local communities.

The EIS goes on to state that the impacts to wildlife from overflights are not significant. Here again, the Air Force has chosen to ignore scientific research that does not agree with this conclusion. What is further disturbing is the use of scientific journal articles to support a conclusion when the article itself warns against making such a conclusion. On page 4-95, noise impacts to raptors are stated to be insignificant, and a list of articles to support this conclusion is

Ken G. Sweat

Phoenix, Arizona

000868

BI-9 given. The Ellis *et al* (1991) article, in its abstract, states "While encouraging, our findings cannot be taken as conclusive evidence that jet flights and/or sonic booms will have no long-term negative effects for raptor species or for other areas." To cite this article as concluding that the noise impacts to raptors are insignificant is going against the intent of the authors.

BI-9 The Ellis *et al.* (1991) article goes on further to note that the animals used were not naive, that is, they all were previously exposed to overflights. The study specifically notes that their results could not be applied to naive animals. The animals in this study were exposed to frequent overflights, in some cases over 20 in a single day. Such heavy exposure would be expected to lead to habituation. The occasional, infrequent exposure to overflights that will occur under any action alternative is not the same. Infrequent exposure would be much less likely to lead to habituation, which means impacts from the proposed action would be more significant than the impacts discussed in the article.

BI-9 Also absent from this discussion are any references to scientific studies that have demonstrated significant impacts to wildlife from low level overflights. Harrington and Veitch (1992) found that low level overflights during the calving and immediate post-calving period increased calf mortality for caribou. Although no caribou exist in the project area, these results could easily be applicable to other ungulates (deer, bighorn sheep, domestic livestock) that do live in the project area with the same logic that the Air Force uses on page 4-92 to predict impacts to Aplomado falcons would be insignificant. Berger *et al* (1991) found that aircraft overflights reduced foraging efficiency in bighorn sheep. What is most disturbing about their work is that the highest loss in foraging efficiency (43%) occurs in winter, a time of scarcity in natural communities. Bleich *et al* (1990) found that adult sheep moved an average of 2.5 times further on the day after an aerial overflight was conducted than on other days. They also noted that up to 52% of sheep that were flown over would move to another part of their habitat, as opposed to 1% of animals not overflown. This disturbance to foraging and habitat selection by sheep is therefore a significant negative impact, and needs to be addressed by the EIS. A loss of foraging efficiency, especially during the winter, would have severe consequences for populations in the project area, and could cause a population decline over time. Although the state of New Mexico issues relatively few tags to hunt bighorn sheep, the income from these tags is significant. Since sheep tag revenues are used to manage sheep, a significant impact could also occur to the management programs that help sustain bighorn sheep in New Mexico.

Noise impacts are also dismissed by this EIS on the basis of few and infrequent flights over any one particular area. This pattern of use is least likely to lead to habituation by wildlife. Articles cited by the EIS on wildlife impacts involve studies with frequent aircraft flights (Ellis *et al*, 1991; Krausman *et al*, 1992). Infrequent flights, as proposed in this action, will not have the same ability to habituate wildlife, creating a greater negative impact to local fauna.

BR-4 The analysis of socioeconomic impacts is also wanting in substance. No mention is made of potential land uses for areas under the proposed flight paths. Although the EIS states that no significant impact is expected to tourism, no analysis of the tourism industry is presented. The fastest growing sector of the tourism industry is ecotourism, or nature-oriented tourism. Average annual growth for nature related tourism has been over 30% since 1987, and it is estimated that

Ken G. Sweat

Phoenix, Arizona

000868

nature tourists spend in the U.S. over $7.5 billion annually (Daughtry, 1999). The American Southwest has been a prime destination for ecotourism, with its vast stretches of virtually undisturbed natural ecosystems and many relatively intact indigenous cultures. Although the sight and sound of a low flying military aircraft may be pleasing to some, such an event would be totally inappropriate to an ecotour. This proposal could render large segments of land unsuitable for ecotourism, limiting the economic options of residents and harming the business of tour companies operating in the area. Ideals of ecotourism, such as the employment of guides generally with a graduate level education, means ecotourism provides better economic opportunities than other tourism and service jobs. Ideals such as using native guides for native cultures offers greater economic opportunities to these minority populations. The socioeconomic impact is therefore significant, especially in light of the Executive Order on Environmental Justice (E.O. 12898).

BR-3 The EIS also fails to recognize potential impacts to ranching and farming communities. Recent testimony at the Federal Grazing Reform hearings by ranchers throughout the southwest shows that many of them are barely able to survive today. A lowering of the productivity of their livestock could force many of them into bankruptcy. Since research cited above (Sugawara *et al.*, 1979; Okamoto *et al.*, 1963; Kosin, 1958) notes a drop in productivity in domestic livestock from overflights, this is a likely outcome of any action alternative. Even if there is no noise impact to livestock, the perception of such an impact by ranchers or farmers who already believe

SE-5 that federal actions are slowly destroying their way of life could cause them to go out of business. Nowhere in the EIS is this significant potential impact to minority and low-income groups addressed.

CE-1 The analysis of cumulative impacts also falls short of the goals of the National Environmental Policy Act. The cumulative section fails to recognize the many other flight paths and air operations in the project area. Even if impacts from this proposal are small, their combined effects with the other government land management (e.g. Game and Fish surveys), commercial, private, and military low-level flights in the areas could cause significant negative impacts to wildlife, domestic livestock, and tourism. Nowhere in the EIS are cumulative impacts from all

AO-59 air activity addressed. Appendix B does not give a time frame for the numbers of sorties listed, this must be inferred from the tables in section 2.3. The tables only cover military flights, leaving out three fourths of the types of potential air traffic. The piecemeal presentation and sometimes lack of information on the number of flights renders this document inadequate to make a decision with, and therefore the EIS does not meet its duties under National Environmental Policy Act.

GE-28 The public involvement process for this EIS also appears to be insufficient in reaching local minority populations. All alternatives are located in a region of the country with a long-standing Hispanic culture and traditions. Yet nowhere in Chapter 6 is it noted that publicity materials were made available in Spanish, or Spanish speaking people were present at public hearings. Local, state and federal publications in the Southwest are almost always printed in English and Spanish. Failure to do so for the public involvement process renders this EIS inadequate in light of E.O. 12898.

Ken G. Sweat

Phoenix, Arizona

000868

Because of the omissions, shortcomings, and lack of adequate public involvement, I find this EIS an incomplete document, in need of major revisions before an informed decision can be made in accordance with the National Environmental Policy Act.

Sincerely,

Ken G. Sweat

HERBERT J. ROWE

NAPLES, FL

June 12, 1999

Major Brent Adams
RBTI EIS Project Manager
HQ ACC/CEVPP
129 Andrews Street, Suite 102
Langley AFB, VA 23665-2769

Dear Major Adams,

BR-6 Your Office is now in the process of selecting a route for Low Level B-1 and B-52 Training Flights, known as the Realistic Bomber Training Initiative (RBTI). One of these routes, Initiative D, traverses Philmont Scout Ranch, the site of the Boy Scouts of America's premier High-Adventure Camp.

Thousands of America's finest youth have spent an exhilarating experience in this wild and rugged section of the mountains of New Mexico. On every day from June to September over 5, 000 young men and women and their leaders are camping and hiking in these mountains, directly under the proposed path of bombers flying as low as 300 feet.

It is proposed that these bomber flights will occur six hours a day, every day. You and your staff should be aware of the irreparable harm that will be done to this national treasure and its wildlife, buffalo, and herds of cattle, horses, and burros. This is not an uninhabited area. It is a bustling community.

You or a member of your staff may wish to contact Greg Dodd, Chief of Staff for Congressman Ed Pease of Indiana for more information. Please act quickly, since I understand that the public comment period ends in June and the decision will be made this year.

Philmont is the largest and most famous Scout camp in the world. It is a national resource, built and supported by private citizens, that deserves our support. Thank you for helping to see that Alternative D is not selected.

Sincerely yours,

Herbert J. Rowe

000870

United States Air Force

To Whom It may Concern

RE: Realistic Bomber Training Initiative (RBTI)

Gentleman

If you Fly missions at 300ft you will scare hell out of EVERything. You will disrupt the peace and quiet, the wildlife, the cattle + horse, plus my sense of humor. These AIRCRAFT are noisey, disruptive and burn many gallons of fuel that is not safe because they have none of the comission controls. These Rookie Jetjockys CAN cause problems as well, what happens If they panic OR push the wrong button. They eject to save there ASS and that plane AINT going to fly itself anywhere but into the ground or on your property or house, look to me they Need to fly over the water OR some good own property and leave real America Alone. I own my land from fence line to fence line, I pay TAXES and All the upKeep. If you fly over my Air space be careful, trespasser are treated diffant than neighbors.

PD-7

BR-5

Thanks

Prickly Pear Studio

Alpine, Texas

June 11, 1999

Major Brent Adams, RBTI EIS project Manager
HQ ACC/CEVP
129 Andrews Street, Suite 102
Langley AFB, VA 23665-2769

Dear Sir;

The proposed Environmental Impact Statement, Draft Stage, of the Realistic Bomber Training Initiative targeted for our area, I feel, is unfair and unjust. I would like my comments to go on record and be published in the RBTI, Final Stage.

My own experience with low-flying aircraft has been in New Mexico, in a small town where the same training was taking place. The roar of the jet aircraft just overhead was deafening and terrifying. After a firsthand experience such as this, one realizes that an EIS is nothing but a totally useless piece of propaganda that the government has dreamed up to get around the original purpose of the National Environmental Policy Act.

While commenting at one of your public hearings in Alpine, TX, I asked for a show of hands from the audience of about 40 people if anyone approved of these training flights. Only one person raised their hand. In talking with everyone I meet about the flights, I have never met anyone who is in favor of them. So, if I'm not mistaken, the purpose of the comment period is to get feedback from the public to determine if the training initiative is justified. In a democracy, this kind of feedback is called "the Will of the People." Correct me if I'm wrong, but is that not the founding principle of our country? If the people no longer rule, what kind of regime has our country become?

GE-3

The U.S. military has more weapons of destruction than just about every other country combined. We spend more on the military in five hours than we do on health care in five years. Our defense contractors sell weapons to other countries that we sometimes end up fighting against. Out of 22 countries that we have bombed since World War II, none have become a democratic government interested in human rights. We the people, the taxpayers, are sick and tired of breaking our backs paying for this war machine.

There are millions of acres of government land that could be used for this training, even if it was necessary. The Big Bend area of Texas is one of the last frontiers left, where people can escape the noise, pollution, and chaos of Corporate America. It is not a military training area.

Sincerely,
Tom Curry
A Vietnam era veteran

129 Andrews ST., suite #102
Langley AFB, VA 23665-2769

Dear Major Adams,

TY I feel the Environmental Impact Statement (EIS), Draft Stage of the Realistic Bomber Training Initiative (RBTI), is unfair and unjust. Your office and Pilots fail to realize the adue and unwarranted intrusion upon my living space here in the rural area of Terlingua Ranch. I frequently hear the Drone of Bombers "rounding the curve" South of nearby Dive Point Mesa - an unwelcome noise. One Time a bomb strayed south of the usual route and found it necessary to make a very louder + sharp left Turn to get back to his appointed pathway - Afterburner flaming; Again a very unwelcome noise for me and my Family. Most intrusive however was an air force plane flying directly over my house at 150 - 200 FT. at 11:00 P.M. with Afterburner flare This Disrupted my families sleep and was very upsetting.
My Family and I are not in the Military and this is not Government property - But Private property for quiet rural life.
Your training flights are an unnecessary and harmful intrusion upon our environment. Please use the Federal Lands already set aside for Training - Not my Backyard!
Thank You for your Time + Attention
DAVID A. PARKER Yours Truly

000873

John M. Moore

Arlington, Texas

Major Brent Adams
RBTI EIS Project Manager
HQ ACC/CEVPP
129 Andrews Street, Suite 102
Langley AFB, VA 23665-2769

Major Adams:

BR-6 As an Eagle Scout by age 13 and a Philmont visitor that same summer (northern route), I was disturbed to hear recently of an Air Force plan for low level flight over Philmont.

This pristine wilderness area, which belongs to and is maintained by the Scouts, is kept in much better condition than most of the public national wildlife areas and should be preserved for solely Scouting use.

I flew helicopters gunships in Vietnam and know from experience that low level flight has the ability to interdict the open travel of both people and animals. But...UH-1C and Cobra gunships have a relatively low noise signature compared to a jet fighter bomber flying low level.

Please tell the Air Force to get a grip... If the Air Force wants to fly low level missions why don't you pick the U.S./Mexico border where we have far too many illegal visitors crossing and where low level fighter bombers with camera gear (or iridescent dye markers for the frequent and uninvited visitors) might help.

Please do your best not to allow the Air Force to impose this on the Boy Scouts. There are also animals who call Philmont home and the animal rights activists will be much more active politically and willing to protect their rights than the Scouts.

Boy Scouts should own the airspace above Philmont. Just as airspace above military bases like Groom Lake and airspace above National Parks, National Monuments, etc., is restricted, the airspace above Philmont should be restricted with no flights below normal airline flight levels without prior permission from the Boy Scouts. And then only on a limited basis.

Philmont is a National Monument (make that National Treasure) for all who've been and for future generations to go and develop into good citizens from the experience. It just happens to be privately owned. Again please assure the Air Force leaves it alone.

Thank you for your support.

Sincerely,
John M. Moore

Dear Major Adams,

BR-6 I am writing to request your firm support in opposing the selection of Alternative D under the U.S. Air Force's proposed Realistic Bomber Training Initiative (RBTI). The Air Force is seeking to establish a new training route for low-level B-1 and B-52 bomber flights from bases in Texas and Louisiana. One of the proposed routes, Alternative D, traverses Philmont Scout Ranch in northeastern New Mexico's Colfax County.

Philmont is a 137,000-acre mountain backpacking and high adventure facility of the Boy Scouts of America. Each year, thousands of Scouts and their adult leaders from across the nation participate in two-week wilderness backpacking trips in the mountains of Philmont. Many of them also camp and work on conservation projects in the adjacent Valle Vidal Wilderness of the Carson National Forest.

The Air Force's proposed Alternative D will establish a military training route directly over most of Philmont. More than 2600 flights each year, some as low as 300 feet above ground level, are proposed for the segment over Philmont. As a former Philmont staff member, I have serious concerns about the impact of the Air Force's proposal on the health and safety of Scouts attending Philmont and the potential effects of daily low-level flights on the ranch itself.

On any given day in the summer, as many as 5,000 Scouts and Scouters will be hiking and camping in Philmont's backcountry. Each day, several hundred of them will be engaged in activities such as rock climbing and rapelling, spar pole climbing, and mountain horseback rides. The sudden roar of jet engines has a high likelihood of distracting an inexperienced climber or causing a horse to bolt on a narrow mountain trail with resulting serious injury (or worse).

Appreciation and protection of the wilderness and our natural resources is a key part of the Philmont program. Scouts from around the world have a unique opportunity to see and experience wildlife in native habitat. Noise and emissions from bombers cannot help but have a damaging effect on that wildlife, as well as on Philmont's herds of buffalo, horses, cattle and burros. The disruptive effects of noisy bomber overflights on Philmont's famous living history programs, in which Scouts experience the lifestyles of the West's mountain men, homesteaders, lumberers and cowboys, are obvious.

Most of Philmont is mountainous with many peaks in the 10,000' to 12,000' range. Philmont has a tremendous fuel load of dead trees in its forests and is in the midst of a long-term drought. Unburned jet fuel finding its way to the ground or being dumped in an emergency over such terrain, with campers using backpacking stoves for cooking, creates the potential for a serious fire that would endanger hundreds of lives. The possibility of a crash, however remote, is simply not acceptable for the safety of these Scouts.

For these reasons, I seek your help in advocating the selection of a different RBTI route. I ask that you express your opposition to Alternative D to the Secretary of the Air Force and other defense officials who may be involved in this decision. Please act now, as the public comment period ends in June and a final decision will be made this year.

Philmont is the largest and most famous Scout camp in the world. It is a national resource that has positively impacted the lives of hundreds of thousands of our nation's youth for more than sixty years. It deserves and demands our protection. Thank you for helping to see that Alternative D is not selected.

Sincerely,
Linda Heasell
Philmont staff 1978 to 1980

Major Brent Adams
RBTI EIS Prj. Mgr.
HQ ACC/CEVPP
129 Andrews Street, Ste 102
Langley AFB, VA 23665-2769

Dear Major Adams,

BR-6 I am writing to request your firm support in opposing the selection of "Alternative D" under the USAF's proposed Realistic Bomber Training Initiative (RBTI) involving low flying B-52s and B-1s (as low as 300'). As one of several proposed southwestern routes, "D" traverses Philmont Scout Ranch in northeastern New Mexico's Colfax County. Philmont, truly a national treasure, is the 137,000 acre backpacking and training facility of the Boy Scouts of America. I do not protest RBTI since it is a valuable program – my only complaint, as a parent of a Philmont alumnus, is with the proposed route over Philmont.

Several years ago, the USAF ceased its low altitude F-16/F-111 flights over the Ranch as a result of Philmont protests. RBTI's multiple daily flights (up to 16) will create much more severe problems:

a) Program: Philmont is a transient community of 25,000 people with over 3,000 campers in Philmont's back country every day in the summer. Daily, several hundred of them are engaged in spar pole climbing, rock climbing and rapelling, and horse back riding. The sudden roaring of jet engines will distract climbers and bolt horses thereby creating injuries (or worse).

b) Environmental: Appreciation and protection of the wilderness are key parts of Philmont's program. RBTI is inconsistent with wilderness preservation. RBTI will have a damaging effect upon both the unique western wildlife and Philmont herds of cattle, horses, burros, and buffalo. The effect of the unburned portion of jet fuel in the engine exhaust or dumped fuel itself, vaporizing and falling to ground level is as yet unknown, but believed to be anything but beneficial.

c) Safety: The environmental impact study done for the USAF is seriously flawed when it describes Philmont as an "uninhabited" grassland. The smaller portion of Philmont's acreage is prairie. Most of Philmont is mountainous with many peaks in the 10,000 to 12,444' range. Philmont has a tremendous fuel load of dead trees in its forests, and is in the midst of a long term drought. Open fire bans are in effect now. A crashing bomber will create an epic fire of Yellowstone proportions. B-1s and B-52s do not have enviable safety records. The nature of the flights (weaving around mountain peaks and facing violent weather, including frequent, low-level wind shears) dramatically increases the chance of a crash. Unfortunately, Philmont does not have a well-developed highway system for evacuations in case of massive forest fires.

For the above reasons, I seek your help in advocating the selection of a different RBTI route, preferably one that is over a more sparsely populated, less environmentally

000875

sensitive area. I believe that it is critically important to save the wilderness experience for the thousands of young people who visit the Philmont Scout Ranch every year.

There is too much at stake to allow RBTI to overfly Philmont. Thank you for helping to see that alternative D is not selected.

Sincerely,

Cindy Engel

Langley AFB, VA 23655-2769

Dear Major Adams:

BR-6 I have just received information stating that the USAF is contemplating using the airspace over the Philmont Scout Ranch, near Cimmarron, New Mexico, as a training route for low-level practice bombing flights. Though I appreciate the need for these types of training exercises, I am strongly opposed to low-level flights over the Philmont Scout Ranch.

Philmont has been used for training flights for many years, I have experienced them first-hand, the experience is unpleasant to say the least. In August, 1980, a fighter jet buzzed Mt. Baldy, no more than 25 feet off summit, and the crew I was leading. The image and roaring intrusion lasts in my memory to this day. Philmont exists to provide a wilderness experience for thousands of scouts each year. I fear low-level flights would significantly degrade the experience.

In addition, there are many safety and environmental concerns. Philmont is a land of adventure, and, at times, a land where full concentration on the task at hand is essential. For example, imagine a scout half way up his first rock climb, his concentration shattered by a low-flying jets. The USAF would clearly be liable for accidents.

Please consider another route, leave Philmont the peace and quiet it needs and deserves.

Sincerely,

Mark Vander Meer

RE: Realistic Bomber Training Initiative (RBTI) Draft Environmental Impact Statement (DEIS)

Dear Major Adams,

As a rancher in the area under the proposed "Alternative B" in the RBTI, I have been involved in the NEPA process from the beginning. I voiced my concern in the scoping process, conducted significant personal research, appeared at two public hearings, spoke at the public hearing in Snyder, TX, and now write this letter.

BR-4 After months of interaction with the USAF on the RBTI I have grown increasingly distressed by the failure of the USAF to honestly and directly address the major issues raised by me and many of my neighbors. While I could point to any one of many issues, I will focus here on one which I believe is representative of the rest. The issue that I am referring to is the potential loss of hunting revenues in our area, the economics multipliers they trigger and the resulting economic loss this creates. After many letters from land owners which I have read and the public comments on this issue raised during the scoping process, I naturally assumed that this issue would be dealt with in depth in the DEIS. Imagine my frustration and anger when a careful reading of the DEIS did not even produce a single reference to hunting or loss of hunting revenues as a possible result of the proposed overflights. How the USAF could purport to study the socioeconomic effects to our area and not address the hunting issue is incomprehensible.

I can only conclude that the USAF has no real intention of giving the possible impact of the RBTI a "hard look". It would appear instead that the USAF is simply going through the paces of trying to deliver the absolute minimum to comply with the NEPA process. I believe that the USAF has even fallen short of that.

000877

BR-3 Many of our other genuine concerns such as possible damage to our livestock and wildlife were either ignored or trivialized. The DEIS admits that range cattle have not been studied for their reaction to the types and levels of noise to be generated by the RBTI. Yet in spite of the numerous studies that suggest that this type of noise exposure can stress cattle and wildlife and produce serious consequences, the USAF chose to suggest that there was no conclusive evidence that the RBTI would damage our animals. Hardly the honorable way to address our concerns. Hardly a "hard look" at these issues.

BR-1 My most serious criticism however is reserved for the inappropriate urban noise models used by the USAF in calculating the levels of annoyance to local rural residents. Dr. William Weida's comments at the public hearing in Snyder, TX, on April 7, 1999. and the report that he submitted at that time showed the many faults of trying to use "urban community noise standards" in a rural or wilderness setting. Dr. Weida explains in detail in that report how the USAF has used multiple "averaging" to habitually understate the noise to be experienced by residents under the RBTI. It is obvious to any clear thinking person that the USAF is simply trying to "average " the noise levels down to a level that will pass Federal standards. Even the USAF's own consultants have complained about this indefensible approach to noise modeling for years now. At the very least the USAF should admit the inadequacy of their noise models, do the right thing for the US citizens and discard this outmoded and misleading approach to measuring noise in rural areas.

At best this DEIS is an embarrassment to the USAF and at worst it is an intentional attempt to misrepresent the facts. The USAF is required by NEPA to take a "hard look" at the issues. That has not been done in this case. The people need to be protected. Who will look after us?

Sincerely,

John F. Oudt

Dear Major Adams:

I am opposed to the Air Force's proposed RBTI known as Lancer – Option B in the DEIS. My concern(s) about the proposal and the DEIS are as follows:

BR-4 The Air Force has had no concerns for our property value. I don't no any one that wants flying missum over their property or who would want to buy a property with this environment.

BR-3 Not only will this bomber training hurt our ranching operation but hunting
BR-4 & wildlife environment. You have not

AO-55 adequately studied the impact the noise will have over this south of our community. You say the noise will not have a noticible impact But, We have talked to people that have the bomber training missions. (over)

Sincerely yours: Ann Culp

Karen and Dan Ashton

Eagle Nest, NM

June 10, 1999

Dear Sirs.

BR-6 I am writing to ask for your help. My husband and I have spent a total of 11 years at Philmont Scout Ranch. We also live in the area. While I would like to say thank you for taking the Angel Fire route of the RBTI, off of your consideration list, I am concerned that route D is still being considered. Philmont is used year round and is vital to the community and county for employment and economic growth for a very poor county.

With the draft for flying B-1's and B-52's over the majority of land at Philmont this causes one to consider many issues. These flights would encompass 114,000 acres of mountains, canyons, and natural areas. This includes the Barker Wildlife Refuge; this area is strongly protected from any disruption. I strongly agree our flying men and women need training, but at what cost in this area? With over 5000 people on the ranch at one time and the chance of a bomber having to let fuel out to gain altitude, this could be dangerous. If the planes are at a low altitude, say 300 feet, would not fuel falling on a campfire have disastrous results? The noise alone is frightening. The B-52 at 300 feet has a noise level of 117 dBs. Philmont has people climbing rock faces, on horse back, not to mention historical rock carvings and sites throughout the camp that could be damaged. People could be injured, severely. Historical sites and irreplaceable rock structures could be destroyed. Planes would also be flying near a fragile rock face in Cimarron Canyon, called Pallisades. Hundreds of tourists stop by and take pictures of this area every year. They also camp very near these formations. If Philmont is so affected by these flights, not only injuries could occur, but people could stop coming to the area. As I mentioned before, we are a poor county and need Philmont and tourists.

I am asking for your help to stop this initiative. Please decline using Alternative D as a route for RBTI. Thank you for your concerns with this matter.

Sincerely,

Karen Ashton-

Major Brent Adams
RBTI EIS Project Manager
HQ ACC/CEVP
129 Andrews Street, Suite 102
Langley AFB, VA 23665-2769

Dear Major Adams:

We are opposed to the Air Force's proposed RBTI known as Lancer-Option B in the DEIS. Our concerns about the proposal and the DEIS are as follows:

1. The noise – We were in Lubbock recently on the day an Air Force bomber flew over Lubbock and left the gift of the sonic boom along with damage. By news reports, this bomber was flying at 3000 feet. The noise was deafening at that altitude. We can only imagine what it would be like when the aircraft are flying at 300 feet. We moved to the country to get away from road traffic noise and to enjoy the peace and quiet which the Air Force is proposing to take away from us.

CU-5 2. The damage At 3000 feet, the Air Force bomber caused damage to homes and businesses in Lubbock. We live in an older home outside of Wilson. The windowpanes are old, and the stucco siding is old along with the foundation. We do not relish the idea of any damage to our house and other structures on our property.

BI-2 3. The wildlife – Each spring and fall, flocks of Sand Hill Cranes migrate to Lynn County These birds have wingspans of over 6 feet. They migrate here for food and water. They flock in numbers of many hundreds and sometimes thousands. The noise and danger from the aircraft will be hazardous to these birds along with the danger the numbers of these flocks of birds could do to a low flying aircraft.

4. The use of air space over private lands – The Air Force is already the proud owners of land areas that could be used for these training missions. The area proposed is ranchland, farmland and individual homes. The ranchers and farmers have already sacrificed more than should be expected of any citizen. Why take more from them and make it harder to survive?

Please reconsider the proposed RBTI Lancer-Option B. Thank you.

Sincerely,

David & Nona Freeman

Major Brent Adams, RBTI EIS Project Manager
HQ ACC/CEVPP
129 Andrews Street, Suite 102
Langley AFB,VA 23665-2769

Dear Major Adams,

I think the Environmental Impact Statement (EIS), Draft Stage, of the Realistic Bomber Training Initiative (RBTI), is unfair and unjust for many reasons but I will confine my comments to the following:

In our tri-county area we have 3 newspapers all of which give only local news and are printed and sold once a week. These counties are 3 of the largest in Texas and 2 are the largest counties in the continental United States. The area served by these newspapers is comprised of 20,000 square miles and has a population of 21,000 people. I give you this background information to let you know those of us who are trying to keep this pristine desert environment intact have an almost insurmountable job.

My statement is: There was not adequate information printed in the Jeff Davis County, Brewster County, and Presidio County newspapers to inform the general public of the proposed intent of the Air Force regarding the issue of bomber flyovers in this tri-county area. Nor were we informed as to the exact purpose of the proposed meeting. As you well know there were very few citizens at this meeting which directly reflected the lack of adequate information being dispensed to the citizens.

GE-22

To substantiate my statement, you will find copies of news clipping from the 3 area newspapers prior to the Air Force public hearing.

000881

Please enter this letter and the enclosed copies of local newspaper clippings into your federal hearing records.

Thank you for your fairness and your concern for the people, environment, structures and animals in this desert area known as Far West Texas.

Sincerely,

-Daileen-

Air Force to release Environmental Impact Statement on low-level flights

By Jan Talley
Avalanche Staff Writer

The U.S. Air Force issued a press release stating that their Draft Environmental Impact Statement on low level flights will be disseminated on March 19.

The environmental statement on the Realistic Bomber Training Initiative (RBTI) was prepared by an independent firm of Ogden Environmental Group and pertinently uses on B1 and B52 bombers. The Air Force RBTI proposal focuses on low altitudes routes and electronic simulations of combat situations. Presently, the routes includes aircraft other than B1 and B52 bombers, as well as several foreign aircraft and crews.

The Germans, Argentinean and other Air Forces have trained on these routes.

The Air Force is in the process of choosing one of four alternatives for the RBTI, and public input is required to complete the process. The four alternatives are the no action alternative, which means that the routes would remain the same; two alternatives in West Texas and one in New Mexico. The public has 45 days from the time period from the release of the statement to which they can voice their concerns.

Citizens opposing the flights over private property say that the statement disregards National Environmental Policy Act (NEPA) regulations. "The Air Force is exempt from many federal laws governing our inquiries on low level training flights," says Bryan Kelly, who has three honorable discharges from two wars and four Purple Hearts, and is spokesman for the Texas Preservation Group says, "they (Air Force) are violating the Clean Air Act, trespassing on private property and violating NEPA regulations. The Air Force has never made an accommodation to the citizens affected by their low level flights originating from the Dyess Air Force Base, where many of the low level flights originate.

The Trans-Pecos Protection Group is made up of 1400 members representing 38,000 people armed with seven lawyers. Kelly says that these are legitimate concerns and some of the flights over private property are flying 100 feet above the ground over populated areas at speeds up to 640 miles per hour.

"I one hundred percent categorically reject that we are breaking any NEPA regulations," said Lt. Don Kerr of the Public Affairs Division at Dyess Air Force Base, where many of the low level flights originate.

The group maintains that the federal government owns over six million acres of unpopulated land and could take advantage of this space to conduct their training. Other than over privately owned land. They also say that the Air Force will not do conduct between 400-600 flights everyday from the four different

SEE AIR FORCE PAGE A2

AIR FORCE

FROM PAGE A1

bases in the region.

Air Force representatives will be traveling in West Texas to hold public meetings on the RBTI after the statement is released. They will hold two sessions at the Alpine Recreation Center (the old Alpine high gym) on Saturday, April 10, from 10 a.m. to 12 noon and 1 p.m. to 5 p.m. The statement to be released March 19 will be sent to local libraries, agencies and some citizens in West Texas.

Saturday could be last chance to stop low-level bomber runs

ALPINE - This Saturday could be the last chance Big Bend residents get a close look at the Air Force before it starts flying its bombers at altitudes of 200 to 500 feet above the private property of Jeff Davis, Brewster, Culberson and Presidio counties.

Opponents of the Air Force proposal hope large numbers of area residents will help tell the Air Force people here don't want the flights.

The hearing begins at 10 a.m. and continues until noon. It resumes at 1 p.m. and goes to 5 p.m.

The hearing will be in the old Alpine Junior High School Gymnasium (now a recreation center).

Jeff Davis County
Mountain Flyer
Vol. 15, No. 11
March 25, 1999

000881

Hearing April 10 to stop Air Force from flying bombers 200 feet overhead

ALPINE - What many fear will be just another dog and pony show by the U.S. Air Force is planned for April 10 in Alpine.

The hearing is scheduled from 10 to noon, and again from 1 to 3 p.m. at the old Alpine Junior High auditorium in Alpine.

The Air Force is required to hold public meetings by the National Environmental Policy Act (NEPA) to gather comment from citizens about the Realistic Bomber Training Initiative Draft Environmental Impact Statement (DEIS).

The DEIS was sent to local libraries, agencies and entities that requested the document. There is one available to read at the Alpine Public Library for the public to review.

The Air Force has been flying training routes over private land in New Mexico and West Texas for decades and still continues to fly hundreds of flights five days a week with all types of fighter and bomber aircraft and foreign air forces.

Some opponents of the low level flight training believe that this environmental impact statement was taken exercise to superficially appease the general public. Contending that NEPA regulations, the Clean Air Act and other constitutional rights are being violated and "strong armed" by the U.S. Air Force, ranchers, individuals and organizations of the Trans-Pecos Protection Group are fighting the Air Force through litigation, Texas Public Information Requests, and involving public officials to, "educate the public about what the Air Force doesn't want the public to know."

Although an independent firm conducted the environmental assessment, and the public has had the ability for their comments to go on record, the Air Force, not an independent entity, will weigh the comments and recommendations to make the final decision. The Air Force is proposing four different routes, each a different flight training route, with one over private land. There is no altitude restriction imposed by the Air Force to train over the private land, only that the aviators stay above 200 feet.

Spokesmen for the Air Force say that the aviators are using area restaurants, motels and other businesses to stay and eat in large numbers to help the economy of the Alpine area. Many residents, however, have complained that the aviators are causing disturbances to farm and ranch animals, and that the Air Force people here do not want the flights over private property in the Big Bend.

000881

No news in this area newspaper this week.

U.S. Air Force to hold public meeting for input this Saturda

Low level flight training is the topic of discussion

By Ian Talley
Avalanche Staff Writer

The US Air Force will be holding a public hearing this Saturday to gather public input on draft environmental impact statement regarding low level flight training.

The public meeting will be held at 10 a.m. to 12 p.m. and 1 p.m. to 5 p.m. at the Old Junior High Auditorium in Alpine.

The Air Force is required to hold public meetings by the National Environmental Policy Act (NEPA) to gather comment from citizens about the Realistic Bomber Training Initiative Draft Environmental Impact Statement (DEIS).

The DEIS was sent to local libraries, agencies and entities that requested the document. There is one available to read at the Alpine Public Library for the public to review.

The Air Force has been flying training routes over private land in New Mexico and West Texas for decades and still continues to fly hundreds of flights five days a week with all types of fighter and bomber aircraft and foreign air forces.

Some opponents of the low level flight training believe that this environmental impact statement was taken exercise to superficially appease the general public. Contending that NEPA regulations, the Clean Air Act and other constitutional rights are being violated and "strong armed" by the U.S. Air Force, ranchers, individuals and organizations of the Trans-Pecos Protection Group are fighting the Air Force through litigation, Texas Public Information Requests, and involving public officials to, "educate the public about what the Air Force doesn't want the public to know."

Although an independent firm conducted the environmental assessment, and the public has had the ability for their comments to go on record, the Air Force, not an independent entity, will weigh the comments and recommendations to make the final decision. There is no altitude restriction imposed by the Air Force to train over the private land, only that the aviators stay above 200 feet.

000881

Air Force agrees to longer response time for controversial training

Washington - U.S. Congressman Henry Bonilla (R-TX-23) announced that the U.S. Air Force will double the response time for West Texas residents to voice their concerns about the Air Force's Realistic Bomber Training Initiative (RBTI).

The Air Force had originally scheduled a 45 day response period for West Texans to have their voices heard on the issue, but Bonilla spoke to Air Force Chief of Staff, General Michael E. Tyan and requested an extension in the response time. At Bonilla's request, the Air Force will double the response time to 90 days. "It is important that West Texans have ample time to voice their concerns over the Air Force's RBTI program," Bonilla said. "We must do everything we can to make sure the rights of private property owners are protected and their concerns are heard."

Bonilla has been a strong advocate in Congress for West Texans on this issue. Last June, Bonilla secured language in a Defense Appropriations report that required the Air Force to complete an Environmental Impact Statement before implementing their Realistic Bomber Training Initiative.

A draft Environmental Impact Statement has been completed and was made available to the public for review on March 19, 1999. Because Bonilla's request for a response extension, West Texans now have until June 16, 1999 to voice their concerns to the Air Force.

(6) The Big Bend Sentinel, Marfa, Texas, April 8, 1999

Maj. Brent Adams:

Dear Sir:

Please don't let the air force destroy our way of life. We've worked hard to get this land to support our family.

The Lancer project will adversely effect our livestock operation, wild life development and recreational use of my land.

BR-3

I am opposed to the Lancer project. Please help us! Oppose it!

Sincerely,
Rema McGough

000885

United States Air Force:

TY I wish to voice my opposition to B-1 + B-52 training flights over our land in Stonewall County Texas. We have cattle grazing our lands among other things, and we do not need these low level flights. Also noises can effect people with different ailments. Many people have worked hard and sacrificed much to pay for this land and feel like the low level flights will have a bad effect in many ways. Thank you for giving us the chance to oppose this.

Sincerely
Lula Stalye Hinige
Aspermont Texas

000886

TY

I am writing to express my opposition to the Low Level Flight Training by the Air Force in the eight counties in Texas: Scurry, Borden, Lynn, Dickens, Garza, Kent, Lynn, and Stonewall.

My family owns a 16½ section ranch in Scurry County, known as Winston Ranch. It is South of Snyder, Texas. The ranch has been owned by my family since 1917. It has been used to raise cattle. Since the death of Hadie and Ila mae Winston the ranch has been used by my sister and me and our children, and my son-in-law Travis Hatter. We operate the operation of the ranch which is very important as the land is our livelihood.

Please use my opposition in your decision about the Low Level flying.

Sincerely,
Beverly Winston Boyce

RBTL EIS Project Manager
HQ ACC/CEVP
129 Andrews Street
Suite 102
Langley, AFT VA 23665-2769

Dear Major Adams:

I wish to state my opposition to the low level flight training in the Scurry County area which is being considered by the Air Force. I understand this plan is the "Lancer" site (Option B in the DEIS). I feel that livestock and wildlife would be adversely affected by the extremely low-flying planes and that the entire area would be disturbed by the noise. This country is sparsely populated and we value the absence of the noise levels that are largely unnoticed in urban areas.

BR-3

I believe that other options can and should be seriously considered and respectfully request that the Air Force choose an alternate location for this training.

Yours truly,

Mrs. Bobby Goodwin

I do realize that the air force needs some training space somewhere. However our area should be affected more than some air space already owned or secured by the air force.

Our economy does not need to be reduced any more, unless it definitely would be by the low flying bombers planes.

Those things that would be affected by the use of this area for bomber training are, livestock, wild habitat, human beings, even homes shaken and weakened.

An example of home damage by low low flying bombers (planes) has already been experienced in Garza County. As you know this has already been reported to you.

I understand that the air space that you already control is sufficient for this bomber training.

My vote is "No" for the bomber training in this area

Thanks,
J.A. Pebsworth

TY Dear Airforce,
No bomb traing on this ranch! You know how it is to have a destroyed home. That's what might happen because of bombing. Could have a peaceful life it would burn your property for your own self to bomb here on. This is their ranch so they can do anything they want with. And you can't. There more property than just one piece of it. What you may do is gather up all your bombs and get off their property. And that requires our lives one of those things were to drop and land in their house it would explode and they would die because of your bombs. They lived their life there reding horses gathering cows and do you think that's lots of hard work. Yes it is. And if you would just get your fats out of here and they could live in place so that they don't have to put up with you.

Sincerely Charlie

Dear Sir:

AO-47 I feel the environmental impact of the Realistic Bomber Training Initiative is unfair and unjust. It is my understanding that B-1B and B-52 bombers will be flown at 550 mph, and will be flying as low as 200 feet above ground level over the west Texas area. I completely understand and support a strong American military. I also understand that training and experience strengthens our national defense. I want us to have the best trained Air Force in the world. However, conducting this training over populated private property in the west Texas area is totally inappropriate and environmentally harmful.

AO-59 The tremendous noise generated by these bombers is dangerous to humans and crosses the threshold of pain. Flying these huge bombers over homes and ranches will cause a "startle effect" in both people and animals as these flights appear suddenly and unpredictably without warning, followed by a deafening roar. Continued exposure to such noise levels can cause stress and related injuries to those living in the area. Military aircraft are not only dangerous to the

BR-2 people they fly over, but they are also dangerous to border patrol personnel and customs pilots, as well as general aviation pilots. To make matters worse, the high speed low level bombers will be flying at night without any lights, causing a dangerous situation to any general aviation pilots who may be flying at night in the same areas that the Air Force will be conducting this training. There is no "see and avoid" with a jet bomber traveling at such high speeds. And if a military aircraft crashes, not only is the impact dangerous, but the crash will also release fuel and other toxic chemicals that are carried on the plane. In arid west Texas the possibility of a brush fire is a certainty.

For the above reasons, I oppose these flights in the west Texas area.

Sincerely,

Chuck Huber, President
Texas Pilots Association

Langley AFB, VA 23665-2769

Dear Major Adams,

I am opposed to the Air Forces proposed RBTI known as Lancer - Option B in the DEIS. My concerns about the proposal are as follows:

1) To my knowledge, there have not been any studies done on what impact the

BR-3 proposed bomber training will have on this ranch & oversee or any other ranch or farm in this 8 county area.

AO-55 2) The DEIS, I understand, did not adequately study the impact noise will have on any of the area involved. I was at the public DEIS Hearing in Snyder on April 14, 1999. We were informed that the noise level of a bomber is very low. I do not recall what the bomber noise level was compared to but I have heard both. There is no comparison, a bomber is much louder at 3,000 feet (or lower).

3) The last statement brings up another point. I don't have an altimeter but it sure seems that the bombers sometimes fly much lower than 3,000 feet. What will happen when there will be many more

000896

flights, especially at lower altitudes? Another tragedy like the gondola (Italy) incident?

4) Can the U. S. Air Force be trusted? I understand from others that have had long dealings with the Air Force, that the Air Force can not be trusted. Once they have the go ahead on a project, "new" procedures are added. Procedures that were in the "plans" from the start and intended to be added once there was an initial approval.

I am a member of the Heritage - Environmental Preservation Association (H.E.P.A.). I am patriotic, and am grateful to the U. S. Air Force for their effort. But I feel that the proposed RBTI should be done over uninhabitated U.S. Government land, not over land where we work and live everyday. Come see and visit us. Get a first hand view of our concerns.

Sincerely,
William K. Faske

Subject: Respectfully submitted: Please, no USAF training over Philmont Boy Scout Ranch

Importance: High

TO: The Honorable Senators Phil Gramm and Kay Bailey Hutchison of Texas

cc: NBC "Dateline"
CBS "48 Hours"
ABC "20/20"
The Wall Street Journal
The Washington Post
The Philmont Staff Association

Dear Senators Gramm and Hutchison;

I'm writing you today to urgently request your firm support in opposing the selection of Alternative 'D' under the U.S. Air Force's proposed Realistic Bomber Training Initiative (RBTI). The Air Force is seeking to establish a new training route for low-level B-1 and B-52 bomber flights from bases in Texas and Louisiana One of the proposed routes, Alternative 'D', traverses Philmont Scout Ranch in northeastern New Mexico's Colfax County.

Philmont is a 137,000 acre mountain backpacking and high adventure facility of the Boy Scouts of America Each year, literally thousands of Scouts and their adult leaders from across the nation participate in two-week wilderness backpacking and horse packing trips in the Sangre de Cristo mountain range, in which the property is situated. Many of them also camp, trek and work on conservation projects in the adjacent Valle Vidal Wilderness of the Carson National Forest.

The Air Force's proposed Alternative D will establish a military training route directly over most of Philmont. More than 2,600 flights each year, some as low as 300 feet above ground level, are proposed for the segment over Philmont. As a former Philmont staff member, and a current adult Scout leader, I have serious concerns about the impact of the Air Force's proposal on the health and safety of Scouts and their leaders attending Philmont and the potential effects of daily low-level flights on the ranch itself.

On any given day in the summer, as many as 5,000 Scouts and Scouters will be hiking and camping in Philmont's backcountry. Each day, several hundred of them will be engaged in activities such as rock climbing and rappelling, spar pole climbing, and mountain horseback riding. The sudden roar of jet engines has an unreasonably high likelihood of distracting an inexperienced teenage climber or causing a horse carrying an inexperienced teenage or adult rider to bolt on a narrow mountain trail, with the scarcely escapable result being the very high potential for serious injury – or far worse.

Appreciation and protection of the wilderness and our natural resources is a key part of both the Philmont, and also the larger Scouting programs. Scouts from around the world have a unique opportunity to see an experience wildlife in its native habitat. Noise and emissions from bombers cannot help but have a detrimental effect on that wildlife, as well as on Philmont's herds of buffalo, horses, cattle and burros. The disruptive effects of noisy bomber overflights on Philmont's famous living history programs, in which Scouts experience the lifestyles of the West's mountain men, homesteaders, lumberers and cowboys, are obvious – and unacceptable in view of the lower-impact alternatives available to the Air Force.

Most of Philmont is mountainous, with many peaks in the 10,000 to 12,000 foot range. Philmont has a tremendous fuel load of dead trees in its forests and is in the midst of a long-term drought. Unburned jet fuel finding its way to the ground or being dumped in an in-flight emergency over such terrain, with campers using backpacking stoves for cooking, creates the potential for, at the very least, a serious fire that would endanger hundreds of lives, and at the very most, an unspeakable tragedy. Moreover, the possibility of a

crash, however remote, is simply not acceptable for the safety of these Scouts. There can be no statistica probability, however insignificant, that could justify the potential consequences of taking such a risk. The ends simply do not justify the means.

For these reasons, I again seek your help and support (my previous letter to you on this subject dated 8 April '99 is included below,) in advocating the selection of a different RBTI route for the essential training that I agree our service men and women of the Air Force must have. I ask that you express your vehemen opposition to Alternative D to the Secretary of Defense, the Secretary of the Air Force and any other Defense officials who may be involved in this decision. PLEASE ACT NOW, as the public comment period expires on Tuesday, June 15th, and a final decision will be made this year. You or a member of your staff may wish to contact Greg Dodd, Chief of Staff for Congressman Ed Pease of Indiana, who can provide additional information.

Philmont is the largest and most famous Scout camp in the world. It is a national resource that has had an enormous positive impact on the lives of hundreds of thousands of our nation's youth for more than sixty years. It deserves and requires – demands – our attention and protection.

I've been pleased and proud to vote for each of you in the past. However, as one of your many thousands of voting constituents who will be closely watching your respective offices for any public comment on this subject over the next weeks (not to mention the outcome of the Air Force's ultimate route selection,) I want you to know that I'm counting on each of you to not only get involved but also to do the right thing. There are not many things about which I feel strongly enough to even consider becoming a "one issue voter". Yo should both rest assured however, that this is without question one such issue.

Please don't let the Scouting program down now in its time of urgent need.

Respectfully,

Hennon Gilbert, Jr.

Subject: URGENT - TIME SENSITIVE !! NO USAF TRAINING OVER PHILMONT SCOUT RANCH ! ! !
Importance: High

Dear Senators Gramm & Hutchison;

I DO NOT want the military training activity described below to take place over Philmont Scout Ranch, in Cimmarron, New Mexico.

Surely, with as much topographically significant US BLM acreage as there is between the Front Range of the Rockies Salt Lake City, the USAF could spare the ~214 square mile tract of Northern New Mexico that comprises the crown jewel of all the properties owned and operated by the Boy Scouts of America for the benefit of its membership.

Please have your staff pay attention to the calls &/or mail your office receives on this issue, and WEIGH IN with the Air Force.

000897

Thank you.

Regards,

000897

Subject: Bomber Runs at Philmont

----Forwarded Message(s)----
07-Apr-99 21:08:16
Sb: Bomber Runs at Philmont
Fm: Kevin Caine > INTERNET:ptc897@EN.COM

Sometime last summer, there were several postings to this list regarding the USAF conducting bomber training at Philmont. Mark Griffin, Director of the Philmont Training Center posted the following items to the Philmont discussion list in the last few weeks:

"The RBTI (Realistic Bomber Training Initiative) is moving along at a pretty good pace. In the first weeks of April there will be Public Hearing Meetings in the areas that may be impacted by the bombing runs. The meeting in Angel Fire will be April 13.There are currently 4 sites under consideration. The one that impacts Philmont is the path near the proposed Mt. Dora MAO (Military Operations Area). The current corridor would bring flights directly over Mt. Baldy and the Tooth of Time. On your Phil-map, draw a line from Baldy to Rayado and you get the idea. Since one of the ideas is to test terrain avoidance and terrain following technology, they will be rather low and will fly at night as well as during the day.If you have an opinion on this, please contact your Congressman or Senator and ask them to contact:

Major Brent Adams
RBTI EIS Project Manager
HQ ACC/CEVPP
129 Andrews Street, Suite 102
Langley AFB, VA 23665-2769

By the way they are planing 2,660 flights a year, 365 days a year (that is just over 7 a day), 20% of which will be between the hours of 10:00PM and 2:00AM. Flights over Philmont will be at an altitude of 300-1000 feet. That IS three hundred to one thousand feet. The planes will all be B-52's andB-1 bombers."

As you can see, this issue is far from dead. In fact, Philmont is one of the "final four" sites being considered. If the USAF moves forward and chooses Philmont as the site for this training, it would be a real tragedy. If you've ever been to Philmont, considered going to Philmont, or know anyone who has been to Philmont, I urge you to take the time to call or write your Senators and Congressmen and let them know that this would be a terrible place to conduct this training.

000897

Last year, there were over 1.1 Million calls placed trying to get reservations for Philmont slots in 2000. Even if a small percentage of these people took the time to place a call to their elected representatives, it would have a big impact. There are Scouts and Scouters in every state and every congressional district. It would be great if every Senator and Congressman heard the same message - No Bomber Runs at Philmont! Please take the time and write, call, or even e-mail!

----End Forwarded Message(s)----

TO: MAJOR BRENT ADAMS,
RBTI EIS PROJECT MANAGER
HQ ACC / CEVPP
129 ANDREWS ST., SUITE 102
LANGLEY AFB, VA 23665-2769

000898

FROM: JAMES BAKER
DIRECTOR OF CONSERVATION
PHILMONT SCOUT RANCH
CIMARRON, N.M.

DEAR MAJOR ADAMS,

BR-6 I AM A SEASONAL STAFF MEMBER WHO WORKS AT PHILMONT IN THE SUMMER FROM THE BEGINNING OF MAY TO THE END OF AUGUST. I AM WRITING REGARDING THE REALISTIC BOMBER TRAINING INITIATIVE (RBTI). THE PROPOSED FLIGHT PATH FOR RBTI IS OVER PHILMONT SCOUT RANCH, WHERE DURING THE SUMMER, OVER 21,000 SCOUTS GO ON A TEN DAY BACKPACKING TREK. THE BOMBERS, WHICH WILL BE FLYING AT LOW ALTITUDES WILL SIGNIFICANTLY AFFECT THE WILDERNESS EXPERIENCE OF THE SCOUTS WHO BACKPACK AT PHILMONT. SEEING AN OCCASIONAL FIGHTER OR BOMBER FLY BY IS NEAT, BUT TEN LOW LEVEL FLIGHTS OVER PHILMONT WILL NOT BE LOOKED AT POSITIVELY BY STAFF AND CAMPERS. THE CAMPERS WOULD HEAR 100+ DECIBLE NOISE FOR 15 - 30 MINUTES A DAY, THIS NOISE WOULD DETRACT FROM THE PEACE AND SOLITUDE THAT CAMPERS COME TO PHILMONT TO GET AWAY FROM IN THE CITY. THE 21000 SCOUTS AND STAFF EVEN THOUGH THEY ARE A SEASONAL POPULATION, REPRESENTS A SIGNIFICANT POPULATION THAT WOULD BE AFFECTED BY RBTI.

000898

NOT ONLY WILL RBTI DETRACT FROM THE WILDERNESS EXPERIENCE, BUT THE HIGH DECIBLE NOISE WILL ADVERSELY AFFECT THE SAFETY OF PROGRAMS AT PHILMONT: ROCK CLIMBERS, HORSEBACK RIDERS, AND [redacted] PEOPLE ON THE SHOOTING RANGE MAY BE STARTLED BY LOUD AND SUDDEN NOISE, AND ACCIDENTS MAY HAPPEN.

PLEASE CHANGE THE ENVIRONMENTAL IMPACT STATEMENT TO REALISTICALLY REFLECT THE ACTIVITIES AND POPULATION AT PHILMONT. THE RBTI ALTERNATIVE D; FLYING OVER PHILMONT SCOUT RANCH SHOULD BE REJECTED.

THANK YOU,

JAMES BAKER
DIRECTOR OF CONSERVATION
PHILMONT SCOUT RANCH

Do you wish to be sent a copy of the RBTI draft EIS? Yes____ No X

Please give this form to one of the Air Force Representatives or mail to:
Major Brent Adams, RBTI EIS Project Manager
HQ ACC/CEVPP
129 Andrews Street, Suite 102
Langley AFB, VA 23665-2769

000899

I am writing to oppose the choice of "Alternative D" in the Realistic Bomber Training Initiative. I live in the town of Chama, located in northern New Mexico. My concerns are for the greater Chama Valley which extends from Espanola, NM up to the Colorado border and includes the towns of Abique, El Rito, Canjilon, Cebolla, Tierra Amarilla, and Chama. It is only because the U.S. Airforce came to Dulce (my work place) for a public meeting that I was made aware of RBTI. The meeting in Dulce was only publicized in Dulce—not in the Chama Valley.

GE-22 Airforce efforts at public education and public participation in the Chama Valley were a negligent attempt at fulfilling public input requirements. Especially when the proposed flight route directly affects two communities, Cebolla and Canjillon. At the meeting in Dulce, I stated by disbelief at the lack of public meetings in the Chama Valley. In response, Airforce employees smugly stated that "maybe people from the Chama Valley could go to Taos tomorrow (about and hour and a half drive) to learn more about RBTI". For most residents of Canjillon and Cebolla even driving 25 miles to go to Chama is a huge undertaking, going to Taos would be considered an expedition taking days of planning. In short, the Chama Valley is its own unique community that the airforce failed to address.

PD-18 The EIS states that with Alternative D "**Thirteen** Special Land Use Management Areas experience increases in noise levels of 4 to 17 DNL" compared to no special land use management areas in Alternative A, B and C. On page 4-82, the EIS states that "Lands under Alternative D airspace would be subject to the greatest amount of change in noise levels from baseline conditions." This begs the question—then why even consider alternative D?

The communities of Cebolla, Canjillon and a Catholic Monastery on the portion of the Chama River designated as Wild and Scenic River, would be directly affected by Alternative D. RBTI would not just "impact" these towns and places it would devastate them. The noise, visual impact, and the effects on land uses which include, hunting, fishing, kayaking, tourism hiking, horseback riding, and sheep herding would be unforgiving. The quality of every day life in the Chama Valley largely depends on the simple pleasures that silence affords.

On page 4-81, the EIS states that "visual intrusion of military aircraft could adversely affect the recreational experiences of visitors to the public recreation and underlying airspace."

This is a gross understatement. Outdoor recreation and tourism, including a multi-million dollar hunting and fishing industry, makes up the backbone of industry in the Chama Valley along with livestock. Much of this recreational activity occurs within Carson National Forest. Ten flights a day as low as 400 feet would slowly break down the recreation industry. At first people might be "entertained" by a low flying plane but in the end, people would cease to make the trip to the Chama Valley because it lost its appeal as a place to get away from it all.

000899

With such impacts, any wilderness or simple recreational excursion is cheapened, diminished, and generally not worth returning to. The economic impacts to the recreation industry, and every day life for Valley residents, would be a deafening to this rural, already economically depressed, region.

Alternative D, to put it simply, would slowly erode the natural integrity of this region, which is one of the last great bastions of Native American and Spanish Culture and a rural way of life- it is a quiet American treasure. Northern New Mexico is a genuinely unique area that should be protected from the impacts resulting in low-flying B-52 bombers. No to Alternative D!

000900

June 8, 1999

Red River, NM

Major Brent Adams
RBTI EIS Project Manager
HQ ACC/CEVPP
129 Andrews Street
Suite 102
Langley AFB, VA 23665-2769

Dear Major Adams,

TY Twenty years ago, when our daughters were small, we first came to northern New Mexico from Fort Worth, Texas. We grew to love the mountains, the peacefulness, the people, the wildlife and the solitude we found here. We began coming as often as possible, whenever we could afford the time to make the 12 hour drive. The mountains offered escape from the noise and hustle-bustle of big city life. One of the disturbances we sought to escape was noise from Carswell Air Force Base. You see, in 1976 we purchased our first home, which was directly in the training flight pattern for Carswell's B-52s. For the next several years the noise of low-level flights was a constant intrusion in our lives-affecting our outdoor activities, our sleep, our conversations, our peace of mind. We were powerless to do anything to change the situation and were even told by some well-meaning individuals that we would eventually get used to the noise. We, in fact, never "got used to the noise" and in a few years moved away from Fort Worth to Amarillo. Our new home was away from the polluting noise of these loud aircraft and seven hours closer to the mountains. We began to dream of building a cabin in the mountains and, eventually, retiring there.

In 1997 a portion of our twenty-year dream became reality. Our daughters grown and on their own, we decided the time had finally come to build our cabin. We recently completed a beautiful new cabin near Red River, New Mexico. Although it will be a few more years before we can afford to retire and become full-time residents, we are able to spend our summers here and many long weekends throughout the year. Eventually, we hope this will be our legacy to our children and grandchildren.

I tell you this rather long story of our lives and dreams so that you may better understand the irony of the prospect we currently face. If RBTI alternative D is approved, the B-52 may once again be the destroyer of our peace. We endured it disrupting of our lives for several years and were overjoyed to be rid of it. Now, like a haunting nightmare, we look at the possibility of this menacing noise returning to destroy the peace of this place we love. This is our own personal and very selfish reason for opposing proposal D of RBTI. But we are just one family. Many other stories of many other families in this area must be heard and considered. Also to be considered is the impact these low-level flights will have on the wildlife, the ecology, the livestock, numerous small communities, and the economy of the region.

000900

We appreciate the job our Air Force does. We want and need your protection. But why damage this pristine environment and the quality of life it offersto those of us who choose to call this our home? We respectfully ask you to please protect us. Protect us by allowing us to keep the peace we now have. Please do not allow these training missions to destroy one of the few places left in our country that provide nurturing of the body, mind and soul and a promise of contentment to those of us who are hard-working American citizens.

Sincerely,

Rick + Patty Howell

Langley AFB, VA 23665-2769

Dear Major Adams:

BR-6

I am writing to you today to express my opposition to Alternative D, the Air Force proposal to conduct low-level B-1 and B-52 bomber training in the airspace directly over Philmont Scout Ranch. Alternative D of the Realistic Bomber Training Initiative would create a dangerous environment for the thousands of Scouts who hike, rock climb, horseback ride and camp at Philmont every summer.

There are many reasons the Air Force should not choose Alternative D. I have listed several points to consider below:

The EIS (Environmental Impact Statement) incorrectly concludes that very few population centers are affected. On any given day in the summer months, over 5,000 people will be living and camping directly under the flight path at Philmont.

Safety of horseback riders will be endangered. Philmont provides trail rides and pack trips for 7,500 to 9,500 mostly inexperienced riders each summer on steep and narrow mountain trails. As many as 165 inexperienced people may be on horseback on the ranch at various times during the day. The startle effect of a high-decibel low-level flight could easily cause one or more horses to spook and bolt with a novice rider aboard. With the number of flights proposed (an average of 10 per day), it will be only a matter of time before Philmont experiences a serious injury or death due to a rider being thrown from or dragged by a startled horse.

Increased noise levels will interfere with staff trying to provide safety instruction to rock climbers, spar pole climbers, and rifle range shooters. The noise level of a B-52 at 300 feet is 117 decibels. Staff trying to teach safety techniques required in climbing rock faces or firing black powder rifles should not have to compete with such noise interference.

000901

The possibility of a crash is very real. The EIS estimates the chances of a Class A mishap at one every 15 years for a B-1 on the training route that would include Philmont. Aside from the real risk to Scouts who might be in the path of an errant bomber, a crash on Philmont would have the potential of starting a forest fire that could devastate the ranch.

The flights can be expected to have serious impacts on Philmont's wildlife and will overfly the habitats of at least three endangered species, the bald eagle, peregrine falcon, and Mexican spotted owl. The U.S. Fish and Wildlife Service has concluded that overflights at less than 1,000 feet will significantly impact these species.

No plane burns all of its fuel. At higher altitudes, unburned fuel dissipates in the atmosphere. At lower altitudes, one must expect that some unburned fuel will find its way to the ground and streams on Philmont. The effects of a plane in trouble at low altitude dumping fuel over Philmont with numerous cook stoves and campfires are easily imagined.

In closing, Philmont is a national treasure and provides a wilderness camping experience for thousands of Scouts, America's future leaders, every year. That experience should be preserved since alternative training sites exist elsewhere which do not jeopardize the program experience offered by Philmont and the safety of thousands of young people participating in it each year.

Thank you for taking the time to read this letter.

Sincerely,

John Trambley

Langley AFB, VA 23665-2769

Dear Major Adams,

BR-6

As I'm sure you're aware, the public comment period on the Realistic Bomber Training Initiative (RBTI) ends June 15, 1999. I urge you to oppose the selection of Alternative D, which crosses a place I hold dear in my heart. As a former staff member of Philmont Scout Ranch, I have learned that Alternative D would affect 114,000 acres of Philmont's 137,000 acres. I firmly believe that selection of Alternative D would have a tremendous negative impact on Philmont.

I stated above that Philmont has a special place in my heart. Indeed, it was my experience on Philmont staff that made me fall in love with New Mexico. It is because of those summers at Philmont that I decided to make my home in New Mexico.

Philmont is a unique institution. Every year, 18,000 youth and adult leaders venture to Philmont from all over the country. There they experience the beauty of the Cimarron Range of the Sangre de Cristo Mountains. In the mountains, valleys, mesas, and plains of Philmont, they challenge their bodies and minds on ten-day backpacking treks. The isolated wilderness character of the Philmont backcountry is a pivotal element of the Philmont experience.

Picture how a B-1 or B-52 thundering overhead, often within 300 feet of the ground, would change the wilderness experience of a Philmont camper. Picture how such an overflight might affect an inexperienced horseback rider or climber. The odds of a serious injury in such a case are real.

On any given summer day, as many as 5,000 Scouts and Scouters are hiking and camping in the Philmont backcountry. Far from being a deserted land, perfect for bomber crew training, Philmont can be thought of as a community no different in some ways than a small city.

Much of the Philmont terrain is mountainous, with several peaks reaching above 10,000 feet. There have been at least two airplane crashes on or adjacent to Philmont property that I know of. If one of the bombers should crash during the peak summer season at Philmont it could result in significant loss of lives. If a bomber should have to dump its fuel in an emergency, and that fuel should hit a campfire or a backpacking stove, it could cause a catastrophic forest fire. Many parts of Philmont have a heavy fuel load of dead trees.

It is for these reasons that I urge you to help advocate the selection of a different RBTI route.

Sincerely,

Steve Harmony

Major Brent Adams
RBTI EIS Project Manager, HQ ACC/CEVPP
129 Andre WS Street, Suite#102
Langley AFB, VA 23665-2769

Dear Major Adams:

TY A proposal by the U.S. Air Force to conduct RBIT causes great alarm to me. Flights of B-1 and B-52 aircraft through alternative area [D:IR-153/Mt. DORA MOA] would significantly degrade the quality of life I currently enjoy. I purposely chose to reside in this peaceful area because of the emotional damage suffered as a result of my Vietnam duty. Specifically, I am an honorably discharged Army veteran who served as a Combat Medical Corpsman from 8/70 to 2/72 in the 1st Cavalry Division. During search and destroy operations with 2nd Batallon, 5th Cavalry and later on Medevac Missions with 215th Medical detachment. I was decorated with Bronze star and Air Medals V. Devices. Napalm and conventional bombs were dropped by Air Force and Navy jets in close proximity to my units areas of operations. Seeing and hearing military aircraft to this day triggers flashbacks to that time.

If area D:IR-153/Mt. DORA MOA]were chosen for RBIT training it could cause a recurrence of PTSD which took many years of painful therapy to reduce. I respectfully request that for my benefit and the benefit of all Chama Valley residents that alternative A, B or C be chosen for the RBIT, instead of alternative area D:IR-153/Mt. DORA MOA].

Respectfully yours,

Eric Traub
RA-68 122203

Comments

Susan Jacobs, PhD - Taos

TY People living in this area are very much in tune with this planet. We respectfully call her Mother Earth. We don't expect military types to know what we've learned, that might be as far-fetched as scientists researching spiritual issues. Astronauts, all military scientists, have returned from flights spiritually changed, convinced there is more than they had dreamed of. Edgar Mitchell is only one of those astronauts.

People of Taos could have told them there is more to human experience than can be measured with graphs and scales. We feel it every time we touch Mother Earth. We know it every time we are comforted under Taos' night skies. We sense it with every gaze upon these mountains that, for thousands of years, have sheltered Taos' indigenous people and carried prayers out into the universe. *It may not be quantifiable under military analysis but it is nonetheless as tangible as innate creativity to the spiritual people living in Taos.*

Tradition may have programmed you to honor masculine, left brained, military attributes and shut down an inherent intuition that comes from connecting to Mother Earth. You might not be able to do what you do if you knew what you were really doing to our living, breathing, planet.

I am a minister, a metaphysician, and a pastoral counselor and I can tell you, if you understood what these residents of Taos know, we wouldn't be holding these hearings. Perhaps we're really here so that you can learn, while giving people of Taos an opportunity to teach.

Elizabeth Kubbler-Ross measured and weighed the part of human life we call soul. Her scientific research established that mortals are more than flesh and blood. Humans may be animals, but we're highly evolved animals with verifiable spiritual aspects.

We who've gathered here insist that Taos' extraordinary spirituality become a legitimized, primary, quantifier in this bomber-flights' study. Spirituality is primary to Taos. Excluding an aspect so vital to studying a potential impact on any area exposes that study's innate fatal flaws. Studying the cellular, while ignoring the soulular aspects of Taos, is wholly unacceptable to those who understand what is truly important.

000904

Addendum

Susan Jacobs, PhD – Taos

As I understand it, this nation was founded upon the principle of our inalienable human rights and religious freedom. Bringing bombers into my temple is a brutal invasion of my religious freedom.

These mountains are sacred and they are my place of worship. Ravaging them, violating their sacred space, is no different, in my view, than when radical arsonists burn down man-made churches.

Understand this: Taos is, itself, an endangered species being one of very few places where people know their Creator Is on The Mountain.

Addendum II

Poverty must be seen as a relative issue, especially in the Taos area.

Material wealth is no indicator of spiritual affluence and many of this area's residents have opted for the spiritual over the material, being well aware that their choice, while arduous, is a true path to wisdom.

Cultural, historical, creative, and familial, non-material wealth must be given that value beyond whatever revenues they inherently generate.

The people in and around Taos are among the most wealthy in the world, it's just that some riches aren't counted in dollars and cents.

000904

June 9, 1999

Dear Major Adams:

This is to reaffirm any previous statements from me that you have on file regarding the low level bomber flights over what we consider to be sacred space around Taos. My following comments have been alluded to by others but they've not been stated by me and they are:

- This nation was formed to provide freedom to worship for its citizenry.
- The area of and surrounding Taos, New Mexico is not just mountainous terrain, *it truly is a spiritual temple of sacred lands, our place of worship.*
- It is no more plausible to bring your bombers here than to fly them into the Vatican. It is no less unGodly to disturb Taos' sacred space than to rip through Rome's night skies disturbing the private prayers of the Pope.
- Should the final decision be made to fly bombers over these mountains, I will personally take it as an insult against all that is holy and an obscenity against everything that is held sacred in the entirety of this nation and its constitution. I believe that to pursue any low level flights over Taos can be proven unconstitutional and abridgement of these citizens' civil rights.
- Taos is a dedicated, officially designated, Global Peace Zone. Bombers in our skies, and even the hint and/or threat of them, defies Global Peace. I have not lived here all of my life but I've been here long enough to know it's unconscionable to even be discussing flying bombers over *this* terrain.
- There are more cost-effective ways to train pilots to go killing people but *these citizens don't want to be any part of what they do not condone.*

I beseech you to revisit other options. *Taos genuinely is our sacred place.* Where Taosenos are concerned, *God actually resides in, around, and on, these mountains.*

Very Sincerely,

Susan Jacobs

Angel Fire, NM

Major Brent Adams
RBTI EIS Project Manager
HQ ACC/CEVP
129 Andrews St, Suite 102
Langley AFB, VA 23665-2769

6/9/99

Dear Major Adams.

TY I am the only full time physician in the Moreno Valley and strongly oppose the Realistic Bomber Training Initiative-Alternative D. The flight path seems to be dangerously close to this community. I feel this would be disastrous to this area, not only financially and economically, but also physically and emotionally. I believe that the health of our citizens is at risk, if this proposal is implemented.

People who live and move up here, do so for the clean air, peace, and quiet! All of us live up here for our own reasons, but we all enjoy the pleasant surroundings and activities. These training runs will ruin the serenity up here, with the noise of the aircraft. Those of us, used to "the sounds of silence", will not be able to become accustomed to this noise, and this will, in turn, cause an increase in depression, physical and psychological stress, insomnia and the related secondary health problems.

Please reconsider your thoughts about implementing Proposal D which would cause a great deal of misery and upheaval in this valley.

Please do not destroy the peace and quiet we all cherish.

Thank you for your consideration in this matter.

Respectfully yours,

Dennis A. Cohen, M.D., FAAFP

REALISTIC BOMBER TRAINING INTITIATIVE

Public Hearing Comment Sheet

Location: Northern Taos County, New Mexico
Date: June 7, 1999

Thank you for providing your comments on the Realistic Bomber Training Initiative Proposal.

BR-4 I feel the EIS report was inadequate and faulty:
1) It did not adequately address the impact on tourism in the area. 75 % of Taos County is dependent on revenue from tourism — river rafting, skiing, hiking, bird and wildlife observation, historic sites, general sightseeing.

AO-60 2) I question the statement that 7% would be annoyed by noise — How was this decided? Who was polled and what area? I have not talked to anyone that was asked. From my observation the numbers should be reversed.

BR-1 3) The decibel rating of noise was averaged. Average of 75 is faulty. What is it at the time it passes over my house? There are also no real health statistics.

LU-2 4) The town of Amalia is not mentioned and it is directly in the flight path.
5) Another area in the flight path is not.

129 Andrews Street, Suite 102
Langley AFB, VA 23665-2769

000906

ED-2 mentioned: Valle Vidal - a huge wilderness area of 500,000 acres and a refuge for one of the largest concentrations of elk in any National Forest during May-June, the calving season, off-road vehicle use is prohibited and even foot travel is prohibited off the main roads to protect the elk during this critical period. Was this area even visited by anyone preparing the report or the effects of low flying, loud planes on sensitive wildlife considered?

GE-24 (a) This is an unseasonably dry and windy area, stands of piñon and ponderosa abound plus homes and businesses. What happens when the inevitable happens, a plane crashes or is forced to unload fuel? Fire? Loss of home?

AO-16 I urge the Airforce with all its ingenuity and resources to consider another approach to training its pilots.

Respectfully,
Hattie Stone

LANDON BUTLER

VIA CERTIFIED RETURN RECEIPT MAIL

June 11, 1999

Major Brent Adams
RBTI EIS Project Manager
HQ ACC/CEVP
129 Andrews Street, Suite 102
Langley AFB, Virginia 23665-2769

Dear Major Adams:

I am writing to you with my comments on the RBTI EIS.

I have a one-third interest in the Double Mountain River Ranch partnership, which owns 25,000 acres of rangeland in Kent and Fisher Counties, two of the Texas counties impacted by the proposed RBTI program. My other partners in our ranch are Buster Welch and Henry Turley.

BR-4 I am doubly concerned about the impact that RBTI will have on land prices in our area. Our ranch (and many other ranches in our area) derives roughly 60% of its income from ranching operations and 40% from hunting leases. There is no question that RBTI will make cattle ranching more difficult and less attractive in our area, as Buster Welch has described in a separate letter to you. There is also no question that RBTI will adversely affect our ability to attract hunters to our area -- deer hunters do not want B-1 bombers practicing low-level maneuvers over their deer stands.

We have been warned by experienced ranch brokers and local bank executives that our land values would go down if our land becomes more difficult to ranch and if it's less attractive to hunters. If RBTI is established over our land, ranching will be even less profitable than it already is, and hunters will pay less for hunting rights -- that translates to lower land values.

Lower land values will have a wide impact in our area. As land prices go down, taxes paid to local governments also decrease, and that means less money for public schools and other services. Falling land prices also affect the banks that hold the mortgages on our ranches. In short, a rural region that is already economically strapped will face still more economic hardship caused by RBTI.

000907

Major Brent Adams
June 11, 1999
Page Two

The Draft EIS does not adequately address the impact that falling land prices will have on the region's culture, businesses, and environment. I urge the Air Force to study the effect on falling land prices carefully before making a decision on RBTI.

Sincerely,

Landon Butler

Langley AFB, VA 23665-2769

Major Adams:

BR-6

I am writing on behalf of Alternative D. I suggest that you rethink your plans on using this plan.

Having bombers flying over a place not only occupied by humans but also by nature is not the best idea. The violent noise of a plane could startle a rock climber causing him to slip (even with the proper harness people can be injured). Not all the cliffs in Philmont have guard rails so a scout looking over the edge of one could be surprised by the roar of an engine and fall from the cliff. A person could be standing on a ledge and be amazed by seeing your fighters fly over him that he could forget where he is standing, resulting to him falling.

With all the dead trees in Philmont it may look like a wasteland but it is home to many different kinds of animals.

The sudden roar of an engine could scare a herd of buffalo and send them on the move (no animals won't get used to it).

Say something goes wrong with one of the planes and the pilot has to dump his fuel. Campers who will then come through with gas lanterns and small cook stoves are put at great risk.

If something even more terrible goes wrong and a plane crashes and then catches fire. All the dry wood would go up in flames leading to the destruction of the camp.

I am a boy scout and I plan to go to Philmont in the year 2002. I hope my experience is not ruined by the roar of a jet's engine. Thank you.

Yours Truly,

Christopher R. Leach

Re: U.S. Air Force's Realistic Bomber Training Initiative

Dear Major Adams:

BR-6

I am writing to request your firm support in opposing the selection of Alternative D under the U.S. Air Force's proposed Realistic Bomber Training Initiative (RBTI).

The Initiative. The Air Force is seeking to establish a new training route for low-level B-1 and B-52 bomber flights from bases in Texas and Louisiana. The proposed flights will consist of more than 2600 flights each year, some as low as 300 feet above ground level. Alternative D proposes a route directly over most of Philmont Scout Ranch in northeastern New Mexico.

Philmont Scout Ranch. Philmont Scout Ranch is a 137,000-acre mountain backpacking and high adventure base for the Boy Scouts of America. Each year, thousands of scouts and explorers from across the nation and throughout the world participate in two-week wilderness backpacking trips in the mountains of Philmont. These treks allow teenagers to experience true wilderness and teamwork while gaining valuable lifelong skills such as mountain climbing, horseback riding, rock climbing, wrangling and wilderness protection. As a former camper and staff member, I am concerned about the impact that the Air Force's proposal would have on the wilderness experience as well as the health and safety of those scouts attending Philmont and the staff who work there.

Why The Initiative Will Hurt Philmont:

A. Harm To The Experience. The key element of the Philmont experience is to remove scouts from the comfort of their hometowns and place them in the wilderness – to take them away from technology and teach them to rely on their own skills to get them through a challenging two-week trek. Noisy bomber flights (the pinnacle of technology) will destroy this experience.

000909

Scouts also have the opportunity to observe wildlife in its natural habitat at Philmont. A large number of scouts come from the inner city and have never had such an opportunity. But noise and emissions from bombers will drive the wildlife away from the protection of Philmont and will have lasting damaging effects on the wildlife as well as Philmont's herds of buffalo, horses, cattle and burros.

Furthermore, a large part of the Philmont experience is teaching scouts about history. Many of the programs at Philmont involve living history programs. It will be impossible for staff to show campers what life was like for the mountain men, homesteaders, lumberjacks and miners if bombers (which obviously didn't exists during these time periods) are flying overhead.

B. Harm to the Scouts and Staff. On any given day in the summer, as many as 5,000 scouts are hiking and camping in Philmont's backcountry. Each day, several hundred of them are engaged in activities such as rock climbing and rappelling, spar pole climbing and horseback riding. The sudden roar of jet engines has a high likelihood of distracting an inexperienced climber or causing a horse to bolt on a narrow mountain trail. Placing teenage scouts in this type of danger is unacceptable.

Philmont has a tremendous fuel load of dead trees in its forests and is in the midst of a long-term drought. Unburned jet fuel finding its way to the ground or being dumped in an emergency over such terrain, with campers using backpacking stoves for cooking, creates the potential for a serious fire that would endanger hundreds of lives.

For these reasons, I seek your help in advocating the selection of a different RBTI route. I ask that you express your opposition to Alternative D to the Secretary of the Air Force and other defense officials who may be involved in this decision. Please act now, as the public comment period ends this month and a final decision will be made this year.

Philmont is the largest and most famous scout camp in the world. It is a national resource that has positively impacted the lives of hundreds of thousands of our nation's youth for more than sixty years. Please help it to continue to do so. Thank you for helping to see that Alternative D is not selected.

Sincerely yours,

Megan W. Alden

000910

Major Brent Adams
RBTI EIS Prj. Mgr.
HQ ACC/CEVPP
129 Andrews Street, Suite 102
Langley AFB, VA 23665-2769

Dear Major Adams:

BR-6 I am writing to request your firm support in opposing the selection of "Alternative D" under the USAF's proposed Realistic Bomber Training Initiative (RBTI) involving low flying B-52s and B-1s (as low as 300'). As one of several proposed southwestern routes, "D" traverses Philmont Scout Ranch in northeastern New Mexico's Colfax County. Philmont, truly a national treasure, is the 137,000 acre backpacking and training facility of the Boy Scouts of America. I do not protest RBTI since it is a valuable program – my only complaint, as a Philmont alumnus, is with the proposed route over Philmont.

Several years ago, the USAF ceased its low altitude F-16/F-111 flights over the Ranch as a result of Philmont protests. RBTI's multiple daily flights (up to 16) will create much more severe problems:

a) Program: Philmont is a transient community of 25,000 people with over 3,000 campers in Philmont's back country every day in the summer. Daily, several hundred of them are engaged in spar pole climbing, rock climbing and rappelling, and horse back riding. The sudden roaring of jet engines will distract climbers and bolt horses thereby creating injuries (or worse).

b) Environmental: Appreciation and protection of the wilderness are key parts of Philmont's program. RBTI is inconsistent with wilderness preservation. RBTI will have a damaging effect upon both the unique western wildlife and Philmont herds of cattle, horses, burros, and buffalo. The effect of the unburned portion of jet fuel in the engine exhaust or dumped fuel itself, vaporizing and falling to ground level is as yet unknown, but believed to be anything but beneficial.

c) Safety: The environmental impact study done for the USAF is seriously flawed when it describes Philmont as an "uninhabited" grassland. The smaller portion of Philmont's acreage is prairie. Most of Philmont is mountainous with many peaks in the 10,000 to 12,444' range. Philmont has a tremendous fuel load of dead trees in its forests, and is in the midst of a long term drought. Open fire bans are in effect now. A crashing bomber will create an epic fire of Yellowstone proportions. B-1s and B-52s do not have enviable safety records. The nature of the flights (weaving around mountain peaks and facing violent weather, including frequent, low-level wind shears) dramatically increases the chance of a crash. Unfortunately, Philmont does not have a well-developed highway system for evacuations in case of massive forest fires.

For the above reasons, I seek your help in advocating the selection of a different RBTI route, preferably one that is over a more sparsely populated, less environmentally sensitive area. You, or a member of your staff may wish to liaise with Rep. Ed Pease's (Indiana) legislative assistant, Greg Good, who has additional information on RBTI.

There is too much at stake to allow RBTI to overfly Philmont. Please act now – final route determination starts in June. Thank you for helping to see that alternative D is not selected.

Sincerely,

David Kuth

Langley AFB, VA 23665-2769

Dear Major Adams,

Subject: Training Route.

TY I have been a Boy Scout leader for over 30 years and have been to the Philmont Scout Ranch in Northeastern New Mexico twice and I'm leaving a week from tomorrow for my third visit. While I am a veteran and understand the need for a well trained and ever ready military, I am very much opposed to low level training flights over our beloved national scouting treasure.

The hundreds of thousands of young men and women that have hiked the trails and attended other activities at this piece of "God's Country" have returned home with memories of unspoiled wilderness that they treasure for the rest of their lives. Please don't rob our future generations of scouts of these memories. The proposed low level training flights would cause irreparable damage to the fragile ecosystem that we sing of in the Philmont Hymn as "land that I love."

Please, please, please just DON'T DO IT.

Thank you, I remain,

Respectfully,

Gerald E. Kersey

Dear Major Adams,

BR-6 I am writing to request your firm support in opposing the selection of "Alternative D" under the USAF's proposed Realistic Bomber Training Initiative (RBTI) involving low flying B-52s and B-1s (as low as 300'). As one of several proposed southwestern routes, "D" traverses Philmont Scout Ranch in northeastern New Mexico's Colfax County. Philmont, truly a national treasure, is the 137,000-acre backpacking and training facility of the Boy Scouts of America. I do not protest RBTI since it is a valuable program – my only complaint, as a Philmont alumnus, is with the proposed route over Philmont.

Several years ago, the USAF ceased its low altitude F-16/F-111 flights over the Ranch as a result of Philmont protests. RBTI's multiple daily flights (up to 16) will create much more severe problems:

a) Program: Philmont is a transient community of 25,000 people with over 3,000 campers in Philmont's backcountry every day in the summer. Daily, several hundred of them are engaged in spar pole climbing, rock climbing and rappelling, and horse back riding. The sudden roaring of jet engines will distract climbers and bolt horses thereby creating injuries (or worse).

b) Environmental: Appreciation and protection of the wilderness are key parts of Philmont's program. RBTI is inconsistent with wilderness preservation. RBTI will have a damaging effect upon both the unique western wildlife and Philmont herds of cattle, horses, burros, and buffalo. The effect of the unburned portion of jet fuel in the engine exhaust or dumped fuel itself, vaporizing and falling to ground level is as yet unknown, but believed to be anything but beneficial.

c) Safety: The environmental impact study done for the USAF is seriously flawed when it describes Philmont as an "uninhabited" grassland. The smaller portion of Philmont's acreage is prairie. Most of Philmont is mountainous with many peaks in the 10,000 to 12,444' range. Philmont has a tremendous fuel load of dead trees in its forests, and is in the midst of a long-term drought. Open fire bans are in effect now.

000912

A crashing bomber will create an epic fire of Yellowstone proportions. B-1s and B-52s do not have enviable safety records. The nature of the flights (weaving around mountain peaks and facing violent weather, including frequent, low-level wind shears) dramatically increases the chance of a crash. Unfortunately, Philmont does not have a well-developed highway system for evacuations in case of massive forest fires.

For the above reasons, I seek your help in advocating the selection of a different RBTI route, preferably one that is over a more sparsely populated, less environmentally sensitive area.

There is too much at stake to allow RBTI to overfly Philmont. Please assist those of us who wish to protect the peace and sanctity of this one-of-a-kind Boy Scout environment. Without your help we could possibly lose this fragile environment for the many millions of Scouts and Scouters of the future.

Thank you for you kind attention to this matter and it is my sincere hope that you will lend your assistance in helping me and my many fellow Scouts and Scouters preserve Philmont as we have always known it.

Sincerely,

R. W. Hyman

Richard W. Hyman

RBTI Letter

000913

Dear SIR,

BR-6 I am writing to request your firm support in opposing the selection of "Alternative D" under the USAF's proposed Realistic Bomber Training Initiative (RBTI) involving low flying B-52s and B-1s (as low as 300'). As one of several proposed southwestern routes, "D" traverses Philmont Scout Ranch in northeastern New Mexico's Colfax County. Philmont, truly a national treasure, is the 137,000 acre backpacking and training facility of the Boy Scouts of America. I do not protest RBTI since it is a valuable program – my only complaint, as a Philmont alumnus, is with the proposed route over Philmont.

Several years ago, the USAF ceased its low altitude F-16/F-111 flights over the Ranch as a result of Philmont protests. RBTI's multiple daily flights (up to 16) will create much more severe problems:

a) Program: Philmont is a transient community of 25,000 people with over 3,000 campers in Philmont's back country every day in the summer. Daily, several hundred of them are engaged in spar pole climbing, rock climbing and repelling, and horse back riding. The sudden roaring of jet engines will distract climbers and bolt horses thereby creating injuries (or worse).

b) Environmental: Appreciation and protection of the wilderness are key parts of Philmont's program. RBTI is inconsistent with wilderness preservation. RBTI will have a damaging effect upon both the unique western wildlife and Philmont herds of cattle, horses, burros, and buffalo. The effect of the unburned portion of jet fuel in the engine exhaust or dumped fuel itself, vaporizing and falling to ground level is as yet unknown, but believed to be anything but beneficial.

c) Safety: The environmental impact study done for the USAF is seriously flawed when it describes Philmont as an "uninhabited" grassland. The smaller portion of Philmont's acreage is prairie. Most of Philmont is mountainous with many peaks in the 10,000 to 12,444' range. Philmont has a tremendous fuel load of dead trees in its forests, and is in the midst of a long term drought. Open fire bans are in effect now. A crashing bomber will create an epic fire of Yellowstone proportions. B-1s and B-52s do not have enviable safety records. The nature of the flights (weaving around mountain peaks and facing violent weather, including frequent, low-level wind shears) dramatically increases the chance of a crash. Unfortunately, Philmont does not have a well-developed highway system for evacuations in case of massive forest fires.

For the above reasons, I seek your help in advocating the selection of a different RBTI route, preferably one that is over a more sparsely populated, less environmentally sensitive area.

There is too much at stake to allow RBTI to overfly Philmont. Please act now – final route determination starts in June. Thank you for helping to see that alternative D is not selected.

I pray that you can see the importance of this for our future generations and our nation itself. If we are to let this RBTI to-over fly Philmont we have truly lost our common sense as a caring free nation.

Thank you for your support and courage.

Sincerely,

Arvin Scheffler

Re: RBTI Flyovers of Philmont Scout Ranch

Major Adams:

I would like you and the other decision makers to reconsider the decisions and the resulting ramifications you are about to make. I have been involved in the Boy Scouts for the last 45 years and spent 4 summers on staff at Philmont in the 60's. During my years being a Boy Scout the early years were the most formidable, remembering the peace, tranquility and the greatness of the outdoors. I was also impressed with the commitment and unselfish sacrifice the military men and women made to maintain readiness. I respect both still with great admiration.

My point is you certainly have not tried to respect the area of Philmont and what it contributes to the boys, girls and leaders in developing them. Having aircraft flying at low levels is not a positive memorable experience, it is simply intrusive. Much like you trying to enjoy a quite evening at home in your backyard, when your neighbor decides to tune his high powered sports car or run his leaf blower. This is not pleasant.

PD-4 As you should be quite aware of that approximately 80% of New Mexico is uninhabited, you certainly can try to find some other place to train. The Boy Scouts taught me to use my resources, may I suggest you use yours and you will probably find a better plan.

Respectfully,

cc: Diane Finestien, U.S. Senate

Langley AFB, VA 23665-2769

Dear Major Adams:

BR-6 I am currently the Scoutmaster of Boy Scouts of America Troop 209, located in the Verdugo Hills Council, Burbank, California. Troop 209 is the largest Troop in the Verdugo Hills Council, Iron Eyes Cody District.

The purpose in writing to you is to request your firm support in opposing the selection of "Alternative D" under the USAF's proposed Realistic Bomber Training Initiative (RBTI) involving low flying B-52s and B-1s (as low as 300'). As one of several proposed southwestern routes, "D" traverses Philmont Scout Ranch in northeastern New Mexico's Colfax County.

Philmont, truly a national treasure, is the 137,000-acre backpacking and training facility of the Boy Scouts of America.

In the past, I have been blessed to backpack with other member's of Troop 209 at Philmont. To date, the Philmont experience is without a doubt the highlight of not only my scouting experience, but most importantly, the youth of my Troop who have been able to experience the beauty of Philmont. Currently we have a reservation for three 12-man crews to once again visit Philmont during the summer of 2001.

I do not protest RBTI since it is a valuable program - my only complaint, as a Philmont alumnus, is with the proposed route over Philmont.

It is my understanding that several years ago, the USAF ceased its low altitude F-16/F-111 flights over the Ranch as a result

000915

of Philmont protests. RBTI's multiple daily flights (up to 16) will create much more severe problems:

a) Program: Philmont is a transient community of 25,000 people with over 3,000 campers in Philmont's back country every day in the summer. Langley AFB, VA 23665-2769

Dear Major Adams,

TY As a member of the Philmont Staff Association, I hereby go on record to oppose the proposed overflights of the Philmont Ranch and Reservation in Cimarron, N.M. Having attended Training Sessions there in 1982 and serving a Chaplain for the summer of 1991, I realize the importance of this national treasure which provides wilderness camping experience for thousands of Scouts - America's future leaders - every year. That experience should be preserved since alternative training sites exit elsewhere which do not jeopardise the program experience offered by Philmont and the safety of young people partficipating in it each year.

Thank you.

Rev. Joseph J. Schuck

Rev. Joseph J. Schuck, Philmont Staff Association and Director of Scouting, Diocese of Albany, N.Y.

Langley AFB, VA 23665-2769

Dear Sir:

TY I am writing to request your support in opposing the selection of **Alternative "D"** under the U.S. Air Force's proposed Realistic Bomber Training Initiative (RBTI). This initiative will establish a new training route for low-level B-1 and B-52 bomber flights from bases in Texas and Louisiana.

Alternative "D" would allow these flights to fly directly over Philmont Scout Ranch near Cimarron, New Mexico. Philmont is the largest camp of the Boy Scouts of America and serves over 20,000 scouts and leaders every year. As you probably know, the Boy Scouts of America is an organization with very positive goals for society and Philmont provides programs integral to this.

I ask that you consider a different alternative. Philmont is truly a national treasure and it would be such a disappointment if the camp's airspace were to be used as described in Alternative D. I served on Philmont's staff five seasons and have deep personal connections with the place and its people. It is for me and the hundreds of thousands of others that have and will benefit from Philmont that I write this letter.

Respectfully,

Lanny Schnipper

Concerning the Realistic Bomber Training Initiative (RBTI):

TY I would like to strongly recommend that the Air Force select an alternate training route to the proposed one over the **Philmont Boy Scout Ranch**. This is one truly special place. My oldest son is headed there for a rite of passage in just two weeks. I am quite proud.

I read with distrust and frustration of this proposal on the BSA Philmont web site. Do you envision the Boy Scouts as an easy, poorly financed group? We'll, we are poorly financed.

In my bitterness I hope sincerely that no Boy Scouts in good standing will join the Air Force. If you do choose to invade Philmont's pristine air, have the courage to come by and explain. Maybe take a hike and notice what is going on there.

Sincerely,

William B. Bickers

129 Andrews Street, Ste. 102
Langley AFB, VA 23665-2769

Dear Major Adams:

TY There is no Boy Scout high adventure that has stood the test of time as much as participating in a Philmont Trek, a 12-day backpacking experience for young men (at least 8th grade) and women (in the Explorer program). Its popularity is proven by the 2 year advanced reservation system and long waiting lists for Philmont Treks. Scouts from all over the world go to Philmont for a great outdoor adventure in primitive living. Philmont Scout Ranch is a unique and totally priceless treasure of our great country.

I am writing to request your firm support in opposing the selection of "Alternative D" under the USAF's proposed Realistic Bomber Training Initiative (RBTI) involving low flying B-52s and B-1s (as low as 300'). As a Vietnam – Era veteran who served in the USAF, I know the importance of properly trained crews but such training must be valued against the cost to our lands and culture.

How often have you left our busy world with TVs, radios, cellular phones, pagers, and other informational media behind and spent 10 days in the wilderness? Until a person experiences such a return to nature, he/she has little to no opportunity to really appreciate our world and the value of true friends. I have experienced two extremes in "primitive" camping: Philmont Trek with its silent brilliance and an Arkansas camp with daily C-130 flights disrupting activities. I know we cannot protect all wilderness areas from the intrusions of civilization, but we must protect some of best ones that still remain. Philmont must be on that list.

I seek your help in advocating the selection of a different RBTI route, preferably one that is over a more sparsely populated, less environmentally sensitive area. There is too much at stake to allow RBTI to overfly Philmont. Thank you for helping to see that alternative D is not selected.

Sincerely,

Steven L. Stockham, DVM, MS
Scoutmaster

Langley AFB, VA 23665-2769

000922

Dear Major Adams

BR-6 I am writing to register my opposition to the potential selection of "Alternative D" under the United States Air Force's proposed Realistic Bomber Training Initiative (RBTI) involving low flying B-52s and B-1s (as low as 300'). As one of several proposed southwestern routes, "Alternative D" traverses Philmont Scout Ranch in northeastern New Mexico's Colfax County. Philmont, truly a national treasure, is the 137,000 acre backpacking and training facility of the Boy Scouts of America.

In principle, I do not protest RBTI program since proper and extensive training is a key factor in our nation' s military strength. My only complaint, as a former Philmont camper (1988) and staff member (1993 and 1994), is with the proposed route over Philmont. Indeed, several years ago the USAF ceased its low altitude F-16/F-111 flights over the Ranch as a result of Philmont protests over the issues outlined below. It is curious that the area is once again being considered for low level training flights. The proposed RBTI's multiple daily flights (up to 16) may create more severe problems:

a) Program: Philmont is a transient community of 25,000 people with over 3,000 campers in Philmont's back country every day in the summer. Daily, several hundred of them are engaged in spar pole climbing, rock climbing and rapelling, and horse back riding (many for the first time). The sudden roaring of jet engines from low flying bombers will distract climbers and may bolt horses, thereby creating injuries (or worse).

b) Environmental: Appreciation and protection of the wilderness are key parts of Philmont's program. RBTI is inconsistent with wilderness preservation. RBTI will have a damaging effect upon both the unique western wildlife and Philmont herds of cattle, horses, burros, and buffalo. The effect of the unburned portion of jet fuel in the engine exhaust or dumped fuel itself, vaporizing and falling to ground level is as yet unknown, but believed to be anything but beneficial.

c) Safety: The environmental impact study done for the USAF is seriously flawed when it describes Philmont as an "uninhabited" grassland. The smaller portion of Philmont's acreage is prairie. Most of Philmont is mountainous with many peaks in the 10,000 to 12,444' range. Philmont has a tremendous fuel load of dead trees in its forests, and is in the midst of a long term drought. Open fire bans are in effect now. A crashing bomber will create an epic fire of Yellowstone proportions. B-1s and B-52s do not have enviable safety records. The nature of the proposed flights (i.e. weaving around mountain peaks and facing violent weather, including frequent, low-level wind shears) dramatically increases the chance of a crash. Because of the wilderness emphasis of Philmont, a well-developed highway system is not in place to assist in evacuations in the case of a massive forest fire or to help fire personnel fight such a fire.

There is too much at stake to allow RBTI to overfly Philmont. Thank you for allowing me to voice my concerns.

Sincerely,

Scott Neubauer

129 Andrews Street, Suite 102
Langley AFB, VA 23665-2769

Dear Major Adams:

TY It has come to my attention that one of the routes under consideration by the Air Force's Realistic Bomber Training Initiative will take flights across the 214 square mile Philmont Scout Ranch near Cimarron, New Mexico.

I am requesting that you consider alternative routes that will not impact the on-going program at Philmont. I am greatly concerned that the noise levels will disturb, not only the flora and fauna in this delicate area, but reek havoc on the backpacking and training programs offered throughout the year.

I have experienced five treks at Philmont over the years and have experienced first hand the impact of low level fly-overs during hiking and camping experiences.

I have discussed this matter with other individuals in our Armed Forces. They indicate there are many routes under consideration that would not place our Scouts in dangerous situations. I hope you will no longer consider any route over Philmont Scout Ranch a viable choice.

Thank you for your consideration and understanding.

Sincerely,

Robert S.C. Frederick

Dear Major Adams

I am writing as a retired Air Force Lt Col. Pilot and Eagle Scout.

BR-6 I request your firm support in opposing the selection of "Alternative D" under the USAF's proposed Realistic Bomber Training Initiative (RBTI) involving low flying B-52s and B-1s. As one of several proposed southwestern routes, "D" traverses Philmont Scout Ranch in northeastern New Mexico. Philmont, truly a national treasure, is the 137,000 acre backpacking and training facility of the Boy Scouts of America. I do not protest RBTI since it is a valuable program – my only complaint, as a Philmont alumnus, is with the proposed route over Philmont.

This truly beautiful ranch provides many opportunities for our youth to explore and participate in programs that help develop responsible citizens. There are few, if any other organizations, that can provide such a service at this magnitude.

a) Program: Philmont is a transient community of 25,000 people with over 3,000 campers in Philmont's back country every day in the summer. Daily several hundred of them are engaged in spar pole climbing, rock climbing and rapelling, and horse back riding. The sudden roaring of jet engines will distract climbers and bolt horses thereby creating injuries (or worse).

b) Environmental: Appreciation and protection of the wilderness are key parts of Philmont's program. RBTI is inconsistent with wilderness preservation. The environmental impact study done for the USAF is seriously flawed when it describes Philmont as an "uninhabited" grassland. The smaller portion of Philmont's acreage is prairie, the rest is mountains with 10,000' - 12,444' peaks.

c) Safety: The sudden roaring of jet engines will distract climbers and bolt horses thereby creating injuries (or worse). B-52's do not have enviable safety records especially on low level routes, as research of such records will indicate. Philmont has a tremendous fuel load of dead trees in its forest due to a long-term drought. Such a crash would devastate the beauty of this ranch.

For the above reasons, I seek your help in advocating the selection of a different RBTI route, preferably one that is over a more sparsely populated, less environmentally sensitive area. You, or a member of your staff may wish to liaison with Rep. Ed Pease's (Indiana) legislative assistant, Greg Good, who has additional information on RBTI.

Sincerely yours,

Wesley W. Forman Jr.

RBTI EIS Project Manager
HQ ACC/CEVPP
129 Andrews Street, Suite 102
Langley AFB, VA 23665-2769

Dear Major Adams:

TY Just recently I was informed the U.S. Air Force is considering a new training area for it's air craft which includes air space over the property of the Boy Scouts of America of which thousands of boys and leaders use year round for training. The property is known as Philmont Scout Reservation who's base camp and adult training center is just outside of Cimarron, New Mexico.

It doesn't seem to be a good idea since it would be so disruptive to the program the Boy Scouts offer their membership. I can only think there has been a misjudgment or lack of information this project has progressed as far along as it has. To be more precise the name of the project I understand is: Alternative "D" under the U.S. Air Forces' proposed Realistic Bomber Initiative. The Air Force is seeking to establish a new training route for low-level B-1 and B-52 bomber flights from bases in Texas and Louisiana. Some of the flights will only be 300 feet above the ground. Wow! Need I say more?

I am writing to request your firm support in opposing this initiative the Air Force is proposing.

Sincerely,

Robert A. Cunningham

Langley, AFB, VA 23665-2769

Dear Sir:

TY You are presently not abiding by the air space rules governing you, of which there are many instances with witnesses. (i.e. sonic booms over Lubbock and flights at too low altitudes) You have demonstrated your proclivity to lying. Your report contained erroneous information which any competent person would be ashamed to mention. (i.e. sound levels of your aircraft and flying altitudes) Your disdain for procedures is more than evident. You have been forced to listen to the other side. I wonder if you bothered to listen.

The Air Force has shown no responsibility or accountability nor a willingness to be a partner with the people involved. Any suggestion of trusting the Air Force is without merit. The Air Force has at no time in their dealings in West Texas honored their own guidelines. Why would we expect this situation to be different?

Sincerely,

Susan Wallace

Dear Major Adams:

I am opposed to the Air Force's proposed RBTI known as Lancer – Option B in the DEIS. My concern(s) about the proposal and the DEIS are as follows:

I am opposed to the RBTI known as Lancer-Option B in the DEIS.

Our family has a 36,000 acre ranch located in Dawson, Borden and Lynn counties, Texas. This ranch has been in the family for almost 150 years and has been a working ranch all this time. The ranch currently operates a 1000 cow/calf herd. My principle concern

BR-3 is the damage that low flying aircraft can have on our operation. I attended the meeting on April 7, 1999, in Snyder, Texas, and

BR-3 I found the Air Force's position inadequate. First, the studies done concerning noise effect on cattle is old, incomplete and inaccurate. Newer and more complete studies dispute the findings of your studies. It is my opinion that damage to our cow/calf operation will occur when low flying, loud, jet aircraft cross

BR-4 our land. Also, hunting is a very important source of income to many of the ranchers in this eight county area. The noise from the low flying aircraft definitely would have a detrimental effect on the hunting operation which, in turn, would create a financial hardship on all the ranchers. It has been brought

PD-7 to my attention that the Government owns vast amounts of unhabited lands not too far away from your designated area that is of adequate size and would serve the Fir Force's purposes. The loud noise of the low flying aircraft would not have any detrimental effect on people or their ranching operation. This appears to be a more workable solution to the problem and my objection.

Sincerely yours: Clyde S. McCall Jr

Dear Major Adams:

I am opposed to the Air Force's proposed RBTI known as Lancer – Option B in the DEIS. My concern(s) about the proposal and the DEIS are as follows:

To think of the devalvation of our family's ranch when your planes start their maneuvers over it is upsetting. If we considered selling this property, would we even be able to find a buyer? Who wants a West Texas ranch with airforce planes roaring over it? Who wants to hunt or fish in an area with combat practice going on overhead? The decrease in the valve of our ranch is destined to be staggering. Why would you risk the commotion you'll deal with flying over inhabited land when you own property - vast property in New Mexico nearby. Please reconsider. We'll have to hold you responsible for any damage in our family's ranch valve.

Langley AFB, VA 23665-2769

Dear Major Adams,

BR-6

My name is David Colclazier. I am a Star Boy Scout in Troop 157 of Round Rock, Texas. I am writing to request your firm support in opposing the selection of "Alternative D" under the U.S. Air Force's proposed Realistic Bomber Training Initiative (RBTI) involving low flying B-52s and B-1s (as low as 300'). As one of several proposed southwestern routes, "D" traverses Philmont Scout Ranch in northeastern New Mexico's Colfax County. Philmont, truly a national treasure, is the 137,000 acre backpacking and training facility of the Boy Scouts of America. I do not protest RBTI since it is a valuable program – my only is with the proposed route over Philmont.

Several years ago, the USAF ceased its low altitude F-16/F-111 flights over the Ranch as a result of Philmont protests. The RBTI's proposed multiple daily flights (up to 16) would create much more severe problems as outlined below:

a) Program: Philmont is a transient community of 25,000 people with over 3,000 campers in Philmont's back country every day in the summer. Daily, several hundred of them are engaged in spar pole climbing, rock climbing and rappelling, and horse back riding. The sudden roaring of jet engines will distract climbers and bolt horses thereby creating injuries (or worse).

b) Environmental: Appreciation and protection of the wilderness are key parts of Philmont's program. The RBTI is inconsistent with wilderness preservation. The RBTI will have a damaging effect upon both the unique western wildlife and Philmont herds of cattle, horses, burros, and buffalo. The effect of the unburned portion of jet fuel in the engine exhaust or dumped fuel itself, vaporizing and falling to ground level is as yet unknown, but believed to be anything but beneficial.

c) Safety: The environmental impact study done for the USAF is seriously flawed when it describes Philmont as "uninhabited" grassland. The smaller portion of Philmont's acreage is prairie. Most of Philmont is mountainous with many peaks in the 10,000 to 12,444' range. Philmont has a tremendous fuel load of dead trees in its forests, and is in the midst of a long term drought. Open fire bans are in effect now. A crashing bomber will create an epic fire of Yellowstone

000930

proportions. B-1s and B-52s do not have enviable safety records. The nature of the flights (weaving around mountain peaks and facing violent weather, including frequent, low-level wind shears) dramatically increases the chance of a crash. Unfortunately, Philmont does not have a well-developed highway system for evacuations in case of massive forest fires.

For the above reasons, I seek your help in advocating the selection of a different RBTI route, preferably one that is over a more sparsely populated, less environmentally sensitive area.
There is too much at stake to allow the RBTI to overfly Philmont. Please act now as the final route determination starts in this month. Thank you for helping to see that alternative D is not selected.

Sincerely yours,

David Colclazier

Dear Major Adams:

I am opposed to the Air Force's proposed RBTI known as Lancer – Option B in the DEIS. My concern(s) about the proposal and the DEIS are as follows:

I am shocked to discover that you are considering sending YOUR roaring aircraft over privately owned land. You have a vast amount of land close by in New Mexico ... why can't you fly your maneuvers there ?!? The damage to the value of private ranches when Air Force jets begin flying over must be staggering. I strongly encourage you to reconsider, if not I promise to hold you personally responsible.

Re: Lancer Site (Option B – DEIS)

Dear Major Adams,

TY

Thank you for your concern and for meeting with interested citizens of our eight county area which includes Scurry County, Texas, my home.

I am opposed to bomber training in this area and over my home which is located north of Snyder, Texas. I am engaged in raising livestock (cow-calf) and my permanent home is on my ranch. I would certainly not welcome low-level flying B-1 and B-52 bombers over my livestock or over my house.

It would be impossible for me to move my operation or my house from this area.

Please consider an alternate plan which would not threaten the citizens of this area, their way of life and their ranching operations.

Sincerely,

Marjorie T. Mathis

Langley AFB, VA 23665-2769

Dear Major Adams,

BR-6

I am asking your opposition to the proposed Realistic Bomber Training Initiative (RBTI) selection of Alternative D, which will establish a new training route for low-level B-1 & B-52 bomber flights over Philmont Scout Ranch in NE New Mexico's Colfax County.

Each year, thousands of Scouts & their adult leaders from across the nation engage in 2-week wilderness backpacking trips in the mountains of Philmont, hike, camp, ride horseback, climb & rappel, learn to fire black powder rifles, & a host of related activities on this 137,000± site. The Air Force's proposed Alternative D would establish a military training route directly over these campers & their facilities. Some 2,600 flights per year, some only 300-400' above this varied-terrain wilderness with peaks in the 10-12,000' range, would endanger the 5,000 Scouts on a regular basis. Who knows when the sudden roar of a jet engine might distract an inexperienced climber or cause a horse to bolt on a narrow mountain trail. Staff trying to teach spar pole climbers & rifle range shooters should not have to compete with such noise interference. Besides, this flight route would ruin the pristine wilderness camping experience. Projected flight operations indicate campers would be exposed to noise levels greater than a diesel train for up to 6 hours during a typical 12-day stay.

This is not to mention the danger to the wilderness habitat itself, home to at least three endangered species (the bald eagle, peregrine falcon & the Mexican spotted owl). And the trees at Philmont. The camp is undergoing a long-term drought. It has a tremendous fuel load of dead trees. What if unburned jet fuel were dumped in an emergency over such terrain with camper cooking over open flames on campfires in those forests? And, God forbid, what if there were an accident & one of those planes went down? Not to mention any risks from noise levels & vibrations to the 100s of abandoned & the 2 active mines on Philmont, the impact of flyovers on Philmont's 2 National Historical sites (the Kit Carson/Maxwell Abreu houses at Rayado & the Ville Philmonte), & the possibly damaging effects of noise & emissions on flora & fauna, such as Philmont's herds of buffalo, horses, cattle, & burros.

All in all, I'm asking your help in selecting a different RBTI route. Please spare the entire 25,000 plus Philmont population, which comes from all across this nation at various times of the year to experience the great American outdoors & to continue the traditions of the West's mountain men, homesteaders, lumberjacks, & cowboys. Thank you for helping to see that Alternative D is not selected.

Sincerely,
David W. Diller, pastor

Major Brent Adams
RBTI EIS Project Manager
HQ ACC/CEVPP
129 Andrews Street, Suite 102
Langley AFB,VA 23665-2769

Dear Major Adams:

BR-6

I am writing to request your firm support in opposing the selection of Alternative D under the US Air Force's proposed Realistic Bomber Training Initiative (RBTI). The Air Force is seeking to establish a new training route for low-level B-1 and B-52 bomber flights from bases in Texas and Louisiana. One of the proposed routes, Alternative D, traverses Philmont Scout Ranch in northeastern New Mexico's Colfax County.

Philmont is a 137,000-acre mountain backpacking and high adventure facility of the Boy Scouts of America. Each year, thousands of Scouts and their adult leaders from across the nation participate in two-week wilderness backpacking trips in the mountains of Philmont. Many of them also camp and work on conservation projects in the adjacent Valle Vidal Wilderness of the Carson National Forest.

The Air Force's proposed Alternative D will establish a military training route directly over most of Philmont. More than 2600 flights each year, some as low as 300 feet above ground level, are proposed for the segment over Philmont. As a former Philmont staff member, I have serious concerns about the impact of the Air Force's proposal on the health and safety of Scouts attending Philmont and the potential effects of daily low-level flights on the ranch itself.

On any given day in the summer, as many as 5,000 Scouts and Scouters will be hiking and camping in Philmont's backcountry. Each day, several hundred of them will be engaged in activities such as rock climbing and rappelling, spar pole climbing, and mountain horseback rides. The sudden roar of jet engines has a high likelihood of distracting an inexperienced climber or causing a horse to bolt on a narrow mountain trail with resulting serious injury (or worse).

Appreciation and protection of the wilderness and our natural resources is a key part of the Philmont program. Scouts from around the world have a unique opportunity to see and experience wildlife in native habitat. Noise and emissions from bombers cannot help but have a damaging effect on that wildlife, as well as on Philmont's herds of buffalo, horses, cattle and burros. The disruptive effects of noisy bomber overflights on Philmont's famous living history programs, in which Scouts experience the lifestyles of the West's mountain men, homesteaders, lumberers and cowboys, are obvious.

000935

Most of Philmont is mountainous with many peaks in the 10,000 to 12,000 range. Philmont has a tremendous fuel load of dead trees in its forests and is in the midst of a long-term drought. Unburned jet fuel finding its way to the ground or being dumped in an emergency over such terrain, with campers using backpacking stoves for cooking, creates the potential for a serious fire that would endanger hundreds of lives. The possibility of a crash, however remote, is simply not acceptable for the safety of these Scouts.

For these reasons, I seek your help in advocating the selection of a different RBTI route. I ask that you express your opposition to Alternative D to the Secretary of the Air Force and other defense officials who may be involved in this decision. Please act now, as the public comment period ends in June and a final decision will be made this year. You or a member of your staff may wish to contact Greg Dodd, Chief of Staff for Congressman Ed Pease of Indiana, who can provide additional information.

Philmont is the largest and most famous Scout camps in the world. It is a national resource that has positively impacted the lives of hundreds of thousands of our nation's youth for more than sixty years. It deserves and demands our protection. Thank you for helping to see that Alternative D is not selected.

Sincerely,

Lance Utterback
President & CEO

Major Brent Adams
RBTI EIS Project Manager
HQ ACC/CEVPP
129 Andrews Street, Suite 102
Langley AFG, VA 23665-2769

Dear Major Adams,

BR-6

Thirty-four years ago my younger brother and I spent two wonderful weeks with boys our age at Philmont Scout Ranch. Our experiences in living on our own in the mountains of New Mexico were unparalleled in testing our ingenuity, bravery, stamina, and willingness to work as a team to survive. Today, my thirteen-year-old son's Boy Scout Troop XV, Sherman, Texas, is planning a Philmont trip for the summer of year 2000. The Air Force's Realistic Bomber Training Initiative alternative D route will put military war and peacekeeping aircraft in close proximity to Philmont staff members, adult troop leaders and most of all our children. The risks of alternative D route are numerous:

- Safety of horseback riders participating in routine hiking and camping maneuvers.
- Increased noise levels from the aircraft will interfere with staff trying to provide safety instruction to rock climbers, spar pole climbers, and rifle range shooters.
- Campers at Philmont will be exposed for many hours each day to noise levels far greater than a chain saw or a diesel train.
- The possibility of a crash and potential dangers to over 5,000 people living and camping directly under the flight path.
- The sudden roar of a jet engine only a few hundred feet overhead has a high likelihood of spooking a horse and scout on a narrow mountain trail or startling an inexperienced climber with resulting tragedy.

Surely there are other RBTI routes that represent less risk to children and those people they are accompanying. I urge you to eliminate alternative D and support preserving the Philmont environment. Thousands of scouts have experienced adventures and growth at Philmont and thousands more should have this opportunity in the future.

Sincerely,

Merlyn Knapp
Troop Committee Member, Troop XV, Sherman, Texas
Eagle Scout

President Bill Clinton
The White House
Washington, D.C. 20500

Dear President Clinton:

BR-6

I am writing to request your support in opposing the selection of Alternative D under the U.S. Air Force's proposed Realistic Bomber Training Initiative (RBTI). The Air Force is seeking to establish a new training route for low level B-1 and B-52 bomber flights from bases in Texas and Louisiana. One of the proposed routes, Alternative D, traverses the Philmont Scout Ranch in Northeastern New Mexico's Colfax County. The Air Force's proposal is a very bad idea.

Philmont is a 137,000 acre mountain backpacking and high adventure facility of the Boy Scouts of America. Each year, thousands of scouts and their adult leaders from across the nation participate in two week wilderness backpacking trips in the mountains of Philmont. Many of them also camp and work on conservation projects in the adjacent Valle Vidal Wilderness of the Carson National Forest. The Philmont experience is incredible fun for thousands of young people each year. The Air Force's proposal will absolutely ruin the experience for all of these people.

The Air Force's proposed Alternative D will establish a military training route directly over most of Philmont. More than 2,600 flights each year, some as low as 300 feet above ground level, are proposed for the segment over Philmont. As the father of three sons who either are or will be in the scouting program, I have serious concerns about the impact of the Air Force's proposal on the health and safety of scouts attending Philmont and the likely adverse effects of daily low level flights on the ranch itself.

On any given day in the summer, as many as 5,000 scouts and scouters will be hiking and camping in Philmont's back country. Each day, several hundred of them will be engaged in activities such as rock climbing and rappelling, spar pole climbing, and mountain horse back rides. The sudden roar of jet engines has a high likelihood of distracting an inexperienced climber or causing a horse to bolt on a narrow mountain trail with resulting serious injury (or worse). Even if the scout avoids injury, he will have an extremely unpleasant, unnatural experience listening to disruptive jet engines instead of the mountain silence.

June 11, 1999

Honorable Kay Bailey Hutchinson
U.S. Senate
Washington, D.C.

Dear Senator Hutchinson:

I am writing to request your support in opposing the selection of Alternative D under the U.S. Air Force's proposed Realistic Bomber Training Initiative (RBTI). The Air Force is seeking to establish a new training route for low level B-1 and B-52 bomber flights from bases in Texas and Louisiana. One of the proposed routes, Alternative D, traverses the Philmont Scout Ranch in Northeastern New Mexico's Colfax County. The Air Force's proposal is a very bad idea.

Philmont is a 137,000 acre mountain backpacking and high adventure facility of the Boy Scouts of America. Each year, thousands of scouts and their adult leaders from across the nation participate in two week wilderness backpacking trips in the mountains of Philmont. Many of them also camp and work on conservation projects in the adjacent Valle Vidal Wilderness of the Carson National Forest. The Philmont experience is incredible fun for thousands of young people each year. The Air Force's proposal will absolutely ruin the experience for all of these people.

The Air Force's proposed Alternative D will establish a military training route directly over most of Philmont. More than 2,600 flights each year, some as low as 300 feet above ground level, are proposed for the segment over Philmont. As the father of three sons who either are or will be in the scouting program, I have serious concerns about the impact of the Air Force's proposal on the health and safety of scouts attending Philmont and the likely adverse effects of daily low level flights on the ranch itself.

On any given day in the summer, as many as 5,000 scouts and scouters will be hiking and camping in Philmont's back country. Each day, several hundred of them will be engaged in activities such as rock climbing and rappelling, spar pole climbing, and mountain horse back rides. The sudden roar of jet engines has a high likelihood of distracting an inexperienced climber or causing a horse to bolt on a narrow mountain trail with resulting serious injury (or worse). Even if the scout avoids injury, he will have an extremely unpleasant, unnatural experience listening to disruptive jet engines instead of the mountain silence.

000937

GRABER & WATSON, L.L.P.

June 11, 1999
Page 2

Appreciation and protection of the wilderness and our natural resources is a key part of the Philmont Scouting Program. Scouts from around the world have a unique opportunity to see and experience wildlife in native habitat. Noise and emissions from loud U.S. Air Force bombers cannot help but have a damaging effect on that wildlife as well as on the Philmont experience for the scouts. The disruptive effects of noisy bomber overflights on Philmont's famous living history programs, in which scouts experience the lifestyles of the west's mountain men, homesteaders, lumberers and cowboys, are obvious. The Air Force proposal makes no sense whatsoever.

I seek your help in convincing the Air Force to select a different RBTI route. I ask that you express your opposition to Alternative D to the Secretary of the Air Force and other defense officials who may be involved in this decision. Please act now, as the public comment ends in June and a final decision will be made this year. You or a member of your staff may wish to contact Greg Dodd, Chief of Staff for Congressman Ed Pease of Indiana, who can provide additional information.

Philmont is the largest and most famous Scout camp in the world. It is a national resource and treasure that has positively impacted the lives of hundreds of thousands of our nations youth for more than 60 years. In a day when character and leadership are increasingly absent from our society, it is critically important that we support organizations like the Boy Scouts of America which seek to teach character and leadership in our youth. Every scout yearns to go to Philmont. Philmont deserves and demands our protection.

Thank you for helping to see that Alternative D is not selected.

Sincerely,

Craig W. Watson, Committee Chairman

Dear Major Adams:

I am opposed to the Air Force's proposed RBTI known as Lancer – Option B in the DEIS. My concern(s) about the proposal and the DEIS are as follows:

I am opposed to Air Force plans to fly low over many farm and in the surrounding communities.

BR-4 It will disturb livestock and tractor drivers and also disturb people

AO-4 in the nearby houses as well as children in the schools.

BR-4 Most of all it will cut land values to a great extent which we don't need.

I pay taxes on this land and I don't want to see it devalued.

Sincerely yours: Gilbert Crawford

Langley AFB, VA 23665-2769

Dear Major Adams:

BR-6 I am writing to request your firm support in opposing the selection of "Alternative D" under the U.S. Air Force's proposed Realistic Bomber Training Initiative (RBTI). The Air Force is seeking to establish a new training route for low level B-1 and B-52 bomber flights from bases in Texas and Louisiana. One of the proposed routes, Alternative "D" traverses the Philmont Scout Ranch in northeastern New Mexico's Colfax County.

Philmont is a 137,000 acre mountain backpacking and high adventure base for the Boy Scouts of America. Each year, thousands of Scouts from across the nation participate in two-week wilderness backpacking trips in the mountains of Philmont. Many of them also camp and work on conservation projects in the adjacent Valle Vidal Wilderness of the Carson National Forest.

The Air Force's proposed Alternative "D" will establish a military training route directly over most of Philmont. More than 2,600 flights each year, some as low as 300 feet above ground level, are proposed for the segment over Philmont. As a Scout leader, parent, wilderness enthusiast and soon to be Philmont participant, I am quite concerned about the negative impact of the Air Force's proposal on the Scouting experience at Philmont along with the obvious safety and environmental concerns that appear to have been overlooked or at least discounted in putting forth this proposal.

Philmont is a transient community of 25,000 people. On any given day in the summer, as many as 5,000 Scouts and leaders will be hiking and camping in Philmont's backcountry. Each day, several hundred will be engaged in activities such as rock climbing and rapelling, spar pole climbing and mountain horseback riding. The sudden roar of jet engines has a high likelihood of distracting an inexperienced climber or causing a horse to spook on a narrow mountain trail possibly resulting in serious injury (or worse).

Appreciation and protection of the wilderness and our natural resources is a key part of the Philmont and Scouting program. Scouts from around the world have a unique opportunity to see and experience wildlife in a native habitat. Noise and emissions from bombers cannot help but have a damaging effect on wildlife, as well as Philmont's herds of buffalo, horses, cattle and burros. The disruptive effects of noisy bomber overflights on Philmont's famous living history programs, in which Scouts experience the lifestyles of the West's mountain men, homesteaders, lumberjacks, miners and cowboys, are obvious.

The environmental impact study done for the USAF is seriously flawed when it describes Philmont as an "uninhabited" grassland. The smaller portion of Philmont's acreage is prairie. Most of Philmont is mountainous with many peaks in the 10,000 to 12,444' range. Philmont has a tremendous fuel load of dead trees in its forests, and is often in the midst of long term droughts. Open fire bans are in effect now. Unburned jet fuel finding its way to the ground or being dumped in an emergency over such terrain would exacerbate the fire, safety and health risks. The weather is typical of mountain areas and is often unstable and could affect flight operations. The possibility of a crash, however, remote, is simply not acceptable for the safety of Scouts using this area. One only has to read the paper about the recent crash in Arkansas to associate the weather with air safety.

000939

Several years ago, the USAF ceased its low altitude F-16/F-111 flights over the Ranch as a result of Philmont protests. RBTI's multiple daily flights (up to 16) will create much more severe problems:

For the above reasons, I ask your help in advocating the selection of a different RBTI route, preferably one that is over a more sparsely populated, less environmentally sensitive area. There is too much at stake to allow RBTI to overfly Philmont. I ask that you express opposition to Alternative "D" to the Secretary of the Air Force and other defense officials who may be involved in this decision. Please act now as the public comment period ends in June and a final decision will be made this year.

Philmont is the largest and most famous Scout camp in the world. It is a national resource that has positively impacted the lives of hundreds of thousands of our nation's youth for more than sixty years. It deserves and demands our protection. Thank you for helping to see that Alternative "D" is not selected.

MAIL MESSAGE:

The U.S. Air Force is currently considering flights over the Philmont Scout Ranch in New Mexico as a possible location for implementing its Realistic Bomber Traiing Initiative (RBTI). As a vetrean I certainly appreciate the need for combat readiness for our troops. As a Scoutmaster in Marietta, GA I also appreciate the beauty and serenity of God's creation that we seek to share with our Scouts every month. I will be taking a group of Scouts to the Philmont Scout Ranch this summer. Through the years, Philmont has been a haven from the civilized world, a chance to revel in the pristine qualities of our natural resources. Having low level jet bombers overhead day and night would definitely diminish the serenity and beauty of the ranch. I urge you to strongly oppose the use of the air space over the Philmont Scout Ranch for the RETI. Please encourage Major Brent Adams, RETI EIS Project Manager, HQ ACC/CEVPP, 129 Andrews Street, Suite 102, Langley AFB, VA 23665-2769 to consider other sites rather than spoil the outdoor experience of the Philmont Scout Ranch.

Dear Major Adams:

BR-6 I recently received the enclosed e-mail message from my constituent, Mr. Douglas Flewelling of Bangor, Maine. Mr. Flewelling is concerned about a proposal to initiate realistic bomber training near the Boy Scout's Philmont Scout Ranch in New Mexico.

Specifically, Mr. Flewelling is worried that these low-level flights will be extremely disruptive to the scout ranch. I am writing to inquire as to the consideration that the Air Force has given this matter, and I would appreciate it if you would respond directly Mr. Flewelling at:

Bangor, ME

I would also appreciate it if you would send a copy of your response to the attention of Paul Howard in my Washington office.

Thank you for your attention to this matter.

Sincerely,

Susan M. Collins
United States Senator

TO: Senator at Collins-DC
Subject: US Air Force vs Philmont Scout Ranch

000941

Dear Senator Collins,

It has come to my attention that the Air Force has a program called the Realistic Bomber Training Initiative (RBTI) that involves Air Force bomber training for low level bombing. The program is currently in the Public Hearing phase. One of the sites being considered for this program will adversely effect the Boy Scout's Philmont Scout Ranch in New Mexico. Philmont has a special place in the hearts of Scouts old and new as a place where Scouts can experience the wilderness of the southwest in relative peace and solitude. Training flights at the Mt. Dora Military Operations Area will pass directly over several of Philmont's key landmarks such as the Tooth of Time and Mt Baldy. The noise and intrusion of low level flights on this wilderness will destroy the basic character of the Philmont Scout Ranch.

I am urging you to call Major Brent Adams, who is the RBTI EIS Project Manager, and see what action can be taken to avoid using the air space above Philmont for these training flights. Major Adams can be contacted at:

Major Brent Adams
RBTI EIS Project Manager
HQ ACC/CEVPP
129 Andrews Street, Suite 102
Langley AFB, VA 23665-2769

Thank you for your attention to this matter. It is my hope that we can preserve a piece of Scouting heritage for future generation of Boy Scouts.

Sincerely yours,

Douglas Flewelling

Dear Major Adams:

BR-6 I am forwarding a copy of a letter I received from Mr. Thomas Heavey. Mr. Heavey is from Tacoma, Washington and is a constituent of mine.

Mr. Heavey has concerns that the U.S. Air Force's selection of the Mount Dora Military Operations Area for bombing practice would have negative effects on Scouts who regularly use the area at the Philmont Scout Ranch. I would appreciate an update on the selection process and urge that the Air Force take into consideration the presence of a camp for children when making its final decision.

Thank you in advance for your consideration to this matter.

Sincerely,

Patty Murray
United States Senator

PM/jp

SEATTLE, WA SPOKANE, WA VANCOUVER, WA TACOMA, WA

000942

April 10, 1999

The Honorable Patty Murray
United States Senate
Washington, D.C.

Senator Murray:
I thank you for your recent letter to my son, congratulating him on achieving the rank of Eagle Scout. Among the many letters he has received, yours is among those most cherished, as he said "she's one of the good guys."

I write today to bring up another issue affecting scouting. The US Air Force is looking at several sites to conduct what they term "The Realistic Bomber Training Initiative" (RBTI). One of the four sites being considered is the Mount Dora Military Operations Area. Selection of the Mt. Dora MOA would necessarily cause the bomber training runs to fly directly over Philmont Scout Ranch.

Please know that the Philmont Scout Ranch is not just another Boy Scout summer camp. This is the National Training for Scouts and Scout Leaders. It is the "Mecca" of Scouting in the United States. Last year over 1.1 million phone calls were made trying to obtain coveted slots for Philmont expeditions and training courses. On any given day in the summer, there are 5,000 boys, girls and adults spread throughout Philmont's acreage. (Yes, girls too. A significant portion of the Venturing Program (formerly Exploring) participants are 14 to 21 year old girls, including this year's Queen of the Pasadena Rose Festival.)

The proposed bombing runs, according to the Air Force's own figures they are planning 2,660 flights a year, 365 days a year (that is just over 7 a day), 20% of which will be between the hours of 10:00PM and 2:00AM. Flights over Philmont will be at an altitude of three hundred to one thousand feet. The planes will all be B-52's andB-1 bombers. The intrusion of this bomber training into the wilderness at Philmont would inflict serious degradation on the rustic experience, the wildlife, and even the safety of the people at Scouting's premier camping and training center.

I encourage you to look further into this matter. A place to start might be with
Major Brent Adams
RBTI EIS Project Manager
HQ ACC/CEVPP
129 Andrews Street, Suite 102
Langley AFB, VA 23665-2769

In advance, I thank you for your attention to this issue.

000943

Major Brent Adams 6/15/99
RBTI EIS Project Manager
HQ ACC/CEVPP
Langley AFB, VA 23665-2769

Dear Major Adams;

BR-6 I am writing to request your firm support in opposing the selection of Alternative D under the U.S. Air Force's proposed Realistic Bomber Training Initiative (RBTI). The Air Force is seeking to establish a new training route for low-level B-1 and B-52 bomber flights from bases in Texas and Louisiana. One of the proposed routes, Alternative D, traverses Philmont Scout Ranch in northeastern New Mexico's Colfax County.

Philmont is a 137,000 acre mountain backpacking and high adventure facility of the Boy Scouts of America. Each year, thousands of Scouts and their adult leaders from across the nation participate in two-week wilderness backpacking trips in the mountains of Philmont. Many of them also camp and work on conservation projects in the adjacent Valle Vidal Wilderness of the Carson National Forest. The Air Force's proposed Alternative D will establish a military training route directly over most of Philmont. More than 2,600 flights each year, some as low as 300 feet above ground level, are proposed for the segment over Philmont. As a Scouter, I have serious concerns about the impact of the Air Force's proposal on the health and safety of Scouts attending Philmont and the potential effects of daily low-level flights on the ranch itself.

On any given day in the summer, as many as 5,000 Scouts and Scouters will be hiking and camping in Philmont's back country. Each day, several hundred of them will be engaging in activities such as rock climbing and rappelling, spar pole climbing, and mountain horseback rides. The sudden roar of jet engines has a high likelihood of distracting an inexperienced climber or causing a horse to bolt on a narrow mountain trail with resulting serious injury (or worse).

Appreciation and protection of the wilderness and our natural resources is a key part of the Philmont program. Scouts from around the world have a unique opportunity to see and experience wildlife in native habitat. Noise and emissions from bombers cannot help but have a damaging effect of that wildlife, as well as on Philmont's herds of buffalo, horses, cattle, and burros. The disruptive effects of noisy bomber overflights on Philmont's famous living history programs, in which

000943

Scouts experience the lifestyles of the West's mountain men, homesteaders, lumberers, and cowboys, are obvious.

Most of Philmont is mountainous with many peaks in the 10,000 to 20,000 foot range. Philmont has a tremendous fuel load of dead trees and is in the midst of a long-term drought. Unburned jet fuel finding its way to the ground or being dumped in an emergency over such terrain, with campers using backpacking stoves for cooking, creates the potential for a serious fire that would endanger hundreds of lives. The possibility of a crash, however remote, is simply not acceptable for the safety of these Scouts.

For these reasons, I seek your help in advocating the selection of a different RBTI route. I ask that you express your opposition to Alternative D to the Secretary of the Air Force and other defense officials who may be involved in this decision. Please act now, as the public comment period ends in June and a final decision will be made this year.

Philmont is the largest and most famous Scout camp in the world. It is a national resource that has positively impacted the lives of hundreds of thousands of our nation's youth for more than sixty years. It deserves and demands our protection. Thank you for helping to see that Alternative D is not selected.

RE: West Texas Bomber Flights

Dear Major Adams:

This is to advise you that I am troubled by the missions you are so forcefully continuing to practice in West Texas. Why don't you stay along the Mexican/U.S. Border. Maybe you can help with the overtaking of the borders by the Mexican cartel. Having grown up in Balmorhea, Texas I see what your flights are doing to the area. Yes, you do spook livestock, startle old timers and children, pollute the environment among other things. I have witnessed your low level flights through the area and am not impressed when your hot shot pilots do their 90 degree turns to go north.

West Texas is harsh country and people out there are just trying to make a living. They do not benefit from your activities out there, nor do they want them. I would be at the forefront in attempts to fight your flights out there, but currently I have other priorities before I return to the area where I grew up in. Why does the US continue to train foreign pilots on our soil? Is this a way for you to fund your "project"? I do not see that it is necessary to extend a open hand to other countries in this manner, at our expense! Why don't you go train in their country and lets see how long you last there. Incidents such as the one in Italy doesn't give the U.S. Military any respect.

What happens when one of those aircraft crashes out in West Texas? Actually, you already have had one do that. It just so happened that it was in a remote location and nothing became of it. What is next? Endangerment of the communities out there is unacceptable. I hope that you reconsider and decide to

PD-20 play your games elsewhere, say out in the open waters of the Atlantic or Pacific. You have the capability to create terrain on your avionics systems to simulate land. Set up your buoys as targets and leave West Texans in peace. Air and noise pollution is one less thing they need to struggle with.

Sincerely,

Rudy Carrasco

Subject: USAF Realistic Bomber Training Initiative (RBTI)
Comments on Draft EIS

Dear Sir,

BR-6 Thank you for the opportunity to comment on the alternatives and impacts of the United States Air Force's Realistic Bomber Training Initiative (RBTI.) I fully support the mission of the United States Air Force and understand the need for insuring that our pilots and crews receive the best training possible, at the least possible expense of limited defense dollars. I am very concerned, however, with RBTI Alternative D, and it's potential impacts to the wildlife and recreational areas of New Mexico, particularly Philmont Scout Ranch. I feel that the Draft Environmental Impact Study (DEIS) has not fully examined the environmental and social impacts on Philmont or the surrounding communities in sufficient detail to appreciate the value of this resource. My primary concern is the loss of the "wilderness feeling" that Scouts come to Philmont to experience, as well their actual health and safety.

Philmont Scout Ranch is a truly unique resource, unequalled anywhere in the world, and a vital part of the outdoor program of the Boy Scouts of America. Its 137,000 acres have provided a meaningful wilderness experience for over 600,000 boys and adults since 1938. Boy Scouts have emphasized the value of the wilderness experience in the growth and maturation of boys since it's founding. Philmont Scout Ranch represents the crown jewel of the Boy Scout outdoor program. In 1998, more than 25,000 youth and adults experienced its splendor.

Trekking through the rugged, majestic Sangre de Cristo Mountains, Philmont provides fascinating backcountry programs and 330 miles of remote trail to challenge and inspire both youth and adults who backpack this scenic and historic area. Established programs provide the opportunity for boys to engage in rock climbing, rappelling, horse back riding, spar pole climbing, gold panning and spar pole climbing on a daily basis. Programs provide rare educational opportunities to experience the life and history of early day gold miners and trappers, several varieties of Indian life, and the Old Western settlers.

What makes the Philmont Scout Ranch special is its "unestablished" program. The remote wilderness and mountain setting provide a true appreciation of the natural environment, low impact camping, mountainous terrain and abundant wildlife, not to mention the leadership, growth and team building that occurs within every crew, and every individual.

My concern is that the proposal is not only inconsistent with this natural environment, but would actually disrupt the natural balance of nature and the Scout's ability to appreciate it within this important area. The proposed route covers 114,600 of Philmont's 137,000 acres, including the most commonly hiked trails, the Ranch Headquarters, and Training Center

000945

areas. According to the Air Force's calculations, each Philmont overflight would average 3.3 minutes for B-52's (360 mmph) and 2.1 minutes for B-1's (540 mmph). A Scout participating in a 12-day trek would be exposed to 4 to 6 hours of overflight. Every Philmont participant would directly experience overflights.

I am very concerned with the potential noise impacts of the proposed plan on the ranch, it's inhabitants and it's environment. The DEIS projects noise levels (Segments EF – GH) will increase from a baseline noise level of 45 dBs to an average of 62 dBs. This increase is briefly stated, but largely dismissed throughout the route. The DEIS, however, also states that at the proposed altitude, the noise level of a B-52 is 111dBs at low altitude (B-1 is 116 dBs) as it flies overhead. I would argue that it is not the average noise level that is relevant, but rather the short duration shock or startle effect of individual overflights.

This dramatically increased noise level will undoubtedly interfere not only individual activities such as rock climbing and horseback riding, but with the prior training and instruction, safety or otherwise, offered by the ranch staff. Recognize that Scout participants are generally novices at most of the individual program activities, requiring specific instruction on procedures and safety. Any distraction can be critical when Scouts need to be devoting 100% of their attention to personal safety. Further, the sound from aircraft activity will interfere with the solemnity of important Scouting ceremonies and disrupt important team building interactions, both vital portions of Scouting and Philmont.

The DEIS suggests that residents in the flight path will get used to the overflights over time. While the majority of Philmont's participants are in residence for less than 2 weeks (living in tents) not only will they not "get used to it", they will likely become highly agitated and sarcastic, further compromising their health and safety. Of the greater concern may be that, within 2 weeks, the participants would become accustom to these flights.

While the DEIS does specifically reference the location of the Philmont Scout Ranch and other special land use management areas, it seems to greatly underrepresent these impacts. In fact, the portrayal of the noise impacts on the Philmont environment are greatly underrepresented when compared to studies conducted by the United States government on similar facilities – the National Parks. In a 1994 National Park Service report to Congress (*Report on Effects of Aircraft Overflights on the National Park System*), the noise impacts are noted as much more significant to the natural environment and the outdoor recreationalist than the DEIS describes.

The National Park Service manages "natural quiet" as a significant park resource. The indigenous sound levels at Philmont, as in national parks, is considerably lower than sound levels commonly experienced in most residential areas. In such areas, even distant aircraft can be easily heard. Preservation of natural quiet under these circumstances can mean that aircraft must fly several miles from the area to be protected. Natural quiet is an increasingly scarce resource in America.

The National Park System report includes an important discussion about the "high expectation of experiencing natural quiet" in wilderness/recreational areas. The use of the Philmont Scout Ranch clearly provides this type of area and experience. In fact, "natural quiet" may be even more important at Philmont than to many visitors of the National Parks. The most sensitive users of the park system are the backcountry activists - the primary user of

000945

Philmont Scout Ranch. Separated from car and other civilization noise, overflights are much more noticeable and intrusive.

While the vast majority of the Park System's overflights are scenic tourists, military overflights make up a sizeable portion of the complaints. The Park System survey reported 90% of backcountry users considered military overflights as inappropriate. Modifying the typical scenic overflight (70 – 90 dB's) to a 300' altitude simulated bombing run (111 116 dBs) would seem to greatly exaggerate the impacts. The Park System's report would recommend elimination of all overflights if not for the economic and social issues involved in scenic tours. Several National Parks have mandated a minimum ceiling of 2000' above the surface (considered the highest elevation). At Philmont, this ceiling would be over 14,500', which would presumably conflict with the low altitude training proposed.

The DEIS represents that Alternative D does not affect populated areas and that the areas under the airspace are used for livestock grazing. Philmont and the surrounding areas are depicted as "rangeland" with scenic mountainous areas. In fact, Philmont's mountainous terrain ranges in elevation from 6,600 feet at headquarters to 12,441 feet at the top of Baldy Mountain. This rugged terrain supports in excess of 5,000 people on a given day in the summer. These people are all participating in outdoor recreational and educational activities which may be disrupted by the proposed plan. Wildlife is abundant on Philmont's forested mountains and grassy plains. Deer, elk, mountain lion, bear, bobcat, buffalo, and antelope are frequently spotted by observant campers on the ranch.

Anyone, who has spent any time in the outdoors, understands how wildlife brings an excitement to the wilderness. Philmont has an abundant and varied wildlife. Low-level overflights are suspected to affect/reduce the wildlife's fitness and ability to survive by causing excessive arousal and alertness or stress. Indirect effects on wildlife such as accidental injury, energy losses, habitat avoidance and abandonment are very difficult to detect, but experts suspect they occur. The loss of area wildlife would compromise an important portion of the wilderness experience.

At Philmont, the additional prospect of the startle effect of aircraft on wildlife intermingled with youth is noteworthy. Simply image a frightened bear in the midst of a crew of 16 year old Boy Scouts as a B-52 passes 300' overhead. Philmont's backcountry program includes Western lore and horseback riding. Naturally the startle effect of low level overflights on horseback riding programs could be tragic. The National Park System report cites incidents of serious injuries to riders thrown from startled horses. Maintaining a "working ranch" is not only an important program element, but also one of the requirements put on the Philmont gift by benefactor Waite Phillips. Philmont maintains over 250 head of Hereford cows and a 60 head of buffalo ranging its pastures. For summer packing and riding, 100 burros and 250 saddle horses are maintained.

Another intricate component of Philmont's composition is it's rich supply of cultural and historical resources, which would be affected by the sight, and sound of overflights. The setting, ambiance, feeling or association can be disrupted, and vibrations may be induced that can be damaging to structures. The sound from aircraft activity has been proven to cause damage to archeological resources. Structures and artifacts vibrate resulting in fatigue

000945

cracking, and direct or indirect structural damage. Heavy subsonic aircraft (bombers) at close range can produce substantial low frequency energy. For example, the vortices from heavy aircraft are of concern at all major airports because of their ability to compromise the safety of smaller aircraft following in their wake.

The DEIS reports only five cultural sites under the entire route of Alternative D. Philmont alone has two sites on the National Register of Historic Places - the Villa and the Rayado community. Other significant resources include the ancient Anasazi petroglyph sites and the only known footprint of a Tyrannosaurus Rex in the world, both located in the Ponil Canyon area of Philmont and not included in the DEIS. The Baldy Town mining district around Baldy Mountain was one of the richest gold mining areas in the world and provides a unique window into this way of life. Clearly the remnants from this time period would be threatened, including the old mine shafts which are toured daily by campers.

Additional concerns that are not fully addressed in the DEIS and may create additional significant impacts include the potential effects of aircraft emissions, the potential for a serious aircraft mishap , the impact of the proposed plan on Philmont's emergency radio communications and impacts of a mishap and associated rescue/recovery efforts. The DEIS reports that the "effects from aircraft emissions and the potential for aircraft mishaps would be inconsequential for all alternatives," however emissions at 300' altitude cannot be negligible. A Class A mishap involving a B-1 could occur once every 15 years (DEIS). Philmont's has a history of violent thunderstorms, frequent lightening and mountainous wind sheers. The impacts of such a mishap can have extremely significant consequences (the impacts of an unfortunate 1942 crash of a B-24 are still very visible on Trail Peak).

I certainly do not object to the purpose of the United States Air Force's Realistic Bomber Training Initiative (RBTI,) and I fully support the mission of the United States Air Force and understand the need for insuring that our pilots and crews receive the best training possible. My troop features several former Air Force pilots and has proudly graduated several former Scouts into the Air Force. While at Philmont, I have occasionally witnessed military overflights with fascination.

The key is their relative impacts. Our crews of Scouts have enjoyed witnessing individual low level F-16 overflights, watched high level aerial refueling of B-1 bombers and still discuss the morning of high level F-117 overflights fondly. The 1942 crash of the B-24D Liberator at Philmont is visited reverently by thousands of Scouts each year (see article of the April 1942 crash at http://philmont.bowline.org/history/crash1.html). But these events were scattered, and with the exception of the tragic B-24 incident, did not significantly impact the environment or our ability to enjoy it. My understanding is that the USAF ceased its low altitude F-16/F-111 flights over the Ranch several years ago as a result of Philmont protests. RBTI's multiple daily flights (up to 16) will create much more severe problems.

It is impossible to experience two weeks in the Philmont wilderness without coming to a true appreciation of what the environment represents, and what our place in it should be. Many of the young participants are from large urban cities and never get an opportunity to experience the true wilderness environment. Appreciation and protection of the wilderness are key parts of Philmont's program. RBTI is inconsistent with wilderness preservation.

000945

Just as the wilderness contains many tangible features, such as animals, plants, waters, geological features, historic buildings and archeological sites, they have intangible qualities as well. These qualities include solitude, space, scenery, clear night skies, sounds of nature and natural quiet. Such qualities are not only becoming increasingly rare in America; they are the foundation of upon which the Boy Scouts of America are based. The scarcity of these resources, their importance to the outdoor experience and their place in the Scouting program are what makes them so valued at Philmont. Philmont is 137,493 acres of challenging Scout adventure spread among the mountains and mesas of northeastern New Mexico. It was the gift of Waite Phillips, who "donated and dedicated it to the Boy Scouts of America for the purpose of perpetuating faith, self-reliance, integrity, freedom, principles used to build this great country by the American Pioneer."

From reviewing the DEIS (which I applaud the Air Force for making so readily available), it appears to me that the impacts of Alternative D are much more numerous and significant than the other proposed Alternatives, especially when discussing wilderness and recreational areas, both public and private. Please review the proposed Alternatives and their potential impacts to these unique and irreplaceable resources, particularly the Philmont Scout Ranch, and select an alternative other than RBTI Alternative D. Thank you for the opportunity to comment and voice my concerns.

Very truly yours,

Jon Wiley

Langley AFB, VA 23665-2769

Dear Major Adams,

BR-6

I am writing to request your firm support in opposing the selection of "Alternative D" under the USAF's proposed Realistic Bomber Training Initiative (RBTI) involving low flying, B-52s and B-1s (as low as 300'). As one of several proposed southwestern routes, "D" traverses Philmont Scout Ranch in northeastern New Mexico's Colfax County. Philmont, truly a national treasure, is the 137,000 acre backpacking and training facility of the Boy Scouts of America. I do not protest RBTI since it is a valuable program. -- my only complaint, as a Philmont alumnus, is with the proposed route over Philmont.

Several years ago, the USAF ceased its low altitude F-16/F-111 flights over the Ranch as a result of Philmont protests. RBTI's multiple daily flights (up to 16) will create much more severe problems:

a) Program: Philmont is a transient community of 25,000 people with over 3,000 campers in Philmont's back country every day in the summer. Daily, several hundred of them are engaged in spar pole climbing, rock climbing and rapelling, and horse back riding. The sudden roaring of jet engines will distract climbers and bolt horses thereby creating injuries (or worse).

b) Environmental: Appreciation and protection of the wilderness are key parts of Philmont's program. RBTI is inconsistent with wilderness preservation. RBTI will have a damaging effect upon both the unique western wildlife and Philmont herds of cattle, horses, burros, and buffalo. The effect of the unburned portion of jet fuel in the engine exhaust or dumped fuel itself, vaporizing and falling to ground level is as yet unknown, but believed to be anything but beneficial.

c) Safety: The environmental impact study done for the USAF is seriously flawed when it describes Philmont as an "uninhabited" grassland. The smaller portion of Philmont's acreage is prairie. Most of Philmont is mountainous with many peaks in the 10,000 to 12,444' range. Philmont has a tremendous fuel load of dead trees in its forests, and is in the midst of a long term drought. Open fire bans are in effect now. A crashing

000946

bomber will create an epic fire of Yellowstone proportions. B-1s and B-52s do not have enviable safety records. The nature of the flights (weaving around mountain peaks and facing violent weather, including frequent, low-level wind shears) dramatically increases the chance of a crash. Unfortunately, Philmont does not have a well-developed highway system for evacuations in case of massive forest fires.

For the above reasons, I seek your help in advocating the selection of a different RBTI route, preferably one that is over a more sparsely populated, less environmentally sensitive area. You, or a member of your staff may wish to liaise with Rep. Ed. Pease's (Indiana) legislative assistant, Greg Good, who has additional information on RBTI.

There is too much at stake to allow RBTI to overfly Philmont. Please act now -- final route determination starts in June. Thank you for helping to see that alternative D is not selected.

Respectfully

Donald J Vandamme, Jr.

Langley AFB, VA 23665-2769

Dear Major Adams;

TY

I am requesting your support in opposition of the selection of Alternative D under the U.S. Air Force's proposed Realistic Bomber Training Initiative (RBTI). The Air Force is considering as Alternative D, a route crossing the National High Adventure Base known as Philmont Scout Ranch, in Northeastern New Mexico, Colfax County.

Philmont is a 137,000-acre mountain backpacking and high adventure facility of the Boy Scouts. Each year, thousands of Scouts fill the trails and camps of this property.

The Air Force's Alternative D will establish a military training route directly over most of Philmont. We understand that more than 2600 flights each year, some as low as 300 feet above ground level, are proposed. During the summer months, as many as 5,000 Scouts on any given day, make use of the property.

I hope you will express your opposition to Alternative D to other defense officials who may be involved in this decision. I understand the public comment period ends in June.

Sincerely,

Jerry Dempsey
Scout Executive
Oregon Trail Council, Boy Scouts of America

June 12, 1999

Senator Don Nickles
U. S. Senate
Washington D. C

Dear Senator Nickles:

BR-6 I am writing to request your firm support in opposing the selection of Alternative D under the U. S. Air Force's proposed Realistic Bomber Training Initiative (RBTI). The Air Force is seeking to establish a new training route for low level B -1 and B - 52 bomber flights from bases in Texas and Louisiana. One of the proposed routes, Alternative D, traverses Philmont Scout Ranch in northeastern New Mexico's Colfax County. This proposed route would result in more than 2,600 flights each year, with some flying as low as 300 feet above the ground, for the segment over Philmont. I have serious concerns about the impact of Alternative D on the health and safety of Scouts and the potential negative effects of these daily low level flights on the ranch

Philmont Scout Ranch is a 137,000 acre mountain backpacking and high adventure facility of the Boy Scouts of America. Each year, thousands of Scouts and their adult leaders from across the world participate in wilderness backpacking trips at Philmont. Many of them also camp and work on conservation projects in the adjacent Valle Vidal Wilderness of the Carson National Forest.

On any given day in the summer, as many as 5,000 Scouts and Scouters will hike and camp in Philmont's backcountry. Each day, several hundred will engage in activities such as rock climbing, rappelling, spar pole climbing, rifle range shooting, and mountain horseback riding. The sudden roar of a jet engine would have a high likelihood of distracting an inexperienced climber or shooter or causing a horse to bolt on a narrow mountain trail which could result in serious injuries or worse to the Scouts.

The Philmont experience instills in Scouts an appreciation of and protection of the wilderness and our natural resources. Scouts from around the world have a unique opportunity to see and experience wildlife in native habitat. Noise and emissions from bombers will have a damaging effect on the wildlife including the endangered species of bald eagle, peregrine falcon, and the Mexican spotted owl, as well as the Philmont herds of buffalo, horses, cattle, and burros. The noisy bomber overflights will also be disruptive to Philmont's famous living history programs in which Scouts experience the lifestyle of the West's mountain men, homesteaders, lumberers, and cowboys.

Most of Philmont is mountainous with many peaks between 10,000 and 12,000 feet high. Philmont has a tremendous fuel load of dead trees in its forests and is in the midst of a long term drought. Unburned jet fuel finding its way to the ground or being dumped over such terrain in an emergency would create the potential for serious fires for the campers using backpacking stoves. That added possibility of a crash is simply not acceptable for the safety of the Scouts participating in the Philmont experience.

For these reasons, I ask your help in promoting the selection of a different RBTI route. Please express your opposition to Alternative D to the Secretary of the Air Force and other pertinent military and defense officials. Please act now as the public comment period ends in June and a final decision will be made this year. (Greg Dodd, Chief of Staff for Congressman Ed Pease of Indiana, can be contacted for additional information.)

000949

Philmont is the largest and most famous Scout camp in the world and is a natural resource that has had a positive impact on the lives of thousands of our nation's youth for more than sixty years. It deserves and demands our protection.

I had the opportunity to participate in the Philmont experience with each of my two sons. It is a priceless experience I will treasure forever. Thank you for your help in seeing that Alternative D is not selected and for preserving the opportunity for other fathers and sons (or daughters) to enjoy this priceless experience.

Sincerely,

Don Allen

Stillwater, Oklahoma

Langley AFB, VA 23665-2769

June 4th, 1999

Dear Major Adams,

I am writing as a member of the community which will be impacted by RBTI-Route D. I appreciate the opportunity and feel that it is my responsibility to comment on the Draft EIS for RBTI-Route D. Although I suspect otherwise, I truly hope that this process is taken very seriously by the USAF and not merely as a formality designed to placate the taxpayers in the name of saving taxpayer dollars and national security.

We taxpayers will not see a tax cut as a result of RBTI. Therefore, RBTI will not save taxpayers' dollars. RBTI will save the USAF dollars. While $10,000 per hour for jet fuel is a stunning amount, that amount becomes insignificant when compared with the stupendous cost of our national defense operation. One B-1 costs over $200 million, one B-52 costs $74 million. One B-2 costs $1.3 billion. The Department of Defense appropriations budget authorization for fiscal year 1998 was $251.4 billion. (Horatio Trujillo – Legislative Assistant on Foreign Policy and Economic Policy for Tom Udall, U.S. Representative, New Mexico, ___ *Congressional District.)*

Perhaps the need for operations such as RBTI could someday be reduced or even eliminated, saving billions of taxpayer dollars, and strengthening national security by using more energy and tax dollars to help our leaders further develop the techniques, skills, and tools for dialogue and communication in order to wage peace through conflict resolution without violence.

The Draft–EIS bases its findings on objective data and quantitative studies in order to arrive at its conclusions. It also includes advisories from the USFWS and the USFS. It appears that no conclusions were arrived at regarding some of the topics.

In this letter I wish to address some of these sensitive and controversial issues using the data and information I found in the Draft-EIS.

Section 4: Affected Environment and Environmental Consequences:
RBTI-Route D will fly over Mexican Spotted Owl habitats as low as 400 feet AGL, 12 times per day and over at least three active nesting sites for Peregrine Falcons 11 times a day at 400-1000 feet AGL. The bomber route flies over wintering habitat for bald eagles 12-14 times daily below 1,000 feet AGL.

According to the *Bird of Prey and Wildlife Monitoring Study of the Ute Mountain Section of the Rio Grande Gorge* (1986-1989), RBTI will cross two branches of the Rio Grande Flyway for migratory birds of prey and waterfowl. Also, the eastern fork of the Rio Grande is located

000950

directly over the Valle Vidal Unit of the Carson National Forest where a large elk herd is strictly protected and which is managed for its wildlife and recreation opportunities.

p.4- 107 "USFWS advisories have stipulated that the Air Force survey unsurveyed owl habitats underlying IR-153, segments AB and EF in order to determine owl populations (if any) and to avoid overflights by 1,600 feet AGL, March 1-August 31 annually." Additionally they have stated that "significant and adverse impacts would occur to peregrine falcons if they are overflown at levels below 1,600 feet AGL," and that" flights at or below 2,000 feet AGL from October 1 to March 1 could result in significant impacts to wintering bald eagles."

The writers of the Draft-EIS, on the other hand, found a number of studies of mammals and birds which they used to state that p.4-106, "Based on these studies, the evidence would suggest that Alternative D flight operations would not result in significant adverse impacts to wildlife or threaten endangered or sensitive species."

Also the safety section, p.4-50, Draft-EIS states that "neither the existing nor the proposed airspace in IR-153 Section AB would overlie or intersect any migration flyways or water bodies where birds congregate." Clearly, the land managing agencies, i.e. USFWS, BLM-USFS, are in conflict with the USAF or FAA regarding their missions. This conflict must be legally resolved in order for RBTI-D to be considered.

BI-5

Socio-Economic and Environmental Justice:
P. 4-109 The Draft-EIS describes socio-economics as "the general features of the economy, including employment, population, and income, that could be affected by the proposed alternatives." It states that "most direct and indirect socio-economic effects would occur in the immediate vicinity of where the electronic scoring sites and emitter sites would be constructed and operated."

P. 4-109 "The primary measures by which socio-economic impacts were identified include changes to employment, populations, and earnings associated with the proposed alternatives." They detailed their methods, assumptions and calculations in Appendix I.

The Draft-EIS states on p. 4-118, Table 4-4-1 for alternative D: "No measurable impacts to socio-economics. No disproportionate impacts to minority and low income populations."

BR-4 Taos County and others nearby were not considered in the Study, presumably because of the criteria used. Nevertheless, they could sustain adverse and devastating changes to employment, populations, and earnings as a direct result of the implementation of RBTI-Route D.

BR-3 Livestock would be impacted similarly to wildlife by bomber noise, thereby affecting ranchers and farmers, along with all of their supporting industries, i.e. feed and supply stores, equipment sales, etc.

Northern New Mexico is well known as a haven for seekers of solitude and quiet of many kinds. Sportsmen such as hunters, fishermen, trail riders, as well as hikers, bikers, campers, rafters, back-country skiers, snow shoers, families, mushroom hunters, and bird-watchers come from all over the world to enjoy the tranquility, beauty, and originality of the region, as do people

000950

searching for many types of physical and spiritual healing. We have retreats, spas, and gatherings, in beautiful wilderness settings.

More than 60 per cent of Taos County's fragile economy is based on tourism. The implementation of the RBTI Route D could cause many of our tourists (bread and butter) to find their "peace and quiet" elsewhere, far from the incredibly monstrous and loud machines of war. A reduction in tourism would impact nearly every person and industry in the county: outfitters and tour guides, camping and sporting goods stores, health spas, health professionals, spiritual retreats and healers, as well as all the supporting businesses, such as hotel, motel, bed and breakfast inns, restaurants, gas stations, gift shops, art galleries, movie theaters, and all of their employees (low income).

Similarly to tourism, Taos County's real estate and construction industries could be adversely and devastatingly impacted by RBTI-Route D. In recent years, many people have moved to Taos and the surrounding area to "get away from it all." Many of these people bring money and even the ones who don't contribute to the economy. These people, like the tourists, could take their dollars and find other places to live and retire, thereby impacting not only the real estate market but also the construction industry, one of the stronger parts of our economy at this time. People affected will be bankers, builders, building supply yards and stores, home decorating and furniture stores, and well as tradesmen of all kinds; i.e. plumbers, electricians, plasterers, adobe layers, tilers, excavators, landscapers, painters, laborers, etc.

BR-4 Property values could fall, not only as a result of fewer people moving to the area because of RBTI-Route D, but also people, such as myself, could choose to leave the area, further jeopardizing our tenuous economy.

The socio-economic impact of RBTI-Route D to Taos County and the neighboring counties must be studied before RBTI-Route D is allowed to move ahead.

P4-109: the EIS addresses environmental justice, as defined in Executive Order 12898: "Federal Actions to Address Environmental Justice in Minority and Low Income Populations." It looks at whether an action disproportionately affects these types of populations. According to1990 census data in the Community Profile Packet from the Taos County Chamber of Commerce, a large portion of Taos County's population is made up of Hispanic and Native American people., (65% Hispanic, 7% Native American, 27% Anglo, and 1% Other). Many of these are low wage earners or are unemployed. We currently have 27 percent earning below the poverty line and an unemployment rate of 18 percent, according to the Western Environmental Law Center.

There are hundreds of small entrepreneurial businesses in the Taos area. They struggle for survival. Many are "mom and pop" style operations. Many of the potential job losses would be among their employees. When business gets slow around here, the low wage earners are the first to go; i.e. during our off seasons, spring and late fall, the small business owners and managers can cover the duties themselves. Thus the employees are - at least temporarily – laid off. Among these workers would be shop helpers, fast food employees, construction laborers, hotel and motel service, restaurants, ski area gift shops, etc. These are the low income people. Many are minority members. They could become even poorer or unemployed. Potential impact regarding the Environmental Justice for Taos County must be carefully studied before the RBTI-Route D moves forward.

BR-4

000950

Noise: "Noise is generally described as unwanted sound. Unwanted sound can be based on objective effects (hearing loss, damage to structures, etc.), or subjective judgments (community annoyance). Noise analysis thus requires a combination of physical measurement of sound, physical and physiological effects, plus psycho/socio-acoustic effects of the sound's loudness."

P.4-6: The Air Force uses three noise measuring techniques:
1. L-max and SEL = single noise events
2. DNL = Day Night Average sound levels and cumulative energy average noise.
3. DBA=A weighting in decibels.

There are tables, explanations, and diagrams showing SEL and L-max levels, as well as a number of tables. explanations, and diagrams of DNL (pgs. 4-6,4-7,4-8,4-47,4-49, appendix G, p. g-4).
The EIS states that "DNL has emerged as the most widely accepted metric for aircraft noise." P. 4-9

On P. 4-46, the EIS states that the noise levels on the 38 segments of IR-153 would range from less than 45 DNL to 64 DNL. 65 decibels is 50% louder than average conversation.

On P. 4-46, the EIS also states that sortie operations on all but three segments of IR-153 could generate SEL's ranging from 86 to 116 decibels.

Appendix G, p. G-2: "A change in sound level of about 10 decibels is perceived by the average person as a doubling (or halving) of the sound's loudness."

Therefore, to an average person, a sound that measured 70 decibels would be twice as loud as a sound of 60 decibels (average conversation). If you do the arithmetic, a sound of 120 decibels would be 64 times as loud to the average person as a sound of 60 decibels. According to pages, 4-6, table 4.1-1, a B-1 at 300 feet AGL produces an L-max of 117 decibels. Table 4-1-3: an SEL of 116 decibels.

AO-55 Although the DNL measurement is the most widely accepted measurement for aircraft noise, it is clear after careful study of the information provided by the EIS, (and also my own experiences of being overflown), that for these low-level types of flights, the single event level and the L-max factor must be given at least equal weight to DNL averages before the USAF is allowed to move forward with this project.

Cultural Resources:
P. 4-122: The EIS states that "the effects of noise on cultural resources may also be related to setting. Noise impacts to Native American traditional cultural properties may be related to interference with ceremonies and other traditional activities at sacred sites. Undisturbed habitats, resources, and settings are considered to be critical to religious practices. Potential impacts can be identified only through consultation with the affected groups."

The USAF has altered RBTI-Route D to avoid the Taos Pueblo and Blue Lake areas as a result of consultation with Taos Pueblo leaders. It is not necessary for the USAF to reveal sacred and religious sites to the general public: however, they must provide assurance that all issues regarding sacred and religious sites have been resolved to the satisfaction of the various Pueblos that were consulted before moving forward with RBTI-Route D.

CU-4

000950

Cumulative Impact:
There are currently numerous low-flying training routes in New Mexico originating from military bases throughout the U.S. When added to the proposed RBTI flight operations, some areas may experience over 6,300 flyovers per year. The USAF must study these cumulative impacts and the cumulative impacts of all low level training flights in the western U.S. in a programmatic EIS.

Public Safety:

The EIS addresses safety issues and on p.4-50, states that "since IR-153 does not currently exist, it is difficult to draw direct comparisons of baseline and projected mishap potential. Secondary MTRs that overlap or intersect segments of proposed IR-153 do provide a rough comparison. Estimated years between class A mishaps on these routes rage from 22-2,800. For proposed IR-153, estimated years between Class A mishaps for B-52's would fall into this range, whereas the potential for B-1's would be slightly greater. However, when considered as probabilities, the estimated years equate to a 0.02 probability of a B-52 Class A mishaps per year and a 0.07 probability for the B-1's."

We know that there have been a number of military plane crashes over the years. There was one incident with a sailplane where the Air Force pilot didn't even see the glider because the difference in speed was so great. The wing wheel of the glider was found in the military aircraft. In our area, there are not only sailplanes but also small private and commercial planes and hang gliders.

AO-61 No Class A mishaps are acceptable. The USAF must be able to estimate a 0 percent probability for Class A mishaps. Also, the Air Force should provide a list description of all mishaps – Class A and otherwise – that have actually occurred over the lifespan of the military aircraft training programs before it moves ahead with this project.

In conclusion, in order to formulate my response to the Draft EIS for RBTI-Route D, I have read the report carefully. After having done the research necessary to write this letter, i have discovered that it is possible to use objective criteria and quantitative data in order to arrive at more than one conclusion. From my research, most of which comes directly from the Draft EIS, I conclude that the USAF must further study and resolve many of the issues addressed in the Draft-EIS, including potential harm to endangered, threatened and sensitive species and potential harm to other wildlife, ecology and livestock.

The noise level issue must be re-addressed and made to include L-max and SEL measurements. The public safety issue has not been adequately addressed re: military plane crashes, small aircraft and bird strikes. The study must make readily available to the public a list of all Class A mishaps that have actually occurred over the life of the military aircraft training programs.

The EIS must be made to include a socio-economic and environmental justice report on potential impact to the socio-economic structure of Taos County, New Mexico. Finally the USAF must complete their consultations with the various Native Americanindian Pueblos and resolve any issues regarding sacred and religious sites to the satisfaction of each tribal community consulted.

000950

It is clear that all of these issues must be addressed, re-addressed and resolved by the USAF before RBTI-Route D is allowed to move forward.

Sincerely,

Christine W. Earl

Major Brent Adams
RPTI EIS Project Manager
U.S. Air Force
HQ ACC/CEVP
129 Andrews Street, Suite 102
Langley AFB, Virginia 23665-2769

Dear Major Adams:

Enclosed is a letter from my constituent, John Cabeza of Seminole, Florida. In his letter, Mr. Cabeza outlines his concerns about the U.S. Air Force's Alternative D for the Realistic Bomber Training Initiative (RBTI) and I would ask that his views be included in the public comments portion of the official record.

Thank you for your assistance in this regard. With best wishes and personal regards, I am

Very truly yours,

C. W. Bill Young
Member of Congress

CWY:bks

May 24, 1999

Congressman Bill Young

St. Petersburg, FL 1999, MAY 28 1999

Dear Congressman Young:

BR-6

I am writing to request your first support in opposing the selection of Alternative D under the U.S. Air Force's proposed Realistic Bomber Training Initiative (RBTI). The Air Force is seeking to establish a new training route for low-level B-1 and B-52 bomber flights from bases in Texas and Louisiana. One of the proposed routes, Alternative D, traverses Philmont Scout Ranch in northeastern New Mexico's Colfax County.

Philmont is a 137,000-acre mountain backpacking and high adventure facility of the Boy Scouts of America. Each year, thousands of Scouts and their adult leaders from across the nation participate in two-week wilderness backpacking trips in the mountains of Philmont. Many of them also camp and work on conservation projects in the adjacent Valle Vidal Wilderness of the Carson National Forest.

The Air Force's proposed Alternative D will establish a military training route directly over most of Philmont. More than 2600 flights each year, some as low as 300 feet above ground level, are proposed for the segment over Philmont. As a former Philmont staff member, I have serious concerns about the impact of the Air Force's proposal on the health and safety of Scouts attending Philmont and the potential effects of daily low-level flights on the ranch itself.

On any given day in the summer, as many as 5,000 Scouts and Scouters will be hiking and camping in Philmont's backcountry. Each day, several hundred of them will be engaged in activities such as rock climbing and rappelling, spar pole climbing, and mountain horseback rides. The sudden roar of jet engines has a high likelihood of distracting an inexperienced climber or causing a horse to bolt on a narrow mountain trail with resulting serious injury (or worse).

Appreciation and protection of the wilderness and our natural resources is a key part of the Philmont program. Scouts from around the world have a unique opportunity to see and experience wildlife in native habitat. Noise and emissions from bombers, cannot help but have a damaging effect on that wildlife, as well as on Philmont's herds of buffalo, horses, cattle and burros. The disruptive effects of noisy bomber overflights on Philmont's famous living history programs, in which Scouts experience the lifestyles of the West's mountain men, homesteaders, lumberers and cowboys, are obvious.

Most of Philmont is mountainous with many peaks in the 10,000 to 12,000 range. Philmont has a tremendous fuel load of dead trees on its forest and is in the midst of a long-term drought. Unburned jet fuel finding its way to the ground or being dumped in an emergency over such terrain, with campers using backpacking stoves for cooking, creates the potential for a serious fire that would endanger hundreds of lives. The possibility of a crash, however remote, is simply not acceptable for the safety of these Scouts.

For these reasons, I seek your help in advocating the selection of a different RBTI route. I ask that you express your opposition to Alternative D to the Secretary of the Air Force and other defense officials who may be involved in this decision. Please act now, as the public comment period ends in June and a final decision will be made this year. You or a member of your staff may wish to contact Greg Dodd, Chief of Staff for Congressman Ed Pease of Indiana, who can provide additional information.

Philmont is the largest and most famous Scout camp in the world. It is a national resource that has positively impacted the lives of hundreds of thousands of our nation's youth for more than sixty years. It deserves and demands our protection. Thank you for helping to see that Alternative D is not selected.

Sincerely,

John Cabeza
Scout Executive

REALISTIC BOMBER TRAINING INTITIATIVE

Public Hearing Comment Sheet

Location: Taos, New Mexico
Date: 7

Thank you for providing your comments on the Realistic Bomber Training Initiative Proposal.

I strongly oppose Alternative D.
How could you comply w/ state in page 3-61 ~~text~~ "no likely effects to land use, recreation resources visual settings"?
The Rio Grande Wild & Scenic River "seeks preserve the natural state and beauty of an environmentally treasure." This river
"represents vestiges of primitive America and shall be protected for the benefit and enjoyment of present & future generations"
How can you say in the chart on pg. 3-61 - "no reasonable
BR-4 impacts to socioeconomics"? Choosing Alternative D would have a
negative socioeconomics. It would affect tourist business.
It would drive people & their $ out & drive them crazy of
low flying planes over "Rented over Canadian & the other" communities
People like Taos County & Mexico to come hunt & ski here.
The Valle Vidal Unit of the Carson National Forest provides elk
during the calving season. Bears are not allowed to leave their
cave? How would low flying ~~bombers~~ bombers affect these protected
birds?
NO NO NO TO ALT. D.

June 4th, 1999

Dear Major Adams,

I am writing as a member of the community which will be impacted by RBTI-Route D. I appreciate the opportunity and feel that it is my responsibility to comment on the Draft EIS for RBTI-Route D. Although I suspect otherwise, I truly hope that this process is taken very seriously by the USAF and not merely as a formality designed to placate the taxpayers in the name of saving taxpayer dollars and national security.

We taxpayers will not see a tax cut as a result of RBTI. Therefore, RBTI will not save taxpayers' dollars. RBTI will save the USAF dollars. While $10,000 per hour for jet fuel is a stunning amount, that amount becomes insignificant when compared with the stupendous cost of our national defense operation. One B-1 costs over $200 million, one B-52 costs $74 million. One B-2 costs $1.3 billion. The Department of Defense appropriations budget authorization for fiscal year 1998 was $251.4 billion. (Horatio Trujillo – Legislative Assistant on Foreign Policy and Economic Policy for Tom Udall, U.S. Representative, New Mexico. *Congressional District.)*

Perhaps the need for operations such as RBTI could someday be reduced or even eliminated, saving billions of taxpayer dollars, and strengthening national security by using more energy and tax dollars to help our leaders further develop the techniques, skills, and tools for dialogue and communication in order to wage peace through conflict resolution without violence.

The Draft-EIS bases its findings on objective data and quantitative studies in order to arrive at its conclusions. It also includes advisories from the USFWS and the USFS. It appears that no conclusions were arrived at regarding some of the topics.

In this letter I wish to address some of these sensitive and controversial issues using the data and information I found in the Draft-EIS.

"Eagles May Soar But Weasels Don't Get Sucked Into Jet Engines"

Section 4: Affected Environment and Environmental Consequences:
RBTI-Route D will fly over Mexican Spotted Owl habitats as low as 400 feet AGL, 12 times per day and over at least three active nesting sites for Peregrine Falcons 11 times a day at 400-1000 feet AGL. The bomber route flies over wintering habitat for bald eagles 12-14 times daily below 1,000 feet AGL.

According to the *Bird of Prey and Wildlife Monitoring Study of the Ute Mountain Section of the Rio Grande Gorge* (1986-1989), RBTI will cross two branches of the Rio Grande Flyway for migratory birds of prey and waterfowl. Also, the eastern fork of the Rio Grande is located

1

000953

directly over the Valle Vidal Unit of the Carson National Forest where a large elk herd is strictly protected and which is managed for its wildlife and recreation opportunities.

p.4-107 "USFWS advisories have stipulated that the Air Force survey unsurveyed owl habitats underlying IR-153, segments AB and EF in order to determine owl populations (if any) and to avoid overflights by 1,600 feet AGL, March 1-August 31 annually." Additionally they have stated that "significant and adverse impacts would occur to peregrine falcons if they are overflown at levels below 1,600 feet AGL," and that" flights at or below 2,000 feet AGL from October 1 to March 1 could result in significant impacts to wintering bald eagles."

The writers of the Draft-EIS, on the other hand, found a number of studies of mammals and birds which they used to state that p.4-106, "Based on these studies, the evidence would suggest that Alternative D flight operations would not result in significant adverse impacts to wildlife or threaten endangered or sensitive species."

Also the safety section, p.4-50, Draft-EIS states that "neither the existing nor the proposed airspace in IR-153 Section AB would overlie or intersect any migration flyways or water bodies where birds congregate." Clearly, the land managing agencies, i.e. USFWS, BLM-USFS, are in conflict with the USAF or FAA regarding their missions. This conflict must be legally resolved in order for RBTI-D to be considered.

BI-5

Socio-Economic and Environmental Justice:

P. 4-109 The Draft-EIS describes socio-economics as "the general features of the economy, including employment, population, and income, that could be affected by the proposed alternatives." It states that "most direct and indirect socio-economic effects would occur in the immediate vicinity of where the electronic scoring sites and emitter sites would be constructed and operated."

P. 4-109 "The primary measures by which socio-economic impacts were identified include changes to employment, populations, and earnings associated with the proposed alternatives." They detailed their methods, assumptions and calculations in Appendix I.

The Draft-EIS states on p. 4-118, Table 4-4-1 for alternative D: "No measurable impacts to socio-economics. No disproportionate impacts to minority and low income populations."

Taos County and others nearby were not considered in the Study, presumably because of the criteria used. Nevertheless, they could sustain adverse and devastating changes to employment, populations, and earnings as a direct result of the implementation of RBTI-Route D.

BR-4

Livestock would be impacted similarly to wildlife by bomber noise, thereby affecting ranchers and farmers, along with all of their supporting industries, i.e. feed and supply stores, equipment sales, etc.

BR-3

Northern New Mexico is well known as a haven for seekers of solitude and quiet of many kinds. Sportsmen such as hunters, fishermen, trail riders, as well as hikers, bikers, campers, rafters, back-country skiers, snow shoers, families, mushroom hunters, and bird-watchers come from all over the world to enjoy the tranquillity, beauty, and originality of the region, as do people

000953

searching for many types of physical and spiritual healing. We have retreats, spas, and gatherings, in beautiful wilderness settings.

More than 60 per cent of Taos County's fragile economy is based on tourism. The implementation of the RBTI Route D could cause many of our tourists (bread and butter) to find their "peace and quiet" elsewhere, far from the incredibly monstrous and loud machines of war. A reduction in tourism would impact nearly every person and industry in the county: outfitters and tour guides, camping and sporting goods stores, health spas, health professionals, spiritual retreats and healers, as well as all the supporting businesses, such as hotel, motel, bed and breakfast inns, restaurants, gas stations, gift shops, art galleries, movie theaters, and all of their employees (low income).

Similarly to tourism, Taos County's real estate and construction industries could be adversely and devastatingly impacted by RBTI-Route D. In recent years, many people have moved to Taos and the surrounding area to "get away from it all." Many of these people bring money and even the ones who don't contribute to the economy. These people, like the tourists, could take their dollars and find other places to live and retire, thereby impacting not only the real estate market but also the construction industry, one of the stronger parts of our economy at this time. People affected will be bankers, builders, building supply yards and stores, home decorating and furniture stores, and well as tradesmen of all kinds; i.e. plumbers, electricians, plasterers, adobe layers, tilers, excavators, landscapers, painters, laborers, etc.

Property values could fall, not only as a result of fewer people moving to the area because of RBTI-Route D, but also people, ~~such as myself~~, could choose to leave the area, further jeopardizing our tenuous economy.

BR-4

The socio-economic impact of RBTI-Route D to Taos County and the neighboring counties must be studied before RBTI-Route D is allowed to move ahead.

P4-109: the EIS addresses environmental justice, as defined in Executive Order 12898 "Federal Actions to Address Environmental Justice in Minority and Low Income Populations." It looks at whether an action disproportionately affects these types of populations. According to 1990 census data in the Community Profile Packet from the Taos County Chamber of Commerce, a large portion of Taos County's population is made up of Hispanic and Native American people.. (65% Hispanic, 7% Native American, 27% Anglo, and 1% Other). Many of these are low wage earners or are unemployed. We currently have 27 percent earning below the poverty line and an unemployment rate of 18 percent, according to the Western Environmental Law Center.

There are hundreds of small entrepreneurial businesses in the Taos area. They struggle for survival. Many are "mom and pop" style operations. Many of the potential job losses would be among their employees. When business gets slow around here, the low wage earners are the first to go, i.e. during our off seasons, spring and late fall, the small business owners and managers can cover the duties themselves. Thus the employees are - at least temporarily – laid off. Among these workers would be shop helpers, fast food employees, construction laborers, hotel and motel service, restaurants, ski area gift shops, etc. These are the low income people. Many are minority members. They could become even poorer or unemployed. Potential impact regarding the Environmental Justice for Taos County must be carefully studied before the RBTI-Route D moves forward.

BR-4

000953

Noise: "Noise is generally described as unwanted sound. Unwanted sound can be based on objective effects (hearing loss, damage to structures, etc.), or subjective judgments (community annoyance). Noise analysis thus requires a combination of physical measurement of sound, physical and physiological effects, plus psycho/socio-acoustic effects of the sound's loudness."

P 4-6: The Air Force uses three noise measuring techniques:
1. L-max and SEL = single noise events
2. DNL = Day Night Average sound levels and cumulative energy average noise.
3. DBA=A weighting in decibels.

There are tables, explanations, and diagrams showing SEL and L-max levels, as well as a number of tables, explanations, and diagrams of DNL (pgs. 4-6,4-7,4-8,4-47,4-49, appendix G, p. g-4).
The EIS states that "DNL has emerged as the most widely accepted metric for aircraft noise." P 4-9.

On P. 4-46, the EIS states that the noise levels on the 38 segments of IR-153 would range from less than 45 DNL to 64 DNL, 65 decibels is 50% louder than average conversation

On P. 4-46, the EIS also states that sortie operations on all but three segments of IR-153 could generate SEL's ranging from 86 to 116 decibels.

Appendix G, p. G-2: "A change in sound level of about 10 decibels is perceived by the average person as a doubling (or halving) of the sound's loudness."

Therefore, to an average person, a sound that measured 70 decibels would be twice as loud as a sound of 60 decibels (average conversation). If you do the arithmetic, a sound of 120 decibels would be 64 times as loud to the average person as a sound of 60 decibels. According to pages, 4-6, table 4.1-1, a B-1 at 300 feet AGL produces an L-max of 117 decibels. Table 4-1-3: an SEL of 116 decibels.

Although the DNL measurement is the most widely accepted measurement for aircraft noise, it is clear after careful study of the information provided by the EIS, (and also my own experiences of being overflown), that for these low-level types of flights, the single event level and the L-max factor must be given at least equal weight to DNL averages before the USAF is allowed to move forward with this project.

AO-55

Cultural Resources:

P. 4-122: The EIS states that "the effects of noise on cultural resources may also be related to setting. Noise impacts to Native American traditional cultural properties may be related to interference with ceremonies and other traditional activities at sacred sites. Undisturbed habitats, resources, and settings are considered to be critical to religious practices. Potential impacts can be identified only through consultation with the affected groups."

The USAF has altered RBTI-Route D to avoid the Taos Pueblo and Blue Lake areas as a result of consultation with Taos Pueblo leaders. It is not necessary for the USAF to reveal sacred and religious sites to the general public; however, they must provide assurance that all issues regarding sacred and religious sites have been resolved to the satisfaction of the various Pueblos that were consulted before moving forward with RBTI-Route D.

CU-4

000953

Cumulative Impact:

There are currently numerous low-flying training routes in New Mexico originating from military bases throughout the U.S. When added to the proposed RBTI flight operations, some areas may experience over 6,300 flyovers per year. The USAF must study these cumulative impacts and the cumulative impacts of all low level training flights in the western U.S. in a programmatic EIS.

Public Safety:

The EIS addresses safety issues and on p.4-50, states that "since IR-153 does not currently exist, it is difficult to draw direct comparisons of baseline and projected mishap potential. Secondary MTRs that overlap or intersect segments of proposed IR-153 do provide a rough comparison. Estimated years between class A mishaps on these routes rage from 22-2,800. For proposed IR-153, estimated years between Class A mishaps for B-52's would fall into this range, whereas the potential for B-1's would be slightly greater. However, when considered as probabilities, the estimated years equate to a 0.02 probability of a B-52 Class A mishaps per year and a 0.07 probability for the B-1's."

We know that there have been a number of military plane crashes over the years. There was one incident with a sailplane where the Air Force pilot didn't even see the glider because the difference in speed was so great. The wing wheel of the glider was found in the military aircraft. In our area, there are not only sailplanes but also small private and commercial planes and hang gliders.

No Class A mishaps are acceptable. The USAF must be able to estimate a 0 percent probability for Class A mishaps. Also, the Air Force should provide a list description of all mishaps – Class A and otherwise – that have actually occurred over the lifespan of the military aircraft training programs before it moves ahead with this project. They can't do that in RMS.

In conclusion, in order to formulate my response to the Draft EIS for RBTI-Route D, I have read the report carefully. After having done the research necessary to write this letter, I have discovered that it is possible to use objective criteria and quantitative data in order to arrive at more than one conclusion. From my research, most of which comes directly from the Draft EIS, I conclude that the USAF must further study and resolve many of the issues addressed in the Draft-EIS, including potential harm to endangered, threatened and sensitive species and potential harm to other wildlife, ecology and livestock.

The noise level issue must be re-addressed and made to include L-max and SEL measurements. The public safety issue has not been adequately addressed re: military plane crashes, small aircraft and bird strikes. The study must make readily available to the public a list of all Class A mishaps that have actually occurred over the life of the military aircraft training programs.

The EIS must be made to include a socio-economic and environmental justice report on potential impact to the socio-economic structure of Taos County, New Mexico. Finally the USAF must complete their consultations with the various Native American Indian Pueblos and resolve any issues regarding sacred and religious sites to the satisfaction of each tribal community consulted.

000953

It is clear that all of these issues must be addressed, re-addressed and resolved by the USAF before RBTI-Route D is allowed to move forward.

Sincerely,

ALS
ANI SCHWARTZ

Chama NM

June 14, 1999

Major Brent Adams
HQ ACC/CEVPP
RBTI Project Manager
129 Andrews Street, Suite 102
Langley Air Force Base VA 23665-2769

Dear Sir:

I received a copy of the Draft EIS for the RBTI several weeks ago. I have read it thoroughly and am writing to you today to express some of the concerns I have.

I live in Chama, NM about 15 miles from Segment AB of the IR-153 Corridor. Alternative D of the RBTI will directly affect me and many neighboring communities. I believe it is without question the worst choice of the four alternatives. Even the DEIS states "Alternative D would result in the greatest amount of change from baseline conditions". I believe Alternative D is also the poorest choice for the following reasons:

- It is the only alternative that will result in overflights of Threatened or Endangered Species.
- It is the only alternative that will overfly a nationally designated Wild and Scenic River (Rio Grande) while the approach to the flight corridor will overfly another Wild and Scenic River (Rio Chama).
- It will result in the largest noise increase (up to 64 DNL) for areas under any of the four alternatives.
- The largest number of cultural sites is found under flights in Alt. D.
- The potential for soil erosion on emitter sites is highest under Alt. D.
- It offers the lowest reduction in low value transit times for crews of B-1 Bombers (by a significant margin).
- It will lead to the lowest increase in combat training time of any of the four alternatives.
- There are more candidate emitter sites on Prime Farmland under Alt. D.
- Although not listed in the DEIS, areas under Alt. D are migratory corridors for waterfowl and thereby increase the likelihood of a Bird-aircraft strike.
- It WILL lead to the highest percentage of "Highly Annoyed Population" of the four alternatives.
- It will lead to a major increase in emitted pollutants over sensitive wildlife areas.
- It will intersect jet routes and Federal Airways and require increased airspace management. The other alternatives do not require increased management.
- Low altitude, high-speed aircraft are considered the most annoying to see or hear, this is precisely the sort of aircraft that will be overflying our communities.
- Although they will be directly affected (overflown), there were NO towns or communities in the Chama Valley included in the scoping process. I know for a fact that towns that lie directly under the path of low level flights have no idea B-1 and B-52 bombers might be flying over them in the near future. I think the Air Force has done a great injustice to these citizens.
- Changes of 3 DNL can be perceived as negatively affecting quality of life. Segment AB of the IR-153 Corridor will experience an increase of 15 DNL!

GE-2

The Chama Valley is a very rural area. It is renowned for it's big game hunting, fishing, rafting/kayaking, and other outdoor activities. Many people come here to experience the natural

000954

beauty and scenery of the area. I believe that overflights of large, noisy bombers will result in a significant degradation of these resources and visits by people that come to experience them.

BI-1

The subject of overflights of big game is completely glossed over in the DEIS. Some comment is made to the effect that the effects of direct overflights of Elk and Mule Deer is unknown at this point. I believe that common sense dictates that large animals that are free to roam as they wish will tend to avoid areas where massive, noisy aircraft are flying as low as 300 feet above them and simply move to other areas where they are not overflown. This may not seem like a big issue, but a large percentage of the local economies depend on revenues generated by people coming to hunt and fish in the area. What will these people do when the big game moves on to some other area? How can you claim that there will be "no impacts to socioeconomics" in the area? Page 4-81 clearly states that "Most visitors to these areas would notice the change in noise levels due to aircraft." There are many businesses that depend on visitors and the money they spend in the area. If visitors choose to vacation in some other rural mountainous area these businesses will be severely impacted.

Although the DEIS fails to mention it, the approach to IR-153 dictates that up to 3,020 aircraft a year would be flying over the Rio Chama Wild and Scenic River. The corridor actually begins just east of the river but it is obvious that aircraft do not just "appear" at the start of a corridor, they must fly into it. Since the minimum flight altitude is just 300 feet in the first segment, it is possible that 3,020 B-52 and B-1 bombers a year flying at speeds of over 350 mph may overfly a Wild and Scenic River at altitudes under 1000 feet. This is totally unacceptable. The whole reason people GO to a Wild and Scenic River is to escape such intrusion.

In conclusion, I want to state that I am not "anti-military". I realize that it is important to have an effective and well-trained military. At the same time, I believe that any rational person can see that Alternative D is by far the poorest choice in the RBTI. I hope you will wisely choose another alternative.

Thank you for your time.
Sincerely,

Mark Blakemore

000955

Major Brent Adams
RBTI EIS Project Manager
HQ ACC CEVP
129 Andrews St., Suite 102
Langley AFB, VA 23665-2769

June 4th, 1999

Dear Major Adams,

I am writing as a member of the community which will be impacted by RBTI-Route D. I appreciate the opportunity and feel that it is my responsibility to comment on the Draft EIS for RBTI-Route D. Although I suspect otherwise, I truly hope that this process is taken very seriously by the USAF and not merely as a formality designed to placate the taxpayers in the name of saving taxpayer dollars and national security.

We taxpayers will not see a tax cut as a result of RBTI. Therefore, RBTI will not save taxpayers' dollars. RBTI will save the USAF dollars. While $10,000 per hour for jet fuel is a stunning amount, that amount becomes insignificant when compared with the stupendous cost of our national defense operation. One B-1 costs over $200 million, one B-52 costs $74 million. One B-2 costs $1.3 billion. The Department of Defense appropriations budget authorization for fiscal year 1998 was $251.4 billion. (Horatio Trujillo – Legislative Assistant on Foreign Policy and Economic Policy for Tom Udall, U.S. Representative, New Mexico, __ *Congressional District.)*

Perhaps the need for operations such as RBTI could someday be reduced or even eliminated, saving billions of taxpayer dollars, and strengthening national security by using more energy and tax dollars to help our leaders further develop the techniques, skills, and tools for dialogue and communication in order to wage peace through conflict resolution without violence.

The Draft–EIS bases its findings on objective data and quantitative studies in order to arrive at its conclusions. It also includes advisories from the USFWS and the USFS. It appears that no conclusions were arrived at regarding some of the topics.

In this letter I wish to address some of these sensitive and controversial issues using the data and information I found in the Draft-EIS.

Section 4: Affected Environment and Environmental Consequences:
RBTI-Route D will fly over Mexican Spotted Owl habitats as low as 400 feet AGL, 12 times per day and over at least three active nesting sites for Peregrine Falcons 11 times a day at 400-1000 feet AGL. The bomber route flies over wintering habitat for bald eagles 12-14 times daily below 1,000 feet AGL.

According to the *Bird of Prey and Wildlife Monitoring Study of the Ute Mountain Section of the Rio Grande Gorge* (1986-1989), RBTI will cross two branches of the Rio Grande Flyway for migratory birds of prey and waterfowl. Also, the eastern fork of the Rio Grande is located

000955

directly over the Valle Vidal Unit of the Carson National Forest where a large elk herd is strictly protected and which is managed for its wildlife and recreation opportunities.

p.4-107 "USFWS advisories have stipulated that the Air Force survey unsurveyed owl habitats underlying IR-153, segments AB and EF in order to determine owl populations (if any) and to avoid overflights by 1,600 feet AGL, March 1-August 31 annually." Additionally they have stated that "significant and adverse impacts would occur to peregrine falcons if they are overflown at levels below 1,600 feet AGL," and that" flights at or below 2,000 feet AGL from October 1 to March 1 could result in significant impacts to wintering bald eagles."

The writers of the Draft-EIS, on the other hand, found a number of studies of mammals and birds which they used to state that p.4-106, "Based on these studies, the evidence would suggest that Alternative D flight operations would not result in significant adverse impacts to wildlife or threaten endangered or sensitive species."

Also the safety section, p.4-50, Draft-EIS states that "neither the existing nor the proposed airspace in IR-153 Section AB would overlie or intersect any migration flyways or water bodies where birds congregate." Clearly, the land managing agencies, i.e. USFWS, BLM-USFS, are in conflict with the USAF or FAA regarding their missions. This conflict must be legally resolved in order for RBTI-D to be considered.

BI-5

Socio-Economic and Environmental Justice:

P. 4-109 The Draft-EIS describes socio-economics as "the general features of the economy, including employment, population, and income, that could be affected by the proposed alternatives." It states that "most direct and indirect socio-economic effects would occur in the immediate vicinity of where the electronic scoring sites and emitter sites would be constructed and operated."

P. 4. 109. "The primary measures by which socio-economic impacts were identified include changes to employment, populations, and earnings associated with the proposed alternatives." They detailed their methods, assumptions and calculations in Appendix I.

The Draft-EIS states on p. 4-118, Table 4-4-1 for alternative D: "No measurable impacts to socio-economics. No disproportionate impacts to minority and low income populations."

Taos County and others nearby were not considered in the Study, presumably because of the criteria used. Nevertheless, they could sustain adverse and devastating changes to employment, populations, and earnings as a direct result of the implementation of RBTI-Route D.

BR-4

Livestock would be impacted similarly to wildlife by bomber noise, thereby affecting ranchers and farmers, along with all of their supporting industries, i.e. feed and supply stores, equipment sales, etc.

BR-3

Northern New Mexico is well known as a haven for seekers of solitude and quiet of many kinds. Sportsmen such as hunters, fishermen, trail riders, as well as hikers, bikers, campers, rafters, back-country skiers, snow shoers, families, mushroom hunters, and bird-watchers come from all over the world to enjoy the tranquillity, beauty, and originality of the region, as do people

000955

searching for many types of physical and spiritual healing. We have retreats, spas, and gatherings, in beautiful wilderness settings.

More than 60 per cent of Taos County's fragile economy is based on tourism. The implementation of the RBTI Route D could cause many of our tourists (bread and butter) to find their "peace and quiet" elsewhere, far from the incredibly monstrous and loud machines of war. A reduction in tourism would impact nearly every person and industry in the county: outfitters and tour guides, camping and sporting goods stores, health spas, health professionals, spiritual retreats and healers, as well as all the supporting businesses, such as hotel, motel, bed and breakfast inns, restaurants, gas stations, gift shops, art galleries, movie theaters, and all of their employees (low income).

Similarly to tourism, Taos County's real estate and construction industries could be adversely and devastatingly impacted by RBTI-Route D. In recent years, many people have moved to Taos and the surrounding area to "get away from it all." Many of these people bring money and even the ones who don't contribute to the economy. These people, like the tourists, could take their dollars and find other places to live and retire, thereby impacting not only the real estate market but also the construction industry, one of the stronger parts of our economy at this time. People affected will be bankers, builders, building supply yards and stores, home decorating and furniture stores, and well as tradesmen of all kinds: i.e. plumbers, electricians, plasterers, adobe layers, tilers, excavators, landscapers, painters, laborers, etc.

Property values could fall, not only as a result of fewer people moving to the area because of RBTI-Route D, but also people, such as myself, could choose to leave the area, further jeopardizing our tenuous economy.

BR-4

The socio-economic impact of RBTI-Route D to Taos County and the neighboring counties must be studied before RBTI-Route D is allowed to move ahead.

P4-109: the EIS addresses environmental justice, as defined in Executive Order 12898: "Federal Actions to Address Environmental Justice in Minority and Low Income Populations." It looks at whether an action disproportionately affects these types of populations. According to 1990 census data in the Community Profile Packet from the Taos County Chamber of Commerce, a large portion of Taos County's population is made up of Hispanic and Native American people.. (65% Hispanic, 7% Native American, 27% Anglo, and 1% Other). Many of these are low wage earners or are unemployed. We currently have 27 percent earning below the poverty line and an unemployment rate of 18 percent, according to the Southwest Environmental Law Center.

There are hundreds of small entrepreneurial businesses in the Taos area. They struggle for survival. Many are "mom and pop" style operations. Many of the potential job losses would be among their employees. When business gets slow around here, the low wage earners are the first to go: i.e. during our off seasons, spring and late fall, the small business owners and managers can cover the duties themselves. Thus the employees are - at least temporarily – laid off. Among these workers would be shop helpers, fast food employees, construction laborers, hotel and motel service, restaurants, ski area gift shops, etc. These are the low income people. Many are minority members. They could become even poorer or unemployed. Potential impact regarding the Environmental Justice for Taos County must be carefully studied before the RBTI-Route D moves forward.

BR-4

000955

Noise: "Noise is generally described as unwanted sound. Unwanted sound can be based on objective effects (hearing loss, damage to structures, etc.), or subjective judgments (community annoyance). Noise analysis thus requires a combination of physical measurement of sound, physical and physiological effects, plus psycho/socio-acoustic effects of the sound's loudness."

P.4-6: The Air Force uses three noise measuring techniques:
1. L-max and SEL = single noise events
2. DNL Day Night Average sound levels and cumulative energy average noise.
3. DBA=A weighting in decibels.

There are tables, explanations, and diagrams showing SEL and L-max levels, as well as a number of tables, explanations, and diagrams of DNL (pgs. 4-6,4-7,4-8,4-47,4-49, appendix G, p. g-4).
The EIS states that "DNL has emerged as the most widely accepted metric for aircraft noise." P. 4-9.

On P. 4-46, the EIS states that the noise levels on the 38 segments of IR-153 would range from less than 45 DNL to 64 DNL, 65 decibels is 50% louder than average conversation.

On P. 4-46, the EIS also states that sortie operations on all but three segments of IR-153 could generate SEL's ranging from 86 to 116 decibels.

Appendix G, p. G-2: "A change in sound level of about 10 decibels is perceived by the average person as a doubling (or halving) of the sound's loudness."

Therefore, to an average person, a sound that measured 70 decibels would be twice as loud as a sound of 60 decibels (average conversation). If you do the arithmetic, a sound of 120 decibels would be 64 times as loud to the average person as a sound of 60 decibels. According to pages, 4-6, table 4.1-1, a B-1 at 300 feet AGL produces an L-max of 117 decibels. Table 4-1-3: an SEL of 116 decibels.

Although the DNL measurement is the most widely accepted measurement for aircraft noise, it is clear after careful study of the information provided by the EIS, (and also my own experiences of being overflown), that for these low-level types of flights, the single event level and the L-max factor must be given at least equal weight to DNL averages before the USAF is allowed to move forward with this project.

AO-55

Cultural Resources:

P. 4-122: The EIS states that "the effects of noise on cultural resources may also be related to setting. Noise impacts to Native American traditional cultural properties may be related to interference with ceremonies and other traditional activities at sacred sites. Undisturbed habitats, resources, and settings are considered to be critical to religious practices Potential impacts can be identified only through consultation with the affected groups."

The USAF has altered RBTI-Route D to avoid the Taos Pueblo and Blue Lake areas as a result of consultation with Taos Pueblo leaders. It is not necessary for the USAF to reveal sacred and religious sites to the general public: however, they must provide assurance that all issues regarding sacred and religious sites have been resolved to the satisfaction of the various Pueblos that were consulted before moving forward with RBTI-Route D.

CU-4

000955

Cumulative Impact:

There are currently numerous low-flying training routes in New Mexico originating from military bases throughout the U.S. When added to the proposed RBTI flight operations, some areas may experience over 6,300 flyovers per year. The USAF must study these cumulative impacts and the cumulative impacts of all low level training flights in the western U.S. in a programmatic EIS.

Public Safety:

The EIS addresses safety issues and on p.4-50, states that "since IR-153 does not currently exist, it is difficult to draw direct comparisons of baseline and projected mishap potential. Secondary MTRs that overlap or intersect segments of proposed IR-153 do provide a rough comparison. Estimated years between class A mishaps on these routes rage from 22-2,800. For proposed IR-153, estimated years between Class A mishaps for B-52's would fall into this range, whereas the potential for B-1's would be slightly greater. However, when considered as probabilities, the estimated years equate to a 0.02 probability of a B-52 Class A mishaps per year and a 0.07 probability for the B-1's."

We know that there have been a number of military plane crashes over the years. There was one incident with a sailplane where the Air Force pilot didn't even see the glider because the difference in speed was so great. The wing wheel of the glider was found in the military aircraft. In our area, there are not only sailplanes but also small private and commercial planes and hang gliders

No Class A mishaps are acceptable. The USAF must be able to estimate a 0 percent probability for Class A mishaps. Also, the Air Force should provide a list description of all mishaps – Class A and otherwise that have actually occurred over the lifespan of the military aircraft training programs before it moves ahead with this project.

AO-61

In conclusion, in order to formulate my response to the Draft EIS for RBTI-Route D, I have read the report carefully. After having done the research necessary to write this letter, I have discovered that it is possible to use objective criteria and quantitative data in order to arrive at more than one conclusion. From my research, most of which comes directly from the Draft EIS, I conclude that the USAF must further study and resolve many of the issues addressed in the Draft-EIS, including potential harm to endangered, threatened and sensitive species and potential harm to other wildlife, ecology and livestock.

The noise level issue must be re-addressed and made to include L-max and SEL measurements. The public safety issue has not been adequately addressed re: military plane crashes, small aircraft and bird strikes. The study must make readily available to the public a list of all Class A mishaps that have actually occurred over the life of the military aircraft training programs.

The EIS must be made to include a socio-economic and environmental justice report on potential impact to the socio-economic structure of Taos County, New Mexico. Finally the USAF must complete their consultations with the various Native America Indian Pueblos and resolve any issues regarding sacred and religious sites to the satisfaction of each tribal community. Carson Head

000955

It is clear that all of these issues must be addressed, re-addressed and resolved by the USAF before RBTI-Route D is allowed to move forward.

Sincerely,

Betsy Schwartz

000956

Major Brent Adams
RBTI EIS Project Manager
HQ ACC/CEVP
129 Andrews St., Suite 102
Langley AFB, VA 23665-2769

June 4th, 1999

Dear Major Adams,

I am writing as a member of the community which will be impacted by RBTI-Route D. I appreciate the opportunity and feel that it is my responsibility to comment on the Draft EIS for RBTI-Route D. Although I suspect otherwise, I truly hope that this process is taken very seriously by the USAF and not merely as a formality designed to placate the taxpayers in the name of saving taxpayer dollars and national security.

We taxpayers will not see a tax cut as a result of RBTI. Therefore, RBTI will not save taxpayers' dollars. RBTI will save the USAF dollars. While $10,000 per hour for jet fuel is a stunning amount, that amount becomes insignificant when compared with the stupendous cost of our national defense operation. One B-1 costs over $200 million, one B-52 costs $74 million. One B-2 costs $1.3 billion. The Department of Defense appropriations budget authorization for fiscal year 1998 was $251.4 billion. (Horatio Trujillo - Legislative Assistant on Foreign Policy and Economic Policy for Tom Udall, U.S. Representative, New Mexico, __ *Congressional District.*)

Perhaps the need for operations such as RBTI could someday be reduced or even eliminated, saving billions of taxpayer dollars, and strengthening national security by using more energy and tax dollars to help our leaders further develop the techniques, skills, and tools for dialogue and communication in order to wage peace through conflict resolution without violence.

The Draft–EIS bases its findings on objective data and quantitative studies in order to arrive at its conclusions. It also includes advisories from the USFWS and the USFS. It appears that no conclusions were arrived at regarding some of the topics

In this letter I wish to address some of these sensitive and controversial issues using the data and information I found in the Draft-EIS.

Section 4: Affected Environment and Environmental Consequences:
RBTI-Route D will fly over Mexican Spotted Owl habitats as low as 400 feet AGL, 12 times per day and over at least three active nesting sites for Peregrine Falcons 11 times a day at 400-1000 feet AGL. The bomber route flies over wintering habitat for bald eagles 12-14 times daily below 1,000 feet AGL.

According to the *Bird of Prey and Wildlife Monitoring Study of the Ute Mountain Section of the Rio Grande Gorge* (1986-1989), RBTI will cross two branches of the Rio Grande Flyway for migratory birds of prey and waterfowl. Also, the eastern fork of the Rio Grande is located

000956

directly over the Valle Vidal Unit of the Carson National Forest where a large elk herd is strictly protected and which is managed for its wildlife and recreation opportunities.

p.4- 107 "USFWS advisories have stipulated that the Air Force survey unsurveyed owl habitats underlying IR-153, segments AB and EF in order to determine owl populations (if any) and to avoid overflights by 1,600 feet AGL, March 1-August 31 annually." Additionally they have stated that "significant and adverse impacts would occur to peregrine falcons if they are overflown at levels below 1,600 feet AGL," and that" flights at or below 2,000 feet AGL from October 1 to March 1 could result in significant impacts to wintering bald eagles."

The writers of the Draft-EIS, on the other hand, found a number of studies of mammals and birds which they used to state that p.4-106, "Based on these studies, the evidence would suggest that Alternative D flight operations would not result in significant adverse impacts to wildlife or threaten endangered or sensitive species."

Also the safety section, p.4-50, Draft-EIS states that "neither the existing nor the proposed airspace in IR-153 Section AB would overlie or intersect any migration flyways or water bodies where birds congregate." Clearly, the land managing agencies, i.e. USFWS, BLM-USFS, are in conflict with the USAF or FAA regarding their missions. This conflict must be legally resolved in order for RBTI-D to be considered.

BI-5

Socio-Economic and Environmental Justice:
P. 4-109 The Draft-EIS describes socio-economics as "the general features of the economy, including employment, population, and income, that could be affected by the proposed alternatives." It states that "most direct and indirect socio-economic effects would occur in the immediate vicinity of where the electronic scoring sites and emitter sites would be constructed and operated."

P. 4-109 "The primary measures by which socio-economic impacts were identified include changes to employment, populations, and earnings associated with the proposed alternatives." They detailed their methods, assumptions and calculations in Appendix I

The Draft-EIS states on p. 4-118, Table 4-4-1 for alternative D: "No measurable impacts to socio-economics. No disproportionate impacts to minority and low income populations."

Taos County and others nearby were not considered in the Study, presumably because of the criteria used. Nevertheless, they could sustain adverse and devastating changes to employment, populations, and earnings as a direct result of the implementation of RBTI-Route D.

BR-4

Livestock would be impacted similarly to wildlife by bomber noise, thereby affecting ranchers and farmers, along with all of their supporting industries, i.e. feed and supply stores, equipment sales, etc.

BR-3

Northern New Mexico is well known as a haven for seekers of solitude and quiet of many kinds. Sportsmen such as hunters, fishermen, trail riders, as well as hikers, bikers, campers, rafters, back-country skiers, snow shoers, families, mushroom hunters, and bird-watchers come from all over the world to enjoy the tranquility, beauty, and originality of the region, as do people

000956

searching for many types of physical and spiritual healing. We have retreats, spas, and gatherings, in beautiful wilderness settings.

More than 60 per cent of Taos County's fragile economy is based on tourism. The implementation of the RBTI Route D could cause many of our tourists (bread and butter) to find their "peace and quiet" elsewhere, far from the incredibly monstrous and loud machines of war. A reduction in tourism would impact nearly every person and industry in the county: outfitters and tour guides, camping and sporting goods stores, health spas, health professionals, spiritual retreats and healers, as well as all the supporting businesses, such as hotel, motel, bed and breakfast inns, restaurants, gas stations, gift shops, art galleries, movie theaters, and all of their employees (low income).

Similarly to tourism, Taos County's real estate and construction industries could be adversely and devastatingly impacted by RBTI-Route D. RE: A Realistic Psychological Assessment of the Impact of Bomber Flights in Northern New Mexico

Dear Major Adams:

Like many, if not most, residents of Taos County, NM, I have been dismayed by the prospect of additional air flights over the county, especially by low-flying, relatively loud and large planes. Recently, as I watched and listened to a low-flying United States Air Force plane make a couple of passes over me and the nearby Taos airport, I wondered whether the impact of such flights had been realistically assessed in terms of the psychological reality of the human animal.

Having been a professor of experimental psychology for the last 39 years, I am keenly aware that the psychology of debated issues governs the ultimate success of their resolution. Because I have some understanding of how at least some aspects of psychological impact should be assessed, I'd like to share that understanding with you, just in case these thoughts may strengthen or clarify some of the implications of the bomber initiative and the reaction to it.

I am particularly concerned that decision-makers understand the source of much opposition to the bomber training initiative, and that they not dismiss it as local or idiosyncratic to people of a particular region. The opposition arises from basic and universal human factors that should not be ignored. Though much more could be said, I'll limit this analysis to a brief discussion of only a few factors.

1. The first factor, the absolute sound level of overflights in decibels (dB), must be acknowledged because of its overriding importance, but only in passing since it has necessarily been adequately addressed. I understand peak intensities are anticipated to be high, but not high enough or sufficiently prolonged to cause pain or neural damage. That anticipation is comforting for one's physical well-being, but it is not useful for assessing the psychological impact of sound below thresholds of pain or damage.
2. Much more relevant is the *relative* sound level, that is, the sound intensity relative to the ambient or background sound intensity. A sound of, for example, 80 dB varies greatly in its impact depending on the background ambient level of sound. If the ambient level is already

000957

high, a noise of 80 dB might evoke little or no reaction. However, imposed on a very quiet environment, the same sound would be highly distracting, causing the person (or other animal) to attend to it at the expense of all other activity. Other activity would ordinarily be disrupted, at least temporarily.

BR-1 Thus, a proper psychological assessment of a sound must consider the *relative change in intensity* of sound, not just its absolute peak value. In fact, for sounds below around 85-90 dB, relative intensity is the only relevant intensity factor. The *percentage change* in sound intensity from a background level must be considered the most crucial measure of psychological impact. And, it is easily calculated.

The importance of relative stimulus intensities has long been recognized, at least since the last century when Ernst Heinrich Weber and Gustav Fechner roughly quantified it in the so-called Weber-Fechner law. Relative intensity, or change in intensity, is crucial for all the sense modalities, not just audition. And, in the last century, it has become increasingly clear the nervous system is built in many ways to detect and be particularly sensitive to changes or contrasts in stimulation. Changes, after all, are usually the signs of impending events of importance for any animal, including a human one, and good adaptation requires alert scrutiny of them.

3. The last factor I'll mention is that of the psychological value or worth of something, its "goodness" or "badness." Our attitudes, voluntary acts, and decisions are governed by the values we attach to things. This cannot be overemphasized.

However, as with stimulus intensity, it is not absolute value, but *relative value* that is critical. Value is assessed relative to need or expectation. A dollar bill may be of great value to a child or a pauper, but virtually worthless to a person of wealth. A new automobile would seem of great intrinsic value, but it would be a serious disappointment to one expecting something more or different. In general, the degree of pleasure or displeasure, emotional excitement, or stress experienced from an event depends greatly on one's prior expectations and experience. The hubbub of Manhattan may be exhilarating or maddening if you are from New Mexico, but a non-event to one raised in Boston. A single mosquito may be totally ignored by a resident of the South, but a matter of considerable irritation to a desert dweller. Furthermore, it is not just humans that react in this way: All higher animals judge items of significance to them, such as a piece of food or a mate, relative to their experience and need.

The implications of the latter two of these factors are clear.

1. Bombers flying over Taos county would cause a great *relative* disturbance. The ambient level of sound over most of the county is very low; any sudden, fairly loud sound would be sensed as unduly obtrusive. The same flights over New York or Chicago or near a breaking surf might not even be noticed. Virtually all sensitive creatures, particularly the human ones, are going to be acutely aware of the overflights.
2. Because the people of Northern New Mexico, as well as more than 150,000 visitors yearly from all over the world, have become accustomed to or expect a quiet and peaceful environment--many having been attracted to the area because of exactly that peaceful environment--the value of the flights will be perceived as highly aversive. Their relative aversiveness will be further exacerbated by the well-recognized fact that the

000957

Taos area possesses a unique constellation of cultural, physical, and climatic assets. In short, it is a national treasure and showcase to the world.

Given that assessment, the overflights will be seen as more than just aversive, but indeed a national disgrace. This sort of aversiveness produces genuine distress. I emphasize its genuineness, because some might be tempted to consider it "phony" or liken it to something concocted in an advertising agency. Just because it is "psychological" does not mean it is not real or without actual physical consequences on the body. Incidentally, this distress will then become translated into very negative attitudes toward the United States Air Force and probably lots of related institutions and activities.

The upshot is, if the flights proceed in this area, there are going to be many very angry citizens, angry because of genuine psychological factors that are universal to humans, and not whimsical or peculiar to Northern New Mexico. These factors apply to persons in other areas, too, of course. However, the level of anger and genuine distress will be particularly high in Taos county because of high levels of *relative* aversiveness coupled with high *relative* noise levels. Multiply that level of distress by the number of people affected, and then consider the negative effect on potential visitors (affected by the same relative factors as residents), and there are good, real reasons for people here to be unhappy.

We trust the decision makers will not forget the function of the armed forces is to protect national treasures, not degrade or destroy them. National treasures, by their nature, are psychological treasures, and relative assessments are critical for all matters psychological.

Sincerely,

H. Wayne Ludvigson, Ph.D.

RE: AIR FORCE REALISTIC BOMBER TRAINING INITIATIVE

TY APPROXIMATELY 25 YRS AGO, TWO FRIENDS AND I HAD A HUNTING LEASE OF ABOUT 3600 ACRES 20 MILES SOUTH OF BIG LAKE, TX. ON THE SHANNON ESTATE. EACH FRIDAY WHEN OUR SONS LEFT SCHOOL UNTIL SUNDAY EVENING WE WERE AT THE LEASE. WE OBSERVED DEER, SCALED QUAIL, WILD TURKEY AND JAVALINA HOGS BOTH IN THE PASTURE AND AT OUR FEEDERS. CATTLE WERE ALSO IN THE PASTURE. AIR FORCE PLANES USING TERRAIN FOLLOWING RADAR CAME OVER AT 100 TO 200 FT SEVERAL TIMES A DAY. THEY WERE ON US AND GONE SO QUICKLY WE HEARD THEM FOR JUST A FRACTION OF A SECOND. THE CATTLE AND GAME PAID NO ATTENTION WHATSOEVER. THE DEER WOULD FLICK THEIR TAILS, LOOK SKYWARD THEN GO BACK TO FEEDING. OUR REACTION WAS ABOUT THE SAME AS TO A SMALL UNEXPECTED NOISE SOME 30 FT. AWAY.

Frank B. Webb, M.

MIDLAND, TX.

6/10/99

To Major Brent Adams:

I am strongly opposed to the low level bombing training route over Scurry and surrounding counties (Lancer, option B, in the DEIS). I think the noise will disturb both humans and animals and it will endanger small aircraft. It will also impact property values in that hunters will no longer lease land for hunting. Please use the thousands of acres of air space already under your control.

BR-4

Sincerely,

Drew Bullard

Langley AFB, VA 23665-2769

Dear Major Adams:

I am opposed to the Air Force's proposed RBTI known as Lancer – Option B in the DEIS. My concern(s) about the proposal and the DEIS are as follows:

My family and I have endured decades of nuisance noise and activity, especially while living near Dyess A.F.B. in Tye, Buffalo Gap and other areas of Taylor and Fisher Counties. Any increased activity would be a gross misapprehension of the impact on humans, livestock and wildlife in some of the more valuably remote areas of Texas. Continued illegal "sonic booms" have damaged my own families property (i.e. every piece of china in Kitchen cabinet), the low-level and other flights are a threat to the many migrating birds and, furthermore, enough public land has already been usurped in other states.

BI-2

Sincerely yours: Brandon Young

HQ ACC/CEVPP,129 Andrews Street, Suite 102
Langley AFB, VA 23665-2769

Dear Maj. Adams:

TY I am still opposed to the RTBI. There was no viable alternative presented. One viable alternative that should have been presented was to move these flights to be flown over currently owned federal government lands. These flights should not be conducted over private property, over state highways and freeways, and certainly not where any people could possibly be.

Sincerely,
A. Sforza, MD

Langley AFB, VA 23665-2769

Dear Major Brent Adams,

I am writing to voice my opinion about the Draft Environmental Impact Statement for the Realistic Bomber Training initiative, which was put out on March 19th. I feel this plan is unfair and unjust! As a resident of the Big Bend for 18 years, I have witnessed an ever-increasing amount of military flights over my home and work. With 800 other locals consisting of over one million square miles where training can take place, why must our lives in the Big Bend be sacrificed and subjected to the noise, pollution, and violations? We become military game targets to the pilots who find play in buzzing our homes, even to the point where we can see into the cockpit of their low flying planes. A close friend of mine who rounds-up maverick cattle deep in the desert tells me of the dangers he's had to deal with when his horses and the wild steers get spooked due to these bomber flights. It is noted that the German government has banned these low-level flights in Germany. Admiral Eugene Carroll of the Center for Defense Information testified that the training continues because it "justifies flight hours, training funds, and it's fun for the flight crews".

AF-25 Excuse me, but I do believe our taxes pay for your salaries and training funds, and I do not appreciate sacrificing our safety, standard of living and peace of mind so your pilots can " have fun" practicing tactics which have been abandoned since the Persian Gulf War.

Outside of my personal preferences, I look with great concern toward the environmental impact and safety issues caused by these flights. Independent noise experts and pollution experts state that the RBTI Draft EIS is a beautifully presented document, BUT the environmental information is flawed. I know many people who moved here due to their environmental-diseases, hoping to avoid the air borne pollution which is so prevalent in more populated areas. There are also many organic gardeners and the spent fuel residue from these low-level flights will not be dissipated as with higher elevation flights, not to mention the dangers of potential brush fires should an aircraft crash. The military holds no accountability

BR-2 for the tragedies occurred in its wake, as demonstrated by the gondola event in Italy. Potential dangers are increased to civilian, Border Patrol, and Customs pilots, as there is no "see and avoid" with jets or bombers travelling that fast.

I have looked over the four alternatives offered in the RBTI, and find none of them acceptable. Even the "no-action" alternative shows flights all over West Texas on illegally formed military training routes. Why are the training flights not restricted to military owned bases? Why will the Marines, Navy,

PD-22 Coast Guard also be allowed to train in the designated routes? What will prevent these acquired routes from being exploited by increasingly military use?

GE-29 In addition to the concerns I have expressed here, I want it known how dissatisfied I was/am with

GE-22 the whole procedure used for the Scoping and Public Hearing Process here in West Texas. There was not

GE-23 adequate notice of when the meetings were to be held: only one newspaper notice, and no radio announcement. Even in that, the Air Force notice stated that the Alpine Public Hearing would last until 5:00, and at 3:00 the Air Force personnel had changed clothes, packed up and were loading to leave. The Air Force prevented all interested parties from hearing everyone else's opinions, experiences, and knowledge. There was no recording of the "one on one" dialogues with the Air Force personnel. Therefore, it did not become part of the official documents. I was appalled with the opening statement that stated "the terms of engagement" for the meeting, like we were engaged in some kind of war! As a US citizen I demand my right for a fair and open hearing process, and that the people representing the military be decent and have some kind of integrity in their contact with the citizens of this country.

Janelle Brady

Janelle Brady

Terlingua, Tx

TY LOW LEVEL BOMBING IS A THING OF THE PAST USE KOSOVO AS AN EXAMPLE. ALSO WE DON'T NEED ALL THAT POLLUTION.

WE NEED THESE YOUNG MEN IN THE SCOUTING PROGRAM. THEY WILL BE OUR FUTURE LEADERS. WHAT YOU NEED IS A BETTER REASON FOR LOW LEVEL BOMBING, AND YOU CAN'T FIND ONE. LET THESE YOUNG BOYS & MEN ENJOY GOD'S CREATION. LET THEM HIKE, CAMPOUT, LEARN TO GET ALONG WITH EACH OTHER & TO RESPECT WHAT GOD HAS CREATED.

JUST LEAVE THIS 10 SQUARE MILES OF GOD'S CREATION AS IT IS.

Respectfully Yours
D. P. Hunter

Dear Major Adams,

BR-6 I am writing to request your firm support in opposing the selection of "Alternative D" under the USAF's proposed Realistic Bomber Training Initiative (RBTI) involving low flying B-52s and B-1s (as low as 300'). As one of several proposed southwestern routes, "D" traverses Philmont Scout Ranch in northeastern New Mexico's Colfax County. Philmont, truly a national treasure, is the 137,000 acre backpacking and training facility of the Boy Scouts of America. I do not protest RBTI since it is a valuable program – my only complaint, as a Philmont alumnus, is with the proposed route over Philmont.

Several years ago, the USAF ceased its low altitude F-16/F-111 flights over the Ranch as a result of Philmont protests. RBTI's multiple daily flights (up to 16) will create much more severe problems:

a) Program: Philmont is a transient community of 25,000 people with over 3,000 campers in Philmont's back country every day in the summer. Daily, several hundred of them are engaged in spar pole climbing, rock climbing and rapelling, and horse back riding. The sudden roaring of jet engines will distract climbers and bolt horses thereby creating injuries (or worse).

b) Environmental: Appreciation and protection of the wilderness are key parts of Philmont's program. RBTI is inconsistent with wilderness preservation. RBTI will have a damaging effect upon both the unique western wildlife and Philmont herds of cattle, horses, burros, and buffalo. The effect of the unburned portion of jet fuel in the engine exhaust or dumped fuel itself, vaporizing and falling to ground level is as yet unknown, but believed to be anything but beneficial.

c) Safety: The environmental impact study done for the USAF is seriously flawed when it describes Philmont as an "uninhabited" grassland. The smaller portion of Philmont's acreage is prairie. Most of Philmont is mountainous with many peaks in the 10,000 to 12,444' range. Philmont has a tremendous fuel load of dead trees in its forests, and is in the midst of a long term drought. Open fire bans are in effect now. A crashing bomber will create an epic fire of Yellowstone proportions. B-1s and B-52s do not have enviable safety records. The nature of the flights (weaving around mountain peaks and facing violent weather, including frequent, low-level wind shears) dramatically increases the chance of a crash. Unfortunately, Philmont does not have a well-developed highway system for evacuations in case of massive forest fires.

There is too much at stake to allow RBTI to overfly Philmont. Please act now – final route determination starts in June.

Thank you for helping to see that alternative D is not selected.

Sincerely,

Virginia Haynes

Virginia Haynes

Langley AFB, VA 23665-2769

Dear Major Adams,

BR-6 **I am writing to request your firm support in opposing the selection of Alternative D under the U.S. Air Force's proposed Realistic Bomber Training Initiative (RBTI).** The Air Force is seeking to establish a new training route for low-level B-1 and B-52 bomber flights from bases in Texas and Louisiana. One of the proposed routes, Alternative D, traverses Philmont Scout Ranch in northeastern New Mexico's Colfax County.

Philmont is a 137,000 acre mountain backpacking and high adventure facility of the Boy Scouts of America. Each year, thousand of Scouts and their adult leaders from across the nation participate in two-week wilderness backpacking trips in the mountains of Philmont. Many of them also camp and work on conservation projects in the adjacent Valley Vidal Wilderness of the Carson National Forest.

The Air Forces proposed Alternative D would establish a military training route directly over most of Philmont. More than 2,600 flights each year, some as low as 300 feet above ground level, are proposed for the segment of Philmont. As my son plans to go to Philmont in two years, I have serious concerns about the impact of the Air Force's proposal on the health and safety of him and other Scouts attending Philmont as well as the potential effects of daily low-level flights on the ranch itself.

On any given day in the summer, as many as 5,000 Scouts and Scouters will be hiking and camping in Philmont's backcountry. Each day, several hundred of them will be engaged in activities such as rock climbing and rappelling, spar pole climbing, and mountain horseback rides. The sudden roar of jet engines has a high likelihood of distracting an inexperienced climber or causing a horse to bolt on a narrow mountain trail with resulting serious injury or worse.

Appreciation and protection of the wilderness and our natural resources is a key part of the Philmont program. Scouts from around the world have a unique opportunity to see and experience wildlife in native habitat. Noise and emissions from bombers can not help but have a damaging effect on that wildlife, as well as on Philmont's herds of buffalo, horses, cattle and burros. The disruptive effects of noisy bomber overflights on Philmont's famous living history programs, in which Scouts experience the lifestyles of the West's mountain men, homesteaders, lumberers and cowboys, are obvious.

Most of Philmont is mountainous with many peaks in the 10,000 to 12,000 ranges. Philmont has a tremendous fuel load of dead trees in its forests and is in the midst of a long-term drought. Unburned jet fuel finding its way to the ground or being dumped in an emergency over such terrain, with campers using backpacking stoves for cooking, creates the potential for a serious fire that would endanger hundreds of lives. The possibility of a crash, however remote, is simply not acceptable for the safety of these Scouts.

For these reasons, I seek your help in advocating the selection of a different RBTI route, I ask that you express your opposition to Alternative D to the Secretary of the Air Force and other defense officials who may be involved in this decision. Please act now, as the public comment period ends in June and a final decision will be made this year. You or a member of your staff may wish to contact Greg Dodd, Chief of Staff for Congressman Ed Pease of Indiana, who can provide additional information.

Philmont is the largest and most famous Scout camp in the world. It is a national resource that has positively impacted the lives of hundreds of thousands of our nations' youth for more than sixty years. It deserves and demands our protection. Thank you for helping to see that Alternative D is not selected.

Sincerely,

Kathryn J. Murphy

RE: Realistic Bomber Training Initiative

Dear Maj. Adams,

I'm writing to oppose RBTI.

TY I respectfully request that the Air Force consider using existing MOAs in more remote areas for low-level bomber training.

I've heard that the rationale for using West Texas skies for RBTI includes the fact that there are bombers stationed at bases which are relatively far away from existing MOAs. Rather than to disrupt life in our tranquil West Texas, please consider looking at relocating the bombers.

Sincerely,

Steven W. Brooks, Ed.D.

This is a letter of complaint about the unfair actions of the United States Air Force and their Realistic Bomber Training Initiative on the Toone Family and other residents in our area of southern Reeves County.

We are not against the United States Air Force or the training that is absolutely necessary for the pilots and other personnel , but we feel the training could be done elsewhere, possibly over more isolated land that already belongs to the United States Government. **PD-4**

Today is the last day to protest your low flying war machines that come over our area. We thought the problem had been solved at the meeting in Pecos when the officer in charge assured us that we were not on the route and that we would not have any more bombers coming over our home and farms. But that was not true. The bombers have been regularly flying over us.. Yesterday, June 15, at 10:27 a.m., there was another flight just a tad to the west of our home, but we got the noise and the black stuff that comes out of your jet.

Then, low and behold, at 10:37 a.m. another low-flying bomber came directly over our home and we got an even louder, horrific noise and even more of your black stuff spread over the our home, our farmland, our ground water, and the all the folks in the surrounding communities.

The day became night and at 10:07 p.m., the LOWEST-FLYING war machine we had ever had flew directly over our home and this time everything in our home shook as if we were experiencing an earthquake. I cannot think of any words to describe the sound. It seems as if there were millions of noises all wrapped up into one horrifying sound. It was horrible. My neighbors a quarter of a mile away were awakened by the sound, too. I talked to folks in Balmorhea and they talked about how low and loud the bomber was and about windows rattling. Not only do you fly over homes, in Saragosa you fly over the Head Start and scare the four-year-old children, and in Balmorhea you fly over the school and disrupt classes.Why do you want to do this stuff to us?

P.2/2
Toone

000969

You cannot imagine what misery and suffering all these flights heap upon us. We, in this area, feel we are being discriminated against because we live in small-populated area, farmers, ranchers, and residents of small Hispanic communities like Verhalen, Saragosa, Brogado, Balmorhea, Toyahvale, and Toyah. You are absolutely guilty of taking away our Constitutional right to peace and tranquility.

BR-5 Your taking control of our air space is another violation of our rights. If you, the Air force gets its way in this matter, what is there to keep you from coming to southern Reeves County and taking acres of our crop lands, or place your men in peoples' homes so the men "will be closer to the practice area"? Is this not your stated reason for not using the already available United States Government land? The people's Constitution states there will be "...no quartering"... so it seems to me, a little old lady in Saragosa area, that you are in violation.

AO-11 Perhaps the most awful thing you are doing to us is polluting our area with the jet fuel residue you leave all over our land. You are already doing a great injustice to us with the three or so flights a day and night. And now you want to increase it to ten. Do you have no conscience? This jet fuel will ruin our health, our groundwater, our wildlife, our Lake Balmorhea and the new bird watching area, and our Balmorhea State Park swimming pool at Toyahvale. Our lives, as we once had before the low-flying bombers, will never be the same.

RE: Realistic Bomber Training Initiative (RBTI), Draft Environmental Impact Statement (DEIS)

To Whom It May Concern:

I am writing to express my concerns regarding the RBTI Draft Environmental Impact Statement (DEIS). After much study and deliberation, I find the RBTI DEIS to be unfair and unjust. My objections include but are not limited to the following:

GE-10

* the RBTI DEIS and it's scoping and public hearing processes are not in accordance with the National Environmental Policy Act (NEPA).

Many of the concerns I heard expressed at the scoping meetings were NOT addressed in the DEIS.

NEPA 1500.1 (a) "Section 102 (2) contains 'action-forcing' provisions to make sure that federal agencies (USAF) act according to the letter and spirit of the Act."

GE-22 The public hearing held in Alpine was NOT well publicized and the notice in the paper did not make the format of the meeting clear. Times were listed for a morning and afternoon session.

GE-23 The 'open house' was held during the morning hours and the 'public hearing' began shortly after the start of the afternoon session at 1:00p.m. I arrived at 1:00p.m. and was thus ***UNABLE to get my questions answered satisfactorily*** before the 'hearing' was called to order.

The military judge (Col. Berg?) presiding over the Public Comment portion of the hearing was hostile and intimidating in his demeanor and had a chilling effect on the proceedings as he

000970

Page 2

exerted his authority and explained the "rules of engagement" for our public comments. He went on to instruct us NOT to ask any questions during our 3 minute comment period and stated that he would decide when and if our comments were to be limited or curtailed.

My understanding of the public hearing process is that it is my opportunity to voice my opinion and have my comments on the DEIS made a part of the record to be considered in the preparation of the Final EIS and in the decision making process.

A quote from the inside cover of the RBTI DEIS states, *" The hearings provide an open forum for discussion of the initiative and its alternatives and provides a direct feed back mechanism for the public and agencies to orally address or submit written comments directly to the Air Force. We provide a written response to all of the written issues submitted during the public comment period as well as the issues presented at the public hearings."*

GE-30 I feel I was denied this open forum for discussion, that my questions went unanswered and that the presiding military judge attempted to intimidate those of us desiring to make public comments. This colonel is obviously used to giving orders. He needs to be reminded that we, the people, don't take orders from him. He is here to protect and serve our country and it's citizens.

GE-23 Two final complaints about the public hearing: The published notice stated that the afternoon session would be held from 1:00p.m. to 5:00p.m.; however, after the public comments ended, Air Force personnel were turning late arriving people away at the door, while other USAF personnel were changing into civilian clothes and packing up to leave at 3:00p.m. Some of these citizens had traveled great distances to attend a meeting they believed would be an open house until 5:00p.m.

GE-11 Also, I do not believe that simply mailing a copy of the Final EIS to all who make written comments serves as a "written response" or satisfies the "letter and spirit" of NEPA as outlined above. The NEPA process is designed to allow the public to be fully informed and to participate in these decisions. The way in which the USAF has handled these proceedings has not allowed either full disclosure or public participation in the way that NEPA intends.

* the DEIS contains numerous seriously flawed studies which are then used to justify conclusions of "minimal or negligible impact" or "no impact" of the RBTI to our living environment. These findings are extremely controversial.

Again, to quote the CEQ for NEPA, Section 1500.1 (b): *NEPA procedures must insure that*

000970

Page 3

environmental information is available to public officials and citizens before actions are taken. The information must be of high quality. Accurate scientific analysis, expert agency comments, and public scrutiny are essential to implementing NEPA. Most important, NEPA documents must concentrate on the issues that are truly significant to the action in question, rather than amassing needless detail. Section 1500.2 : *Federal agencies shall to the fullest extent possible: (b) Implement procedures to make the NEPA process more useful to decisionmakers and the public; to reduce paperwork and the accumulation of extraneous background data; and to emphasize real environmental issues and alternatives.*

AO-62 I do not feel that these requirements have been satisfied. The air quality analysis data relies heavily upon the Multiple Aircraft Instantaneous Line Source (MAILS) Model which assumes a mixing height of 5000 ft. for the various emissions and pollutants. These Low Level Realistic Combat Training Flights (LLRCTFs) will be occurring at altitudes of 200 ft A.G.L. I do not believe that the LLRCTFs are in compliance with the Clean Air Act.

AO-65 I believe that there are Environmental Justice issues that must be addressed. I do not accept the adjusted noise levels as a basis for the finding of "No Impact" on the human environment. The "Onset-Adjusted Monthly Day-Night Average Sound Level" is simply an attempt to finagle the figures down to the 65 dB "acceptable level" thus freeing the USAF from having to mitigate the effects of flights with a verifiable noise impact of up to 120 dB. The DEIS states *"The lands under the affected airspace currently support higher proportions of these* (minority and low-income) *groups than is found, on average, nationwide."* I believe that

SE-5 minority and low-income populations ARE being subjected to noise levels of 65 dB or higher; therefore, further assessment of environmental justice IS warranted.

* The designation of RBTI Alternative A as a "No Action" alternative is deceptive and misleading.

Alternative A has undergone several significant modifications from what was initially presented and later published in *RBTI Newsletter One - January 1998* to the form it appears in

PD-23 with the publication of the DEIS. These changes have NOT been clarified or explained to the public. The use of the words "No Action" to describe Alternative A are deliberately deceptive.

AF-26 This "No Action" Alternative would result in an increase in the number of sorties and types of aircraft flown, at altitudes as low as 200 ft. A.G.L. Modification of existing air space is ongoing. I have personally witnessed three different maps of IR-178 in use by USAF personnel since 1996.

000970

Page 4

* The presentation of RBTI Alternative D: IR 153/ MT. Dora as affecting only New Mexico is deceptive and misleading.

Alternative D is represented graphically on a map of New Mexico. No where in the presentation of this alternative is the continued use of IR-178 in West Texas highlighted. Only by reading through the entire DEIS, did I discover that under Alternative D, LLRCTFs will continue in west Texas.

* There are many other issues in the DEIS that I could address, but allow me to proceed to what I feel to be the most important issue: Air Safety & Air Space Management

As a resident of south Brewster county for the past six years, the issues of Air Safety and Air Space Management are what I have found to be most disconcerting when dealing with the USAF and their LLRCTFs. My residence is located near IR-178. I have witnessed many air space and air safety violations committed by USAF pilots training on this MTR.

Since July of 1996, I have been requesting that my residence be designated a Noise Sensitive Area (NSA) on your maps and flight charts. I was assured by Mr. Don King at the Holloman scoping meeting in Alpine that this would be done and that it would cause flights occurring directly over my house to cease. I was also instructed to call and report any further violations so that pilots could be reprimanded and these unsafe practices halted.

Not only have these violations continued, but I never received so much as a return phone call for all my efforts and expense. At the RBTI scoping meeting in February of 1998, I again attempted to rectify this situation. My location was again noted on your maps and I was again told that these illegal unsafe flights would stop. I was shocked to discover that the width of the MTR corridor of IR-178 had somehow expanded during the past two years so that now my residence was under the MTR. No USAF personnel could tell me how or when this expansion had occurred, but all agreed that it was irrelevant since my home was a NSA and would be avoided by all pilots flying the MTR.

In June of 1998, I was contacted by Captain Greg Meyers of Dyess AFB. He wanted to come to my residence with his military GPS equipment so that he could plot the exact coordinates of my location on the USAF maps and flight charts. This was done and I was told that the information would be published within 90 days. Captain Meyers also asked my husband if he knew of any land for sale in the area. Captain Meyers stated he wanted to purchase 15 acres. He never mentioned that this would be for the Electronic Emitter & Scoring Sites for RBTI.

000970

Page 5

In April of 1999, I attended the public hearing in Alpine for the RBTI DEIS. Major Meyers was there and was unable to find the GPS coordinates he had taken 10 months earlier noted on his maps or in the flight charts. I gave the coordinates to several USAF personnel at the map table and proceeded into the hearing room as the hearing was being called to order.

On April 29, 1999, an incident occurred involving 2 B-1 Bs, one of which was directly over my residence and flying at so low an altitude that I could see the pilot in the cockpit. This incident was reported to Dwight Williams at Dyess AFB. He said that he would speak to the offending pilots and get an explanation from them. He also stated that since the meeting in Alpine on April 10, 1999 that all pilots had been instructed to avoid my residence by an altitude of 1000 ft. A.G. L. and a distance of 1/4 mile. He could not verify whether the coordinates of my location had been included for publication with the most recent maps and flight charts. These maps and charts are updated every 54 days. I do not think it unreasonable to expect that this information, gathered one year ago, should be published by now.

BR-2 I also do not feel that it is unreasonable to demand that pilots flying these Low Level High Speed Combat Training Flights be expected to **stay within their designated air space and follow the accepted international, FAA and Military Flight Regulations.** When pilots are allowed to violate these rules, they endanger my life, the lives of my family, my property and my community. ***THIS IS NOT ACCEPTABLE - especially in a training situation.***

Air Space and Air Safety violations also endanger civilian aviation in our area. There are numerous small private landing strips in the area surrounding IR-178. LLRCTFs are a real danger when they are miles outside of the designated air space.

Both the Air Safety Officer and the Assistant Chief of Air Operations for the Marfa Sector of the U.S. Border Patrol (INS) have expressed grave concerns regarding the potential for mishaps and air space conflicts when INS agents are flying missions and unexpectedly encounter USAF aircraft outside of the MTR. I am told that INS was contacted about RBTI and that a letter was drafted (why was it not included in the DEIS??) outlining a plan to minimize these conflicts, but that the agreed upon ongoing communication from USAF personnel necessary to coordinate these missions was not happening.

Again, this is simply unacceptable. If LLRCTFs were occurring only when and where they are supposed to, this would not be an issue. Conflicts of air space would occur only when INS needed to cross the MTR and communication with ATC could prevent even that. The fact that a few renegade pilots can endanger the lives of Border Patrol pilots, private pilots, tourists and residents is unconscionable.

000970

Page 6

Must we have another tragedy with loss of lives before this issue is adequately addressed? The recent incident at Aviano, Italy, only serves to highlight the systemic nature of this problem. Within the USAF, it is cultural - a problem of mentality - if you will... "Aim High" push the limits, etc... These pilots are considered 'top gun', elite and, in the past, they have answered to no one. This might be acceptable EXCEPT where CIVILIANS & PRIVATE PROPERTY are endangered! In the wake of the Aviano tragedy, I must ask: where are RESPONSIBILITY, ACCOUNTABILITY AND LEADERSHIP?

Gentlemen, I support our nations' military personnel and understand their need for adequate training to maintain a strong defense and the freedoms we all cherish. However, we are not a nation at war. We are not a nation under siege. The citizens of Brewster county, Texas are not here for target practice and I do not choose to live in a war zone.

The USAF currently conducts these same types of training missions in Utah and South Dakota. Alternative A will continue to use facilities in Arkansas and Colorado. I see no reason to subject additional citizens and private lands to the negative impact these missions have on our living environment.

Further, it has been stated that this type of low altitude training has been rendered obsolete and unnecessary in light of current technology and sophistication of ground-fired anti-aircraft weapons. The tactic of low-altitude flying in actual combat situations as already been abandoned and the USAF did NOT use these tactics in the Persian Gulf war. No other NATO country even allows these low level combat training flights. Low Level Combat Flights have not been allowed in Kosovo or anywhere in Europe. I can see no reason to subject United States citizens in the sanctity of their private property to this invasive activity.

Currently, on IR178 in Brewster county, Texas, B-1 bombers from Dyess AFB are the most frequent offenders, committing air safety violations on a regular basis.

Until the USAF can demonstrate responsible use of air space and accountability to the citizens they serve, I must protest, in the strongest possible terms, any attempt to expand these missions. ***I therefore OPPOSE RBTI in all four of the stated Alternatives.***

I will be in close contact with Congressman Bonilla and Senator Hutchison in Washington, D.C. The USAF has shown themselves to be unresponsive to our valid concerns. We will push to have funding for these missions stopped unless and until compliance and accountability are restored.

I anxiously await you thoughtful reply!

Karen Reimes

Major Brent Adams
RBTI EIS Project Manager
HQ ACC/CEVP
129 Andrews Street, suite 102
Langley AFB, VA. 23665-2769

Dear Major Adams:

First and foremost I am for the best trained Air Force in the World but these eight counties are not the place to do it!

As President of HEPA and land owner:

GE-24 #1: I am opposed to the Air Force's proposed RBTI known as Lancer - B in the DEIS. My concern(s) about the proposal and the DEIS are as follows: Their has been NO study in our area ever! For all the paper in the DEIS, no one ever stepped foot on our land or looked at our economy when preparing the study. All of the conclusions were based on broad assumptions.

BR-4 #2:No one knows the full effects on the economy of our small towns if they were to be cut off from the use of private planes. Boll Weevil Programs and Aerial Spraying Services with our area under a Perpetual Bombing Raid. These eight counties economy cannot stand NOW what the Air Force states as minimal hindrance let alone maximum hindrance. What CEO of a large company is going to start a new business in these eight counties.

#3: As a rancher and businessman who operates about 50,000 acres I have had to diversify in order to stay profitable. I have 3 legs that are the main support or my operation.

A: Intensely managed set of cows. I sell around 1200 high quality feeder calves each year. Because of the methods I use to ranch I am able to sell to specialty meat operations that bring a higher premium than generic cattle.

B: Our horse breeding and training operation which is renowned world wide demands top dollar in this industry. While running them on the range we are very vulnerable to stampedes through fences as well a danger to us and our personnel.

000971

C:Hunting and entertaining is a big business in this day and time. I generate about 15 percent of my income from this activity. I lease 16,000 acres to a professional dog trainer who pays me above market price for the PEACE and QUIET of this ranch to train his top young dogs on.

We have just completed about 6 weeks of intensive cow work out on the range with a cow crew. At one point we worked 7 days sorting out and gathering 450 head of cows and calves. We were very vulnerable to any disruption particularly on the day of delivery. Five big trucks all the way from Iowa waiting to load the calves, everything had to go just right. If a bomber had flown over us at low-level and startled the herd, all our work would have been in vain.

We are out on the ranch every day, working cows and calves, shipping, training horses, moving and balancing our cattle for conservation reasons as the rain and weather dictates.

I know its hard for the average layman to comprehend what an intense business this is and success is achieved ONLY by top management and control of the working environment. With bombers flying overhead it is very hard, if not impossible to control a herd of cattle.

We must also address what this low-level bomber training will do to the value of our land.

I am concerned that the draft EIS did not adequately address these issues.

Sincerely,

Buster Welch

Major Brent Adams
RBTI EIS Project Manager
HQ ACC/CEVPP
129 Andrews Street, suite 102
Langley AFB, VA 23665-2769

Dear Major Adams:

For a long time now we have read and studied your Draft Environmental Impact Statement, and do not agree with many things in it. The study is flawed, and of course was slanted in favor of the Air Force; was not done by independent professionals qualified in the highly specialized field to work on the facts to arrive at unbiased conclusions. No one has talked to us or been to study the effect of low flying bombers on our fragile environment, wild life etc.

You have flown various types of planes over our property for a good many yrs all without permission or notice, but not in great numbers and not as low as now. Once, long ago, I considered the bombers somewhat of a novelty and exotic, but no more. Now they are a great menace, affecting us in many negative ways such as noise, pollution and fright.

BR-5 You are violating our basic rights as private property owners, spoiling the clear airspace above our land and contaminating our beautiful, pristine County in general; all without compensation. We have rights in the sub-surface beneath the land and the air space above it, but your planes come low directly over our house in increased numbers and you are telling us you will add more flights. This is a travesty of Justice. Please Consider our rights. Your Impact statement is a cruel farce to us private land owners who had a right to choose this lovely area with peace and tranquility to live in all our days and then pass it on to Children and Grand Children. We don't believe such low level flights are a necessary part of your training program, and know it could Logically be done elsewhere with less invasion of privacy. Please Consider moving the route elsewhere.

Respectfully Yours

Jack E. Brown

REALISTIC BOMBER TRAINING INTITIATIVE

Public Hearing Comment Sheet

Location: 9 miles SW Marfa or 25 miles NE Ft Stockton
Date: 15 June 1999

Thank you for providing your comments on the Realistic Bomber Training Initiative Proposal.

For several years low level Training flights by the Military has flown over my ranch where I live. On more than two occasions I have called Dyess AFB, Texas as well, An Air Force in Barksdale, La. I believe it was I complained about low level Aircraft flying over my residence as well as frightening cattle causing the cattle to run over my fence & ruining it & entering A neighbors ranch. Each party who answered my Telephone call was very polite & assured me Agent would return my call. No one called me

AF-15 If these low level flights continue I demand compensation for their consequence

Betsy L. Brown June 14, 19

Marfa, Tx.

000974

Dear Sirs,

This is to inform you that I strongly object to the proposed Air Force RBTI. I also object to the current number of flights that the Air Force is making in IR-178. According to the draft EIS, since overflights have been made in this area since the 1940's, there is no change in the environment & it is a negligible change. This statement is a farce! Until the mid 1990's there were fewer than one flight a month that came over my house. Now are more often three or four flights in one day that come directly over or very close to my home. This is a very definite & drastic change, which does have a very negative impact on our quality of life. I also believe that this has to have a negative impact on birds, animals, hunting, tourists and visitors. The draft EIS states that the Air Force is planning to increase the flights in IR-178 by over 1000 flights annually, and quite possibly to have them fly at even lower altitudes. This is really unconscionable. We are pleased that we have properties and not private

PD-4

by a majority of people who have attended the meetings which is hard to argue that there are better alternatives. Until the Air Force could find a better solution that the Air Force should make every effort to find a more acceptable solution for training their pilots.

Sincerely

Betsy L. Brown

REALISTIC BOMBER TRAINING INTITIATIVE

Public Hearing Comment Sheet

Location: Alpine Texas
Date: April 10th 1999

Thank you for providing your comments on the Realistic Bomber Training Initiative Proposal.

Dear Major Adams and whomever may be concerned:

As an interested party living in the Trans-Pecos of Texas I am writing to protest the totally unfair proposed "Realistic Bomber training initiative". I believe the Department of Defense & the U.S. Air Force flying 500 ft above ground level is trespassing over private property and will create a negative environmental impact over the privately owned property. I also believe more information needs to be given to local landowners & private citizens about plans for such training who will be exposed to excessive noise that can be deafening and chemical pollutants that can kill.

Please reconsider your plans for the bomber training out in the Trans Pecos area.

129 Andrews Street, Suite 102
Langley AFB, VA 23665-2769

Dear Major Adams,

We feel the Environmental Impact Statement (EIS), Draft Stage, of the Realistic Bomber Training Initiative (RBTI) is unfair and unjust.

The Scoping process and meetings and the Public Hearings for the Draft RBTI did not comply with the National Environmental Policy Act (NEPA) requirements. We attended the Fort Davis "Community Meeting" in December 1997 and all of the scoping meetings and public hearings in Snyder, Big Lake, Pecos, Van Horn and Alpine for this proposal.

There was not adequate notice of the meetings. There was no real "meeting". The "Open House" format prevented all interested parties that did find out about the meetings from sharing their experiences, questions and knowledge with everyone present. The media did not hear what everyone had to say. The charming Air Force public relations personnel could not/would not answer any questions about the environmental impact on the people on the ground or the real dangers of non-military pilots sharing the same airspace with these bombers and their jet fighter escorts. None of the Open House exchanges between the Air Force and the citizens was recorded so the decisionmaker will not have access to those statements.

GE-30

The 3-minute time limit for comments with no questions allowed during the public hearings was a direct violation of NEPA. In July 1997, during the public hearings for the Draft EIS for the Proposed Expansion of German Air Force Operations at Holloman AFB, New Mexico there was a panel of 5 to 7 military personnel that we could address questions to in a real meeting. The presiding officer running the meeting stated that they would be there "until the last question was answered". That was complying with the NEPA--making sure that the impacted public fully understood the proposal. (Of course, the military could afford to do that back in 1997 because the public did not have any background information and did not know what questions to ask. More recently, with this RBTI, the military is dealing with a more educated and less tolerant public. This has made them go to the "non-meeting" and "open house" formats in order to try to keep the people

GE-6

000976

confused and in the dark about the real effects this proposal will have on them.)

The RBTI Draft itself is a beautifully-presented document but the contents are flawed. The military continues to use incorrect studies and data that justify their position. Independent noise experts and pollution experts inform us that this data is a farce and a fiction.

No where in this draft, or any others we have analyzed, is there a true accounting of how these Low Level Combat Training Flights affect the safety, livlihoods, quality of life or the mental and physical health of the impacted public.

The whole draft is fraught with misleading statements that could be vigorously disputed by anyone who has experienced one of these Low Level Realistic Combat Training Flights.

The required No-action alternative, Alternative A, appears to be trying to justify the present illegal use of part of the airspace in West Texas. Parts of the illustrated routes are not found on aeronautical maps used by non-military pilots.

The military will not provide us with a Programatic EIS to give us the big picture of what they want to do to our area. Their piecemeal actions of adding more planes, then expanding more military airspace, then adding more planes, etc. is a direct violation of the NEPA.

We want our military to have the best training available. Locating these "Realistic" flights over the human environment is unreasonable. You are stomping on our constitutional rights by proposing to subject us to this war time experience.

Respectfully,

Kay Kelley

GE-24 We are entitled to an environmental assessment on one and each and alternatives to all construction and maintenance procedures.

And the big picture of telling ourselves that the way to settle our problems is to bomb God Kill. This is a terrible role model for our age where violence is prevalent. To kill is to take away a life that God has given us Creator and to kill any one of our earth or Contaminate Earth and water is suicide as you fail free to kill the earth. Our mother provider, shelter, loves all great and small what matters how many studies done on each DoD or DoE test ranges no study can bring back a life be it bird, fish or human. The migratory bird treaty must be being violated by this proposal Q. Does it affect other alternatives for the Rio Grande and what other flyways - the great plains

BI-2 migratory birds can be inspected by all July alternatives I liked the suggestion for an alternative to move these planes close to Nevada or Wyoming maybe some new ideas for non violent crisis management.

AO-27 The Rio Grande gorge is the biggest fault on our continent it is a cliff. The reverberation and wake force of military flights can destabilize the rocks of boulders and fall on the people who engage this wild and scenic habitat. The way noise effects tourism is one thing but being bombed by falling rocks will cause big trouble.

Thank you for providing your comments on the Realistic Bomber Training Initiative Proposal.

I personally believe that these airplanes effect the weather by increasing wind velocities and causing wind directions. The wind storms are quite serious those tornados might be accelerated by passing jet wakes, heavy wind and dust blows always. Hold power. How do you think dust clouds on the surface these impact the airplanes. Have dust analysis considered the cumulative with to include pesticides (obsolete) pesticides, jet fuel fallout, nuclear fallout, acid rain, and the dangerous new studies in climate control experiments. These cumulative impacts endanger most, if not all species and adversely impact our health. Add this to the panic nervous system response to the loud noise terror torment. Over for more space →

So Enclosed is a map of the WIPP Routes for radioactive waste and you need to note the places where bomber flights cross these highways. Also you need to research and map the over land routes of Nuclear weapons and note where bomber flights would interact these in each alternative too, along with the potential environmental impact. I feel that the emotional impact is huge as folks feel threatened, invaded and violated by the noise and brute force, this must be acknowledged and understood. Social I hope our planet and nation will turn to peaceful ways of dealing with our precieved problems and humanity will become evolve to be kind & humane, to live in peace,

Thank you

Thank you for providing your comments on the Realistic Bomber Training Initiative Proposal.

TY As a Co-ordinator of an Organization that deals with issues of radioactive dumping, & object to locating the realistic bomber training initiative in our state, New Mexico, which has a high level of nuclear activity. Since airplanes land on highways in emergencies, the fact that bombs and nuclear waste are traveling on our highways should eliminate us as a candidate for this program. This should also be true of any area where nuclear bombs are being transported or tested or where nuclear waste is being transported or stored.

REALISTIC BOMBER TRAINING INTITIATIVE

Public Hearing Comment Sheet

Location: Taos, New Mexico
Date: April 8 1999

Thank you for providing your comments on the Realistic Bomber Training Initiative Proposal.

I absolutely oppose RBTI Alternate D! I implore you to choose A - no action.

Alternate D would severely and negatively impact many aspects of Northern New Mexico. Alternate D low level flights would significantly degrade and disrupt our environment, our economy, our quality of life, and our precious historical and spiritual cultural sites.

Low level bomber flights would markedly disrupt our ecology, wildlife, and environment in areas including:

- Carson and Santa Fe National Forests
- Rio Grande Wild & Scenic Rivers Area
- Urraca and Elliot Baker Wildlife Areas
- Cimarron Canyon, Villanueva, and Summer Lake State Parks
- Kiowa and Rita Blanca National Grasslands
- Philmont Scout Ranch

These beautiful and environmentally fragile areas are enjoyed by New Mexicans and thousands of visitors to our state. Of course, these areas are home to

Page 2

000979

BI-5 numerous wildlife and livestock. Bombers flying low over peregrine falcon and mexican spotted owl habitats, could send these birds into extinction in our area. The U.S. Fish and Wildlife Service has advised you (the Air Force) that flying any craft under 1600' less than a mile away is extremely harmful for these species.

BI-5 Also, bomber flights (about 10 per day!) below 1000' over Bald Eagle wintering habitat (October → march) could significantly harm our Bald Eagle population.

BI-1 Besides the various bird species, other wildlife such as elk, deer, and antelope herds would be disrupted by the frequent low level bombers. Bison and

BR-3 livestock would also be impacted. Bison have an extremely acute sense of hearing.

The adverse and potentially devastating effects on our economy in this region is also reason enough to abandon Alternative D. Your Draft EIS Appendix I "Socioeconomics" only talks of the construction dollars and handful of jobs that could come about from Alternative D.

BR-4 It seems you completely ignore our tourist based economy. Taos county unemployment rate of 18% and 23% of the population living below the poverty like means that we cannot afford to loose any of our tourist economy.

My business relies on 95% on tourists to the Taos area. Clients often comment on the peaceful serenity here. If our quiet rural setting is altered, many of us could be "wiped out" financially. Year round people come from all over to enjoy our outdoors, and not just in all the areas (forests, parks, scenic areas) that I mentioned on the first page. People enjoy quiet days and a deeply restful sleep without blasting decibels of bomber aircraft. Enclosed are two charts from Draft EIS Appendix G: Noise. These charts show the unacceptability of low level flights.

Page 3

000979

To fill our skies with 2,600 flights per year, six days a week which would include night flights, will surely impact our tourism. The miniscule positive construction economic impact is far outweighed by the detrimental negative economic impact of RBTI Alternative D.

The distress and disruption that tourists will notice will be magnified by those people living directly under and in close proximity of the route and flight corridor. The people living in Ocate, Anton Chico, Mosquero, Wagon Mound, Clayton, Roy, Abbott, and Mount Dora will all be appalled at the severe degregation of their quality of life if low level bombers are to fly directly overhead. When I lived in Albuquerque near the airport, the inssedible noise of military aircraft from Kirtland AFB was so much more disruptive than commercial aircraft. There are many more people beyond those specific towns I listed that will suffer if Alternative D is approved.

Northern New Mexico is fortunate to be home to many historical and spiritually rich cultural sites. Alternative D emitters and scoring sites would affect 4 prehistoric sites, 4 isolate prehistoric sites and 1 historic sight. Plus, living cultural sites would be affected such as Taos Pueblo, Santa Clara Pueblo, San Juan Pueblo, Picuris Pueblo and Jicarilla Apache Reservation. Many of the Pueblo structures are made of adobe brick and mud mortar

CU-1 and mud plaster. Vibration from bomber noise would accelerate decay of the very homes of these people.

No one can put a price on the quality of life and the spiritual affinity that many of us enjoy and cherish in Northern New Mexico. Please do not endorse RBTI Alternative D!

Thank you,

Kristen M. Hall

Major Brent Adams, RBTI EIS Project Manager
HQ ACC/CEVPP
129 Andrews Street, Suite 102
Langley AFB, VA 23665-2769

Dear Major Adams,

I feel the Environmental Impact Statement (EIS), Draft Stage, of the Realistic Bomber Training Initiative (RBTI) is unfair and unjust.

As a patriotic American I must voice my concern regarding the ways in which the Air Force has dealt with the public with regards to this issue. Though our small community is spread out over many miles, local people received no notice of the Air Force's plans regarding our area. Perhaps you could have considered radio announcements and placed several notices in all our area newspapers. Luckily, vigilant citizens used the proper channels to contact citizens and did what government agencies ought to have done – informed the public of the Air Force's plan.

GE-22

I write to you today to voice my specific concerns regarding the increase in military flights in West Texas. As a resident of the tranquil Terlingua Ranch, I have long enjoyed the solitude and peace of West Texas. It has been the intrusion of military flights that have interrupted our seclusion. The noise has disturbed many of my neighbors, their families, and their livestock.

As an educator and child advocate, I am concerned with the effect these flyovers will have on the property values in Brewster County. Our tax base is small enough, and devalued property could seriously affect school revenues in already under-funded districts.

The number one industry in South Brewster County is tourism, and these flyovers will affect the experience of our visitors. People from around the country and around the world come to Big Bend to "get away from it all." Big Bend is one of few places left in our country that is free from the hustle and bustle of the city, from the throngs of people, the noises of traffic and airports. The increased flights in our area will influence the impression visitors have of our area, and may deter future visits. The noise will impact birdwatchers, horseback riders, cyclists, campers, and hikers, Americans who work hard and hope to find a brief respite from the sounds and aggravations of "civilized life". I am especially concerned about the welfare of the many civilian pilots that visit our area. The many reports of USAF pilots veering off their routes is alarming to the civilian pilot, who would have little time to react if he/she found him/herself in the wrong place at the wrong time.

BR-4

000982

But, my concerns are greater than those that related to my personal comfort and local affairs. Frankly, I am disturbed that West Texas is becoming a training area for pilots from all over the world. I find it odd that the United States government would train foreign military personnel around our borders. I am disturbed to discover that some of these countries do not allow this type of training in their own countries and I question why my own government would sacrifice the security, health, and tranquility of its own citizens to the training of foreign pilots.

As a member of a variety of international organizations I understand the desire of the United States government to assist in the training of pilots with whom we will work. But, I know that there are many other areas where this training could take place. The military has access to hundreds of thousands square acres under government jurisdiction. Why does the USAF insist upon disturbing the tranquillity of West Texan private landowners?

For these reasons, and a few others I wish to restate that I believe that the proposed RBTI is **unfair** and **unjust**. I do not believe that the USAF has respected the concerns of American taxpayers and landowners. West Texas is historically a very patriotic place. Local citizens would not express so much concern and outrage over these proposed flights if we felt that it would somehow assist our national security. But, the USAF has not yet put energy into finding an alternative that we can all live with. Please, Major Adams, I implore you. Reconsider all the options and relocate these flights (if deemed necessary) to government-owned land. Preserve the unique silence of the desert and the solitude and seclusion that must prevail. Thank you.

Sincerely,

Bernadette Devine

16 June 1999

Maj. Adams,

Thank you very much for the professionalism and courtesy that you and your team have shown throughout the EIS process.

I'm including my final written comments on the RBTI Draft EIS. Please include these as part of the final EIS.

In addition, I'm including a copy of the sectionals that cover the entire route for Alternative D. While the full copy is for your team's use, I'd greatly appreciate it if you would publish the entire route map that I've provided at full size. Although it will take eight to ten pages (8½" x 11"), this will allow people to see just where the route runs in relation to their homes and the places that they love. It will also help satisfy the complaint by many citizens, including Sen. Jeff Bingaman, that the USAF's maps have shown insufficient detail.

I'm also forwarding a copy of a letter written by the BLM to the USAF requesting "no flyovers between April 15 and September 15 in the Ute Mountain area." As it happens, the northern-most leg of Alternative D directly overflies Ute Mountain. Although the BLM's letter was submitted during the USAF RBTI scoping process, it was not included in the "correspondence section of the draft EIS.

In addition, I'm including a list of seventy-one questions and sub-questions. Some, but not all, of these were addressed by the draft EIS. As you can see, I compiled the list prior to the draft EIS being published.

000983

Included also are copies of an address and phone number list that individuals can use for writing their legislators and other individuals who can help defeat Alt. D.

Dive also included an RBTI fact sheet which summarizes a list of reasons for opposing Alternative D. Please publish each of these items in full.

As Dive stated publicly, I do not oppose RBTI — rather, I oppose Alt. D. RBTI makes sense as you seek to provide realistic training for your aircrews. However, I'm convinced that the devastating impact of Alt. D on Northern New Mexico's environment, economy, and quality of life, outweighs the training and operational benefit to the USAF.

Again, thank you,

Richard D. Williams, Major, Ret.
U.S. Air Force Reserve

Mai. Richard D. Williams, Ret.
, Taos, NM

27 April 1998

Lt Col Wheeless,

Thank you for the courtesy and professionalism that you and your team demonstrated during your April visit to New Mexico. I've put together a list of questions, comments, and requests which follow.

Questions:

AO-63 1) What is the full length of the route prior to the B-1's turning into the Mt. Dora MOA? It appears that the B-1 route is approximately 310nm and that the B-52 route is up to several hundred nm longer.

AO-63 2) What is the full length of the entire route including the portion which the B-52's will fly after the B-1's turn into the Mt. Dora MOA?

AO-63 3) What is the minimum route corridor width? Maximum corridor width?

AO-63 4) What is the total number of square nm of land that falls below the B-1 route corridor? Below the entire corridor included the extended B-52 route?

AO-63 5) Are you restricted to using existing air routes in the Moreno Valley (Angel Fire) Area? In order to keep your promise to the people of Angel Fire that the RBTI, Alt. D route, would be at least 5nm from Angel Fire, would create a route section not using an existing air route?

AO-63 6) What will be your minimum route corridor width in the Moreno Valley area?

AO-64 7) Where will the emitter sites be located?

AO-64 8) Will the DOD seek to place the emitter sites on public or private land?

AO-64 9) How far apart will the emitter sites be located?

10) How will the bomber aircrew receive feedback from the emitter sites? Electronic pod? Radio receivers? Verbal/visual debriefing on the ground?

11) How will the electronic sites score the aircrew performance? Info based on visual/optical sighting? Transponder data? Electronic pod carried by aircraft?

AF-28 12) Will there be any weapons or ordnance of any kind stored at the emitter sites?

000983

13) What electronic frequency bands and strengths will the emitter sites use for acquisition, targeting, ECM/ECCM, etc.?

14) What electronic frequency bands and strengths will the aircraft use for acquisition, targeting, ECM/ECCM, etc. during the route and upon entering the Mt. Dora MOA?

AF-27 15) What effect will the electronics used as part of RBTI or by aircraft participating in RBTI missions have on the existing radio, tv, satellite, microwave, and other electronic systems currently in place?

PD-24 16) How will the land for the emitter sites be obtained? My understanding is that the Federal Government will offer to purchase the land, and that if the current owner refuses to sell, that it will be legally condemned and taken? Is that correct?

AF-29 17) Will there any ordnance of any kind, nuclear or conventional carried on board the aircraft flying the RBTI route?

AF-29 18) Will aircraft carrying ordnance for a live bombing mission ever be diverted to fly the RBTI route while carrying live ordnance?

AF-29 19) Will aircraft carrying nuclear, biological, or chemical weapons ever fly the RBTI route?

AF-29 20) Will the aircraft carry any kind of payload/additional weight to simulate the combat weight of an aircraft carrying bombs?

21) Some years back, a USAF bomb was found in a farmer's field near Roy, NM in the Mt. Dora MOA. Was that bomb live? Conventional or nuclear? How long had it been since it was dropped there? What type of aircraft dropped it? What type of mission was the aircraft on? What has been done since to prevent similar incidents in the future?

AF-29 22) Where will the simulated weapons delivery area be for RBTI aircraft? Somewhere along the route or in the Mt. Dora MOA?

AF-29 23) Will the bombers be participating in ACT/DACT or other training during which other aircraft simulate attacking them during the route? After entering the Mt. Dora MOA?

24) If so, will the attacking aircraft ever be carrying any type of ordnance? If so, conventional or unconventional and what type?

PD-14 25) Will the night missions involve night vision goggle training? If so, will pilots be flying under visual or instrument conditions during night missions?

PD-14 26) Will the daytime missions be under visual or instrument conditions?

AF-31 27) What are the weather and visibility minimums for aircraft flying on the RBTI route? Within the Mt. Dora MOA?

AF-32 28) When will 300' AGL be used as the minimum altitude? When will 500' AGL be used as the minimum altitude?

PD-15 29) What will be the training level of pilots/aircrews flying on the RBTI routes?

000983

PD-15 30) Will RBTI be connected with initial B-1 or B-52 training programs? Are the bombers stationed at each Dyess AFB, TX and Barksdale AFB, LA assigned to operational squadrons or training squadrons?

PD-16 31) During which hours will the USAF fly missions along the MTR proposed for RBTI? Within Mt. Dora MOA?

AO-65 32) Will there be any supersonic missions along the route or within the Mt. Dora MOA?

AO-65 33) What airspeeds will the B-1's fly along the route? B-52's?

AO-5 34) Under what conditions would the B-1's dump fuel? Under what conditions would the B-52's dump fuel? How will the USAF insure that fuel dumped during emergency or other procedures is cleaned up? How will the USAF comply with the "Clean Waters Act" regarding either emergency or non-emergency fuel dumping?

AO-66 35) What chemicals are contained in the fuel? What are the chemical ratios of these chemicals?

AO-16 36) What HAZMAT considerations, precautions, and procedures must local agencies observe if responding to a plane crash as part of RBTI missions? What would be the risk to "first on the scene" Search and Rescue personnel, and what precautions should they take? Firefighter and ambulance crews? Others?

AO-1 37) What chemicals and pollutants are in the exhaust of each B-51's and B-52's? What are the chemical components and ratios of these pollutants? What will be the amount of pollution created by each B-1's and B-52's per hour while flying on the RBTI route and within the Mt. Dora MOA? How will the USAF comply with the "Clean Air Act"?

38) At 300' how much reaction time would the aircrew have to an emergency prior to crashing? What if the emergency involved loss of flight controls?

AF-6 39) Will the data received by the emitter sites be provided to the FAA to help ensure that aircraft are within the flight corridor and at, or above, minimum assigned altitudes? If not, then what accountability will the aircrews have to insure they comply with airspace restrictions?

BR-3 BR-5 40) What impact will the flights have on cattle, sheep, chickens and other livestock at farms and ranches along the route? What means of compensation will the USAF use for compensating farmers, ranchers, and individuals who suffer losses due to RBTI? What agencies will handle the compensation for these losses and what are the mailing addresses and phone numbers for those agencies?

AF-8 41) What agencies should individuals contact to report aircraft that they feel are below or outside of corridor boundaries? What are their addresses and phone numbers?

GE-31 42) What agency will be responsible for scheduling RBTI and Mt. Dora MOA operations? What is there address and phone number?

000983

CU-1 43) What effect will the low-flying aircraft have on adobe structures to include homes, pueblos and kivas?
CU-4 44) How will the USAF mitigate the impact to cultural and religious practices by the Taos Pueblo Indians and others?
45) Will the RBTI EIS be a comprehensive EIS including past, present, and future activities of a similar nature?
GE-32 46) Will the RBTI EIS be programatic, that is, to include not only USAF flight activity, but also Air Force Reserve, Air National Guard, Navy, USMC, and Army flight activities on past, existing, and proposed fight training routes and activities?
PD-16 47) Will the RBTI missions be limited to certain days of the week or open to flying Monday through Sunday of each week? Will there be a moratorium on flying on any days of the week?
AO-41 48) Will Air National Guard/Air Force Reserve/Navy/USMC/Army flights conducted within the RBTI route count against the 2,660 maximum number of missions proposed for RBTI?
GE-1 49) What is the total proposed cost for RBTI? How does this break down? Does this include flying and operational related costs?
AO-64 50) Will the emitter sites be manned or unmanned?
SE-4 51) How many jobs, if any, will RBTI create in New Mexico? Will these positions be filled by military, civilian, or DOD contract personnel?
SE-4 52) How much revenue, if any, will RBTI bring to New Mexico?
53) What benefits, if any, will RBTI offer the people of New Mexico?
BR-4 54) Since RBTI is likely to reduce the attractiveness to tourists, lower property values, and affect ranching (thereby reducing the ability of the people of northern New Mexico to make a living) does this create a tacit taxation—that is a special tax on a subset of the population through which the people of northern New Mexico will in effect pay a higher price for national defense than people in other areas?
55) Can the USAF/DOD legally withdraw RBTI, Alternative D, from the "area of consideration" prior to completion of the Draft RBTI EIS? If so, at what level could such a decision be made and by whom? What is the address and phone number for that individual/agency?
56) What is the operating cost per hour for each a B-1 and B-52 flying at 300' to 500' AGL?
PD-1 57) Citizens attending the initial RBTI meeting in Santa Fe, NM were told by USAF representatives that the USAF has sufficient training routes and areas in existence now, but that RBTI is needed to resolve the scheduling conflicts of existing airspace and routes. Is this true? If so, where are those conflicts and what options have been explored?
PD-1 58) Why does the USAF need RBTI?

000983

AO-67 59) Is it true that the USAF has 4-6 bomber sorties per day flying the existing air routes which fall within RBTI alternatives B and C (in Texas) now?
60) What benefits, if any, will RBTI bring to northern New Mexico?
GE-29 61) Would a new EIS be required for aircraft other than B-1 and B-52 aircraft to use the RBTI route and the Mt. Dora MOA?
AO-67 62) What is the current usage of each existing air route which will comprise the RBTI alternative D route? Alternative B and C routes?
AO-67 63) What will be the resulting increase in usage for each route?
AO-67 64) What has been the previous usage for the routes along each of the proposed alternatives? Please provide documents reflecting the actual use showing using agencies, types of aircraft, numbers of sorties and flights, altitudes, etc.
BI-10 65) How will the USAF comply with the "Migratory Bird Treaty"?
CU-6 66) How will the USAF comply with the "Historical Preservation Act"?
AF-35 67) Has the USAF ever had any reported incidents of B-1 aircraft going supersonic without authorization? If so, when and how was this resolved?
AO-65 68) What effect would unauthorized supersonic B-1 flights have on the pueblos, kivas and adobe homes in northern New Mexico?
BR-1 69) How does the USAF measure noise impact as part of the RBTI EIS? How have the USAF's noise study techniques been changed since the Brooks AFB document declaring that the USAF's noise models and techniques were inadequate, was used in court against the USAF?
BR-1 70) Will the RBTI EIS noise impact studies involve actual measurements at various places along the route or use computer models?
AO-68 71) Does ACC use a set dB level for noise studies or measure the difference between the existing noise level in the environment and the noise level created by the bombers?

000983

Thanks again for the professionalism that you and your team have shown, and thanks again for your assistance with the above.

LETTER WRITING CAMPAIGN TO DEFEAT RBTI-ALERNATIVE D

It is vital that people comment at U.S. Air Force hearings and send written comment to: **Major Brent Adams, RBTI EIS Project Manager, HQ ACC/CEVP, 129 Andrews Street, Suite 102, Langley AFB VA 23665-2769.** The comment period will run until mi June.

Equally important are letters to politicians and government agencies in opposition to RBTI-Alternative D.

WHO TO WRITE TO:

U.S Senator Pete Domenici
Washington, D.C.

U.S. Senator Jeff Bingamon
3
Washington, D.C.

U.S. Rep. Tom Udall
Washington, D.C.

F. Whitten Peters
[address as "Secretary Peters"]
Acting Secretary of the Air Force
Washington, D.C.

Federal Aviation Administration
Southwest Regional Headquarters
Attn: Don Day
Ft. Worth, TX

Pres. Bill Clinton
The White House
Washington, D.C.

Gov. Gary Johnson
Office of the Governor
State Capitol Building
Santa Fe, NM

Typed or handwritten letters have more impact than email or phone calls

000983

Healing the Sacred Silence

Snow-capped mountains—Blood of Christ, you touch the hand of God.
You're watching over Taos, your infant child.

My heart cries for you Mother.
Sacred temple of the earth, men worship you.

I hear the bombers coming—screaming through the sunset.
The silence shatters.
The deer race wild-eyed at the sound.
The eagles leave their nests—rising to meet an unbeatable foe.
A sick child, almost asleep, cries out in pain.

I stand before you Mother. Sword laid down. Pen in hand.
Arms outstretched, I reach for you.
Cracking voice, I cry for you.

The bombers are coming.
I hear them now.

A thousand voices echo out my cry.
Ten-thousand voices—now the bombers fade.

Together, your children stand—nursing at your breasts.
Arms locked, we hold fast—circling round your feet.

The bombers are gone now.
Silence blankets your virgin soul once more.
You sigh.
We smile.
And we both know you are loved.

Richard Daniel Williams

000983

FACT SHEET

FACTS ABOUT REALISTIC BOMBER TRAINING INITIATIVE PROPOSAL-D (Northern New Mexico Route)

What: 2,600 flights per year
6 days per week
10 flights per day
15% of flights will occur AFTER 10 PM, until 6 AM

Who: B-52 Bombers=185 ft. wing span
160 ft. wingspan = 2/3 of a football field
B-1 Bombers= roughly equivalent to B-52

HOW HIGH DO THEY FLY? As Low As 200 ft Above Ground Level (AGL)

Where: The route affects 9 counties and some of the most beautiful areas in northern New Mexico, including: Carson National Forest, Rio Grande Wild and Scenic River Area, Urraca Wildlife Area, Elliott Barker Wildlife Area, Philmont Scout Ranch, Colin Neblett Wildlife Area, Cimarron Canyon State Park, Santa Fe National Forest, Villaneuva State Park, Sumner Lake State Park, Kiowa National Grassland, Rita Blanca National Grassland, Chicosa Lake State Park, Clayton Lake State Park. See Attached map for flight route.

How Much? $10,000/hour spent on jet fuel per flight

WHY OPPOSE RBTI-PROPOSAL-D

RBTI-Proposal D is ill-conceived and fraught with danger on every side. Here is a list of ten compelling reasons to oppose RBTI-Proposal D.

1) Disruption and damage to northern New Mexico's wildlife, ecology and livestock due to 2,600 low level bomber flights per year over wilderness and ranch areas.

2) Disruption and distress to local populations of people directly under and in close proximity to the route and flight corridor. The route will fly directly over Ocate, Anton Chico, Mosquero, Wagon Mound, Clayton, Roy, Abbott, and Mt. Dora, and will fly near many more communities and residences.

000983

3) Extremely high noise levels as they fly over Northern New Mexico at 300-500 feet above ground level. Recent studies show that jet aircraft flying at such altitudes produce sound levels at just be low the pain threshold.

4) Adverse and potentially devastating effect on the already fragile economy of the region, more than 60% based on tourism. This would effect each and every person in the region, already suffering 18% unemployment (Taos County), and 27% of the population below the poverty line (Taos County).

5) Direct flights over numerous state or federally protected areas, including wild and scenic areas, states parks, national forest, and state wildlife areas.

6) Depreciation of land values which would be diminished by 2,600 B-52 low level flyovers each year.

7) Impacts on endangered species. The bomber route flies over Mexican Spotted Owl habitat, as low as 400 ft AGL, 12 times a day, and over at least three active nesting sites for the Peregrine Falcon, 11 times a day at 400-1000 feet AGL. The U.S. Fish and Wildlife Service has advised the Air Force that anything less than 1600 ft. AGL and less than 1 mile away laterally will harm these species.

8) The bomber route flies over wintering habitat for bald eagles 12 to 14 times per day below 1,000 ft AGL. The U.S. Fish and Wildlife Service has advised the Air Force that anything at or below 2000 ft AGL between October 1 and March 1 could result in significant impacts to wintering bald eagles.

9) There are currently numerous low-flying training routes in New Mexico originating from military bases throughout the U.S. When added to the proposed RBTI flight operations, some areas may experience over 6,300 fly-overs per day The Air Force must study these cumulative impacts, and the cumulative impacts of all low-level training flights in the western U.S. in a programmatic EIS.

10) The public safety is at risk. Numerous military aircraft have crashed on domestic training missions, some within New Mexico, within the past 3 years. Crashes have the potential to start forest fires.

000984

Major Brent Adams
RBTI EIS Project Manager
HQ ACC/CEVP
129 Andrews St., Suite 102
Langley AFB, VA 23665-2769

June 4th, 1999

Dear Major Adams,

I am writing as a member of the community which will be impacted by RBTI-Route D. I appreciate the opportunity and feel that it is my responsibility to comment on the Draft EIS for RBTI-Route D. Although I suspect otherwise, I truly hope that this process is taken very seriously by the USAF and not merely as a formality designed to placate the taxpayers in the name of saving taxpayer dollars and national security.

We taxpayers will not see a tax cut as a result of RBTI. Therefore, RBTI will not save taxpayers' dollars. RBTI will save the USAF dollars. While $10,000 per hour for jet fuel is a stunning amount, that amount becomes insignificant when compared with the stupendous cost of our national defense operation. One B-1 costs over $200 million, one B-52 costs $74 million. One B-2 costs $1.3 billion. The Department of Defense appropriations budget authorization for fiscal year 1998 was $251.4 billion. (Horatio Trujillo – Legislative Assistant on Foreign Policy and Economic Policy for Tom Udall, U.S. Representative, New Mexico, _ *Congressional District.*)

Perhaps the need for operations such as RBTI could someday be reduced or even eliminated, saving billions of taxpayer dollars, and strengthening national security by using more energy and tax dollars to help our leaders further develop the techniques, skills, and tools for dialogue and communication in order to wage peace through conflict resolution without violence

The Draft EIS bases its findings on objective data and quantitative studies in order to arrive at its conclusions. It also includes advisories from the USFWS and the USFS. It appears that no conclusions were arrived at regarding some of the topics.

In this letter I wish to address some of these sensitive and controversial issues using the data and information I found in the Draft-EIS.

Section 4: Affected Environment and Environmental Consequences:
RBTI-Route D will fly over Mexican Spotted Owl habitats as low as 400 feet AGL, 12 times per day and over at least three active nesting sites for Peregrine Falcons 11 times a day at 400-1000 feet AGL. The bomber route flies over wintering habitat for bald eagles 12-14 times daily below 1,000 feet AGL.

According to the *Bird of Prey and Wildlife Monitoring Study of the Ute Mountain Section of the Rio Grande Gorge* (1986-1989), RBTI will cross two branches of the Rio Grande Flyway for migratory birds of prey and waterfowl. Also, the eastern fork of the Rio Grande is located

1

000984

directly over the Valle Vidal Unit of the Carson National Forest where a large elk herd is strictly protected and which is managed for its wildlife and recreation opportunities

p.4- 107 "USFWS advisories have stipulated that the Air Force survey unsurveyed owl habitats underlying IR-153, segments AB and EF in order to determine owl populations (if any) and to avoid overflights by 1,600 feet AGL. March 1-August 31 annually." Additionally they have stated that "significant and adverse impacts would occur to peregrine falcons if they are overflown at levels below 1,600 feet AGL," and that" flights at or below 2,000 feet AGL from October 1 to March 1 could result in significant impacts to wintering bald eagles."

The writers of the Draft-EIS, on the other hand, found a number of studies of mammals and birds which they used to state that p.4-106, "Based on these studies, the evidence would suggest that Alternative D flight operations would not result in significant adverse impacts to wildlife or threaten endangered or sensitive species."

Also the safety section, p.4-50, Draft-EIS states that "neither the existing nor the proposed airspace in IR-153 Section AB would overlie or intersect any migration flyways or water bodies where birds congregate." Clearly, the land managing agencies, i.e. USFWS, BLM-USFS, are in conflict with the USAF or FAA regarding their missions. This conflict must be legally resolved in order for RBTI-D to be considered.

BI-5

Socio-Economic and Environmental Justice:
P. 4-109 The Draft-EIS describes socio-economics as "the general features of the economy, including employment, population, and income, that could be affected by the proposed alternatives." It states that "most direct and indirect socio-economic effects would occur in the immediate vicinity of where the electronic scoring sites and emitter sites would be constructed and operated."

P. 4, 109 "The primary measures by which socio-economic impacts were identified include changes to employment, populations, and earnings associated with the proposed alternatives." They detailed their methods, assumptions and calculations in Appendix I.

The Draft-EIS states on p. 4-118, Table 4-4-1 for alternative D: "No measurable impacts to socio-economics. No disproportionate impacts to minority and low income populations."

Taos County and others nearby were not considered in the Study, presumably because of the criteria used. Nevertheless, they could sustain adverse and devastating changes to employment, populations, and earnings as a direct result of the implementation of RBTI-Route D.

BR-4

Livestock would be impacted similarly to wildlife by bomber noise, thereby affecting ranchers and farmers, along with all of their supporting industries, i.e. feed and supply stores, equipment sales, etc.

BR-3

Northern New Mexico is well known as a haven for seekers of solitude and quiet of many kinds. Sportsmen such as hunters, fishermen, trail riders, as well as hikers, bikers, campers, rafters, back-country skiers, snow shoers, families, mushroom hunters, and bird-watchers come from all over the world to enjoy the tranquility, beauty, and originality of the region, as do people

2

000984

searching for many types of physical and spiritual healing. We have retreats, spas, and gatherings, in beautiful wilderness settings.

More than 60 per cent of Taos County's fragile economy is based on tourism. The implementation of the RBTI Route D could cause many of our tourists (bread and butter) to find their "peace and quiet" elsewhere, far from the incredibly monstrous and loud machines of war. A reduction in tourism would impact nearly every person and industry in the country: outfitters and tour guides, camping and sporting goods stores, health spas, health professionals, spiritual retreats and healers, as well as all the supporting businesses, such as hotel, motel, bed and breakfast inns, restaurants, gas stations, gift shops, art galleries, movie theaters, and all of their employees (low income).

Similarly to tourism, Taos County's real estate and construction industries could be adversely and devastatingly impacted by RBTI-Route D. In recent years, many people have moved to Taos and the surrounding area to "get away from it all." Many of these people bring money and even the ones who don't contribute to the economy. These people, like the tourists, could take their dollars and find other places to live and retire, thereby impacting not only the real estate market but also the construction industry, one of the stronger parts of our economy at this time. People affected will be bankers, builders, building supply yards and stores, home decorating and furniture stores, and well as tradesmen of all kinds; i.e. plumbers, electricians, plasterers, adobe layers, tilers, excavators, landscapers, painters, laborers, etc.

Property values could fall, not only as a result of fewer people moving to the area because of RBTI-Route D, but also people, such as myself, could choose to leave the area, further jeopardizing our tenuous economy.

BR-4

The socio-economic impact of RBTI-Route D to Taos County and the neighboring counties must be studied before RBTI-Route D is allowed to move ahead.

P4-109: the EIS addresses environmental justice, as defined in Executive Order 12898: "Federal Actions to Address Environmental Justice in Minority and Low Income Populations." It looks at whether an action disproportionately affects these types of populations. According to1990 census data in the Community Profile Packet from the Taos County Chamber of Commerce, a large portion of Taos County's population is made up of Hispanic and Native American people., (65% Hispanic, 7% Native American, 27% Anglo, and 1% Other). Many of these are low wage earners or are unemployed. We currently have 27 percent earning below the poverty line and an unemployment rate of 18 percent, according to the Western Environmental Law Center.

There are hundreds of small entrepreneurial businesses in the Taos area. They struggle for survival. Many are "mom and pop" style operations. Many of the potential job losses would be among their employees. When business gets slow around here, the low wage earners are the first to go; i.e. during our off seasons, spring and late fall, the small business owners and managers can cover the duties themselves. Thus the employees are - at least temporarily – laid off. Among these workers would be shop helpers, fast food employees, construction laborers, hotel and motel service, restaurants, ski area gift shops, etc. These are the low income people. Many are minority members. They could become even poorer or unemployed. Potential impact regarding the Environmental Justice for Taos County must be carefully studied before the RBTI-Route D moves forward.

000984

Noise: "Noise is generally described as unwanted sound. Unwanted sound can be based on objective effects (hearing loss, damage to structures, etc.), or subjective judgments (community annoyance). Noise analysis thus requires a combination of physical measurement of sound, physical and physiological effects, plus psycho/socio-acoustic effects of the sound's loudness."

P.4-6: The Air Force uses three noise measuring techniques:
1. L-max and SEL = single noise events
2. DNL = Day Night Average sound levels and cumulative energy average noise.
3. DBA=A weighting in decibels.

There are tables, explanations, and diagrams showing SEL and L-max levels, as well as a number of tables, explanations, and diagrams of DNL (pgs. 4-6,4-7,4-8,4-47,4-49, appendix G, p. g-4).
The EIS states that "DNL has emerged as the most widely accepted metric for aircraft noise." P 4-9.

On P. 4-46, the EIS states that the noise levels on the 38 segments of IR-153 would range from less than 45 DNL to 64 DNL., 65 decibels is 50% louder than average conversation

On P. 4-46, the EIS also states that sortie operations on all but three segments of IR-153 could generate SEL's ranging from 86 to 116 decibels

Appendix G, p. G-2: "A change in sound level of about 10 decibels is perceived by the average person as a doubling (or halving) of the sound's loudness."

Therefore, to an average person, a sound that measured 70 decibels would be twice as loud as a sound of 60 decibels (average conversation). If you do the arithmetic, a sound of 120 decibels would be 64 times as loud to the average person as a sound of 60 decibels. According to pages, 4-6, table 4.1-1, a B-1 at 300 feet AGL produces an L-max of 117 decibels. Table 4-1-3: an SEL of 116 decibels.

Although the DNL measurement is the most widely accepted measurement for aircraft noise, it is clear after careful study of the information provided by the EIS, (and also my own experiences of being overflown), that for these low-level types of flights, the single event level and the L-max factor must be given at least equal weight to DNL averages before the USAF is allowed to move forward with this project.

AO-55

Cultural Resources:
P. 4-122: The EIS states that "the effects of noise on cultural resources may also be related to setting. Noise impacts to Native American traditional cultural properties may be related to interference with ceremonies and other traditional activities at sacred sites. Undisturbed habitats, resources, and settings are considered to be critical to religious practices. Potential impacts can be identified only through consultation with the affected groups."

The USAF has altered RBTI-Route D to avoid the Taos Pueblo and Blue Lake areas as a result of consultation with Taos Pueblo leaders. It is not necessary for the USAF to reveal sacred and religious sites to the general public; however, they must provide assurance that all issues regarding sacred and religious sites have been resolved to the satisfaction of the various Pueblos that were consulted before moving forward with RBTI-Route D.

CU-4

4

000984

Cumulative Impact:
There are currently numerous low-flying training routes in New Mexico originating from military bases throughout the U.S. When added to the proposed RBTI flight operations, some areas may experience over 6,300 flyovers per year. The USAF must study these cumulative impacts and the cumulative impacts of all low level training flights in the western U.S. in a programmatic EIS.

Public Safety:

The EIS addresses safety issues and on p.4-50, states that "since IR-153 does not currently exist, it is difficult to draw direct comparisons of baseline and projected mishap potential. Secondary MTRs that overlap or intersect segments of proposed IR-153 do provide a rough comparison. Estimated years between class A mishaps on these routes rage from 22-2,800. For proposed IR-153, estimated years between Class A mishaps for B-52's would fall into this range, whereas the potential for B-1's would be slightly greater. However, when considered as probabilities, the estimated years equate to a 0.02 probability of a B-52 Class A mishaps per year and a 0.07 probability for the B-1's."

We know that there have been a number of military plane crashes over the years. There was one incident with a sailplane where the Air Force pilot didn't even see the glider because the difference in speed was so great. The wing wheel of the glider was found in the military aircraft. In our area, there are not only sailplanes but also small private and commercial planes and hang gliders.

No Class A mishaps are acceptable. The USAF must be able to estimate a 0 percent probability for Class A mishaps. Also, the Air Force should provide a list description of all mishaps – Class A and otherwise – that have actually occurred over the lifespan of the military aircraft training programs before it moves ahead with this project.

AO-61

In conclusion, in order to formulate my response to the Draft EIS for RBTI-Route D, I have read the report carefully. After having done the research necessary to write this letter, I have discovered that it is possible to use objective criteria and quantitative data in order to arrive at more than one conclusion. From my research, most of which comes directly from the Draft EIS, I conclude that the USAF must further study and resolve many of the issues addressed in the Draft-EIS, including potential harm to endangered, threatened and sensitive species and potential harm to other wildlife, ecology and livestock.

The noise level issue must be re-addressed and made to include L-max and SEL measurements. The public safety issue has not been adequately addressed re: military plane crashes, small aircraft and bird strikes. The study must make readily available to the public a list of all Class A mishaps that have actually occurred over the life of the military aircraft training programs.

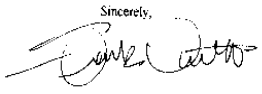
The EIS must be made to include a socio-economic and environmental justice report on potential impact to the socio-economic structure of Taos County, New Mexico. Finally the USAF must complete their consultations with the various Native America Indian Pueblos and resolve any issues regarding sacred and religious sites to the satisfaction of each tribal community consulted.

5

000984

It is clear that all of these issues must be addressed, re-addressed and resolved by the USAF before RBTI-Route D is allowed to move forward.

Sincerely,



6

000985

Suzanne Schwartz

El Prado. NM

Major Brent Adams
RBTI EIS Project Manager
HQ ACC/CEVP
129 Andrews St., Suite 102
Langley AFB, VA 23665-2769

June 4th, 1999

Dear Major Adams,

I am writing as a member of the community which will be impacted by RBTI-Route D. I appreciate the opportunity and feel that it is my responsibility to comment on the Draft EIS for RBTI-Route D. Although I suspect otherwise, I truly hope that this process is taken very seriously by the USAF and not merely as a formality designed to placate the taxpayers in the name of saving taxpayer dollars and national security.

First, we taxpayers will not see a tax cut as a result of RBTI. Therefore, RBTI will not save taxpayers' dollars. RBTI will save the USAF dollars. While $10,000 per hour for jet fuel is a stunning amount, that amount becomes insignificant when compared with the stupendous cost of our national defense operation. One B-1 costs over $200 million, one B-52 costs $74 million. One B-2 costs $1.3 billion. The Department of Defense appropriations budget authorization for fiscal year 1998 was $251.4 billion. (Horatio Trujillo – Legislative Assistant on Foreign Policy and Economic Policy for Tom Udall, U.S. Representative, New Mexico, ___ *Congressional District.)*

Second, there is the subjective issue of national security. These bombers are used to drop bombs. The United States and NATO use them to wage war on smaller, weaker countries. These relentless bombings complete with "regrettable but inevitable collateral damages," could backfire. Consider the recent mistaken bombing of the Chinese Embassy in Belgrade. China, along with it's ally Russia, has significant nuclear technology. Continued bombing activity, combined with arms sales to other small countries, often followed by acts of military aggression and intervention (war) against the same, could actually threaten rather than strengthen national security. One of these many small, weak countries could decide to turn against us and attack us, using our own weaponry and technology.

Perhaps the need for operations such as RBTI could someday be reduced or even eliminated, saving billions of taxpayer dollars, and strengthening national security by using more energy and tax dollars to help our leaders further develop the techniques, skills, and tools for dialogue and communication in order to wage peace through conflict resolution without violence.

1

000985

The Draft–EIS bases its findings on objective data and quantitative studies in order to arrive at its conclusions. It also includes advisories from the USFWS and USFS. It appears that no conclusions were arrived at regarding some of the topics.

In this letter I wish to address some of these sensitive and controversial issues using the data and information I found in the Draft-EIS.

Section 4: Affected Environment and Environmental Consequences:
RBTI-Route D will fly over Mexican Spotted Owl habitats as low as 400 feet AGL, 12 times per day and over at least three active nesting sites for Peregrine Falcons 11 times a day at 400-1000 feet AGL. The bomber route flies over wintering habitat for bald eagles 12-14 times daily below 1,000 feet AGL.

BI-5 According to the *Bird of Prey and Wildlife Monitoring Study of the Ute Mountain Section of the Rio Grande Gorge* (1986-1989), RBTI will cross two branches of the Rio Grande Flyway for migratory birds of prey and waterfowl. Also, the eastern fork of the Rio Grande is located directly over the Valle Vidal Unit of the Carson National Forest where a large elk herd is strictly protected and which is managed for its wildlife and recreation opportunities.

p.4- 107 "USFWS advisories have stipulated that the Air Force survey unsurveyed owl habitats underlying IR-153, segments AB and EF in order to determine owl populations (if any) and to avoid overflights by 1,600 feet AGL, March 1-August 31 annually." Additionally they have stated that "significant and adverse impacts would occur to peregrine falcons if they are overflown at levels below 1,600 feet AGL," and that" flights at or below 2,000 feet AGL from October 1 to March 1 could result in significant impacts to wintering bald eagles."

The writers of the Draft-EIS, on the other hand, found a number of studies of mammals and birds which they used to state that p.4-106, "Based on these studies, the evidence would suggest that Alternative D flight operations would not result in significant adverse impacts to wildlife or threaten endangered or sensitive species."

Also the safety section, p.4-50, Draft-EIS states that "neither the existing nor the proposed airspace in IR-153 Section AB would overlie or intersect any migration flyways or water bodies where birds congregate." Clearly, the land managing agencies, i.e. USFWS, BLM-USFS, are in conflict with the USAF or FAA regarding their missions. This conflict must be legally resolved in order for RBTI-D to be considered.

Socio-Economic and Environmental Justice:
P. 4-109 The Draft-EIS describes socio-economics as "the general features of the economy, including employment, population, and income, that could be affected by the proposed alternatives." It states that "most direct and indirect socio-economic effects would occur in the immediate vicinity of where the electronic scoring sites and emitter sites would be constructed and operated."

P. 4-109. " The primary measures by which socio-economic impacts were identified include changes to employment, populations, and earnings associated with the proposed alternatives.". They detailed their methods, assumptions and calculations in Appendix I.

2

000985

The Draft-EIS states on p. 4-118, Table 4-4-1 for alternative D: "No measurable impacts to socio-economics. No disproportionate impacts to minority and low income populations."

BR-4 Taos County and others nearby were not considered in the Study, presumably because of the criteria used. Nevertheless, they could sustain adverse and devastating changes to employment, populations, and earnings as a direct result of the implementation of RBTI-Route D.

BR-3 Livestock would be impacted similarly to wildlife by bomber noise, thereby affecting ranchers and farmers, along with all of their supporting industries, i..e. feed and supply stores, equipment sales, etc.

Northern New Mexico is well known as a haven for seekers of solitude and quiet of many kinds. Sportsmen such as hunters, fishermen, trail riders, as well as hikers, bikers, campers, rafters, back-country skiers, snow shoers, families, mushroom hunters, and birdwatchers come from all over the world to enjoy the tranquility, beauty, and originality of the region, as do people searching for many types of physical and spiritual healing. We have retreats, spas, and gatherings, in beautiful wilderness settings.

More than 60 per cent of Taos County's fragile economy is based on tourism. The implementation of the RBTI Route D could cause many of our tourists (bread and butter) to find their "peace and quiet" elsewhere, far from the incredibly monstrous and loud machines of war. A reduction in tourism would impact nearly every person and industry in the county: outfitters and tour guides, camping and sporting goods stores, health spas, health professionals. spiritual retreats and healers, as well as all the supporting businesses, such as hotel, motel, bed and breakfast inns, restaurants, gas stations, gift shops, art galleries, movie theaters, and all of their employees (low income).

Similarly to tourism, Taos County's real estate and construction industries could be adversely and devastatingly impacted by RBTI-Route D. In recent years, many people have moved to Taos and the surrounding area to "get away from it all." Many of these people bring money and even the ones who don't contribute to the economy. These people, like the tourists, could take their dollars and find other places to live and retire, thereby impacting not only the real estate market but also the construction industry, one of the stronger parts of our economy at this time. People affected will be bankers, builders. building supply yards and stores, home decorating and furniture stores, and well as tradesmen of all kinds; i.e. plumbers, electricians, plasterers, adobe layers, tilers, excavators, landscapers, painters, laborers, etc.

BR-4 Property values could fall, not only as a result of fewer people moving to the area because of RBTI-Route D, but also people, such as myself, could choose to leave the area, further jeopardizing our tenuous economy.

One of the major reasons for my living here is my love of the outdoors and finding solitude and quiet in nature. I have visited many of the areas which will be overflown. Although the EIS claims through the use of quantitative averaging that the likelihood of a person being overflown is highly unlikely, I have been overflown on a number of occasions by I don't know what types of military aircraft over the years. These few experiences were traumatic for me, which is unacceptable. Increasing the odds by 2,600 flights per year of even bigger, scarier, lower and louder machines is also unacceptable.

3

000985

The socio-economic impact of RBTI-Route D to Taos County and the neighboring counties must be studied before RBTI-Route D is allowed to move ahead.

P4-109: the EIS addresses environmental justice, as defined in Executive Order 12898: "Federal Actions to Address Environmental Justice in Minority and Low Income Populations." It looks at whether an action disproportionately affects these types of populations. According to1990 census data in the Community Profile Packet from the Taos County Chamber of Commerce, a large portion of Taos County's population is made up of Hispanic and Native American people., (65% Hispanic, 7% Native American, 27% Anglo, and 1% Other). Many of these are low wage earners or are unemployed. We currently have 27 percent earning below the poverty line and an unemployment rate of 18 percent, according to the Western Environmental Law Center.

There are hundreds of small entrepreneurial businesses in the Taos area. They struggle for survival. Many are "mom and pop" style operations. Many of the potential job losses would be among their employees. When business gets slow around here, the low wage earners are the first to go: i.e. during our off seasons, spring and late fall, the small business owners and managers can cover the duties themselves. Thus the employees are - at least temporarily – laid off. Among these workers would be shop helpers, fast food employees, construction laborers, hotel and motel service, restaurants, ski area gift shops, etc. These are the low income people. Many are minority members. They could become even poorer or unemployed. Potential impact regarding the Environmental Justice for Taos County must be carefully studied before the RBTI-Route D moves forward.

BR-4

Noise: "Noise is generally described as unwanted sound. Unwanted sound can be based on objective effects (hearing loss, damage to structures, etc.), or subjective judgments (community annoyance). Noise analysis thus requires a combination of physical measurement of sound, physical and physiological effects, plus psycho/socio-acoustic effects of the sound's loudness."

P.4-6: The Air Force uses three noise measuring techniques:
1. L-max and SEL = single noise events / sound exposure level
2. DNL = Day Night Average sound levels and cumulative energy average noise.
3. DBA−A weighting in decibels.

There are tables, explanations, and diagrams showing SEL and L-max levels, as well as a number of tables, explanations, and diagrams of DNL (pgs. 4-6,4-7,4-8,4-47,4-49, appendix G, p. g-4).
The EIS states that "DNL has emerged as the most widely accepted metric for aircraft noise." P. 4-9

On P. 4-46, the EIS states that the noise levels on the 38 segments of IR-153 would range from less than 45 DNL to 64 DNL, 65 decibels is 50% louder than average conversation.

On P. 4-46, the EIS also states that sortie operations on all but three segments of IR-153 could generate SEL's ranging from 86 to 116 decibels.

Appendix G, p. G-2: "A change in sound level of about 10 decibels is perceived by the average person as a doubling (or halving) of the sound's loudness."

4

000985

Therefore, to an average person, a sound that measured 70 decibels would be twice as loud as a sound of 60 decibels (average conversation). If you do the arithmetic, a sound of 120 decibels would be 64 times as loud to the average person as a sound of 60 decibels. According to pages, 4-6, table 4.1-1, a B-1 at 300 feet AGL produces an L-max of 117 decibels. Table 4-1-3: an SEL of 116 decibels.

I have been overflown and experienced the "startle effect" of military aircraft here in the Taos area—both out hiking and over my house. I don't know what type of planes they were To my ears, the noise was extremely loud, disruptive and frankly terrifying. One time a friend gave me a flight in his little bush plane. We flew over Arroyo Seco at approximately 300 feet AGL. This was illegal although I didn't know it at the time. There were a number of complaints called in to the Taos Municipal Airport. People were extremely annoyed. A bush plane is very small. A B-52 has a wingspan of 185 feet, and, no doubt, produces many, many times the noise of a bush plane.

AO-61

Although the DNL measurement is the most widely accepted measurement for aircraft noise, it is clear after careful study of the information provided by the EIS, (and also my own experiences of being overflown), that for these low-level types of flights, the single event level and the L-max factor must be given at least equal weight to DNL averages before the USAF is allowed to move forward with this project.

Cultural Resources:
P. 4-122: The EIS states that "the effects of noise on cultural resources may also be related to setting. Noise impacts to Native American traditional cultural properties may be related to interference with ceremonies and other traditional activities at sacred sites. Undisturbed habitats, resources, and settings are considered to be critical to religious practices. Potential impacts can be identified only through consultation with the affected groups."

CU-4

The USAF has altered RBTI-Route D to avoid the Taos Pueblo and Blue Lake areas as a result of consultation with Taos Pueblo leaders. It is not necessary for the USAF to reveal sacred and religious sites to the general public: however, they must provide assurance that all issues regarding sacred and religious sites have been resolved to the satisfaction of the various Pueblos that were consulted before moving forward with RBTI-Route D.

Cumulative Impact:
There are currently numerous low-flying training routes in New Mexico originating from military bases throughout the U.S. When added to the proposed RBTI flight operations, some areas may experience over 6,300 flyovers per year. The USAF must study these cumulative impacts and the cumulative impacts of all low level training flights in the western U.S. in a programmatic EIS.

Public Safety:

The EIS addresses safety issues and on p.4-50, states that "since IR-153 does not currently exist, it is difficult to draw direct comparisons of baseline and projected mishap potential. Secondary MTRs that overlap or intersect segments of proposed IR-153 do provide a rough comparison. Estimated years between class A mishaps on these routes rage from 22-2,800. For proposed IR-153, estimated years between Class A mishaps for B-52's would fall into this range, whereas the

5

000985

potential for B-1's would be slightly greater. However, when considered as probabilities, the estimated years equate to a 0.02 probability of a B-52 Class A mishaps per year and a 0.07 probability for the B-1's."

We know that there have been a number of military plane crashes over the years. There was one incident with a sailplane where the Air Force pilot didn't even see the glider because the difference in speed was so great. The wing wheel of the glider was found in the military aircraft. In our area, there are not only sailplanes but also small private and commercial planes and hang gliders

AO-55

No Class A mishaps are acceptable. The USAF must be able to estimate a 0 percent probability for Class A mishaps. Also, the Air Force should provide a list or description of all mishaps – Class A and otherwise – that have actually occurred over the lifespan of the military aircraft training programs before it moves ahead with this project.

In order to formulate my response to the Draft EIS for RBTI-Route D, I have read the report carefully. I attended one of the public hearings held in Taos in late March. I also had conversations with a number of experts including a local bird-of-prey researcher who has worked extensively throughout the area for a number of years, the Taos Pueblo Warchief's Office, an environmental lawyer (local), a legislative assistant to U.S. Representative Tom Udall in Washington, D.C. In addition, I call on my own experiences as a Northern New Mexico resident of 15 years, as well as the experiences of friends that might relate to this issue.

In conclusion, after having done the research necessary to write this letter, I have discovered that it is possible to use objective criteria and quantitative data in order to arrive at more than one conclusion. From my research, most of which comes directly from the Draft EIS, I conclude that the USAF must further study and resolve many of the issues addressed in the Draft-EIS. including potential harm to endangered, threatened and sensitive species and potential harm to other wildlife, ecology and livestock.

The noise level issue must be re-addressed and made to include L-max and SEL measurements. The public safety issue has not been adequately addressed re: military plane crashes, small aircraft and bird strikes. The study must make readily available to the public a list of all Class A mishaps that have actually occurred over the life of the military aircraft training programs.

The EIS must be made to include a socio-economic and environmental justice report on potential impact to the socio-economic structure of Taos County, New Mexico. Finally the USAF must complete their consultations with the various Native American Indian Pueblos and resolve any issues regarding sacred and religious sites to the satisfaction of each tribal community consulted.]

It is clear that all of these issues must be addressed, re-addressed and resolved by the USAF before RBTI-Route D is allowed to move forward.

Sincerely,

Suzanne Schwartz

Langley AFB. VA 23665-2769

Dear Major Adams:

TY

I am enclosing for your consideration a number of letters written by the Boy Scouts in my troop concerning Alternative site D for the RBTI project over Philmont Scout Ranch. Our troop has over 80 scouts and 30 adults. We are unanimous in our protest of this site. We respectfully request that you reconsider. Personally, for me, my trek at Philmont was one of the most rewarding and enriching experiences in my life as I shared this wilderness experience with my oldest son. It could not have been so if our honorable USAF were conducting bombing runs with B-1 and B-52s flying overhead. Please do not invade the peace, natural beauty and quiet of this national treasure.

Respectfully submitted,

Nancey Anderson
Assistant Scoutmaster, Troop 261

RBTI Comment

Number 000987

This letter was written in light-blue, highlighter marker and was not readable when scanned. Below is a verbatim copy of the letter. The original is on file.

Dear Major Adams:

TY We in the Boy Scouts of America are deeply concerned in the Bomber test over Philmont Scout Ranch. If you consecrate this area for bombing runs, it will upset natural balance and affect the lives of not only the local citizens, but hundreds of thousands of Boy Scouts' lives. Philmont, also known as "Alternative D," is the biggest most prestigious Scout camp in the world. Its sanctity will be damaged by noise and jet fuel pollution, and so will the Air Force's reputation. Boy Scouts has prepared many boys *(illegible word)* into the Armed Forces. Please reconsider your decision to use "Alternative D" for bombing practice.

Sincerely,

David (*last name illegible*)
Scout Patrol Leader (Temp.)
Troop 261

000988

Dear Major Grent Adams:

TY We, the undersigned, strongly believe that alternative site D is an unacceptable choic for the Air Force's R, B.T.I project. Though your studies show that Philmont Scout Ranch is sparcely populated it is a fact that on any given day there are more than 5,000 Boy Scouts on any given spot on the ranch. We, the Boy Scouts of America, would appreci the Air Force to concider other alternative

Thank you for your consideration,

Grant Denton Eagle Scout

John Beck

000989

Dear Major Adams:

Sir, it has come to our attention that you have chosen Philmont, one of the most respected scout camps in the world, a bombing. My associates and I feel that in bombing Philmont, you are doing two things that are against what we stand for as the United States. Destroying endangered animals, including our nations symbol, will send a message that we can do what we want, including killing endangered animals, is acceptable as long as we have money and government backing.

BI-5

Sincerly,

Star Scout Kenny Hughes
First Class Scout

000990

Dear Major

TY As you know Philmont Scout Ranch A.K.A. Selection D is selected as your primary site of bombing simu rings. Philmont is a highly popular scout camp whe lets many many scouts experience real nature. Thi ranch is one of the few places that are not industrialized. At any giventime there are 500 scouts on Philmont that want an experience in the wilderness. So please, co bombing Philmont. Thank you for your time.

Sincerely,

Craig Johnston

Dear Major Adams:

I am opposed to the Air Force's proposed RBTI known as Lancer – Option B in the DEIS. My concern(s) about the proposal and the DEIS are as follows:

BR-4 1. The effect on my property values and the fact that this has not been adequately addressed in the DEIS.

2. The effect the bomber training will have on my ranching and farming operations and the fact that the DEIS did not provide for any actual study of this impact on my operations or anyone else's in the area. No one ever visited the area for the study!

AO-55 3. the fact that the DEIS did not adequately study the impact that noise wi... have in our community. Over 2,000 flights at 3,000 feet or less are currently planned annually, with more on the way. They have said this will not have a noticeable noise impact.

BR-4 4. Hunting is big business in this area. Yet the DEIS made no attempt to quantify the impact this would have on our economy- see the recent Texas Wildlife article.

Major Brent Adams,
RBTI EIS Project Manager,
HQ ACC/CEVPP
129 Andrews Street, Suite 102,
Langley AFB, VA 23665-2769

Dear Major Adams,

I live in El Rito, eight miles north of Questa. My home is a log cabin on 20 acres of wooded mountain land between the Rio Grande Wild and Scenic River and the Latir Peak Wilderness Area. My windows look out on Ute Mountain, which is right on your proposed flight path.

I am opposed to the northern New Mexico route for the RBTI. My reasons are personal and passionate.

I first settled here in 1975. After ten years, I took a long hiatus to complete my Ph.D. and become a licensed psychotherapist and a published writer. I risked a great deal to return here. I lost income, professional and financial security, gave up the comforts of the city, left my clients and students, neighbors and friends, all for one thing: quality of life.

The bombers will destroy the very qualities I came here for.

I came here, first of all, for silence. Silence is not just the absence of noise. Silence is a crucial medium for coming to truth. If I can't hear myself think, how can I clarify my thinking? If I am constantly distracted, how can I refine my perceptions? If I am numb from noise, how can I listen to the urgent things other voices have to tell me?

I came here to live in one of the few places in the country that is still pristine and wild, to experience the world largely unaltered by human purposes. I came here for privacy and solitude. I came here for safety. I came here for peace of mind. I came here for empty skies, skies a little girl in a writing class described as, "full of the mind of God."

I have not been disappointed. Everything I sought here, I have found. This place teaches and inspires me daily, as a person seeking a vision of how to live, and as a writer committed to living in circumstances that allow me to explore deeply what it means to be human in this world.

000995

I will fight to stay here. I built this cabin with my own hands. I have tended and protected this land for almost 25 years, and plan to pass it on to my daughter. This land is my home, my nest egg, my legacy. I will oppose anything that damages its beauty and its value.

I am happy here. I feel nurtured and strengthened, not just by the inexhaustible beauty of this earth and this sky but also by the human community. In Taos I have found my kin, people who love this land and will do whatever it takes to stay here.

This is my version of "the pursuit of happiness," a right guaranteed to me by the Constitution. Our government was designed to uphold our freedom to create lives worth living according to our personal values.

Isn't that what the military is for?

The Air Force was never intended to endanger our lives, damage our environment, and diminish the value of our property. Yet the Air Force is coming into an area as traditional and wild as northern New Mexico and threatening to do just that, as if it had a right to.

How can you justify this unwanted intrusion? "High-quality" training facilities exist in Utah and South Dakota. The only stated reason is to cut some transit time out of the training runs--a matter of convenience, efficiency, and money. You are asking me to sacrifice the quality of my life for these values. But I don't share them. If I did, I wouldn't be living here--and neither would most of my neighbors. It is certainly neither convenient, efficient nor lucrative to live in these mountains. It is simply worth it.

PD-25 If the pilots need more training, why not give them a few additional weeks of flying time? However "fixed" the flying hours may be, they can't be half as fixed as the migration path of the whooping crane, the nesting ground of the peregrine falcon, and the site of Taos Pueblo.

My life matters, to me and to the founders of this country. My neighbors' lives matter. Let the Air Force do what it was created to do: protect our freedom to live good lives in the place we have chosen.

Sincerely,

Morgan Farley

Major Brent Adams
RBTI EIS Prj. Mgr.
HQ ACC/CEVPP
129 Abdrews Street, Ste. 102
Langley AFB, VA 23665-2769

Dear Major Adams:

BR-6 I am writing to request your firm support in opposing the selection of Alternative D under the U. S. Air Force's proposed Realistic Bomber Training Initiative (RBTI). The Air Force is seeking to establish a new training route for low-level B-1 and B-52 bomber flights from bases in Texas and Louisiana. One of the proposed routes, Alternative D, traverses Philmont Scout Ranch in north-eastern New Mexico's Colfax County.

Philmont is a 137,000 acre mountain backpacking and high adventure facility of the Boy Scouts of America. Each year, thousands of Scouts and their adult leaders from across the nation participate in two-week wilderness backpacking trips in the mountains of Philmont. Many of them also camp and work on conservation projects in the adjacent Valle Vidal Wilderness of Carson National Forest.

The Air Force's proposed Alternative D will establish a military training route directly over most of Philmont. More than 2600 flights each year, some as low as 300 feet above ground level, are proposed for the segment over Philmont. As a former Philmont leader, I have serious concerns about the impact of the Air Force's proposal on the health and safety of Scouts attending Philmont and the potential effects of daily low-level flights on the ranch itself.

On any given day in the summer, as many as 5,000 Scouts and Scouters will be hiking and camping in Philmont's back country. Each day, several hundred of them will be engaged in activities such as rock climbing and rappelling, spar pole climbing, and mountain horseback rides. The sudden roar of jet engines has a high likelihood of distracting an inexperienced climber or causing a horse to bolt on a narrow mountain trail with resulting serious injury (or worse).

Appreciation and protection of the wilderness and our natural resources is a key part of the Philmont program. Scouts from around the world have a unique opportunity to see and experience wildlife in native habitat. Noise and emissions from bombers cannot help but have a damaging effect on that wildlife, as well as on Philmont's herds of buffalo, horses, cattle and burros. The disruptive effects of noisy bomber overflights on Philmont's famous living history programs, in which Scouts experience the lifestyles of the West's mountain men, homesteaders, lumberers and cowboys, are obvious.

Most of Philmont is mountainous with many peaks in the 10,000'to 12,000' range. Philmont has a tremendous fuel load of dead trees in its forests and is in the midst of a long-term drought. Unburned jet fuel finding its way to the ground or being dumped in an emergency over such terrain, with campers using backpacking stoves for cooking, creates the potential for a serious fire that would endanger hundreds of lives. The possibility of a crash, however remote, is simply not acceptable for the safety of these Scouts.

For these reasons, I seek your help in advocating the selection of a different RBTI route. I ask that you express your opposition to Alternative D to the Secretary of the Air Force and other defense officials who may be involved in this decision. Please act now, as the public comment period ends in June and a final decision will be made this year.

Philmont is the largest and most famous Scout camp in the world. It is a national resource that has positively impacted the lives of hundreds of thousands of our nation's youth for more than sixty years. It deserves and demands our protection. Thank you for helping to see that Alternative D is not selected.

Sincerely,

James E. Craig

Major Brent Adams
RBTI EIS Project Manager
HQ ACC/CEVPP
129 Andrews Street,Suite 102
Langley AFB,VA 23665-2769 June 15,1999

Dear Major Adams:

BR-6 During the 1970's I was fortunate to have led a group of Boy Scouts on a 10 day hiking adventure in the Philmont Scout Ranch in Cimarron, New Mexico. This experience will remain in my memory for years to come. The 15 boys of varying ages started the trek as a disparate group and completed the hike as a cooperative unit. I feel that the Philmont Experience is a positive influence in the development of these young citizens.

Recently I became aware of a frightening plan by the Government/Air Force to use the Philmont Ranch as a training area for bomber flights. I sincerely believe that this plan, if consummated, would led to significant disruption of the Scouting Program at Philmont, and indeed, nationally. The noise and vibration, deposition of unburned fuel, the deleterious effect upon wildlife and flora(especially endangered species), and the adverse effects upon hikers would be substantial. Serious accidents to both flight crews and scouts may very well result.

I believe that this flight training plan would lead to permanent damage to the Philmont Ranch and to its scouting programs, both national treasures as they now exist.

Please consider using some alternative plan and site rather than using the Philmont Ranch.

Thank you for this consideration.

Sincerely yours,

Francis E. Cuppage,M.D.

Subject: Realistic Bomber Training Initiative Alternative D
Draft Environmental Impact Statement March, 1999

Dear Major Adams,

BR-6 I am writing to express concern about a safety at Philmont Scout Ranch, Cimarron, New Mexico, under Alternative D. The program at Philmont includes horseback riding for young people who have little or no experience on horseback. During the summer season as many as 9,500 such rides take place. The concern is how the horse and rider on the hillside trail will react when a B-1 bomber comes over a mountain and flies down the valley at the projected elevations and speeds.

Page 7-4 of the Draft Environmental Impact Statement refers to two studies on the impact of aircraft on animals - "Effects of Jet Aircraft on Mountain Sheep" and "The Effects of Low Altitude Jet Aircraft on Desert Ungulates". I've read the reports on these tests that were published in the Journal of Wildlife Management. For the most part the test results published related to changes in heart rate beat of the animals.

The report on "Effects of Jet Aircraft on Mountain Sheet says that, "On 54 occasions our flights caused animals to run". While most of the running episodes were short, on one occasion the sheep ran 40 meters.

000998

I have reviewed two other reports on the effects of aircraft on wild animals that have appeared in the Journal and have talked with one of the people involved in these tests.

He tells me after animals become accustomed to the noise they no longer reacted to it. Referring to the Philmont program, I asked, "How much time of trail exposure would it take for a horse to gain such immunity and how long would the immunity last when there is no longer an exposure?" He declined to speculate on the answer. The horses at Philmont would not be exposed to loud noise for a time frame of about five months during the non-camping season. This would mean that probably the horses would have to get used to the noise every summer. In response to another question, he thought that early season exposures to the sudden loud noise would cause a horse to react in such a way as to throw an inexperienced rider.

Because of the safety hazard Alternate D should not be recommended over the other alternatives which do not appear to have a similar safety problem.

Sincerely,

Vittz-James Ramsdell

Major Brent Adams
RBTI EIS Project Manager
HQ ACC/CEVPP
129 Andrews Street, Suite 102
Langley AFB, VA 23665-2769

Dear Major Adams:

BR-6 I am writing to express my opposition to the selection of "Alternative D" under the USAF's proposed Realistic Bomber Training Initiative (RBTI) involving low flying B-52s and B-1s (as low as 300). As one of several proposed southwestern routes, "D" traverses Philmont Scout Ranch in northeastern New Mexico's Colfax County. Philmont, truly a national treasure, is the 137,000 acre backpacking and training facility of the Boy Scouts of America. I support RBTI since it is a valuable program; my only complaint, as a Philmont biker and Boy Scout leader, is with the proposed route over Philmont.

Several years ago, the USAF ceased its low altitude F-16/F-111 flights over the Ranch as a result of Philmont protests. RBTI's multiple daily flights (up to 16) will create much more severe problems:

a) Program: Philmont is a transient community of 25,000 people with over 3,000 campers in Philmont's back country every day in the summer. Daily, several hundred of them are engaged in spar pole climbing, rock climbing and rapelling, and horse back riding. The sudden roaring of jet engines will distract climbers and bolt horses thereby creating injuries (or worse).

b) Environmental: Appreciation and protection of the wilderness are key parts of Philmont's program. RBTI is inconsistent with wilderness preservation. RBTI will have a damaging effect upon both the unique western wildlife and Philmont herds of cattle, horses, burros, and buffalo. The effect of the unburned portion of jet fuel in the engine exhaust or dumped fuel itself, vaporizing and falling to ground level is as yet unknown, but believed to be anything but beneficial.

c) Safety: The environmental impact study done for the USAF is seriously flawed when it describes Philmont as an "uninhabited" grassland. The smaller portion of Philmont's acreage is prairie. Most of Philmont is mountainous with many peaks in the 10,000 to 12,444' range. Philmont has a tremendous fuel load of dead trees in its forests, and is in the midst of a long term drought. Open fire bans are in effect now. A crashing bomber will create an epic fire of Yellowstone proportions. B-1s and B-52s do not have enviable safety records. The nature of the flights (weaving around mountain peaks and facing violent weather, including frequent, low-level wind shears) dramatically increases the chance of a crash. Unfortunately, Philmont does not have a well-developed highway system for evacuations in case of massive forest fires.

For the above reasons, I seek your help in advocating the selection of a different RBTI route, preferably one that is over a more sparsely populated, less environmentally sensitive area. There is too much at stake to allow RBTI to overfly Philmont. Thank you for helping to see that alternative D is not selected.

Sincerely,

001000

Subject: Realistic Bomber Training Initiative Alternative D
Draft Environmental Impact Statement March, 1999

Dear Major Adams.

The appendix to the Impact Statement includes a number of communications from the U. S. Fish & Wildlife Service, none of which appear to be definitive in identifying their view or position on your RBTI.

The side bar on Page 4-106 says, "The USFWS based on consultation has indicated that low-altitude flights could result in adverse impacts on sensitive bird species, including Peregrine Falcon and Mexican Spotted Owl".

On page 4-108 paragraph 4.3.6 states that, "None of the alternatives would have more than moderate effects on natural resources". However, Table 4.1-4.3-1 contradicts that statement. It says that the USFWS considers low altitude over-flights as potentially significant to Peregrine Falcon, Bald Eagle, and American Spotted Owl.

Based on USFWS past positions on activities that interfere with the Northern Spotted Owl in Oregon and Washington and the Peregrine Falcon in Alaska, one would expect a more definitive reaction.

001001

Because of the potential under Alternative D for impact on endangered and threatened species, one of the other three alternatives, which has less potential impact, should be selected.

GE-33 Will the USFWS formal response to RBTI be a matter of public record and if so, where will it be published?

Sincerely,

Vittz-James Ramsdell

Major Adams:

BR-6 I am writing to express my concern about, and strenuous opposition to, Alternative D of the Realistic Bomber Training Initiative which would result in low-level flights over the Philmont Scout Ranch in Cimarron, New Mexico. Looking back to my childhood experiences, I can truthfully say that my fondest memories, as well as some of the most important lessons I learned about life, came from my association with the Boy Scouts, and many of these occurred during the several summers that I was fortunate enough to spend at Philmont Scout Ranch, both as a camper and as a staff member. It would be a real tragedy if the wilderness experience that Philmont has offered to hundreds of thousands of young men were to be destroyed by low-level bomber flights over that area. I am confident that if you were to inquire among your brother officers in the Air Force, you would find some former scouts who have been to Philmont, and I would be very surprised if any who have been to Philmont would support this proposal.

Respectfully.

David A. White
CDR, US Coast Guard (Ret)

President Bill Clinton
The White House
Washington, D.C.

Dear President Clinton:

BR-6 I am writing to request your firm support in opposing the selection of Alternative D under the U.S. Air Force's proposed Realistic Bomber Training Initiative (RBTI). The Air Force is seeking to establish a new training route for low-level B-1 and B-52 bomber flights from bases in Texas and Louisiana. One of the proposed routes, Alternative D, traverses Philmont Scout Ranch in northeastern New Mexico's Colfax County.

Philmont is a 137,000-acre mountain backpacking and high adventure facility of the Boy Scouts of America. Each year, thousands of Scouts and their adult leaders from across the nation participate in two-week wilderness backpacking trips in the mountains of Philmont. Many of them also camp and work on conservation projects in the adjacent Valle Vidal Wilderness of the Carson National Forest.

The Air Force's proposed Alternative D will establish a military training route directly over most of Philmont. More than 2600 flights each year, some as low as 300 feet above ground level, are proposed for the segment over Philmont. As a former Philmont staff member, I have serious concerns about the impact of the Air Force's proposal on the health and safety of Scouts attending Philmont and the potential effects of daily low-level flights on the ranch itself.

On any given day in the summer, as many as 5,000 Scouts and Scoters will be hiking and camping in Philmont's backcountry. Each day, several hundred of them will be engaged in activities such as rock climbing and rappelling, spar pole climbing, and mountain horseback rides. The sudden roar of jet engines has a high likelihood of distracting an inexperienced climber or causing a horse to bolt on a narrow mountain trail with resulting serious injury (or worse).

The Philmont experience instills in Scouts an appreciation of and protection of the wilderness and our natural resources. Scouts from around the world have a unique opportunity to see and experience wildlife in native habitat. Noise and emissions from bombers cannot help but have a damaging effect on wildlife including endangered species of bald eagle, peregrin falcon, and the Mexican spotted owl, as well as herds of buffalo, horses, cattle and burros on the Philmont Ranch. The disruptive effects of noisy bomber overflights on Philmont's famous living history programs, in which Scouts experience the lifestyles of the West's mountain men, homesteaders, lumberers and cowboys are obvious.

Most of Philmont is mountainous with many peaks in the 10,000' to 12,000' range. Philmont has a tremendous fuel load of dead trees in its forests and is in the midst of a long-term drought. Unburned jet fuel finding its way to the ground or being dumped in an emergency over such terrain, with campers using backpacking stoves for cooking, creates the potential for a serious fire that would endanger hundreds of lives. The possibility of a crash, however remote, is simply not acceptable for the safety of these Scouts.

001003

For these reasons, I seek your help in advocating the selection of a different RBTI route. I ask that you express your opposition to Alternative D to the Secretary of the Air Force and other defense officials who may be involved in this decision. Please act now, as the public comment period ends in June and a final decision will be made this year. You or a member of your staff may wish to contact Greg Dodd, Chief of Staff for Congressman Ed Pease of Indian, who can provide additional information.

Philmont is the largest and most famous Scout camp in the world. It is a national resource that has positively impacted the lives of hundreds of thousands of our nation's youth for more than sixty years. It deserves and demands our protection. Thank you for helping to see that Alternative D is not selected.

As Scoutmaster of Troop 814, Stillwater, Oklahoma, I have participated in the Philmont experience since 1983 not only with my two son that became Eagle Scouts, but also with many other Scouts from Oklahoma and Texas. I will treasure those experiences forever. Thank you for your help in seeing that Alternative D is not selected and for preserving the Philmont experience for future scouts and scouters from around the world.

Sincerely,

Robert L. Ochrtman

TEN POINTS FOR OPPOSITION TO RBTI ALTERNATIVE D (OVER PHILMONT)

1. The EIS (Environmental Impact Statement) incorrectly concludes that very few population centers are affected. On any given day in the summer months, over 5,000 people will be living and camping directly under the flight path at Philmont.
2. Safety of horseback riders will be endangered. Philmont provides trail rides or pack trips for 7,500 to 9,500 most inexperienced riders each summer on step and narrow mountain trails. As many as 165 inexperienced people may be on horseback on the ranch at various times during the day. The startle effect of a high-decibel low-level flight could easily cause one or more horses to spook and bolt with a novice rider aboard. With the number of flights proposed, it will be only a matter of time before Philmont experiences a serious injury or death due to a rider being thrown from or dragged by a startled horse.
3. Increased noise levels will interfere with staff trying to provide safety instruction to rock climbers, spar pol climbers, and rifle range shooters. The noise level of a B52 at 300 feet is 117 decibels. Staff trying to teach safety techniques required in climbing rock faces or firing black powder rifles should not have to compete with such noise interference.
4. The high noise levels generated by B1 and B52 bombers flying only a few hundred feet above ground level are greater than being near a chain saw or a diesel train. Campers at Philmont will be exposed to such noise levels for more than six hours during a typical 12-day stay based on projected flight operations. This is not a true wilderness experience.
5. The possibility of a crash is very real. The EIS estimates the chances of a "Class A mishap" at once every 15 years for a B1 on the training route that would include Philmont. Aside from the real risk to Scouts who might be in the path of an errant bomber, a crash on Philmont would have the potential of starting a serious forest fire that could devastate the ranch.
6. The EIS fails to mention any impact of flyovers on Philmont's two National Historic sites, The Kit Carson/Maxwell Abreu houses at Rayado and the Villa Philmont.
7. The flights can be expected to have serious impacts on Philmont's wildlife and will overfly the habitats of at least three endangered species, the bald eagle, peregrine falcon, and Mexican spotted owl. The US Fish and Wildlife Service has concluded that overflights at less than 1,000 feet will significantly impact these species.
8. No one has investigated the cumulative effects of the planned noise levels and vibrations on the hundreds of abandoned and the two active mines on Philmont.
9. No plane burns all of its fuel. At higher altitudes, unburned fuel dissipates in the atmosphere. At lower altitudes, one must expect that some unburned fuel will find its way to the ground and streams of Philmont. The effects of a plan in trouble at low altitude dumping fuel over Philmont with numerous cook stoves and campfires are easily imagined.
10. Philmont is a national treasure and provides a wilderness camping experience for thousands of Scouts, America's future leaders, every year. That experience should be preserved since alternative training sites exist which do not jeopardize the program experience offered by Philmont and the safety of thousands of young people participating in it each year.

J. ROBERT GARRETT

GARLAND, TX
USA

June 14, 1999

Major Brent Adams
RBTI EIS Proj. Mgr.
HQ ACC/CEVPP
129 Andrews Street, Ste 102
Langley AFB, VA 23665-2769
USA

Dear Sir:

BR-6 I am writing to request your firm support in opposing the selection of "Alternative D" under the USAF's proposed Realistic Bomber Training Initiative

(RBTI) involving low flying B-52s and B-1s (as low as 300'). As one of several proposed southwestern routes, "D" traverses Philmont Scout Ranch in

northeastern New Mexico's Colfax County. Philmont, truly a national treasure, is the 137,000 acre backpacking and training facility of the Boy Scouts of

America. I do not protest RBTI since it is a valuable program -- my only complaint, as a Philmont alumnus, is with the proposed route over Philmont.

Several years ago, the USAF ceased its low altitude F-16/F-111 flights over the Ranch as a result of Philmont protests. RBTI's multiple daily flights (up to

16) will create much more severe problems:

a) Program: Philmont is a transient community of 25,000 people with over 3,000 campers in Philmont's back country every day in the summer.

Daily, several hundred of them are engaged in spar pole climbing, rock climbing and rapelling, and horse back riding. The sudden roaring of jet

engines will distract climbers and bolt horses thereby creating injuries (or worse).

b) Environmental: Appreciation and protection of the wilderness are key parts of Philmont's program. RBTI is inconsistent with wilderness

preservation. RBTI will have a damaging effect upon both the unique western wildlife and Philmont herds of cattle, horses, burros, and buffalo. The

effect of the unburned portion of jet fuel in the engine exhaust or dumped fuel itself, vaporizing and falling to ground level is as yet unknown, but

believed to be anything but beneficial.

001006

c) Safety: The environmental impact study done for the USAF is seriously flawed when it describes Philmont as an "uninhabited" grassland. The

smaller portion of Philmont's acreage is prairie. Most of Philmont is mountainous with many peaks in the 10,000 to 12,444' range. Philmont has a

tremendous fuel load of dead trees in its forests, and is in the midst of a long term drought. Open fire bans are in effect now. A crashing bomber

will create an epic fire of Yellowstone proportions. B-1s and B-52s do not have enviable safety records. The nature of the flights (weaving around

mountain peaks and facing violent weather, including frequent, low-level wind shears) dramatically increases the chance of a crash. Unfortunately,

Philmont does not have a well-developed highway system for evacuations in case of massive forest fires.

For the above reasons, I seek your help in advocating the selection of a different RBTI route, preferably one that is over a more sparsely populated, less

environmentally sensitive area. You, or a member of your staff may wish to liaise with Rep. Ed Pease's (Indiana) legislative assistant, Greg Good, who

has additional information on RBTI.

There is too much at stake to allow RBTI to overfly Philmont. Please act now – final route determination starts in June. Thank you for helping to see that

alternative D is not selected.
Sincerely:

J. Robert Garrett

John W. Corpany

Keller, Texas

10 June 1999

Major Brent Adams
RBTI EIS Project Manager
HQ ACC/CEVPP
129 Andrews Street, Suite 102
Langley AFB, VA 23665-2769

Dear Major Adams;

BR-6 In response to the invitation for public comment on the RBTI, please find enclosed my recent correspondence with both of my U.S. Senators, Mr. Gramm and Ms. Hutchison of Texas. I would greatly appreciate your entering this correspondence into the official record as my comment on this matter.

Sincerely,

John W. Corpany

TO: The Honorable Senators Phil Gramm and Kay Bailey Hutchison of Texas

Dear Senators Gramm and Hutchison;

I'm writing you today to urgently request your firm support in opposing the selection of Alternative 'D' under the U.S. Air Force's proposed Realistic Bomber Training Initiative (RBTI). The Air Force is seeking to establish a new training route for low-level B-1 and B-52 bomber flights from bases in Texas and Louisiana. One of the proposed routes, Alternative 'D', traverses Philmont Scout Ranch in northeastern New Mexico's Colfax County.

Philmont is a 137,000 acre mountain backpacking and high adventure facility of the Boy Scouts of America. Each year, literally thousands of Scouts and their adult leaders from across the nation participate in two-week wilderness backpacking and horse packing trips in the Sangre de Cristo mountain range, in which the property is situated. Many of them also camp, trek and work on conservation projects in the adjacent Valle Vidal Wilderness of the Carson

001007

National Forest.

The Air Force's proposed Alternative D will establish a military training route directly over most of Philmont. More than 2,600 flights each year, some as low as 300 feet above ground level, are proposed for the segment over Philmont. As a former Philmont staff member, and a current adult Scout leader, I have serious concerns about the impact of the Air Force's proposal on the health and safety of Scouts and their leaders attending Philmont and the potential effects of daily low-level flights on the ranch itself.

On any given day in the summer, as many as 5,000 Scouts and Scouters will be hiking and camping in Philmont's backcountry. Each day, several hundred of them will be engaged in activities such as rock climbing and rappelling, spar pole climbing, and mountain horseback riding. The sudden roar of jet engines has an unreasonably high likelihood of distracting an inexperienced teenage climber or causing a horse carrying an inexperienced teenage or adult rider to bolt on a narrow mountain trail, with the scarcely escapable result being the very high potential for serious injury – or far worse.

Appreciation and protection of the wilderness and our natural resources is a key part of both the Philmont, and also the larger Scouting programs. Scouts from around the world have a unique opportunity to see and experience wildlife in its native habitat. Noise and emissions from bombers cannot help but have a detrimental effect on that wildlife, as well as on Philmont's herds of buffalo, horses, cattle and burros. The disruptive effects of noisy bomber overflights on Philmont's famous living history programs, in which Scouts experience the lifestyles of the West's mountain men, homesteaders, lumberers and cowboys, are obvious -- and unacceptable in view of the lower-impact alternatives available to the Air Force.

Most of Philmont is mountainous, with many peaks in the 10,000 to 12,000 foot range. Philmont has a tremendous fuel load of dead trees in its forests and is in the midst of a long-term drought. Unburned jet fuel finding its way to the ground or being dumped in an in-flight emergency over such terrain, with campers using backpacking stoves for cooking, creates the potential for, at the very least, a serious fire that would endanger hundreds of lives, and at the very most, an unspeakable tragedy. Moreover, the possibility of a crash, however remote, is simply not acceptable for the safety of these Scouts. There can be no statistical probability, however insignificant, that could justify the potential consequences of taking such a risk. The ends simply do not justify the means.

For these reasons, I again seek your help and support (my previous letter to you on this subject dated 8 April '99 is included below,) in advocating the selection of a different RBTI route for the essential training that I agree our service men and women of the Air Force must have. I ask that you express your vehement

001007

opposition to Alternative D to the Secretary of Defense, the Secretary of the Air Force and any other Defense officials who may be involved in this decision. PLEASE ACT NOW, as the public comment period expires on Tuesday, June 15th, and a final decision will be made this year. You or a member of your staff may wish to contact Greg Dodd, Chief of Staff for Congressman Ed Pease of Indiana, who can provide additional information.

Philmont is the largest and most famous Scout camp in the world. It is a national resource that has had an enormous positive impact on the lives of hundreds of thousands of our nation's youth for more than sixty years. it deserves and requires – demands -- our attention and protection.

I've been pleased and proud to vote for each of you in the past. However, as one of your many thousands of voting constituents who will be closely watching your respective offices for any public comment on this subject over the next weeks (not to mention the outcome of the Air Force's ultimate route selection,) I want you to know that I'm counting on each of you to not only get involved but also to do the right thing. There are not many things about which I feel strongly enough to even consider becoming a "one issue voter". You should both rest assured however, that this is without question one such issue.

Please don't let the Scouting program down now in its time of urgent need.

Respectfully,

John W. Corpany

Keller, Texas

Earl Gonzales

001008

5th.

June 1, 1999

To whom it may concern:

My name is Earl Gonzales, I am in the 10th grade, and I have lived in Taos my whole life. I very concerned with the B-52 Bombers flying over our home of Taos.

There is no need for B-52 Bombers flying over Taos, once it is dangerous in every way. Our historic Taos Pueblo is home to many Native Americans, and every flight would destroy the pueblo more and more. As you know our major income in Taos is our tourists. With your disruptance going on 10+ times a day, tourism will decrease immensely.

CU-2

BR-4

The extremely high noise levels will not only affect people and pueblo, but also our wildlife. It is a proven fact that the noise endangers the Mexican Spotted Owl, but also the bald eagle that flies over wintering habitats 12 to 14 times a day.

BI-3

I hope you take my concerns into consideration. Thank you for taking the time to read my letter.

001009

June 3, 1999

Laura Montoya

Taos High

TY

To whom it may concern,
I am eighten years old and I have lived in Taos New Mexico my whole life. Taos is one of the most beautiful places I've ever seen. There has been much controversy over the air force bombers flying routine flights over us in our English class we were assigned to write letters about it and our point of view. I'm concerned about the environment, but more so I'm concerned about how our community has been torn apart due to conflicting views from free today because of the power and courage of people who came before me. My father was in Vietnam and I believe strongly in the Armed Forces, but to take advantage of New Mexico because we are a poor State is wrong. I believe the military needs to practice to remain strong. But couldn't you do it somewhere else? If not I understand and I will endure what I must. Thank you for your time.

Sincerely,
Laura Montoya

001010

Travis Hanna
5/28/99

To whom it may concern,
In my opinion, I don't feel that you should send the bombers to give us hair cuts. It will kill the tourism in Taos. Taos is a community strictly dependant on tourism. When will make all of our businesses loose money. What if one of them crashed and started fires on our streets and killed people? It is also a danger to our wildlife, ecology and livestock. The noise pollution is another issue. Personally I don't want to hear 7600 low level bombers per year flying 300 feet over my head. Our land values will also go down. Who wants to live in a place where bombers fly overhead every twenty minutes. To me, this is a bad choice.

BR-4

AO-16

BR-4

Sincerely,
Travis Hanna

001011

Heather Gonzales

June 1st 1999

To whom it may Concern;

I am very worried about the bomber jets flying low to the ground it may cause a few problems. For being that we can hear jets when their way up high, if they were low it could cause people to go deaf or really bad ear aches. It can also cause windows to break if they are low. In response to this tourists may not want to visit and some businesses may ~~not~~ go out of business. As for wildlife, they to may be in danger. This may cause animals to fly away farther. Oh yes another thing is they will be flying from 10:pm to 6:am, this is not right people would not be able to sleep and get there rest. One more concern is what if the jet crashed, its a possibility. This could cause a fire or lead to injury of ~~the~~ people & animals. I hope they don't fly right over New Mexico, because I'm really not looking forward to it.

Bomber Letter

Jessical Adame
Ranchos De
Taos, NM
June 1, 1999

To Whom It May Concern:

PD-1 I am Jessica Adame and I am hoping there is going to be a change. I will be explaining how bad I think the bombs are to the New Mexico land. It is very dangerous for the bombs to fly so low because here in Taos, New Mexico people come to tour and visit the Taos Pueblo. It will make our economic go really bad. We also can't afford to

BR-4 have any tourists and people be frighten to leave home until the bombs have passed at a very low height 2,600. You guys are spending just to much on fuel for the jets. (10,000/hrs fuel). Taos will have a very bad economic if those bombs go through Taos. In my final thought I think you should think of the consequences because people are getting really angry are are going to ruin a really beautiful land of a lot of work.

Amanda Greathouse

001014

Wellsley NM
June 1, 1999

To Whom It May Concern:

I do not agree with you flying plains over our heads. It could destroy our wildlife. We could lose all of the animals that we are famous for. We will destroy a very good it is. The animals and people have lived together for hundreds of years.

BI-3 If you fly your planes over head you will scare of our wildlife. If the animals are scared off some people will not be able to survive because they hunt them for food and even write about them. We should not be a state known for having all or most of there wildlife scared off because someone needed flying lessons.

Amanda
Greathouse

Bomber Letter

001015

Pearl Lujan
Taos, NM
June 1, 1999.

To whom it may concern.

My concern about the Air Force bomber is not a good idea for most people. It also will not be right for the children and also for the reservation of Taos Pueblo. If the Air Force bombers

CU-2 went over Taos Pueblo the Ruins will fall over with the vibrations.

People would not feel comfortable with all the Air Force bombers flying over even if you had to Rest up.

I think that it is not right at all to bring the Air Force bombers here into New Mexico.

I wish that I could do more to bring the Air Force out of New Mexico. I hope people speak out also for the Safty of Taos Pueblo

Sincerely,
Pearl Lujan

001016

Marlene Montoya
Taos, NM
June 1, 1999

To whom it may concern:

I am a student at Taos High School, and I am deeply concerned about the Bomber Training in Northern New Mexico. I would not appreciate B-52 and B-1 Bombers flying over 10 times a day. It is very peaceful and quiet in our part of the state, and these planes would disrupt our way of life. It would not only be a disturbance to people but also to wildlife. The bomber route flies over the Mexican Spotted owl habitat, as well nesting sites for the Peregrine Falcon, and wintering habitat for bald eagles these bombers could have damaging effects and could harm these species.

BI-5

001017

Shannen Chavez
Arroyo Hondo, NM

To whom it may Concern,

I am a student at the Taos High School and a mother-to-be. I think that bombing over head in the New Mexico area will bring a lot of stress to the humans and children. People would go crazy waking up and going to bed, having to hear the bomber up above them.

About the herds of elk in Valle Vidal I think that the noise and stuff will make them change location and we won't be able to see them or the hunters will not be able to hunt them. (which is not a big deal!) I think that why should we (the people) have to pay by hearing this all day and all night long.

BI-1

Thanks for taking the time to read this letter.

001018

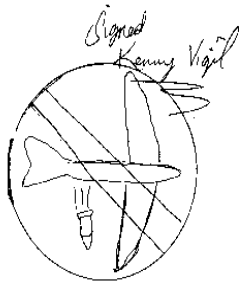
1-1-99 Bomber Letter

To whom it may concern,

I Think this deal with flying bombers over our little tiny peaceful town is a bunch of Shit!! pardon my French but that endangers our town especialy when you are flying that crap so close to our mountains, Wal-Mart, Furrs, Smith's, and McDonalds. You could crash and screw up my town very badly and I think it is inconsiderate of you to do something like this. The government should find restricted areas and designated routes to fly their airplanes. This whole deal just pisses me off.

PD-39

Signed
Kenny Vigil



001019

Jacob Vargas
Ranchitos Taos, New Mexico
June 1, 1999

To whom it may concern:

My name is Jacob Vargas and I am 16 years old. I am currently a Junior at Taos High School and I live in Ranchitos in Taos county. I think that the B-52 bombers should not have test flights in Northern New Mexico because it is a waste of time and money. The money that is used for fuel could and should be used for schools in Northern New Mexico. The flights will disrupt local populations of people and the wildlife of Northern New Mexico. There is also a risk of the bombers crashing into a populated area or crashing in the forest and causing a forest fire. The bombers will also disrupt the peacefulness of Northern New Mexico along with its beauty.

AO-16

001020

To whom it may concern:

There are so many reasons why I am so against training procedure. My main concern is the Taos Pueblo. This historical sight is one of the last two stonie adobe pueblos still standing.

CU-2 The vibration from these flight could cause the pueblo to fall. This is going
AO-1 to pollute the air and water.
BI-2 Not only that it's more than likely going to kill animals like birds. I love animals. Most of these flight are going

PD-16 to be done between 10pm to 6am how are the people in the community going to sleep? Why do they choose to do this over New Mexico! Our land is so precious to us. We live of our land. I could understand they need their practice but please go some where else you're not wanted here.

Sincerly
Cristal E. Norfin

Taos, NM

11th grade
June 1, 1999

001021

To Whom it May Concern: June, 1, 99

My name is Ruby Maestas and I am a Junior at Taos High school. I am writing this letter because I am against the bombers Flying over Taos and Taos Pueblo. The reason I am against it is because it can destroy

CU-2 the old adobe buildings of Taos Pueblo, which has been around for centuries.

I think that Flying bombers over Taos, is a bad idea because it causes noise pollution, and it is bad for tourism

BR-4 which brings in the most money to Taos. Another reason that it is a bad idea is because it spends a lot of money on fuel.

What I dont understand is why they

PD-4 dont just fly the planes in a deserted area. Why does it have to be where people live and around where the forest and scenic areas where it is inhabited.

Ruby Maestas
Taos, New Mexico

001022

Mark Jaramillo

6-2-99

To whom It may Concern:

TY This letter concern all of the people in charge in the government Please do not used New Mexico for all of your practices. The plane that will pass by all over new mexico is not a good idea the people of New Mexico needs to have a little peace and privacy and so I ask you that please stop this plan. Mother Nature is falling apart and New Mexico is one of the place that have a lot of trees and animals. What if there will be no more animals and they have to leave or die where would New Mexico stand this place is the unpopulated place and I know this is the perpect place to do you plan. But we are human to and need a little peaceful place to be in, This is that place and so please give us our privacy. Please think of all the children they are our future and maybe oneday they'll pay you back for All of your concern. Thank you

001023

Juanita Morfin
Taos, New Mexico
June 2, 1999

TY To whom it may concern:
I am strongly against all the plans about the B52 Bombers. We must all do what the best way it is because of our own personal reasons. It would be risky to our community. It is the Guard of our Spirit, the people in particular, that people would drive hundreds of thousands of miles to come see. I think it's wrong thoughtless for the bombers not to think of it. It is the silence of our land and our community that people enjoy the most. So, when you want to think about the B52 please take into consideration our community.

Thank You
Juanita Morfin

001024

Bobby Perez

Taos, NM

6/2/99

To whom It May Concern:

TY The bombers aren't a good idea because our town is nice and quiet, but if you fly over ten times a day at that low it would disrupt our lives.

If you fly over the mountains those are are like our backyard, and how would you like if we went and flew planes that low and that loud over your backyard and tell us that you don't mind it.

001025

Mario Vigil

Arroyo Seco NM

6/2/99

To whom it may concern:

I am a sophomore at Taos High I am writting about the RBTI, I think as individuals we also should have a say on whats going to effect our comunity. Here in Taos culture is a big part of life and by sending B-52 bombers could

CU-2 destroy cultural ruins and other important cultural items, For instance the Taos Pueblo has been around for many years. Wild life in Taos has a great population and with

BI-3 all the racket and noise the animals will be frightend. I hope you take this letter into consideration because we people of Taos Do care about our comunity. Tank you for your time

Thanks,

Mario Vigil

El Prado NM

Bomber letter

My name is Jeremy Montano and I am a Sophomore at Taos High school. The issue has been brought up concerning the fact that Taos county is being looked at as a consideration for Realistic bomber training. My opinion on this issue is that I am totally against this idea. I feel that Taos county is a very ~~fine~~ beautiful place and the atmosphere around ~~it~~ includes some of the worlds

CU-2 most famous cultural buildings is going to be ruined if this is not stopped.

BR-4 I also feel this issue will effect the economy of the people here in Taos because Taos will no longer be a peaceful vacation spot for the countries main source of income tourist. I feel this issue can have a very big effect on many lives in the county and I strongly believe that the issue is looked at by the people of Taos county in a negative way.

001027

REALISTIC BOMBER TRAINING INTITIATIVE

Public Hearing Comment Sheet

Location: Taos, New Mexico
Date: 5/31/99

Thank you for providing your comments on the Realistic Bomber Training Initiative Proposal.

I believe that this Bomber Training is a bad idea for a number of reasons. First of all, I think Taos is a pretty quiet town, compared to other places, it's going to be noisy and

PD-39 destracting to hear the Bomber planes fly constantly. Another reason that the Bomber Training is not a good idea is that the beautiful

AO-1 skies of Taos will get filled and polluted with the smoke from the planes.

In conclusion, the whole Bomber Training is just not a good idea. Not only will the noise of the planes be disruptive and disterbing, but the landscape and beauty of Taos will be destroyed. That's the way I feel and if we go through this bomber training, Taos will never be the same.

001030

Name: Jennifer Pacheco
Full address:
Arroyo Seco, N.M.

Date: 6/2/99

To whom it may concern:

This bomber training initiative is a very bad idea, and I oppose it greatly. It will be very disrupting, especially during the night, and damaging to many ranch areas and to northern New Mexico's wild life. It is crazy, because the noise levels will be extremely high in the middle of the night due to the low flights, and with this will come many complaints.

BR-4 This could also effect tourism and unemployment. Who's going to want to come to a town with so many as ten disruptions a day? This leads to galleries and stores in the town that attract tourists, going out of business. These low flights will harm endangered

001030

such as the Mexican Spotted Owl, or the Peregrine Falcon, even the bald eagles.

It is also very scary to know that numerous military aircraft have crashed on domestic training missions, some within New Mexico, within the past three years. We've already have had massive forest fires, and these crashes have the potential to start more.

The public safety is at risk, and we need to consider the pro's and con's of this and make the decision from the outcome.

Thankyou very much for allowing me to voice my opinion, and for taking time to hear it.

Thank you,
Sincerely,
Jennifer Pacheco

001031

Eric Rivera
El Prado, New Mexico
6-1-99

To whom it may concern:

I am a 16-year old sophomore student writing about the Bomber issue that will affect the community that I live in. Taos and all the other Northern New Mexico communities are very dependent on tourism. The attractions that get
CU-2 tourists, such as the Taos Pueblo building, will start to deteriorate due to the strong noise that these
BR-4 B-52 bombers produce. Not having these tourist attractions would cause are community to become poor.

The B-52 bombers would also effect our wildlife in which they will fly over 8 of our forests and 2 major habitats of endangered species. The noise level would destroy the forests
BI-5 and the endangered species would soon become extinct. The noise level would also drive other animals in the forests to the small communities endangering the citizens of these communities. With all the people leaving New Mexico the state would then look like a deserted town.

001031

These are only a few of the problems that these bombers will bring. Thankyou for taking the time in reading my letter.

Sincerely,
Eric Rivera

REALISTIC BOMBER TRAINING INTITIATIVE

Public Hearing Comment Sheet

Location: Taos County
Date: 5-26-99

Thank you for providing your comments on the Realistic Bomber Training Initiative Proposal.

To whom it may concern,
I don't think that the B-52 bombers should fly. I'm a High School student and a teen mom and I don't want my daughter growing up in that kind of society. I grew up living here and I loved the peace and quiet and that's how I want my daughter to grow up. Also $10,000/hour is a lot just for jet fuel. Instead of spending money on jet fuel just to make turns. I know it's a good cause but spend that money on people who need it, there are many homeless people out there. It will also disrupt our wildlife and hunters need it for meat. Please pick somewhere else like a desert or abanded town.

not a beautiful place like Taos.
Also think about the Taos Pueblo
CU-1 those adobe houses have been around for a long time and the vibrations of the B-52's will bring them down. In a desert there is plenty of room to go back and fourth and practice. Taos means a lot to us and especially to me cause I have my daughter. Please pick another place. Thank You.

REALISTIC BOMBER TRAINING INTITIATIVE

Public Hearing Comment Sheet

Location: Taos, NM
Date: May 28, 1999

Thank you for providing your comments on the Realistic Bomber Training Initiative Proposal.

I am writing in regards to the idea of flying your test flights over the Taos Pueblo. There are numerous reasons as to why I do not think it should be done here.

First of all, what about all of the noise and disturbance that these flights will cause. This has always been a nice quiet little town that people enjoy coming to. If we had these test flights all of this would change.

Second, what about all of the tourists we get year round. They keep most of our businesses open. They usually come to Taos for the mountains and our Taos Ski Valley. If your test flights started going through here the tourists would stop coming. You'd would destroy the town. We would no longer have a beautiful town that many people love coming to.

Next issue is all the fuel you will pe Over for more space →

001033

using. Which means that you will be hearing often in Taos. It is bad enough that these flights are going to be done between 10 pm and 6am but landing to refill will only cause more disturbance. There may even be a possibility that gas prices will increase.

PD-16
AO-69

Last but definately not least is what it would do and now sadly it would destroy our Taos People as well as our wildlife. We have had the Taos Pueblo for many years and I really don't think we are willing to let people come in and destroy it just to do test flights. There are many other places to do this and I don't think Taos should be one of them.

Thank you for providing your comments on the Realistic Bomber Training Initiative Proposal.

To whom it may concern,

Hello. My name is Javier Garcia, and I am a sophomore in H.S. I am writing this letter to inform you about my opposition to the R.B.T.I. I think that this will cause a lot of destruction to the Historical Taos Pueblo. The Taos Pueblo has been around for over 900 years, and it is to important to the Pueblo people to have it destroyed by the government with the vibrations of the test flights.

CU-2

Another issue with the R.B.T.I. are the tourists. Tourists are constantly touring Taos year-round. Tourists mainly for Taos during the winter season for the great skiing, but for the past 2 years, there hasn't been a lot Over for more space →

of snow for the tourists to enjoy. This has really affected Taos. This also causes tourists to stop visiting Taos. If the R.B.T.I. went on, tourists nor the residents of Taos wouldn't like it, because you would only here jet sounds all day.

BR-4

There are many other concerns, such as Pollution. The jets will use about $10,000 worth of fuel per hour, which will cause pollution. This will cause pollution to a town which many people enjoy because it has a fraction of the pollution caused the big cities.

AO-1

There are also other concerns that I cannot list at this time, but if the R.B.T.I. issue proceeds, it is going to bring a lot of destruction and disturbances to Taos, N.M.

Thank You for Your Time,

Javier Garcia

Thank you for providing your comments on the Realistic Bomber Training Initiative Proposal.

To Whom it may concern,

I, Erick Struck, a student of Taos High School and Son of a Vietnam Veteran, take it to my concern that you should not test the B-52 Bombers over Northern New Mexico. My biggest reason for this is that this area has a large population of Veterans of War. It was such a horrible thing that they experienced. Now they will have to go through part of that fueling again if you test your aircraft over Northern New Mexico. It would not be fair to the Veterans and their families. I say their families also because, What effects my father, would also effect myself, my sister and mother. I know for a fact that this was the same for the families of the Veterans. Please don't put them through that fueling again.

001035

It is also not a good thing because, most of the Money that is in Taos is the Surrounding Communities comes from the Tourists. The Pueblo, the San Francisco de Assisi Church and many other historic buildings attract the tourists. Eventually these buildings are going to collapse from the vibrations of these low flying aircraft that will lead to the loss of Tourists, & this, the loss of money. The Town will not be able to operate like it does. Please take my letter & thoughts into consideration. Thank You for your time in reading this letter.

Sincerely,
Erick Struck

BR-4

RBTI Comment Number 001036

This letter was written in light-blue ink and was not readable when scanned. Below is a verbatim copy of the letter. The original is on file.

To Whom It May Concern:

My name is Lynette Martinez. I am a sophomore at Taos High School. I am writing to you to oppose the Realistic Bomber Training Initiative because I have lived here for all of my 16 years of life. I love my hometown of Taos and all the natural wildlife it has to hold for me. If you let these bomber planes fly over our area it will really destroy our economy. Taos is one town that depends on the tourists that come here. Most of the people make a living off the stores or shops tourists buy many things from and if you let bombers come through I am very sure tourists won't come. Tourists come to see the peacefulness here not the bombers doing test flights in the middle of the night and at the crack of dawn. Tourists will stop visiting Taos and most of our town will be out of jobs.

BR-4

Not only will these training flights destroy our economy but also our natural wildlife habitats. There are many endangered species in Northern New Mexico, and by doing these training flights they may kill or injure many of these species. After all the fighting we have done to try to preserve these species you're just going to come and destroy this natural and beautiful wildlife we have?

BI-5

Our town of Taos, New Mexico is very proud of the oldest pueblo almost 900 years old, the Taos Pueblo. The Taos Pueblo is a very old site made of very old materials. With the bombers flying over every day, the Taos Pueblo will eventually turn into a big pile of dirt, and many of the pueblo people will be very devastated because that's where their ancestors have lived and some still live today. You will be destroying many people's homes. Let me ask you one question, if this was happening in your town and many of things at risk would you go ahead and let the bombers fly over you?

CU-1

Sincerely,

Lynette Martinez

Thank you for providing your comments on the Realistic Bomber Training Initiative Proposal.

I am writing in regard to the Realistic Bomber Training Initiative. First of all Taos is a very historic place. We have places such as Taos Pueblo where people still live in today. BRTI will very likely be serious damage to that piece of History. Taos also relies very much on tourists. With 16 flights per week and 10 per day this will discourage tourists from coming to Taos. Another one of my concerns is the noise pollution. This is very disruptive to not only the tourist and people of Taos, but also the wildlife in our region. It is a fact that it will have an impact on our endangered specie the Mexican Spotted Owl and also bald eagles. My last concern is how low they

Date: June 2, 1999

Thank you for providing your comments on the Realistic Bomber Training Initiative Proposal.

My name is Matthew Garcia and I am a Junior at Taos High School. I've lived in Taos my entire life and greatly appreciate all that Northern New Mexico has to offer its people and ...

Recent information has educated me about the United States Air Force wanting to conduct training flights over some of Northern New Mexico's finest and loveliest lands. This do concerns me very much because our environment is essential to everyday life. The wildlife is resource of recreation and also of income. Should the US Air Force conduct low training flights this will have a great impact on wildlife. If the wildlife is affected BI-3 neighboring communities will also be affected.

Another concern is the immense noise pollution produced by these aircrafts. The vibrations caused will have drastic CU-1 effects on historic buildings such as Taos Pueblo and also on old homes throughout Northern New Mexico. The vibration may cause cracks in the walls of these homes, that will reduce

REALISTIC BOMBER TRAINING INTITIATIVE

Public Hearing Comment Sheet

Location: Taos, New Mexico
Date: 5-27-99

Thank you for providing your comments on the Realistic Bomber Training Initiative Proposal.

To who it may concern, I would like to talk about these so-called bomber planes. There are many reasons for these planes to be stopped. First of all it would cause a big disruption and damage to Northern New Mexicos wild life and livestock due to 7,000 low level bombers flights/years wilderness and ranch areas.

Then it would cause a big disruption and distress to local populations of people directly under and on close area to this route, flight corridor. The roughness will fly over directly, Cerro Negro, Chico, Manquero etc. It will fly also over near more communities residence.

BR-4 It will hurt Taos economy. Many tourists will not want to visit because of all the noise. These are numerous

REALISTIC BOMBER TRAINING INTITIATIVE

Public Hearing Comment Sheet

Location: Taos, New Mexico
Date: May 21, 1999

Thank you for providing your comments on the Realistic Bomber Training Initiative Proposal.

To whom it may concern,

My name is Lori Ann Maestas. I am a Junior at the Taos High School. As you know, education is a big part of someone's life and is very important. Not being able to concentrate in school or at work can be a problem to many people. This will happen when the bomber training flights fly overhead. For example, at night, 99% of the people are asleep. With these flights at night, people would be waking up tired, going to work or school tired, people get fired, drop out of school. This is a big situation. For another reason, Taos is a beautiful, peaceful, quiet place and everyone likes it that way. Tourist come here because of that, and tourism makes my paycheck. If flights pass people will move out but then all of the tourist shops and stores will go out of business. At that point, Taos would look unacceptable. Also the air here,

001044

is fresh and rarely polluted. But not with the flights. The fuel will fill up the air and it will smell like rotten egg. Then people will be getting sick. Another thing about flying as low as 1200 ft and disturbing the wild life, it will disturb our lifes. Everyone goes fishing, hunting, camping and it will be distroyed.

AO-70

Taos is a nice place the way it is, and I think that everybody agrees with me. So don't disturb this nice area. If you want to train bombers, go train them near the ocean where noone would be disturbed, disrupted or bothered.

001045

REALISTIC BOMBER TRAINING INTITIATIVE

Public Hearing Comment Sheet

Location: Taos, New Mexico
Date: June 1, 1999

Thank you for providing your comments on the Realistic Bomber Training Initiative Proposal.

I don't want the Air Force Bombers flying over New Mexico. The bombers have to be at 500 feet above ground level and make a lot of noise. It will hurt the people and the animals hearing. A single 15% of flights will occur after 10 PM many people will be losing sleep especially me. I'm not a light sleeper when I hear loud noises in the middle of the night. I don't feel that spending $1-6,000,000 on jet fuel per flight is a waste of money. Since I already have a job, my money, I am happy living in Taos. It's quiet and peaceful and if the bombers fly here it will be loud and upsetting and everything will change. Just

May 11, 1999

Bob Stump
U.S House of Representatives

Washington, D.C.

Dear Congressman Stump:

I am writing to request your firm support in opposing the selection of "Alternative D" under the USAF's proposed Realistic Bomber Training Initiative (RBTI) involving low flying B-52s and B-1s (as low as 300'). As one of several proposed southwestern routes, "D" traverses Philmont Scout Ranch in northeastern New Mexico's Colfax County. Philmont, truly a national treasure, is the 137,000-acre backpacking and training facility of the Boy Scouts of America. I do not protest RBTI since it is a valuable program – my only complaint is with the proposed route over Philmont.

Several years ago, the USAF ceased its low altitude F-16/F-111 flights over the Ranch as a result of Philmont protests. RBTI's multiple daily flights (up to 16) will create much more severe problems:

1. **Program:** Philmont is a transient community of 25,000 people with over 3,000 campers in Philmont's backcountry every day in the summer. Daily, several hundred of them are engaged in spar pole climbing, rock climbing and rappelling, and horse back riding. The sudden roaring of jet engines will distract climbers and bolt horses thereby creating possible injuries (or worse).
2. **Environment:** Appreciation and protection of the wilderness are key parts of Philmont's program. RBTI is inconsistent with wilderness preservation. RBTI will have a damaging effect upon both the unique western wildlife and Philmont herds of cattle, horses, burros, and buffalo. The effect of the unburned portion of jet fuel in the engine exhaust or dumped fuel itself, vaporizing and falling to ground level is as yet unknown, but believed to be anything but beneficial.
3. **Safety:** The environmental impact study done for the USAF is seriously flawed when it describes Philmont as "an uninhabited" grassland. The smaller portion of Philmont's acreage is prairie. Most of Philmont is mountainous with many peaks in the 10,000 to 12,444' range. Philmont has a tremendous fuel load of dead trees in its forests, and is in the midst of a long-term drought. Open fire bans are in effect now. A crashing bomber could create an epic fire of Yellowstone proportions. B-1s and B-52s do not have enviable safety records. The nature of the flights (weaving around mountain peaks and facing violent weather, including frequent, low-level wind shears) dramatically increases the chance of a crash. Unfortunately, Philmont does not have a well-developed highway system for evacuations in case of massive forest fires.

For the above reasons, I seek your help in advocating the selection of a different RBTI route, preferably one that is over a more sparsely populated, less environmentally sensitive area. There is too much at stake to allow RBTI to overfly Philmont. Please act now – final route determination starts in June.

Thank you for helping to see that alternative D is not selected.

MEMO

Topic : Regarding the attached letters,
To evince my feelings on the topic I offer :

BR-6 As Robert Duvall stated in Apocalypse Now " I love the smell of napalm in the morning "

I think it was (1950's), and is - (1999), inspiring to see a BUFF* at three hundred feet using the Tooth of Time as a marker. What an inspiration for a young scout as he is tending to his morning ablutions to see one as George Scott said in Dr. Strangelove. " Flying so low that they can fry chickens in the barnyard ".

Double the flights - double the inspiration.

Kind Regards from Asia

PHILMONT STAFF ASSOCIATION
Philmont Scout Ranch
Route 1, Box 35
Cimarron NM 87714

May 10, 1999

Dear PSA Member:

The Philmont Scout Ranch that we know and love is about to be changed dramatically – unless we act.

Bombers will be coming to our ranch – day and night, 2,660 times every year, if the U.S. Air Force selects a proposed route over Philmont for its "Realistic Bomber Training Initiative" (RBTI).

The Air Force is considering several areas in west Texas and New Mexico for this training, which would involve up to 16 low-level flights a day of B-1 and B-52 bombers from Dyess Air Force Base in Abilene, Texas, and Barksdale Air Force Base in Louisiana. Alternative D would establish a training route over some 114,000 of Philmont's 137,000 acres. Aircraft would fly over Philmont at altitudes as low as 300 feet, day and night, six days a week, 52 weeks a year.

You can easily imagine the effects that flights like this would have on Philmont's program. Ranch management has serious health and safety concerns for campers if Philmont is subjected to repeated daily bombardments of noise and unburned jet fuel, not to mention the very real possibility of a catastrophic accident.

We – the former members of the Philmont staff – need to act **now** to keep this from happening.

Register your protest against the selection of Alternative D with the Air Force and FAA officials listed below. Enlist the support of your congressional delegation to prevent the end of the Philmont experience that Waite Phillips envisioned. A sample letter is enclosed. You can adapt it as you see fit, add the appropriate addresses, and send it to your representatives and Senators in Congress, the FAA, and the Air Force. You can also download the letter and obtain additional information from the PSA's website at **www.philmont.com/rbti.** Be sure to delete the paragraph relating to Congressman Ed Pease when transposing the letter for the Air Force and FAA.

In your letters, please follow a few basic guidelines:

1. Be cordial and polite in statement and tone.
2. Make no statement or claim that you do not absolutely know to be true.
3. Focus on the issues: the health and safety of campers and the value of the Philmont experience.
4. Do not focus on other issues or ideology, such as whether we need military training flights, etc.

Enlist the help of your family, friends, and fellow Scouters. Your voices will make a difference – a nationwide protest is not likely to materialize for the west Texas alternatives. The public comment period ends **June 15.** It is imperative that you write **now** – the 25,000 Scouts and leaders who visit Philmont each year need our efforts. If we don't take the initiative, we will lose. A few minutes of your time and some 33-cent stamps don't cost much – but the cost of thundering, low-flying bombers roaring over Philmont at all hours of the day and night simply can't be measured.

This is something you can do for Philmont that will directly affect the future of the ranch. Philmont will never be the same – unless we help. Please write today.

The Executive Committee of the
Philmont Staff Association

001047

TEN POINTS FOR OPPOSITION TO RBTI ALTERNATIVE D (OVER PHILMONT)

1. The EIS (Environmental Impact Statement) incorrectly concludes that very few population centers are affected. On any given day in the summer months, over 5,000 people will be living and camping directly under the flight path at Philmont.

2. Safety of horseback riders will be endangered. Philmont provides trail rides or pack trips for 7500 to 9500 mostly inexperienced riders each summer on steep and narrow mountain trails. As many as 165 inexperienced people may be on horseback on the ranch at various times during the day. The startle effect of a high-decibel low-level flight could easily cause one or more horses to spook and bolt with a novice rider aboard. With the number of flights proposed, it will be only a matter of time before Philmont experiences a serious injury or death due to a rider being thrown from or dragged by a startled horse.

3. Increased noise levels will interfere with staff trying to provide safety instruction to rock climbers, spar pole climbers, and rifle range shooters. The noise level of a B-52 at 300 feet is 117 decibels. Staff trying to teach safety techniques required in climbing rock faces or firing black powder rifles should not have to compete with such noise interference.

4. The high noise levels generated by B-1 and B-52 bombers flying only a few hundred feet above ground level are greater than being near a chain saw or a diesel train. Campers at Philmont will be exposed to such noise levels for more than six hours during a typical 12-day stay based on projected flight operations. This is not a true wilderness experience.

5. The possibility of a crash is very real. The EIS estimates the chances of a "Class A mishap" at one every 15 years for a B-1 on the training route that would include Philmont. Aside from the real risk to Scouts who might be in the path of an errant bomber, a crash on Philmont would have the potential of starting a serious forest fire that could devastate the ranch.

6. The EIS fails to mention any impact of flyovers on Philmont's two National Historic sites, The Kit Carson/Maxwell Abreu houses at Rayado and the Villa Philmonte.

7. The flights can be expected to have serious impacts on Philmont's wildlife and will overfly the habitats of at least three endangered species, the bald eagle, peregrine falcon, and Mexican spotted owl. The U.S. Fish and Wildlife Service has concluded that overflights at less than 1,000 feet will significantly impact these species.

8. No one has investigated the cumulative effects of the planned noise levels and vibrations on the hundreds of abandoned and the two active mines on Philmont.

9. No plane burns all of its fuel. At higher altitudes, unburned fuel dissipates in the atmosphere. At lower altitudes, one must expect that some unburned fuel will find its way to the ground and streams on Philmont. The effects of a plane in trouble at low altitude dumping fuel over Philmont with numerous cook stoves and campfires are easily imagined.

10. Philmont is a national treasure and provides a wilderness camping experience for thousands of Scouts, America's future leaders, every year. That experience should be preserved since alternative training sites exist which do not jeopardize the program experience offered by Philmont and the safety of thousands of young people participating in it each year.

SAMPLE LETTER

I am writing to request your firm support in opposing the selection of Alternative D under the U.S. Air Force's proposed Realistic Bomber Training Initiative (RBTI). The Air Force is seeking to establish a new training route for low-level B-1 and B-52 bomber flights from bases in Texas and Louisiana. One of the proposed routes, Alternative D, traverses Philmont Scout Ranch in northeastern New Mexico's Colfax County.

Philmont is a 137,000-acre mountain backpacking and high adventure facility of the Boy Scouts of America. Each year, thousands of Scouts and their adult leaders from across the nation participate in two-week wilderness backpacking trips in the mountains of Philmont. Many of them also camp and work on conservation projects in the adjacent Valle Vidal Wilderness of the Carson National Forest.

The Air Force's proposed Alternative D will establish a military training route directly over most of Philmont. More than 2600 flights each year, some as low as 300 feet above ground level, are proposed for the segment over Philmont. As a former Philmont staff member, I have serious concerns about the impact of the Air Force's proposal on the health and safety of Scouts attending Philmont and the potential effects of daily low-level flights on the ranch itself.

On any given day in the summer, as many as 5,000 Scouts and Scouters will be hiking and camping in Philmont's backcountry. Each day, several hundred of them will be engaged in activities such as rock climbing and rapelling, spar pole climbing, and mountain horseback rides. The sudden roar of jet engines has a high likelihood of distracting an inexperienced climber or causing a horse to bolt on a narrow mountain trail with resulting serious injury (or worse).

Appreciation and protection of the wilderness and our natural resources is a key part of the Philmont program. Scouts from around the world have a unique opportunity to see and experience wildlife in native habitat. Noise and emissions from bombers cannot help but have a damaging effect on that wildlife, as well as on Philmont's herds of buffalo, horses, cattle and burros. The disruptive effects of noisy bomber overflights on Philmont's famous living history programs, in which Scouts experience the lifestyles of the West's mountain men, homesteaders, lumberers and cowboys, are obvious.

Most of Philmont is mountainous with many peaks in the 10,000' to 12,000' range. Philmont has a tremendous fuel load of dead trees in its forests and is in the midst of a long-term drought. Unburned jet fuel finding its way to the ground or being dumped in an emergency over such terrain, with campers using backpacking stoves for cooking, creates the potential for a serious fire that would endanger hundreds of lives. The possibility of a crash, however remote, is simply not acceptable for the safety of these Scouts.

For these reasons, I seek your help in advocating the selection of a different RBTI route. I ask that you express your opposition to Alternative D to the Secretary of the Air Force and other defense officials who may be involved in this decision. Please act now, as the public comment period ends in June and a final decision will be made this year. You or a member of your staff may wish to contact Greg Dodd, Chief of Staff for Congressman Ed Pease of Indiana, who can provide additional information.

Philmont is the largest and most famous Scout camp in the world. It is a national resource that has positively impacted the lives of hundreds of thousands of our nation's youth for more than sixty years. It deserves and demands our protection. Thank you for helping to see that Alternative D is not selected.

Sincerely,

Dear Major Adams:

BR-6 I am forwarding to you a copy of a letter from Mr. Jason Fritz concerning the Philmont Scout Ranch in Cimarron, New Mexico.

It is the desire of this office to be responsive to all inquiries and communications. I respectfully ask for your assistance in resolving the issues outlined in this correspondence.

Please forward a copy of your findings to Thomas L. Weber of my Boston office.

I thank you for your cooperation in this matter.

Sincerely,

John F. Kerry

RECEIVED APR 14 1999

Senator Kerry:

Dear Rep. Delahunt and Sens. Kennedy and Kerry:

If any of you were ever Boy Scouts, you are probably familiar with the Philmont Scout Ranch in Cimarron, NM, and you may have even been there. Philmont is the BSA's premier high adventure base (primarily backpacking) nestled in the Sangre de Christo Mountains of northern NM. It has come to my attention via a mailing list of current and past Philmont staffers that the United States Air Force is in the process of holding public hearings about their proposal to establish a new training run, which would have low-flying aircraft going directly over Philmont Scout Ranch several times a day. As a former Philmont Ranger and Eagle Scout who understands firsthand the value of the Philmont experience, I am concerned about this. The major concerns are addressed below in a letter from Mark Griffin, one of the year-round staff members. He also included the contact information for the USAF officer you should to prevent the training runs from flying through Philmont airspace. Thank you for attention to this matter.

While Philmont supports fully the mission of the United States Air Force, Philmont is extremely concerned about the impact on Scouts safety, on the program that Scouts and families receive, and the wildlife that inhabit the 137,000 acres of the ranch.

Obviously, with in nearly of 5,000 people on the ranch on any given day during the summer, the chance for a mishap, while considered minor by the Air Force, is there. Of primary concern is the horse program. We are very concerned about horses being "spooked" by low flying aircraft and throwing a rider. With strings of 30 riders, at four locations (base, Beaubien, Ponil, and Clark's), four times a day, plus cavalcades and working staff, this is a real concern.

The impact of planes flying overhead at low level is also of concern as it relates to the wilderness backcountry experience. Not to mention the lack of sleep caused by the 20% of the flights between 10:00am and 2:00pm.

Finally, we are concerned about wildlife migrating off the ranch to get away from the noise. Philmont's elk, deer, lion, predatory bird, and bear populations - not to mention smaller wildlife populations - are an important part of the Philmont experience.

Dear Major Adams:

TY The deadline for writing you is almost up. I have not done so earlier because it is very hard for me to find the energy to do so. I have a neurological disorder called fibromyalgia. This is a very real medical problem — it is recognized as such by the World Health Organization. Fibromyalgia is characterized by chronic pain and chronic fatigue, with up to 50 other symptoms of central nervous system malfunction. Stress and external stimuli of all kinds — light, noise, heat, cold etc. are distorted by the individuals brain or nervous system (it is still not medically understood) and can be very painful.

I moved to Ft. Davis in hopes of improving my health. I've only lived here 4 months but I already have met 3 other people who moved here for health reasons — one other for fibro, one for lupus, and one for MCS. While I cannot speak for them,

I can say for myself that those low-level training flights by extremely loud jets would not be conducive to improving my health. In fact, since I find listening to radio and television both uncomfortable, I imagine the sound of a very loud jet overhead would be excruciating.

There aren't many people out here, and very few have much money, or the time to write you. One has to sacrifice big city jobs and amenities to live out here. But we have chosen to live here because of the remoteness, the beauty of the landscape, and the quiet ... the precious silence. The city people with their constant traffic noise, sirens and leaf blowers, are used to noise. We don't want it and that's why we choose to live here.

Please don't inflict this terrible, startling noise on me and others who have come here for the silence.

Sincerely,
Victoria Lowe

Dear Major Adams:

"I feel the Environmental Impact Statement (EIS), Draft Stage, of the Realistic Bomber Training Initiative (RBTI) is unfair and unjust"

I was born and raised in the rural West. The family farm - living from, and a respect for the land is deep in my consciousness. I am very much against the proposed flight plans over this rural Texas landscape. I have contributed to the effort and attended meetings in the community effort to have this proposed defeated. I will not list the many arguments and facts presented, circulated, spoken and published to support our position. I feel sure that you have such material in abundance already.

001050

I will simply say that I feel this idea of a flyover to be an invasion, contrary to the spirit of the constitution and that, not only being unlawful, but immoral as well. I feel that the activity violates this very American concept of living with the land to supply the nations food and to husband & protect the land, for future generations, the natural character - air, water and all growing things. I feel intensely that your activity will do great violence to this concept. I respectfully urge you to seek a path way over Federally controlled land, if such flying activity is deemed absolutely necessary.

Sincerely,
James & Sara Pierce

Major Brent Adams, RBTI EIS Project Manager
HQ ACC/CEVPP
129 Andrews Street, Suite 102
Langley AFB, VA 23665-2769

Major Adams:,

We feel the Environmental Impact Statement (EIS), Draft Stage, of the Realistic Bomber Training Initiative (RBTI), is unfair and unjust.

Our family is a ranching family, who lives and works southeast of Marathon, Tx. Our living is dependent upon cattle, horses and wildlife. The tremendous noise that these bombers generate is heartstopping, and dangerous. On numerous occasions we have been "buzzed". Sometimes we are in our home, the windows shake! Sometimes we are in a vehicle, often we are horseback or on foot. We have been on a hill and have seen the pilot! Regardless of where we are or what we are doing the noise is terribly frightening. There is no way to avoid the noise and when the jets come we can only brace ourselves and cover our ears.

BR-3
BI-3

These low level flights are dangerous! A colt looking for an excuse to break in two is given just the chance when these bombers use us as targets. Cattle are frightened and scattered when these jets hit. A large part of our income comes from our wildlife; the deer, quail, javelina are all frightened by the jets. Our hunters are bothered by these horrible low-level flights.

Our children have been frightened to the point of tears when these unexpected monsters fly so close. Our youngest is afraid to go outside by himself for fear of a jet. Even though I am outside with them, these jets come so fast that often times I cannot get to the children fast enough to protect them. (On such occasion I thank God these are 'our guys' and not the enemy with a bomb.) These cases are made worse when horses and cattle are in the formula. Not only is it difficult to comfort the children within arms reach --- the matter is worsened when the child is on a horse, out of arms reach and I don't know what the horses reaction will be, or the cattle.

These low-level flights happen, they happen often, they are unexpected, they happen day and night, throughout the year. The noise is terrible, they decrease our land value and damage our property. Our quality of life is diminished as a result. Furthermore; there is no way we can say a crash will never happen to us. Just what would happen if a jet or bomber crashed here? When these young pilots 'hot dog' in and out of these hills it is a great possibility. Our grass alone is our main source of bread and butter. A crash would start a fire for certain.

We are real people who live and work and play out here. WE DO NOT WANT LOW LEVEL FLIGHTS OF ANY DESCRIPTION IN OUR AREA. (Why in the world would we train German pilots in our planes over our country? !)

PD-7

Why are low-level flights of any nature necessary where we live and work and play? It seems to us that the U.S. Government owns quite a bit of her own land. Shouldn't she use it? We oppose the unreasonable location of these Low Level Realistic Combat Training Flights.

001052

REALISTIC BOMBER TRAINING INITIATIVE (RBTI) ALTERNATIVE D

Dear Major Adams:

BR-6

Located in the Sangre de Cristo Mountains of Northern New Mexico is a 137,000 acre tract of land that is owned and operated by the Boy Scouts of America. This land has been used since the late 1930's as the National Scout Camp, and, as such, has been the destination of scouts from all over the world. The camp, Philmont Scout Ranch and Explorer Base, has been used for training young men and women, adult scouters and their families, and has given hundreds of thousands of scouts a true wilderness camping experience.

To the consternation of many, 114,000 of Philmont's 137,000 acres have been selected to be a part of Alternative D of the RBTI. The flights involved would consist of an average of 10 low level (1000 feet above ground level) flights per day. It is assumed that these would take place both night and day, and would have a drastic effect on this private wilderness area.

During the summer, 19,000 scouts and scouters backpack through Philmont's peaks and canyons. At any one time, 5,000 scouts and scouters in addition to 600 plus staff members are present on the camp. Several of the programs could be adversely affected by jet bombers flying at low levels over the camp. One of the programs, horseback riding, involves inexperienced equestrians riding on narrow trails. Needless to say, the noise of a low level bomber could result in tragedy. Other programs such as rock climbing and rifle shooting could be affected by safety instructions not heard or understood due to the noise.

The environmental impact statement (EIS) estimates that a camper will be subjected to this low level noise for an average of 6 hours during a typical 12 day stay. This certainly takes away the wilderness aspect of the camping experience, and would change Philmont forever.

The EIS incorrectly concludes that few population areas are affected by the flight paths. This could be that Philmont is not shown as a town, but, as stated above, is definitely a population center.

In addition, the EIS estimates that a Class A accident will take place once every 15 years for a B-1 bomber. This may be acceptable for Air Force crews, but is totally unacceptable if 14 to 18 year old scouts happen to be in the impact area of such an accident. One can only imagine the tragedy that would be felt be felt by families that would lose their loved ones.

001053

Craig A. Vandell

Englewood, CO
USA

I have been a strong supporter of the military, particularly the Air Force, all of my life. Indeed, my father was a career civil service employee of the Air Force. In this case, however, I feel that the Air Force has not fully researched nor have they thought out fully the impact of this flight plan. Philmont is a national, indeed international, treasure that has provided, and hopefully will continue to provide a wilderness camping experience to thousnads of scouts, America's future leaders. every year. This treasure should be preserved since alternative training sites exist elsewhere which do not jeopardize the unique program experience offered by Philmont.

If you have further questions, I suggest that you contact either Congressman Ed Pease or Congressman Pete Sessions. Major Adams, I respectfully request your reconsideration in directing the flights according to alternative D flight plans. Your help would be gratefully appreciated.

Sincerely

Craig A. Vandell

Major Brent Adams
RBTI EIS Project Manager
HQ ACC/CEVPP
129 Andrews Street, Suite 102
Langley AFB, VA 23665-2769

Dear Major Adams,

BR-6 I am writing to request your firm support in opposing the selection of "Alternative D" under the USAF's proposed Realistic Bomber Training Initiative (RBTI) involving low flying B-52s and B-1s (as low as 300'). As one of several proposed southwestern routes, "D" traverses Philmont Scout Ranch in northeastern New Mexico's Colfax County. Philmont, truly a national treasure, is the 137,000 acre backpacking and training facility of the Boy Scouts of America. I do not protest RBTI since it is a valuable program -- my only complaint, as a Philmont alumnus, is with the proposed route over Philmont.

Several years ago, the USAF ceased its low altitude F-16/F-111 flights over the Ranch as a result of Philmont protests. RBTI's multiple daily flights (up to 16) will create much more severe problems:

a) Program: Philmont is a transient community of 25,000 people with over 3,000 campers in Philmont's back country every day in the summer. Daily, several hundred of them are engaged in spar pole climbing, rock climbing and rapelling, and horse back riding. The sudden roaring of jet engines will distract climbers and bolt horses thereby creating injuries (or worse).

b) Environmental: Appreciation and protection of the wilderness are key parts of Philmont's program. RBTI is inconsistent with wilderness preservation. RBTI will have a damaging effect upon both the unique western wildlife and Philmont herds of cattle, horses, burros, and buffalo. The effect of the unburned portion of jet fuel in the engine exhaust or dumped fuel itself, vaporizing and falling to ground level is as yet unknown, but believed to be anything but beneficial.

c) Safety: The environmental impact study done for the USAF is seriously flawed when it describes Philmont as an "uninhabited" grassland. The smaller portion of Philmont's acreage is prairie. Most of Philmont is mountainous with many peaks in the 10,000 to 12,444' range. Philmont has a tremendous fuel load of dead trees in its forests, and is in the midst of a long term drought. Open fire bans are in effect now. A crashing bomber will create an epic fire of Yellowstone proportions. B-1s and B-52s do not have enviable safety records. The nature of the flights (weaving around mountain peaks and facing violent weather, including frequent, low-level wind shears) dramatically increases the chance of a crash. Unfortunately, Philmont does not have a well-developed highway system for evacuations in case of massive forest fires.

There is too much at stake to allow RBTI to overfly Philmont. Please act now -- final route determination starts in June.

Thank you for helping to see that alternative D is not selected.

Sincerely,

Karen Fielder

001055

June 11, 1999

Corvallis, OR.

Senator Gordon Smith

Washington D.C.

Dear Gordon,

I have been a member of the Boy Scouts of America for more than forty years, first as a boy and as an adult leader. Recently, I received correspondence from the Staff Association of Philmont Scout Ranch in Cimarron New Mexico. Their concern was about a United States Air Force proposed RBTI Route "D." This program would overfly the scouts' property at elevations as low as 300 feet during training missions for B-1 and B52 bombers. Philmont Ranch, no doubt, provides terrain which would be of value for such training. However, the ranch is intensively used as a training and high adventure facility for both boy and adult leaders. It also is an active cattle ranch.

I have been privileged to attend training sessions at Philmont and both of my sons have served on staff at the ranch. It would seem that the use of airspace over this property proposed by the Air Force is inconsistent with the Boy Scout's mission because it poses a potential danger to Philmont participants and the ranch's facilities.

As a veteran, I appreciate the need for military training to maintain excellence. My eldest son is a retired Air Force Lt. Colonel, thus I am somewhat familiar with the demands of that branch of our armed forces. With all of the mountainous terrain in federal ownership in the southwest it would seem that such training could take place over those properties.

PD-7

Perhaps, after fighting the northwest timber battles for the past thirty years, I am prone to jump to conclusions. Let me suggest that the Air Force has been prevented from over flying federal properties because of environmental constraints on noise pollution and the potential of disturbing the tranquility and solitude of wilderness users.

I would appreciate your looking into this matter.

Sincerely,

Larry M. Christiansen

b) Environmental: Appreciation and protection of the wilderness are key parts of Philmont's program. RBTI is inconsistent with wilderness preservation. RBTI will have a damaging effect upon both the unique western wildlife and Philmont herds of cattle, horses, burros, and buffalo. The effect of the unburned portion of jet fuel in the engine exhaust or dumped fuel itself, vaporizing and falling to ground level is as yet unknown, but believed to be anything but beneficial.

c) Safety: The environmental impact study done for the USAF is seriously flawed when it describes Philmont as an "uninhabited" grassland. The smaller portion of Philmont's acreage is prairie. Most of Philmont is mountainous with many peaks in the 10,000 to 12,444' range. Philmont has a tremendous fuel load of dead trees in its forests, and is in the midst of a long term drought. Open fire bans are in effect now. A crashing bomber will create an epic fire of Yellowstone proportions. B-1s and B-52s do not have enviable safety records. The nature of the flights (weaving around mountain peaks and facing violent weather, including frequent, low-level wind shears) dramatically increases the chance of a crash. Unfortunately, Philmont does not have a well-developed highway system for evacuations in case of massive forest fires.

There is too much at stake to allow RBTI to overfly Philmont. Please act now -- final route determination starts in June.

Thank you for helping to see that alternative D is not selected.

Sincerely,

Jimmy R. Haynes

Dear Major Adams,

BR-6 I am writing to request your firm support in opposing the selection of "Alternative D" under the USAF's proposed Realistic Bomber Training Initiative (RBTI) involving low flying B-52s and B-1s (as low as 300'). As one of several proposed southwestern routes, "D" traverses Philmont Scout Ranch in northeastern New Mexico's Colfax County. Philmont, truly a national treasure, is the 137,000 acre backpacking and training facility of the Boy Scouts of America. I do not protest RBTI since it is a valuable program -- my only complaint, as a Philmont alumnus, is with the proposed route over Philmont.

Several years ago, the USAF ceased its low altitude F-16/F-111 flights over the Ranch as a result of Philmont protests. RBTI's multiple daily flights (up to 16) will create much more severe problems:

a) Program: Philmont is a transient community of 25,000 people with over 3,000 campers in Philmont's back country every day in the summer. Daily, several hundred of them are engaged in spar pole climbing, rock climbing and rapelling, and horse back riding. The sudden roaring of jet engines will distract climbers and bolt horses thereby creating injuries (or worse).

b) Environmental: Appreciation and protection of the wilderness are key parts of Philmont's program. RBTI is inconsistent with wilderness preservation. RBTI will have a damaging effect upon both the unique western wildlife and Philmont herds of cattle, horses, burros, and buffalo. The effect of the unburned portion of jet fuel in the engine exhaust or dumped fuel itself, vaporizing and falling to ground level is as yet unknown, but believed to be anything but beneficial.

c) Safety: The environmental impact study done for the USAF is seriously flawed when it describes Philmont as an "uninhabited" grassland. The smaller portion of Philmont's acreage is prairie. Most of Philmont is mountainous with many peaks in the 10,000 to 12,444' range. Philmont has a tremendous fuel load of dead trees in its forests, and is in the midst of a long term drought. Open fire bans are in effect now. A crashing bomber will create an epic fire of Yellowstone proportions. B-1s and B-52s do not have enviable safety records. The nature of the flights (weaving around mountain peaks and facing violent weather, including frequent, low-level wind shears) dramatically increases the chance of a crash. Unfortunately, Philmont does not have a well-developed highway system for evacuations in case of massive forest fires.

There is too much at stake to allow RBTI to overfly Philmont. Please act now -- final route determination starts in June.

Thank you for helping to see that alternative D is not selected.

The Honorable Kay Granger
House of Representatives

Washington, D.C.

RE: U.S. Air Force's Realistic Bomber Training Initiative ("RBTI") overflights of Philmont Scout Ranch, Cimarron, New Mexico

Dear Congresswoman Granger:

BR-6 I am writing to request your firm support in opposing the selection of "Alternative D" under the U.S. Air Force's proposed Realistic Bomber Training Initiative ("RBTI") involving low flying B-52s and B-1s (as low as 300'). The reason for my concern is that as one of several proposed southwestern routes, "Alternative D" traverses Philmont Scout Ranch in northeastern New Mexico. Philmont, truly a national treasure, is the 137,000 acre backpacking and training facility of the Boy Scouts of America. I do not protest RBTI as it is a valuable training program, important to our nation's defense -- my only complaint, as a two-time Philmont alumnus, is with the proposed route over Philmont. I am certain that because of your membership on the National Security and Transportation committees this issue will be of interest to you.

Several years ago, the Air Force ceased its low altitude F-16/F-111 flights over the Ranch as a result of Philmont protests. RBTI's multiple daily flights (up to 16) will create much more severe problems:

- Program: Philmont is a community of 25,000 people with over 3,000 campers in Philmont's back country every day in the summer. As I did over twenty years ago, several hundred Scouts are engaged in spar pole climbing, rock climbing and rappelling, and horse back riding daily. The sudden roaring of jet engines will distract climbers and bolt horses thereby creating injuries (or worse).

- Environmental: Appreciation and protection of the wilderness are key parts of Philmont's program. RBTI is inconsistent with wilderness preservation. I am concerned that RBTI will have a damaging effect upon both the unique western wildlife and Philmont herds of cattle, horses, burros, and buffalo. The effect of the unburned portion of jet fuel in the engine exhaust or dumped fuel itself, vaporizing and falling to ground level is as yet unknown, but believed to be anything but beneficial.

- Safety: As I understand it, the environmental impact study done for the Air Force is seriously flawed when it describes Philmont as an "uninhabited" grassland. The smaller portion of Philmont's acreage is prairie. Most of Philmont is mountainous with many peaks in the 10,000 to 12,444' range. Philmont has a tremendous fuel load of dead trees in its forests, and is in the midst of a long term drought. Open fire bans are in effect now. A training accident could create an epic forest fire. B-1s and B-52s do not have enviable safety records. The nature of the flights (weaving around mountain peaks and facing violent weather, including frequent, low-level wind shears)

dramatically increases the chance of a crash. Unfortunately, Philmont does not have a well-developed highway system for evacuations in case of massive forest fires.

For the above reasons, I seek your help in advocating the selection of a different RBTI route, preferably one that is over a more sparsely populated, less environmentally sensitive area. Not unlike the redesignation of Carswell NASJRB, or the continuing production of F-16s and Ospreys in Fort Worth, sometimes there are more alternatives than appear a first glance.

You, or a member of your staff may wish to liaise with Rep. Ed Pease's (Indiana) legislative assistant, Greg Good, who has additional information on RBTI. I have enclosed a fact sheet prepared by the Philmont Staff Association for your review.

Please act now -- final route determination starts this month. Thank you for helping to see that alternative "D" is not selected. Thank you for the great job you do representing Fort Worth and 12th District and I hope to see you at Judge McCoy's next weekend.

Sincerely yours,

/s/

Re: Low Altitude Training Flights over New Mexico

Dear Sir:

TY Nothing to do this summer but play computer games, watch MTV, or just hang out with the guys? Nothing to do but fight the traffic in going to the Mall to see who might be there. Nothing to do but see that new movie for the third time?.....Now try this:

This summer how about getting away to the Sangre de Cristo mountains in Northern New Mexico, strapping on a backpack and having the adventure of your life! You might learn to flyfish and make your own lures, you might learn to rock climb and repel, you might learn how to saddle a horse, you might learn how to look at nature up close and personal, you might even learn how to make root beer! Your only worries will be looking for the absolute best vistas at this 7000 foot altitude or listening for the sounds of the birds and the chipmunks and maybe finding the signs of the occasional bear! The Boy Scouts of America offer this to teen age boys, and yes, to girls also, at their Philmont Scout Ranch at Cimarron, New Mexico. Each summer over 20,000 young people come to Philmont from across the United States. Over 200 go out on the trails of this 140,000 acre ranch each day to experience the 10 day hikes or ride in the horse cavalcades. Many college students work as rangers and wranglers and staff from across America. All are there for this magnificent wilderness experience.

Suddenly, the swish and roar of the giant bombers! The animals run, the horses spook and the hikers duck! This is not the wilderness experience. The boy might as well be back on the streets in New Jersey to hear that kind of noise.

I'm all for the Air Force. I was a jet bomber pilot and I certainly realize the need for training, but I do not think it should be done over Philmont Scout Ranch. This is a very special place and a lifetime experience for these young people. Don't take it away from them. Please use your influence and support to see that this is not destroyed for our young people.

Yours truly,

Jack F. Callaway
Philmont Training Center Chairman

Dear Major Adams;

BR-6 I am writing to request your firm support in opposing the selection of Alternative D under the U.S. Air Force's proposed Realistic Bomber Training Initiative (RBTI).

For those of us who know and love Philmont Scout Ranch, it is unbelievable that the U.S. Air Force would even consider training flights over this part of the country. Every year, thousands of young men from around the country come to Philmont to grow through the process of meeting the challenges of a wilderness backpacking experience. If there were never any accident, and the aircraft never lost any fuel over the ranch (which of course is unlikely in the extreme), these flights would still have a horrible effect just from the presence of the bombers in the sky above the hikers. It is not possible to have a wilderness experience with a B52 bomber thundering over head. The noise from these flights would not only destroy the tranquility of the wilderness, but would actually endanger these young men as they try new skills in mountainous terrain.

The negative impact on the wildlife will be impossible to measure. We are talking about an area where low impact camping is practiced to the point where campers carry their used toilet paper out with them. What is the point in doing our feeble best to preserve this wilderness while bombers spew exhaust and fuel over the land. One flight will have a more damaging impact than 10,000 hikers.

I had the good fortune of hiking the trails of Philmont in 1966. Those two weeks still stand out as a high point in my life. Philmont is the dream destination of literally 100s of thousands of young men across the country. I can't believe there isn't some other area better suited for this training.

Philmont Scout Ranch is a national treasure which must be preserved.

Sincerely,

Edwin B. Arnold, Eagle Scout, Registered member of Troop 291, Circle 10 Council, BSA

Langley AFB, VA 23665-2769

Dear Major Adams,

TY The proposed low level training flights over Northern New Mexico would create the worst possible kind of public relations situation that the Air Force could possibly envision. To send large planes in frequent daily runs over our well-populated areas – among them even a number of ski resorts – would be to destroy the peaceful beauty of our valleys, to say nothing of the damage that would be done to the environmental and agricultural aspects of the Northern New Mexico area.

It would be possible to say a great deal more in opposition to Alternative D, but we will refrain from doing so. Simply be assured that our opposition to the idea of low level training flights over the Moreno Valley area of Northern New Mexico is shared by all its residents, no matter how firm our support of our United States military may be.

Thank you for your attention to our input in this matter.

Sincerely,

Dear Major Adams:

BR-6 I am a member of the Philmont Staff Association and have been for many years. I was a staff member during the summers of 1963 and 1964. I am expressing my concern over an action by the U.S. Air Force for bomber training flights over the ranch. The following is a model letter the executive Staff Committee composed. It articulates the issues very well and I have chosen to use it to convey my dissatisfaction with the proposed bombing route.

I am writing to request your firm support in opposing the selection of Alternative D under the U.S. Air Force's proposed Realistic Bomber Training Initiative (RBTI). The Air Force is seeking to establish a new training route for low-level B-1 and B-52 bomber flights from bases in Texas and Louisiana. One of the proposed routes, Alternative D, traverses Philmont Scout Ranch in northeastern New Mexico's Colfax County.

Philmont is a 137,000 acre mountain backpacking and high adventure facility of the Boy Scouts of America. Each year, thousands of Scouts and their adult leaders from across the nation participate in two week wilderness backpacking trips in the mountains of Philmont. Many of them also camp and work on conservation projects in the adjacent Valle Vidal Wilderness of the Carson National Forest.

The Air Force's proposed Alternative D will establish a military training route directly over most of Philmont. More than 2,600 flights each year, some as low as 300 feet above ground level, are proposed for the segment over Philmont. As a former Philmont staff member, I have serious concerns about the impact of the Air Force's proposal on the health and safety of Scouts attending Philmont and the potential effects of daily low-level flights on the ranch itself.

On any given day in the summer, as many as 5,000 Scouts and Scouters will be hiking and camping in Philmont's back country. Each day, several hundred of them will be engaged in activities such as rock climbing and rapelling, spar pole climbing, and mountain horseback rides. The sudden roar of jet engines has a high likelihood of distracting an inexperienced climber or causing a horse to bolt on a narrow mountain trail with resulting serious injury (or worse).

Appreciation and protection of the wilderness and our natural resources is a key part of the Philmont program. Scouts from around the world have a unique opportunity to see and experience wildlife in native habitat. Noise and emissions from bombers cannot help but have a damaging effect on that

001068

wildlife, as well as on Philmont's herds of buffalo, horses, cattle and burrows. The disruptive effects of noisy bombers overflights on Philmont's famous living history programs, in which Scouts experience the lifestyles of the West's mountain men, homesteaders, lumberers and cowboys, are obvious.

Most of Philmont is mountainous with many peaks in the 10,000 to 12,000 foot range. Philmont has a tremendous fuel load of dead trees in its forests and is in the midst of a long term drought. Unburned jet fuel finding its way to the ground or being dumped in an emergency over such terrain, with campers using backpacking stoves for cooking, creates the potential for a serious fire that would endanger hundreds of lives. The possibility of a crash, however remote, is simply not acceptable for the safety of these Scouts.

For these reasons, I seek your help in advocating the selection of a different RBTI route. I ask that you express your opposition to Alternative D to the Secretary of the Air Force and other defense officials who may be involved in this decision. Please act now, as the public comment period ends in June and a final decision will be made this year.

Philmont is the largest and most famous Scout camp in the world. It is a national resource that has positively impacted the lives of hundreds of thousands of our nation's youth for more than sixty years. It deserves and demands our protection. Thank you for helping to see that Alternative D is not selected.

Sincerely,

Bill Dunsmoor
Philmont Staff Association Member

001068

TEN POINTS FOR OPPOSITION TO RBTI ALTERNATIVE D (OVER PHILMONT)

1. The EIS (Environmental Impact Statement) incorrectly concludes that very few population centers are affected. On any given day in the summer months, over 5,000 people will be living and camping directly under the flight path at Philmont.

2. Safety of horseback riders will be endangered, Philmont provides trail rides or pack trips for 7,500 to 9,500 mostly inexperienced riders each summer on steep and narrow mountain trails. As many as 165 inexperienced people may be on horseback on the ranch at various times during the day. The startle effect of a high decibel low level flight could easily cause one or more horses to spook and bolt with a novice rider aboard. With the number of flights proposed, it will be only a matter of time before Philmont experiences a serious injury or death due to a rider bing thrown from or dragged by a startled horse.

3. Increased noise levels will interfere with staff trying to provide safety instruction to rock climbers, spar pole climbers, and rifle range shooters. The noise level of a B-52 at 300 feet is 117 decibels. Staff trying to teach safety techniques required in climbing rock faces or firing black powder rifles should not have to compete with such noise interference.

4. The high noise levels generated by B-1 and B-52 bombers flying only a few hundred feet above ground level are greater than being near a chain saw or a diesel train. Campers at Philmont will be exposed to such noise levels for more than six hours during a typical 12 day stay based on projected flight operations. This is not a true wilderness experience.

5. The possibility of a crash is very real. The EIS estimates the chances of a 'Class A mishap" at one every 15 years for a B-1 on the training route that would included Philmont. Aside from the real risk to Scouts who might be in the path of an errant bomber, a crash on Philmont would have the potential of starting a serious forest fire that could devastate the ranch.

6. The EIS fails to mention any impact of flyovers on Philmont's two National Historic sites, The Kit Carson/Maxwell Abreu houses at Rayado and the Villa Philmonte.

7. The flights can be expected to have serious impacts on Philmont's wildlife and will overfly the habitats of at lease three endangered species, the bald eagle, peregrine falcon, and Mexican spotted owl. The U.S. Fish and Wildlife Service has concluded that overflights at less than 1,000 feet will significantly impact these species.

8. No one has investigated the cumulative effects of the planned noise levels and vibration on the hundreds of abandoned and the two active mines on Philmont.

9. No plane burns all of its fuel. At higher altitudes, unburned fuel dissipates in the atmosphere. At lower altitudes, one must expect that some unburned fuel will find its way to the ground and streams on Philmont. The effects of a plane in trouble at low attitude dumping duel over Philmont with numerous cook stoves and campfires are easily imagined.

10. Philmont is a national treasure and provides a wilderness camping experience for thousands of Scouts, American's future leaders, every year. That experience should be preserved since alternative training sites exist which do not jeopardize the program experience offered by Philmont and the safety of thousands of young people participating in it each year.

Re: ***USAF Proposed Realistic Bomber Training Initiative***
Colfax County, New Mexico —Boy Scouts of America Philmont Scout Ranch

Dear Major Adams:

BR-6 We are writing to request your support in opposing the selection of "Alternative D" under the USAF's proposed Realistic Bomber Training initiative (RBTI) involving low flying B-52s and B-1s (as low as 300 feet). As one of several proposed southwestern routes, "D" traverses Philmont Scout Ranch in northeastern New Mexico's Colfax County. Philmont, truly a national treasure, is the 137,000-acre backpacking and training facility of the Boy Scouts of America. I do not protest RBTI since it is a valuable program—our only complaint is with the proposed route over Philmont. We have two sons and now one grandson who have hiked those mountains with the Boy Scouts. This national treasure needs to be preserved for future generation of Scouts.

Several years ago, the USAF ceased its low altitude F-16/F-111 flights over the Ranch as a result of Philmont protests. RBTI's multiple daily flights (up to 16) will create much more severe problems.

- Philmont is a transient community of 25,000 people with over 3,000 campers in Philmont's backcountry every day in the summer. Daily, several hundred of them are engaged in spar pole climbing, rock climbing and rappelling, and horse back riding. The sudden roaring of jet engines will distract climbers and bolt horses, thereby creating injuries.

- Environmental: Appreciation and protection of the wilderness are key parts of Philmont's program. RBTI is inconsistent with wilderness preservation. RBTI will have a damaging effect upon both the unique western wildlife and Philmont herds of cattle, horses, burros, and buffalo. The effect of the unburned portion of jet fuel in the engine exhaust or dumped fuel itself, vaporizing and falling to ground level is as yet unknown, but believed to be anything but beneficial.

001069

USAF's Proposed Realistic Bomber Training Initiative (RBTI)
Colfax County New Mexico—Boy Scouts of America Philmont Scout Ranch
Page 2 of 2 June 14, 1999

- Safety. The environmental impact study done for the USAF is seriously flawed when it describes Philmont as "uninhabited" grassland. The smaller portion of Philmont's acreage is prairie. Most of Philmont is mountainous with many peaks in the 10,000 to 12,444 feet range. Philmont has a tremendous fuel load of dead trees in its forests, and is in the midst of a long-term drought. Open fire bans are in effect now. A crashing bomber will create an epic fire of Yellowstone proportions. B-1s and B-52s do not have enviable safety records. The nature of the flights (weaving around mountain peaks and facing violent weather, including frequent, low-level wind shears) dramatically increases the chance of a crash. Unfortunately, Philmont does not have a well-developed highway system for evacuations in case of massive offset fires.

For the above reasons, I seek your help in advocating the selection of a different RBTI route, preferably one that is over a more sparsely populated, less environmentally sensitive area.

There is too much at stake to allow RBTI to overfly Philmont. Please act now, the final route determination starts in June. **Thank you for helping to see that alternative D is not selected.**

Sincerely,

Horace M. and Joan B. Wall

Langley AFB, VA
23665-2769

Dear Major Adams,

BR-6 I am writing to request your strong support in opposing the selection of Alternative D under the U.S. Air Force's proposed Realistic Bomber Training Initiative (RBTI). The Air Force is seeking to establish a new training route for low-level B-1 and B-52 bomber flights from bases in Texas and Louisiana. One of the proposed routes, Alternative D, traverses Philmont Scout Ranch in northeastern New Mexico's Colfax County.

Philmont is a 137,000 acre mountain backpacking and high adventure facility of the Boy Scout of America. Each year, thousands of Scouts and their adult leaders from across the nation participate in two-week wilderness backpacking treks in the mountains of Philmont. Many of them also camp and work on conservation projects in the adjacent Valle Vidal Wilderness of the Carson National Forest.

The Air Force's proposed Alternative D will establish a military training route directly over most of Philmont. More than 2,600 flights each year, some as low as 300 feet above ground level, are proposed for the segment over Philmont. As a former Philmont staff member, I have serious concerns about the impact of the Air Force's proposal on the health and safety of Scouts attending Philmont and the potential effects of daily low-level flights on the ranch itself.

On any given day in the summer, as many as 5,000 Scouts and Scouters will be hiking and camping in Philmont's back country. Programs also run in the fall and winter at lower participant numbers. Each day, they will be engaged in activities such as rock climbing and rappelling, spar pole climbing , and mountain horseback rides. The sudden roar of jet engines has a high likelihood of distracting an inexperienced climber or causing a horse to bolt on a narrow mountain trail with resulting serious injury (or worse).

Appreciation and protection of the wilderness and our natural resources is a key part of the Philmont program. Scouts from around the world have a unique opportunity to see and experience wildlife in native habitat. At least three endangered species, the bald eagle (our nation's bird) , peregrine falcon, and Mexican spotted owl all call the wilderness of Philmont their home. Noise and emissions from bombers cannot help but have a damaging effect on that wildlife, as well as on Philmont's herds of buffalo, horses, cattle and burros. The disruptive effects of noisy bomber overflights on Philmont's famous living history programs, in which

001070

Scouts experience the lifestyles of the West's mountain men, homesteaders, lumberers and cowboys, are obvious.

Most of Philmont is mountainous with many peaks in the 10,000 to 12,000 range. Philmont has a tremendous fuel load of dead trees in its forests and is in the midst of a long-term drought (which are not uncommon) . Unburned jet fuel finding its way to the ground or being dumped in an emergency over such terrain with campers using backpacking stoves for cooking, creates the potential for a serious fire that would endanger hundreds of lives. The possibility of a crash, however remote, is simply not acceptable for the safety of the Scouts.
For these reasons, I seek your help in advocating the selection of a different RBTI route. I ask that you express your opposition to Alternative D to the Secretary of the Air Force and other defense officials who may be involved in this decision. Please act now, as the public comment period ends in June and a final decision will be made this year.

Philmont is the largest and most famous Scout camp in the world It is a national resource that has positively impacted the lives of hundred of thousands of our nation's youth for more than sixty years. It deserves and demands our protection. If you have never had the opportunity to visit Philmont and the experiences I have described, I invite you to visit what is fondly referred to by many who have been there as " Heaven on earth". Thank you for helping to see that Alternative D is not selected.

Sincerely,

Earl D. Sill

The Honorable Ernest Istook
House of Representatives

Oklahoma City, OK

Dear Representative Istook:

BR-6 Per our conversation in your office, I am writing to request your firm support in opposing the selection of Alternative D under the U.S. Air Force's proposed Realistic Bomber Training Initiative (RBTI). The Air Force is seeking to establish a new training route for low-level B-1 and B-52 bomber flights from bases in Texas and Louisiana. One of the proposed routes, Alternative D, traverses Philmont Scout Ranch in northeastern New Mexico's Colfax County.

As you know, Philmont is a 137,000-acre mountain backpacking and high adventure facility of the Boy Scouts of America. Each year, thousands of Scouts and their adult leaders from across the nation participate in two-week wilderness backpacking trips in the mountains of Philmont. Many of them also camp and work on conservation projects in the adjacent Valle Vidal Wilderness of the Carson National Forest.

The Air Force's proposed Alternative D will establish a military training route directly over most of Philmont. More than 2,600 flights each year, some as low as 300 feet above ground level, are proposed for the segment over Philmont. As the father of a Philmont staff member, I have serious concerns about the impact of the Air Force's proposal on the health and safety of Scouts attending Philmont and the potential effect of daily low-level flights on the ranch itself.

On any given day in the summer, as many as 5,000 Scouts and Scouters will be hiking and camping in Philmont's backcountry. Each day, several hundreds of them will be engaged in activities such as rock climbing and rappelling, spar pole climbing, and mountain horseback rides. The sudden roar of jet engines has a high likelihood of distracting an inexperienced climber or causing a horse to bolt on a narrow mountain trail with resulting serious injury (or worse).

Appreciation and protection of the wilderness and our natural resources is a key part of the Philmont program. Scouts from around the world have a unique opportunity to see and experience wildlife in a native habitat. Noise and emissions from bombers cannot help but have a damaging effect on that wildlife, as well as on Philmont's herds of buffalo, horses, cattle, and burros. The disruptive effects of noisy bomber overflights on Philmont's famous living history programs, in which Scouts experience the lifestyles of the West's mountain men, homesteaders, lumberers and cowboys, are obvious. Most of Philmont is mountainous with many peaks in the 10,000 foot to 12,000 foot range.

001071

Philmont has a tremendous fuel load of dead tress in its forests and is in the midst of a long-term drought. Unburned jet fuel finding its way to the ground or being dumped in an emergency over such terrain, with campers using backpacking stoves for cooking, creates the potential for a serious fire that would endanger hundreds of lives. The possibility of crash, however remote, is simply not acceptable for the safety of these Scouts.

For these reasons, I seek your help in advocating the selection of a different RBTI route. I ask that you express your opposition to Alternative D to the Secretary of the Air Force and other defense officials who may be involved in this decision. Please act now, as the public comment period ends in June and a final decision will be made this year. You or a member of your staff may wish to contact Greg Dodd, Chief of Staff for Congressman Ed Pease of Indiana, who can provide additional information.

Philmont is the largest and most famous Scout camp in the world. It is a national resource that has positively impacted the lives of hundreds of thousands of our nation's youth for more than sixty years. It deserves and demands our protection. Thank you for helping to see that Alternative D is not selected.

Sincerely,

Paul R. Moore

Ref. RBTI Draft Environmental Impact Study and Alternative D (Northern New Mexico).

Dear Major Adams:

BR-6

I respectfully request that my written comments concerning the US Air Force's RBTI draft environmental impact study be entered into the public record.

I believe that the USAF takes seriously it's role as a steward of both public and private resources. The Air Force has had a draft EIS released for public review and comment. The study was compiled by a Denver Colorado based firm. The study (both body and appendix) failed to provide meaningful information as it pertained to Alternative D.

Alternative D would have bomber traffic flying over a majority of 137 thousand acres of land known as Philmont Scout Ranch. The ranch is one of three High Adventure Bases owned and operated by the Boy Scouts of America. Philmont is a transient community of nearly 25,000 people in the summer when on any given day 3,000 (and up to as many as 5,000) young people and their adult leaders can be found on the trails and in organized backcountry camps. The Philmont Training Center is operated year round and hosts from 5,000 to 7,000 adult leaders each year. With the regular employees, visitors to our two museums (open 52 weeks each year) and both a Fall and Winter program for youth the community is well in excess of 28,000. The majority of these people are residents for 12 to 14 days during June, July and August; but the RBTI alternative D would effect campers and training center participants 12 months a year.

Noise levels created by B-1 or B-52 bombers flying between 400 and 1000 feet above the deck are unacceptable. Both people and animals will react to the "startle effect" and I fear for some 300 horseback riders who are on their first or possibly second ride. Spooked, bolting and/or stampeding horses carrying non-experienced riders is a major safety concern. Scouts repelling a rock face, climbing and scrambling for the first time do not need to experience the "startle effect". A 14 year old young man does not need to hear and see a B-52 five hundred feet above his head as he climbs a 30 foot spar pole for the first time. All the safety equipment and instruction will not diminish the "startle effect".

All of us at Philmont are very concerned about how RBTI will impact the health and safety of the youth and adults that participate in our varied High Adventure Programs. If the Philmont airspace were to be used during the summer, fall or winter for low altitude mission profiles and just one scout was subject to the "startle effect" and killed or seriously injured, the Air Force would suffer an image problem for many years to come. The Air Force cannot afford to put Scouts (children) in harms way.

Ronald E. Bromley

001072

Cimarron NM

I would like the Air Force to consider the possible long term effect of forest fires, unburned fuel (jet fuel or AV gas), fuel dumping in emergencies and the very real possibility of an aircraft emergency or crash. Philmont has three airplanes on its mountaintops. One , a Liberator of the Army Air Corps which crashed during a training flight in early 1945. All 5 crewmen were killed. it is my understanding that the USAF does not fall under the ruling of the Federal Aviation Administration (FAA); but, it would seem only logical that FAA rules pertaining to low level flights over "open air assemblies of persons" might be considered in an environmental study. Philmont has many open air assemblies of 3 to 6 hundred people within the RBTI planned flight zone.

Finally, I note with some interest that the village of Angelfire, N.M. was able to convince the Air Force to change their original proposed flightpath so as not to overfly that recreational area and community. The Air Force seems to have made some decisions prior to the draft EIS and definitely before the final EIS. Even knowing of this earlier decision, I am confident that the process established by the Air Force will result in a decision that takes into account the health and safety of all of the people who visit Philmont each year.

Sincerely,

Ronald E. Bromley

001073

Dear Major Adams,

BR-6

I am writing to request your firm support in opposing the selection of Alternative D under the U.S. Air Force's proposed Realistic Bomber Training Initiative (RBTI). The Air Force is seeking to establish a new training route for low-level B-1 and B-52 bomber flights from bases in Texas and Louisiana. One of the proposed routes, Alternative D, traverses Philmont Scout Ranch in northeastern New Mexico's Colfax County.

Philmont is a 137,000- acre mountain backpacking and high adventure facility of the Boy Scouts of America. Each year, thousands of Scouts and their adult leaders from across the nation participate in two-week wilderness backpacking trips in the mountains of Philmont. Many of them also camp and work on conservation projects in the adjacent Valley Vidal Wilderness of the Carson National Forest.

The Air Force's proposed Alternative D will establish a military training route directly over most of Philmont. More than 2600 flights each year, some as low as 300 feet above ground level, are proposed for the segment over Philmont. As a former Philmont staff member, I have serious concerns about the impact of the Air Force's proposal on the health and safety of Scouts attending Philmont and the potential effects of daily low-level flights on the ranch itself.

On any given day in the summer, as many as 5,000 Scouts and Scouters will be hiking and camping in Philmont's backcountry. Each day, several hundred of them will be engaged in activities such as rock climbing and rappelling, spar pole climbing, and mountain horseback rides. The sudden roar of jet engines has a high likelihood of distracting an inexperienced climber or causing a horse to bolt on a narrow mountain trail with resulting serious injury (or worse).

Appreciation and protection of the wilderness and our natural resources is a key part of the Philmont program. Scouts from around the world have a unique opportunity to see and experience wildlife in native habitat. Noise and emissions from bombers cannot help but have a damaging effect on that wildlife, as well as on Philmont's herds of buffalo, horses, cattle and burros. The disruptive effects of noisy bomber overflights on Philmont's famous living history programs, in which Scouts experience the lifestyles of the West's mountain men, homesteaders, lumberers and cowboys, are obvious.

Most of Philmont is mountainous with many peaks in the 10,000' to 12,000' range. Philmont has a tremendous fuel load of dead trees in its forest and is in the midst of a long-term drought. Unburned jet fuel finding its way to the ground or being dumping in a emergency over such terrain, with campers using backpacking stoves for cooking, creates the potential for a serious fire that would endanger hundreds of lives. The possibility of a crash, however remote, is simply not acceptable for the safety of these Scouts.

Philmont is the largest and most famous Scout camp in the world. It is a national resource that has positively impacted the lives of hundreds of thousands of our nation's youth for more than sixty years. It deserves and demands our protection. Thank you for helping to see that Alternative D is not selected.

Major Brent Adams
RBTI EIS Project Manager
HQ ACC/CEVPP
129 Andrews Street, Suite 102
Langley AFB, VA 23665-2769

Dear Major Adams:

BR-6 I am writing in response to the draft environmental impact statement filed by the United States Air Force relating to the proposed Realistic Bomber Training Initiative, particularly to those relating to Alternative D. And I would like to call your attention to several errors and oversights in this report. These errors and oversight are addressed individually in the following paragraphs.

The area is described in the study as primarily uninhabited grassland. In fact much of the area is forested, mountainous terrain. This is part of what makes the area desirable for the RBTI. And instead of being uninhabited, has a transient community of over 25,000 people in the summer, and on any given day will include 3,000 to 5,000 individuals in the proposed training area.

Noise levels in 27 segments of the proposed IR-153 will have noise levels in excess of 58 DNL. In fact from a distance of 300 feet, the proposed training altitude, a B-52 produces a noise level of 117 dbs, requiring ground crews working near the aircraft to wear noise attenuation devices. These devices would not be available to individuals in the proposed training area, and studies have shown that even brief exposure to high noise levels can result in measurable hearing damage.

The impact study further suggests that residents will become accustomed to the noise. This might be true of long-term residents in permanent buildings, but many of the residents are transient in nature (10 to 14 days) and living in tents. Due to these circumstances, they will not have sufficient time to become accustomed to the noise, which will magnify the impact.

The study overlooks several cultural and archeological resources, including two registered National Historical Sites, in the proposed route. It also is incomplete it its determination of the effects of the vibrations attributable to overflights on these and other resources in the area.

The study concludes that, "Flight operations would not be expected to preclude land uses or … preempt recreational uses, threaten public health and safety, or be inconsistent with applicable regulations." Current Federal Aviation Administration regulations generally prohibit flights less than 1,000 feet over an "…open air assembly of persons…" and have regularly restricted overflights of populations of 5,000. The emissions produced by the incomplete combustion of jet fuel, while within State and Federal standards, would have an undesirable affect on the population in the proposed area due to their direct exposure to these emissions and their reliance on ground water sources for drinking water. The startle response resulting from the training missions is inconsistent with the recreational uses of the area. The sudden bolting of saddle stock could cause a serious injury to the rider, especially an inexperience rider like many in the overflight area. Similarly, a distraction while participating in climbing activities could compromise safety. And studies in other locations, notably the Grand Canyon, have shown that regular low-level overflights have resulted in the migration of many species of wildlife out of the area.

001074

I am also concerned by the responses. In the discussion of Aircraft Safety, the probability of a Class A mishap on the proposed IR-153 is given as .07% and .02% for the B-1 and B-52 respectively. With an estimated 1,600 to 2,300 training sorties annually, this translates to a high probability of at least one "incident" each year. Much of the area in and around the proposed route is heavily forested with a large fuel load of fallen branches and trees. The area lacks a well-developed road network for evacuation and access. A crash in this area could precipitate a major conflagration, similar to the 1986 fires in Yellowstone, and has the potential for a substantial loss of life and property.

This is compounded by the high incidence of thunderstorms with the accompanying microbursts and windshear. Recent events in Little Rock, Arkansas, illustrate how little we know about these phenomenon, that occur most frequently in the summer, when the population in the proposed area is greatest.

In addition, neither the B-1 nor the B-52 bombers were designed for low level, terrain-following tactical missions. Rather they were designed as high altitude, strategic bombing platforms. And although modifications have been made to improve performance, the fact remains that the aerodynamics of the aircraft are not optimum for this role which increases the probability of a mishap.

The impact on Biological Resources lists overflights of three peregrine falcon nesting sites, wintering areas for bald eagles and Mexican spotted owl habitat, with a note that the U.S. Fish and Wildlife Service considers the impact "potentially significant". In other locations, including Big Bend and Rocky Mountain National Parks, the USFWS routinely closes large areas to all visitations during the peregrine falcon nesting season. It would follow that low level overflights would be detrimental to the well being of these species.

I am suggesting that due to the incomplete and inaccurate nature of the Environmental Impact Study, the proposed implementation of Alternative D be withdrawn or at least delayed until a more comprehensive study can be completed. If the characteristics of Alternative D are desirable to the Air Force, perhaps similar areas could be located which do not result in the adverse impact of the current proposal.

In closing, I wonder if Alternative A - maintaining the current procedures - is not in fact the most "realistic" of the various alternatives. Given the recent mission assignments in the Balkans and Iraq, which are flown from remote airbases or even the United States, maybe long flights to and from the training area most closely replicate actual combat conditions.

Thank you for your attention and consideration.

Sincerely,

Roy Fisher

001075

6/11/99

Dear Major Adams:

BR-6 I am writing to request your firm support in opposing the selection of Alternative D under the U.S. Air Force's proposed Realistic Bomber Training Initiative (RBTI). The Air Force is seeking to establish a new training route for low-level B-1 and B-52 bomber flights from bases in Texas and Louisiana. One of the proposed routes, Alternative D, traverses Philmont Scout Ranch in northeastern New Mexico's Colfax County.

Philmont is a 137,000 acre mountain backpacking and high adventure facility of the Boy Scouts of America. Each year, thousands of Scouts and their adult leaders from across the nation participate in the two-week wilderness backpacking trips in the mountains of Philmont. Many of them also camp and work on conservation projects in the adjacent Valle Vidal Wilderness of the Carson National Forest.

The Air Force's proposed Alternative D will establish a military training route directly over most of Philmont. More than 2,600 flights each year, some as low as 300 feet above ground level, are proposed for the segment over Philmont. As parents of a Scout who plans to attend Philmont, I have serious concerns about the impact of the Air Force's proposal on the health and safety of Scouts attending Philmont and the potential effects of daily low-level flights on the ranch itself.

On any given day in the summer, as many as 5,000 Scouts and Scouters will be hiking and camping in Philmont's backcountry. Each day, several hundred of them will be engaged in activities such as rock climbing and rappelling, spar pole climbing, and mountain horseback rides. The sudden roar of jet engines has a high likelihood of distracting an inexperienced climber or causing a horse to bolt on a narrow mountain trail with resulting serious injury (or worse).

Appreciation and protection of the wilderness and our natural resources is a key part of the Philmont program. Scouts from around the world have a unique opportunity to see and experience wildlife in native habitat. Noise and emissions from bombers cannot help but have a damaging effect on that wildlife, as well as on Philmont's herd of buffalo, horses, cattle and burros. The disruptive effects of noisy bomber overflights on Philmont's famous living history programs, in which Scouts experience the lifestyles of the West's mountain men, homesteaders, lumberers and cowboys, are obvious.

Most of Philmont is mountainous with many peaks in the 10,000 to 12,000 range. Philmont has a tremendous fuel load of dead trees in its forests and is in the midst of a long-term drought. Unburned jet fuel finding its way to the ground or

001075

being dumped in an emergency over such terrain, with campers using backpacking stoves for cooking, creates the potential for a serious fire that would endanger hundreds of lives. The possibility of a crash, however remote, is simply not acceptable for the safety of these Scouts.

For these reasons, I seek your help in advocating the selection of a different RBTI route. I ask that you express your opposition to Alternative D to the Secretary of the Air Force and other defense officials who may be involved in this decision. Please act now, as the public comment period ends in June and a final decision will be made this year. You or a member of your staff may wish to contact Greg Dodd, Chief of Staff for Congressman Ed Pease of Indiana, who can provide additional information.

Philmont is the largest and most famous Scout camp in the world. It is a national resource that has positively impacted the lived of hundreds of thousands of our nation's youth for more than sixty years. It deserves and demands our protection. Thank you for helping to see that Alternative D is not selected.

Sincerely,

Linda Byrd

Langley AFB, VA 23665-2769

Dear Major Adams:

BR-6 I am writing to request your firm support in opposing the selection of "Alternative D" under the USAF's proposed Realistic Bomber Training Initiative (RBTI) involving low flying B-52s and B-1s (as low as 300'). As one of several proposed southwestern routes, "D" traverses Philmont Scout Ranch in northeastern New Mexico's Colfax County. Philmont, truly a national treasure, is the 137,000 acre backpacking and training facility of the Boy Scouts of America. I do not protest RBTI since it is a valuable program -- my only complaint, as a Philmont alumnus, is with the proposed route over Philmont.

Several years ago, the USAF ceased its low altitude F-16/F-111 flights over the Ranch as a result of Philmont protests. RBTI's multiple daily flights (up to 16) will create much more severe problems:

a) Program: Philmont is a transient community of 25,000 people with over 3,000 campers in Philmont's back country every day in the summer. Daily, several hundred of them are engaged in spar pole climbing, rock climbing and rapelling, and horse back riding. The sudden roaring of jet engines will distract climbers and bolt horses thereby creating injuries (or worse).

b) Environmental: Appreciation and protection of the wilderness are key parts of Philmont's program. RBTI is inconsistent with wilderness preservation. RBTI will have a damaging effect upon both the unique western wildlife and Philmont herds of cattle, horses, burros, and buffalo. The effect of the unburned portion of jet fuel in the engine exhaust or dumped fuel itself, vaporizing and falling to ground level is as yet unknown, but believed to be anything but beneficial.

c) Safety: The environmental impact study done for the USAF is seriously flawed when it describes Philmont as an "uninhabited" grassland. The smaller portion of Philmont's acreage is prairie. Most of Philmont is mountainous with many peaks in the 10,000 to 12,444' range. Philmont has a tremendous fuel load of dead trees in its forests, and is in the midst of a long term drought. Open fire bans are in effect now. A crashing bomber will create an epic fire of Yellowstone proportions. B-1s and B-52s do not have enviable safety records. The nature of the flights (weaving around mountain peaks and facing violent weather, including frequent, low-level wind shears) dramatically increases the chance of a crash. Unfortunately, Philmont does not have a well-developed highway system for evacuations in case of massive forest fires.

For the above reasons, I seek your help in advocating the selection of a different RBTI route, preferably one that is over a more sparsely populated, less environmentally

001076

sensitive area. You, or a member of your staff may wish to liaise with Rep. Ed Pease's (Indiana) legislative assistant, Greg Good, who has additional information on RBTI.

There is too much at stake to allow RBTI to overfly Philmont. Please act now -- final route determination starts in June. Thank you for helping to see that alternative D is not selected.

Sincerely,

John Q. Kelln

Shattuck, Oklahoma

Major Brent Adams
RBTI EIS Project Manager
HQ ACC/CEVP
129 Andrews St., Suite 102
Langley AFB, VA 23665-2769

June 4th, 1999

Dear Major Adams,

I am writing as a member of the community which will be impacted by RBTI-Route D. I appreciate the opportunity and feel that it is my responsibility to comment on the Draft EIS for RBTI-Route D. Although I suspect otherwise, I truly hope that this process is taken very seriously by the USAF and not merely as a formality designed to placate the taxpayers in the name of saving taxpayer dollars and national security.

We taxpayers will not see a tax cut as a result of RBTI. Therefore, RBTI will not save taxpayers' dollars. RBTI will save the USAF dollars. While $10,000 per hour for jet fuel is a stunning amount, that amount becomes insignificant when compared with the stupendous cost of our national defense operation. One B-1 costs over $200 million, one B-52 costs $74 million. One B-2 costs $1.3 billion. The Department of Defense appropriations budget authorization for fiscal year 1998 was $251.4 billion. (Horatio Trujillo – Legislative Assistant on Foreign Policy and Economic Policy for Tom Udall, U.S. Representative, New Mexico, ___ *Congressional District.)*

Perhaps the need for operations such as RBTI could someday be reduced or even eliminated, saving billions of taxpayer dollars, and strengthening national security by using more energy and tax dollars to help our leaders further develop the techniques, skills, and tools for dialogue and communication in order to wage peace through conflict resolution without violence.

The Draft-EIS bases its findings on objective data and quantitative studies in order to arrive at its conclusions. It also includes advisories from the USFWS and the USFS. It appears that no conclusions were arrived at regarding some of the topics.

In this letter I wish to address some of these sensitive and controversial issues using the data and information I found in the Draft-EIS.

Section 4: Affected Environment and Environmental Consequences:
RBTI-Route D will fly over Mexican Spotted Owl habitats as low as 400 feet AGL, 12 times per day and over at least three active nesting sites for Peregrine Falcons 11 times a day at 400-1000 feet AGL. The bomber route flies over wintering habitat for bald eagles 12-14 times daily below 1,000 feet AGL.

According to the *Bird of Prey and Wildlife Monitoring Study of the Ute Mountain Section of the Rio Grande Gorge* (1986-1989), RBTI will cross two branches of the Rio Grande Flyway for migratory birds of prey and waterfowl. Also, the eastern fork of the Rio Grande is located

001078

directly over the Valle Vidal Unit of the Carson National Forest where a large elk herd is strictly protected and which is managed for its wildlife and recreation opportunities.

p.4- 107 "USFWS advisories have stipulated that the Air Force survey unsurveyed owl habitats underlying IR-153, segments AB and EF in order to determine owl populations (if any) and to avoid overflights by 1,600 feet AGL, March 1-August 31 annually." Additionally they have stated that "significant and adverse impacts would occur to peregrine falcons if they are overflown at levels below 1,600 feet AGL," and that" flights at or below 2,000 feet AGL from October 1 to March 1 could result in significant impacts to wintering bald eagles."

The writers of the Draft-EIS, on the other hand, found a number of studies of mammals and birds which they used to state that p.4-106, "Based on these studies, the evidence would suggest that Alternative D flight operations would not result in significant adverse impacts to wildlife or threaten endangered or sensitive species."

Also the safety section, p.4-50, Draft-EIS states that "neither the existing nor the proposed airspace in IR-153 Section AB would overlie or intersect any migration flyways or water bodies where birds congregate." Clearly, the land managing agencies, i.e. USFWS, BLM-USFS, are in conflict with the USAF or FAA regarding their missions. This conflict must be legally resolved in order for RBTI-D to be considered.

BI-5

Socio-Economic and Environmental Justice:
P. 4-109 The Draft-EIS describes socio-economics as "the general features of the economy, including employment, population, and income, that could be affected by the proposed alternatives." It states that "most direct and indirect socio-economic effects would occur in the immediate vicinity of where the electronic scoring sites and emitter sites would be constructed and operated."

P. 4, 109. "The primary measures by which socio-economic impacts were identified include changes to employment, populations, and earnings associated with the proposed alternatives." They detailed their methods, assumptions and calculations in Appendix I.

The Draft-EIS states on p. 4-118, Table 4-4-1 for alternative D. "No measurable impacts to socio-economics. No disproportionate impacts to minority and low income populations."

Taos County and others nearby were not considered in the Study, presumably because of the criteria used. Nevertheless, they could sustain adverse and devastating changes to employment, populations, and earnings as a direct result of the implementation of RBTI-Route D.

BR-4

Livestock would be impacted similarly to wildlife by bomber noise, thereby affecting ranchers and farmers, along with all of their supporting industries, i.e. feed and supply stores, equipment sales, etc.

BR-3

Northern New Mexico is well known as a haven for seekers of solitude and quiet of many kinds. Sportsmen such as hunters, fishermen, trail riders, as well as hikers, bikers, campers, rafters, back-country skiers, snow shoers, families, mushroom hunters, and bird-watchers come from all over the world to enjoy the tranquillity, beauty, and originality of the region, as do people

001078

searching for many types of physical and spiritual healing. We have retreats, spas, and gatherings, in beautiful wilderness settings.

More than 60 per cent of Taos County's fragile economy is based on tourism. The implementation of the RBTI Route D could cause many of our tourists (bread and butter) to find their "peace and quiet" elsewhere, far from the incredibly monstrous and loud machines of war. A reduction in tourism would impact nearly every person and industry in the country: outfitters and tour guides, camping and sporting goods stores, health spas, health professionals, spiritual retreats and healers, as well as all the supporting businesses, such as hotel, motel, bed and breakfast inns, restaurants, gas stations, gift shops, art galleries, movie theaters, and all of their employees (low income).

Similarly to tourism, Taos County's real estate and construction industries could be adversely and devastatingly impacted by RBTI-Route D. In recent years, many people have moved to Taos and the surrounding area to "get away from it all." Many of these people bring money and even the ones who don't contribute to the economy. These people, like the tourists, could take their dollars and find other places to live and retire, thereby impacting not only the real estate market but also the construction industry, one of the stronger parts of our economy at this time. People affected will be bankers, builders, building supply yards and stores, home decorating and furniture stores, and well as tradesmen of all kinds; i.e. plumbers, electricians, plasterers, adobe layers, tilers, excavators, landscapers, painters, laborers, etc.

Property values could fall, not only as a result of fewer people moving to the area because of RBTI-Route D, but also people, such as myself, could choose to leave the area, further jeopardizing our tenuous economy.

BR-4

The socio-economic impact of RBTI-Route D to Taos County and the neighboring counties must be studied before RBTI-Route D is allowed to move ahead.

P4-109: the EIS addresses environmental justice, as defined in Executive Order 12898: "Federal Actions to Address Environmental Justice in Minority and Low Income Populations." It looks at whether an action disproportionately affects these types of populations. According to1990 census data in the Community Profile Packet from the Taos County Chamber of Commerce, a large portion of Taos County's population is made up of Hispanic and Native American people., (65% Hispanic, 7% Native American, 27% Anglo, and 1% Other). Many of these are low wage earners or are unemployed. We currently have 27 percent earning below the poverty line and an unemployment rate of 18 percent, according to the Western Environmental Law Center.

There are hundreds of small entrepreneurial businesses in the Taos area. They struggle for survival. Many are "mom and pop" style operations. Many of the potential job losses would be among their employees. When business gets slow around here, the low wage earners are the first to go; i.e. during our off seasons, spring and late fall, the small business owners and managers can cover the duties themselves. Thus the employees are - at least temporarily – laid off. Among these workers would be shop helpers, fast food employees, construction laborers, hotel and motel service, restaurants, ski area gift shops, etc. These are the low income people. Many are minority members. They could become even poorer or unemployed. Potential impact regarding the Environmental Justice for Taos County must be carefully studied before the RBTI-Route D moves forward.

BR-4

001078

Noise: "Noise is generally described as unwanted sound. Unwanted sound can be based on objective effects (hearing loss, damage to structures, etc), or subjective judgments (community annoyance). Noise analysis thus requires a combination of physical measurement of sound, physical and physiological effects, plus psycho/socio-acoustic effects of the sound's loudness."

P.4-6: The Air Force uses three noise measuring techniques:
1. L-max and SEL = single noise events
2. DNL = Day Night Average sound levels and cumulative energy average noise.
3. DBA=A weighting in decibels.

There are tables, explanations, and diagrams showing SEL and L-max levels, as well as a number of tables, explanations, and diagrams of DNL (pgs. 4-6,4-7,4-8,4-47,4-49, appendix G, p. g-4).
The EIS states that "DNL has emerged as the most widely accepted metric for aircraft noise." P. 4-9.

On P. 4-46, the EIS states that the noise levels on the 38 segments of IR-153 would range from less than 45 DNL to 64 DNL, 65 decibels is 50% louder than average conversation.

On P. 4-46, the EIS also states that sortie operations on all but three segments of IR-153 could generate SEL's ranging from 86 to 116 decibels.

Appendix G, p. G-2: "A change in sound level of about 10 decibels is perceived by the average person as a doubling (or halving) of the sound's loudness."

Therefore, to an average person, a sound that measured 70 decibels would be twice as loud as a sound of 60 decibels (average conversation). If you do the arithmetic, a sound of 120 decibels would be 64 times as loud to the average person as a sound of 60 decibels. According to pages, 4-6, table 4.1-1, a B-1 at 300 feet AGL produces an L-max of 117 decibels. Table 4-1-3: an SEL of 116 decibels.

Although the DNL measurement is the most widely accepted measurement for aircraft noise, it is clear after careful study of the information provided by the EIS, (and also my own experiences of being overflown), that for these low-level types of flights, the single event level and the L-max factor must be given at least equal weight to DNL averages before the USAF is allowed to move forward with this project.

AO-55

Cultural Resources:
P. 4-122: The EIS states that "the effects of noise on cultural resources may also be related to setting. Noise impacts to Native American traditional cultural properties may be related to interference with ceremonies and other traditional activities at sacred sites. Undisturbed habitats, resources, and settings are considered to be critical to religious practices. Potential impacts can be identified only through consultation with the affected groups."

The USAF has altered RBTI-Route D to avoid the Taos Pueblo and Blue Lake areas as a result of consultation with Taos Pueblo leaders. It is not necessary for the USAF to reveal sacred and religious sites to the general public: however, they must provide assurance that all issues regarding sacred and religious sites have been resolved to the satisfaction of the various Pueblos that were consulted before moving forward with RBTI-Route D.

CU-4

001078

Cumulative Impact:
There are currently numerous low-flying training routes in New Mexico originating from military bases throughout the U.S. When added to the proposed RBTI flight operations, some areas may experience over 6,300 flyovers per year. The USAF must study these cumulative impacts and the cumulative impacts of all low level training flights in the western U.S. in a programmatic EIS.

Public Safety:

The EIS addresses safety issues and on p.4-50, states that "since IR-153 does not currently exist, it is difficult to draw direct comparisons of baseline and projected mishap potential. Secondary MTRs that overlap or intersect segments of proposed IR-153 do provide a rough comparison. Estimated years between class A mishaps on these routes rage from 22-2,800. For proposed IR-153, estimated years between Class A mishaps for B-52's would fall into this range, whereas the potential for B-1's would be slightly greater. However, when considered as probabilities, the estimated years equate to a 0.02 probability of a B-52 Class A mishaps per year and a 0.07 probability for the B-1's."

We know that ~~three~~ three have been a number of military plane crashes over the years. There was one incident with a sailplane where the Air Force pilot didn't even see the glider because the difference in speed was so great. The wing wheel of the glider was found in the military aircraft. In our area, there are not only sailplanes but also small private and commercial planes and hang gliders.

No Class A mishaps are acceptable. The USAF must be able to estimate a 0 percent probability for Class A mishaps. Also, the Air Force should provide a list description of all mishaps – Class A and otherwise – that have actually occurred over the lifespan of the military aircraft training programs before it moves ahead with this project.

AO-61

In conclusion, in order to formulate my response to the Draft EIS for RBTI-Route D, I have read the report carefully. After having done the research necessary to write this letter, I have discovered that it is possible to use objective criteria and quantitative data in order to arrive at more than one conclusion. From my research, most of which comes directly from the Draft EIS, I conclude that the USAF must further study and resolve many of the issues addressed in the Draft-EIS, including potential harm to endangered, threatened and sensitive species and potential harm to other wildlife, ecology and livestock.

The noise level issue must be re-addressed and made to include L-max and SEL measurements. The public safety issue has not been adequately addressed re: military plane crashes, small aircraft and bird strikes. The study must make readily available to the public a list of all Class A mishaps that have actually occurred over the life of the military aircraft training programs.

The EIS must be made to include a socio-economic and environmental justice report on potential impact to the socio-economic structure of Taos County, New Mexico. Finally the USAF must complete their consultations with the various Native America Indian Pueblos and resolve any issues regarding sacred and religious sites to the satisfaction of each tribal community. Consulted.

001078

It is clear that all of these issues must be addressed, re-addressed and resolved by the USAF before RBTI-Route D is allowed to move forward.

Sincerely,

Rebecca Smith

Major Brent Adams
RBTI EIS Project Manager
HQ ACC/CEVPP
129 Andrews Street
Suite 102
Langley AFB, VA 23665-2769

Dear Major Adams:

BR-6 I am writing to request your firm support in opposing the selection of "Alternative D" under the USAF's proposed Realistic Bomber Training Initiative (RBTI) involving low flying B-52s and B-1s (as low as 300'). As one of several proposed southwestern routes, "D" traverses Philmont Scout Ranch in northeastern New Mexico's Colfax County. Philmont, truly a national treasure, is the 137,000 acre backpacking and training facility of the Boy Scouts of America. I do not protest RBTI since it is a valuable program -- my only complaint, is with the proposed route over Philmont.

Several years ago, the USAF ceased its low altitude F-16/F-111 flights over the Ranch as a result of Philmont protests. RBTI's multiple daily flights (up to 16) will create much more severe problems:

a) Program: Philmont is a transient community of 25,000 people with over 3,000 campers in Philmont's back country every day in the summer. Daily, several hundred of them are engaged in spar pole climbing, rock climbing and repelling, and horse back riding. The sudden roaring of jet engines will distract climbers and bolt horses thereby creating injuries (or worse).

b) Environmental: Appreciation and protection of the wilderness are key parts of Philmont's program. RBTI is inconsistent with wilderness preservation. RBTI will have a damaging effect upon both the unique western wildlife and Philmont herds of cattle, horses, burros, and buffalo. The effect of the unburned portion of jet fuel in the engine exhaust or dumped fuel itself, vaporizing and falling to ground level is as yet unknown, but believed to be anything but beneficial.

Joseph P. Hamilton 001079 Page 2

c) Safety: The environmental impact study done for the USAF is seriously flawed when it describes Philmont as an "uninhabited" grassland. The smaller portion of Philmont's acreage is prairie. Most of Philmont is mountainous with many peaks in the 10,000 to 12,444' range. Philmont has a tremendous fuel load of dead trees in its forests, and is in the midst of a long term drought. Open fire bans are in effect now. A crashing bomber will create an epic fire of Yellowstone proportions. B-1s and B-52s do not have enviable safety records. The nature of the flights (weaving around mountain peaks and facing violent weather, including frequent, low-level wind shears) dramatically increases the chance of a crash. Unfortunately, Philmont does not have a well-developed highway system for evacuations in case of massive forest fires.

For the above reasons, I seek your help in advocating the selection of a different RBTI route, preferably one that is over a more sparsely populated, less environmentally sensitive area. You, or a member of your staff may wish to get in contact with Rep. Ed Pease's (Indiana) legislative assistant, Greg Good, who has additional information on RBTI.

There is too much at stake to allow RBTI to over fly Philmont. Please act now -- final route determination starts in June. Thank you for helping to see that alternative D is not selected.

Respectfully yours,

Joseph P. Hamilton

REALISTIC BOMBER TRAINING INTITIATIVE

Public Hearing Comment Sheet

Location: BIG LAKE, TX
Date: 6-10-99

Thank you for providing your comments on the Realistic Bomber Training Initiative Proposal.

My family has ranched in West Texas since the mid 1800's. Two generations of my husbands family have had oil related businesses here.

Because of drouth, the last 10-12 years has been so very difficult. There has also been a serious drop in oil prices. Wild game hunting has been curtailed because of low wildlife counts.

Many ranching families, as well as people in the oil industry, have their backs to the wall as a result of economic stress. Added stress from these flights, and their effect on all things could and our ability to cope with these hardships. It could also destroy land value.

BR-4 Our land is private & occupied. Our way of life & our physical & emotional well being is at stake. The US Government has vast amounts of land. PLEASE GO FLY THERE.

Langley AFB, VA 23665-2769

Dear Major Adams,

001081

BR-6 I am writing to request your firm support in opposing the selection of "Alternative D" under the USAF's proposed Realistic Bomber Training Initiative (RBTI) involving low flying B-52s and B-1s (as low as 300'). As one of several proposed southwestern routes, "D" traverses Philmont Scout Ranch in northeastern New Mexico's Colfax County. Philmont, truly a national treasure, is the 137,000 acre backpacking and training facility of the Boy Scouts of America. I do not protest RBTI since it is a valuable program – my only complaint, as a Philmont alumnus, is with the proposed route over Philmont.

Several years ago, the USAF ceased its low altitude F-16/F-111 flights over the Ranch as a result of Philmont protests. RBTI's multiple daily flights (up to 16) will create much more severe problems:

a) Program: Philmont is a transient community of 25,000 people with over 3,000 campers in Philmont's back country every day in the summer. Daily, several hundred of them are engaged in spar pole climbing, rock climbing and rapelling, and horse back riding. The sudden roaring of jet engines will distract climbers and bolt horses thereby creating injuries (or worse).

b) Environmental: Appreciation and protection of the wilderness are key parts of Philmont's program. RBTI is inconsistent with wilderness preservation. RBTI will have a damaging effect upon both the unique western wildlife and Philmont herds of cattle, horses, burros, and buffalo. The effect of the unburned portion of jet fuel in the engine exhaust or dumped fuel itself, vaporizing and falling to ground level is as yet unknown, but believed to be anything but beneficial.

c) Safety: The environmental impact study done for the USAF is seriously flawed when it describes Philmont as an "uninhabited" grassland. The smaller portion of Philmont's acreage is prairie. Most of Philmont is mountainous with many peaks in the 10,000 to 12,444' range. Philmont has a tremendous fuel load of dead trees in its forests, and is in the midst of a long term drought. Open fire bans are in effect now. A crashing bomber will create an epic fire of Yellowstone proportions. B-1s and B-52s do not have enviable safety records. The nature of the flights (weaving around mountain peaks and facing violent weather, including frequent, low-level wind shears) dramatically increases the chance of a crash. Unfortunately, Philmont does not have a well-developed highway system for evacuations in case of massive forest fires.

For the above reasons, I seek your help in advocating the selection of a different RBTI route, preferably one that is over a more sparsely populated, less environmentally sensitive area. You, or a member of your staff may wish to liaise with Rep. Ed Pease's (Indiana) legislative assistant, Greg Good, who has additional information on RBTI.

There is too much at stake to allow RBTI to overfly Philmont. Please act now – final route determination starts in June. Thank you for helping to see that alternative D is not selected.

Sincerely,
Nancy Hoyt Chillicothe, Mo.

INCORRECT INFORMATION IN THE ENVIRONMENTAL IMPACT STATEMENT (EIS) PREPARED FOR THE AIR FORCE

001081

EIS: *Philmont is primarily uninhabited grassland.*
Fact: 60 percent of Philmont is forested, mountainous terrain.
Fact: Philmont is a transient community of nearly 25,000 people in the summer when, on any given day, anywhere from 3,000 to 5,000 people populate the route proposed for Philmont.

EIS: *Noise levels will vary between 62 and 68 dBs.*
Fact: From 300 feet, a B-52 produces a noise level of 117 dBs.
Ground crews working that close to jet aircraft usually wear noise attenuating headsets.

EIS: *Does not mention cultural resources.*
Fact: Philmont is home to two National Historical Sites:
Villa Philmonte and the Rayado complex (Carson, Maxwell, and Abreu homes).

EIS: *Residents will get used to the noise.*
Fact: Ten days (time on the trail for a typical camper) is not enough time to become accustomed to the noise. Since 20 percent of the flights will be at night, many campers will be woken up (especially since they are sleeping in a tent, not a modern home).

EIS: *"Flight operations would not be expected to preclude land uses or ... preempt recreational uses, threaten public health and safety, or be inconsistent with applicable regulations."*
Fact: Philmont is most concerned about how RBTI will impact program, health and safety.

PHILMONT CONCERNS

Injuries (or death) from spooked, bolting and/or stampeding horses throwing or dragging inexperienced riders (roughly 200 riders per day). Over the course of a summer, up to 9,500 people, many as young as age 11, ride or go on pack trips. Some of the horse trails are along canyon walls where falling from a horse could mean plummeting hundreds of feet down to the bottom of a rocky gorge.

Falls from spar poles and rock faces by distracted, novice climbers. At any one moment in the summer, up to 120 young people can be climbing or rapelling on sheer rock faces and/or spar poles. The noise not only interferes with crucial, pre-activity instruction, but will distract climbers when they need to be devoting 100 percent of their attention to personal safety.

Noise pollution totally inconsistent with wilderness preservation so firmly fostered by Philmont.

Some wildlife, particularly the southwest's more civilization-sensitive species such as golden eagles and elk, migrating from Philmont to areas outside of the proposed RBTI route D. The effect of thundering jets on Philmont horse, cattle, burro, and buffalo herds will be unfavorable.

Unenviable safety records of B-1s and B-52s. Over the years, there have been numerous crashes, including those during low altitude training activities. The B-52, in particular, was not designed for the low-level, terrain avoidance mission profile. It was designed as a high altitude, horizontal bomber, hence its name, the B-52 "Stratofortress."

Considering the current drought, existing open fire bans, and the excessive fuel load of fallen, dead trees in Philmont's forests, a bomber crash will create a massive forest fire with which Philmont is not prepared to cope. Philmont does not have a highway network for evacuation similar to that of Yellowstone's, for example. Given the extent to which Philmont backcountry is populated, a bomber crash would involve a substantial loss of life and property (buildings, timber) compared to a crash in one of the other routes where the mountains are not as populated or so heavily forested.

Factors increasing the chances of a crash include: inherently greater danger in very low altitude, terrain-avoidance flying; high incidence of violent, mountain thunderstorms with frequent downbursts/microbursts, hail, and windshears; and in the B-52's case, very old airframes.

UNKOWNS

Effects of vibrations on historic buildings and the many mine shafts (including the two which are toured by thousands of campers annually).

Effects of fuel vapor settling onto campsites, cooking areas, water resources, etc. The vapor comes from the unburned portion of the fuel expelled in jet exhaust and from possible, emergency fuel dumping at low altitude.

5/17/99 4:43 PM

PRECEDENTS

001081

Due to the concerns expressed above, the Air Force withdrew its low level operations of F-111s and F-16s over Philmont when Ranch management protested several years ago. Having once acknowledged that Philmont is an inappropriate venue for terrain avoidance practice missions, one wonders why Philmont is again being proposed for such low altitude training flights.

Although the Air Force originally proposed Philmont because of its varied terrain, there is no shortage of the same type of diversified terrain elsewhere, i.e. portions of southern Colorado, where the population problems do not exist to the same extent.

Although the military operates many low altitude practice areas across the world, the Federal Aviation Administration generally prohibits flights of less than 1,000 feet over any "...open air assembly of persons..." The FAA also prohibits flights of less than 500 feet over sparsely populated areas.

PHILMONT POSITION ON RBTI

Philmont management and the Philmont Staff Association Executive Committee support the principles of RBTI since the need for well-trained aircrews is obvious. The Philmont community, believing that Philmont Scout Ranch is truly a unique, national treasure, opposes the selection of RBTI Alternative D since it creates major program, safety, and land management problems.

Langley AFB, VA 23665-2769

Dear Major Adams:

BR-6 I am writing to request your firm support in opposing the selection of Alternative D under the U S Air Force's proposed Realistic Bomber Training Initiative (RBTI). The Air Force is seeking to establish a new training route for low-level B-1 and B-52 bomber flights from bases in Texas and Louisiana. One of the proposed routes, Alternative D, traverses Philmont Scout Ranch in northeaster New Mexico's Colfax County.

Philmont is a 137,000-acre mountain backpacking and high adventure facility of the Boy Scouts of America. Each year, thousands of Scouts and their adult leaders from across the nation participate in two-week wilderness backpacking trips in the mountains of Philmont. Many of them also camp and work on conservation projects in the adjacent Valle Vidal Wilderness of the Carson National Forest.

The Air Force's proposed Alternative D will establish a military training route directly over most of Philmont. More than 2,600 flights each year, some as low as 300 feet above ground level, are proposed for the segment over Philmont. As a former participant in Philmont programs, I have serious concerns about the impact of the Air Force's proposal on the health and safety of Scouts attending Philmont and the potential effects of daily low-level flights on the ranch itself.

On any given day in the summer, as many as 5,000 Scouts and Scouters will be hiking and camping in Philmont's backcountry. Each day, several hundred of them will be engaged in activities such as rock climbing and rappelling, spar pole climbing, and mountain horseback rides. The sudden roar of jet engines has a high

001082

likelihood of distracting an inexperienced climber or causing a horse to bolt on a narrow mountain trail with resulting serious injury (or worse).

Appreciation and protection of the wilderness and our natural resources is a key part of the Philmont program. Scouts from around the world have a unique opportunity to see and experience Wildlife in native habitat. Noise and emissions from bombers cannot help but have a damaging effect on that wildlife, as well as on Philmont's herds of buffalo, horses, cattle and burros. The disruptive effects of noisy bomber overflights on Philmont's famous living history programs, in which Scouts experience the lifestyles of the West's mountain men, homesteaders, lumberers and cowboys, ar43 obvious.

Most of Philmont is mountainous with many peaks in the 10,000 to 12,000 foot range. Philmont has a tremendous fuel load of dead trees in its forests and is in the midst of a long-term drought. Unburned jet fuel finding its way to the ground or being dumped in an emergency over such terrain, with campers using backpacking stoves for cooking, creates toe potential for serious fire that would endanger hundreds of lives. The possibility of a crash, however remote, is simply not acceptable for the safety of these Scouts.

For these reasons, I seek your help in advocating the selection of a different RBTI route. I ask that you express your opposition to Alternative D to the Secretary of the Air Force and other defense officials who may be involved in this decision. Please act now, as the public comment period ends in June and a final decision will be made this year. You or a member of your staff may wish to contact Greg Dodd, Chief of Staff for Congressman Ed Pease of Indiana, who can provide additional information.

Philmont is the largest and most famous Scout camp in the world. It is a national resource that has positively impacted the lives of hundreds of thousands of our nation's youth for more than sixty years. It deserves and demands our protection. Thank you for helping to see that Alternative D is not selected.

Sincerely yours,

Date 6/5/99

Dear Major Adams:

I am opposed to the Air Force's proposed RBTI known as Lancer – Option B in the DEIS. My concern(s) about the proposal and the DEIS are as follows:

TY We own land that's been in our family for years & we still enjoy returning to our home to visit in peace & quiet — We live near a large airport in D.F.W. & we experience not near the noise & bombers in training. My parents are opposed, & are concerned about the cattle & wildlife as well as the quite peace that we all enjoy on the farm when we are home

Sincerely yours: Kelly Sanders

Langley AFB, VA 23685-2789

Dear Major Adams:

BR-6 I am writing to request your firm support in opposing the selection of "Alternative D" under the USAF's proposed Realistic Bomber Training Initiative (RBTI) involving low flying B-52s and B-1s (as low as 300'). As one of several proposed southwestern routes, "D" traverses Philmont Scout Ranch in northeastern New Mexico's Colfax County. Philmont, truly a national treasure, is the 137,000 acre backpacking and training facility of the Boy Scouts of America. I do not protest RBTI since it is a valuable program -- my only complaint, as a Philmont alumnus, is with the proposed route over Philmont.

Several years ago, the USAF ceased its low altitude F-16/F-111 flights over the Ranch as a result of Philmont protests. RBTI's multiple daily flights (up to 16) will create much more severe problems:

a) Program: Philmont is a transient community of 25,000 people with over 3,000 campers in Philmont's back country every day in the summer. Daily, several hundred of them are engaged in spar pole climbing, rock climbing and rappelling, and horse back riding. The sudden roaring of jet engines will distract climbers and bolt horses thereby creating injuries (or worse).

b) Environmental: Appreciation and protection of the wilderness are key parts of Philmont's program. RBTI is inconsistent with wilderness preservation. RBTI will have a damaging effect upon both the unique western wildlife and Philmont herds of cattle, horses, burros, and buffalo. The effect of the unburned portion of jet fuel in the engine exhaust or dumped fuel itself, vaporizing and falling to ground level is as yet unknown, but believed to be anything but beneficial.

c) Safety: The environmental impact study done for the USAF is seriously flawed when it describes Philmont as an "uninhabited" grassland. The smaller portion of Philmont's acreage is prairie. Most of Philmont is mountainous with many peaks in the 10,000 to 12,444' range. Philmont has a tremendous fuel load of dead trees in its forests, and is in the midst of a long term drought. Open fire bans are in effect now. A crashing bomber will create an epic fire of Yellowstone proportions. B-1s and B-52s do not have enviable safety records. The nature of the flights (weaving around mountain peaks and facing violent weather, including frequent, low-level wind shears) dramatically increases the chance of a crash. Unfortunately, Philmont does not have a well-developed highway system for evacuations in case of massive forest fires.

For the above reasons, I seek your help in advocating the selection of a different RBTI route, preferably one that is over a more sparsely populated, less environmentally sensitive area. You, or a member of your staff may wish to liaise with Rep. Ed Pease's (Indiana) legislative assistant, Greg Good, who has additional information on RBTI.

There is too much at stake to allow RBTI to overfly Philmont. Please act now -- final route determination starts in June. Thank you for helping to see that alternative D is not selected.

Sincerely,

Kenneth W. Yow

Dear Major Adams:

TY I oppose low level realistic combat training flights near populated areas such as Fort Davis, Texas. I am as patriotic as the next person, having served in Vietnam (1964-1967), however, I do not believe that the low level training flights should be conducted over private property. I urge the United States Air Force to conduct low level realistic combat training flights over property owned by the Federal Government in the Western United States.

Sincerely,

THOMAS M. BRUNER

Dear Major Adams:

BR-6 I am writing to request your firm support in opposing the selection of "Alternative D" under the USAF's proposed Realistic Bomber Training Initiative (RBTI) involving low flying B-52s and B-1s (as low as 300'). As one of several proposed southwestern routes, "D" traverses Philmont Scout Ranch in northeastern New Mexico's Colfax County. Philmont, truly a national treasure, is the 137,000 acre backpacking and training facility of the Boy Scouts of America. I do not protest RBTI since it is a valuable program -- my only complaint, as a Philmont alumnus, is with the proposed route over Philmont.

Several years ago, the USAF ceased its low altitude F-16/F-111 flights over the Ranch as a result of Philmont protests. RBTI's multiple daily flights (up to 16) will create much more severe problems:

a. Program: Philmont is a transient community of 25,000 people with over 3,000 campers in Philmont's back country every day in the summer. Daily, several hundred of them are engaged in spar pole climbing, rock climbing and rapelling, and horse back riding. The sudden roaring of jet engines will distract climbers and bolt horses thereby creating injuries (or worse).

b. Environmental: Appreciation and protection of the wilderness are key parts of Philmont's program. RBTI is inconsistent with wilderness preservation. RBTI will have a damaging effect upon both the unique western wildlife and Philmont herds of cattle, horses, burros, and buffalo. The effect of the unburned portion of jet fuel in the engine exhaust or dumped fuel itself, vaporizing and falling to ground level is as yet unknown, but believed to be anything but beneficial.

c. Safety: The environmental impact study done for the USAF is seriously flawed when it describes Philmont as an "uninhabited" grassland. The smaller portion of Philmont's acreage is prairie. Most of Philmont is mountainous with many peaks in the 10,000 to 12,444' range. Philmont has a tremendous fuel load of dead trees in its forests, and is in the midst of a long term drought. Open fire bans are in effect now. A crashing bomber will create an epic fire of Yellowstone proportions. B-1s and B-52s do not have enviable safety records. The nature of the flights (weaving around mountain peaks and facing violent weather, including frequent, low-level wind shears) dramatically increases the chance of a crash. Unfortunately, Philmont does not have a well-developed highway system for evacuations in case of massive forest fires.

For the above reasons, I seek your help in advocating the selection of a different RBTI route, preferably one that is over a more sparsely populated, less environmentally sensitive area. You, or a member of your staff may wish to liaise with Rep. Ed Pease's (Indiana) legislative assistant, Greg Good, who has additional information on RBTI.

I have personally lived and trained at Philmont and hiked its trails, as have my two Eagle Scout sons. To allow this outstanding youth and adult leader training facility to be used for these proposed low-level aircraft flights would seriously harm Philmont's ability to effectively teach outdoor living and leadership skills to tens of thousands of our young young scouts and their leaders each year.

There is too much at stake to allow RBTI to overfly Philmont. Please act now -- final route determination starts in June. Thank you for helping to see that alternative D is not selected.

Sincerely,

Robert D. Verne

Langley AFB, VA 23665-2769

June 4th, 1999

Dear Major Adams,

I am writing as a member of the community which will be impacted by RBTI-Route D. I appreciate the opportunity and feel that it is my responsibility to comment on the Draft EIS for RBTI-Route D. Although I suspect otherwise, I truly hope that this process is taken very seriously by the USAF and not merely as a formality designed to placate the taxpayers in the name of saving taxpayer dollars and national security.

We taxpayers will not see a tax cut as a result of RBTI. Therefore, RBTI will not save taxpayers' dollars. RBTI will save the USAF dollars. While $10,000 per hour for jet fuel is a stunning amount, that amount becomes insignificant when compared with the stupendous cost of our national defense operation. One B-1 costs over $200 million, one B-52 costs $74 million, One B-2 costs $1.3 billion. The Department of Defense appropriations budget authorization for fiscal year 1998 was $251.4 billion. (Horatio Trujillo – Legislative Assistant on Foreign Policy and Economic Policy for Tom Udall, U.S. Representative, New Mexico, ___ *Congressional District.)*

Perhaps the need for operations such as RBTI could someday be reduced or even eliminated, saving billions of taxpayer dollars, and strengthening national security by using more energy and tax dollars to help our leaders further develop the techniques, skills, and tools for dialogue and communication in order to wage peace through conflict resolution without violence.

The Draft-EIS bases its findings on objective data and quantitative studies in order to arrive at its conclusions. It also includes advisories from the USFWS and the USFS. It appears that no conclusions were arrived at regarding some of the topics.

In this letter I wish to address some of these sensitive and controversial issues using the data and information I found in the Draft-EIS.

Section 4: Affected Environment and Environmental Consequences:
RBTI-Route D will fly over Mexican Spotted Owl habitats as low as 400 feet AGL, 12 times per day and over at least three active nesting sites for Peregrine Falcons 11 times a day at 400-1000 feet AGL. The bomber route flies over wintering habitat for bald eagles 12-14 times daily below 1,000 feet AGL.

According to the *Bird of Prey and Wildlife Monitoring Study of the Ute Mountain Section of the Rio Grande Gorge* (1986-1989), RBTI will cross two branches of the Rio Grande Flyway for migratory birds of prey and waterfowl. Also, the eastern fork of the Rio Grande is located

001089

directly over the Valle Vidal Unit of the Carson National Forest where a large elk herd is strictly protected and which is managed for its wildlife and recreation opportunities.

p.4- 107 "USFWS advisories have stipulated that the Air Force survey unsurveyed owl habitats underlying IR-153, segments AB and EF in order to determine owl populations (if any) and to avoid overflights by 1,600 feet AGL, March 1-August 31 annually." Additionally they have stated that "significant and adverse impacts would occur to peregrine falcons if they are overflown at levels below 1,600 feet AGL," and that" flights at or below 2,000 feet AGL from October 1 to March 1 could result in significant impacts to wintering bald eagles."

The writers of the Draft-EIS, on the other hand, found a number of studies of mammals and birds which they used to state that p.4-106, "Based on these studies, the evidence would suggest that Alternative D flight operations would not result in significant adverse impacts to wildlife or threaten endangered or sensitive species."

Also the safety section, p.4-50, Draft-EIS states that "neither the existing nor the proposed airspace in IR-153 Section AB would overlie or intersect any migration flyways or water bodies where birds congregate." Clearly, the land managing agencies, i.e. USFWS, BLM-USFS, are in conflict with the USAF or FAA regarding their missions. This conflict must be legally resolved in order for RBTI-D to be considered.

BI-5

Socio-Economic and Environmental Justice:

P. 4-109 The Draft-EIS describes socio-economics as "the general features of the economy, including employment, population, and income, that could be affected by the proposed alternatives." It states that "most direct and indirect socio-economic effects would occur in the immediate vicinity of where the electronic scoring sites and emitter sites would be constructed and operated."

P. 4-109. "The primary measures by which socio-economic impacts were identified include changes to employment, populations, and earnings associated with the proposed alternatives." They detailed their methods, assumptions and calculations in Appendix I.

The Draft-EIS states on p. 4-118, Table 4-4-1 for alternative D: "No measurable impacts to socio-economics. No disproportionate impacts to minority and low income populations."

Taos County and others nearby were not considered in the Study, presumably because of the criteria used. Nevertheless, they could sustain adverse and devastating changes to employment, populations, and earnings as a direct result of the implementation of RBTI-Route D.

BR-4

Livestock would be impacted similarly to wildlife by bomber noise, thereby affecting ranchers and farmers, along with all of their supporting industries, i.e. feed and supply stores, equipment sales, etc.

BR-3

Northern New Mexico is well known as a haven for seekers of solitude and quiet of many kinds. Sportsmen such as hunters, fishermen, trail riders, as well as hikers, bikers, campers, rafters, back-country skiers, snow shoers, families, mushroom hunters, and bird-watchers come from all over the world to enjoy the tranquility, beauty, and originality of the region, as do people

3

001089

searching for many types of physical and spiritual healing. We have retreats, spas, and gatherings, in beautiful wilderness settings.

More than 60 per cent of Taos County's fragile economy is based on tourism. The implementation of the RBTI Route D could cause many of our tourists (bread and butter) to find their "peace and quiet" elsewhere, far from the incredibly monstrous and loud machines of war. A reduction in tourism would impact nearly every person and industry in the country: outfitters and tour guides, camping and sporting goods stores, health spas, health professionals, spiritual retreats and healers, as well as all the supporting businesses, such as hotel, motel, bed and breakfast inns, restaurants, gas stations, gift shops, art galleries, movie theaters, and all of their employees (low income).

Similarly to tourism, Taos County's real estate and construction industries could be adversely and devastatingly impacted by RBTI-Route D. In recent years, many people have moved to Taos and the surrounding area to "get away from it all." Many of these people bring money and even the ones who don't contribute to the economy. These people, like the tourists, could take their dollars and find other places to live and retire, thereby impacting not only the real estate market but also the construction industry, one of the stronger parts of our economy at this time. People affected will be bankers, builders, building supply yards and stores, home decorating and furniture stores, and well as tradesmen of all kinds; i.e. plumbers, electricians, plasterers, adobe layers, tilers, excavators, landscapers, painters, laborers, etc.

Property values could fall, not only as a result of fewer people moving to the area because of RBTI-Route D, but also people, such as myself, could choose to leave the area, further jeopardizing our tenuous economy.

BR-4

The socio-economic impact of RBTI-Route D to Taos County and the neighboring counties must be studied before RBTI-Route D is allowed to move ahead.

P4-109: the EIS addresses environmental justice, as defined in Executive Order 12898: "Federal Actions to Address Environmental Justice in Minority and Low Income Populations." It looks at whether an action disproportionately affects these types of populations. According to1990 census data in the Community Profile Packet from the Taos County Chamber of Commerce, a large portion of Taos County's population is made up of Hispanic and Native American people., (65% Hispanic, 7% Native American, @7% Anglo, and 1% Other). Many of these are low wage earners or are unemployed. We currently have 27 percent earning below the poverty line and an unemployment rate of 18 percent, according to the Western Environmental Law Center.

There are hundreds of small entrepreneurial businesses in the Taos area. They struggle for survival. Many are "mom and pop" style operations. Many of the potential job losses would be among their employees. When business gets slow around here, the low wage earners are the first to go; i.e. during our off seasons, spring and late fall, the small business owners and managers can cover the duties themselves. Thus the employees are - at least temporarily – laid off. Among these workers would be shop helpers, fast food employees, construction laborers, hotel and motel service, restaurants, ski area gift shops, etc. These are the low income people. Many are minority members. They could become even poorer or unemployed. Potential impact regarding the Environmental Justice for Taos County must be carefully studied before the RBTI-Route D moves forward.

BR-4

4

001089

Noise: "Noise is generally described as unwanted sound. Unwanted sound can be based on objective effects (hearing loss, damage to structures, etc.), or subjective judgments (community annoyance). Noise analysis thus requires a combination of physical measurement of sound, physical and physiological effects, plus psycho/socio-acoustic effects of the sound's loudness."

P.4-6: The Air Force uses three noise measuring techniques:

1. L-max and SEL = single noise events
2. DNL = Day Night Average sound levels and cumulative energy average noise.
3. DBA=A weighting in decibels.

There are tables, explanations, and diagrams showing SEL and L-max levels, as well as a number of tables, explanations, and diagrams of DNL (pgs. 4-6,4-7,4-8,4-47,4-49, appendix G, p. g-4).

The EIS states that "DNL has emerged as the most widely accepted metric for aircraft noise." P. 4-9.

On P. 4-46, the EIS states that the noise levels on the 38 segments of IR-153 would range from less than 45 DNL to 64 DNL, 65 decibels is 50% louder than average conversation.

On P. 4-46, the EIS also states that sortie operations on all but three segments of IR-153 could generate SEL's ranging from 86 to 116 decibels.

Appendix G, p. G-2: "A change in sound level of about 10 decibels is perceived by the average person as a doubling (or halving) of the sound's loudness."

Therefore, to an average person, a sound that measured 70 decibels would be twice as loud as a sound of 60 decibels (average conversation). If you do the arithmetic, a sound of 120 decibels would be 64 times as loud to the average person as a sound of 60 decibels. According to pages, 4-6, table 4.1-1, a B-1 at 300 feet AGL produces an L-max of 117 decibels. Table 4-1-3: an SEL of 116 decibels.

Although the DNL measurement is the most widely accepted measurement for aircraft noise, it is clear after careful study of the information provided by the EIS, (and also my own experiences of being overflown), that for these low-level types of flights, the single event level and the L-max factor must be given at least equal weight to DNL averages before the USAF is allowed to move forward with this project.

AO-55

Cultural Resources:

P. 4-122: The EIS states that "the effects of noise on cultural resources may also be related to setting. Noise impacts to Native American traditional cultural properties may be related to interference with ceremonies and other traditional activities at sacred sites. Undisturbed habitats, resources, and settings are considered to be critical to religious practices. Potential impacts can be identified only through consultation with the affected groups."

The USAF has altered RBTI-Route D to avoid the Taos Pueblo and Blue Lake areas as a result of consultation with Taos Pueblo leaders. It is not necessary for the USAF to reveal sacred and religious sites to the general public: however, they must provide assurance that all issues regarding sacred and religious sites have been resolved to the satisfaction of the various Pueblos that were consulted before moving forward with RBTI-Route D.

CU-4

5

001089

Cumulative Impact:

There are currently numerous low-flying training routes in New Mexico originating from military bases throughout the U.S. When added to the proposed RBTI flight operations, some areas may experience over 6,300 flyovers per year. The USAF must study these cumulative impacts and the cumulative impacts of all low level training flights in the western U.S. in a programmatic EIS.

Public Safety:

The EIS addresses safety issues and on p.4-50, states that "since IR-153 does not currently exist, it is difficult to draw direct comparisons of baseline and projected mishap potential. Secondary MTRs that overlap or intersect segments of proposed IR-153 do provide a rough comparison. Estimated years between class A mishaps on these routes rage from 22-2,800. For proposed IR-153, estimated years between Class A mishaps for B-52's would fall into this range, whereas the potential for B-1's would be slightly greater. However, when considered as probabilities, the estimated years equate to a 0.02 probability of a B-52 Class A mishaps per year and a 0.07 probability for the B-1's."

We know that ~~three~~ there have been a number of military plane crashes over the years. There was one incident with a sailplane where the Air Force pilot didn't even see the glider because the difference in speed was so great. The wing wheel of the glider was found in the military aircraft. In our area, there are not only sailplanes but also small private and commercial planes and hang gliders.

No Class A mishaps are acceptable. The USAF must be able to estimate a 0 percent probability for Class A mishaps. Also, the Air Force should provide a list description of all mishaps – Class A and otherwise – that have actually occurred over the lifespan of the military aircraft training programs before it moves ahead with this project.

AO-61

In conclusion, in order to formulate my response to the Draft EIS for RBTI-Route D, I have read the report carefully. After having done the research necessary to write this letter, I have discovered that it is possible to use objective criteria and quantitative data in order to arrive at more than one conclusion. From my research, most of which comes directly from the Draft EIS, I conclude that the USAF must further study and resolve many of the issues addressed in the Draft-EIS, including potential harm to endangered, threatened and sensitive species and potential harm to other wildlife, ecology and livestock.

The noise level issue must be re-addressed and made to include L-max and SEL measurements. The public safety issue has not been adequately addressed re: military plane crashes, small aircraft and bird strikes. The study must make readily available to the public a list of all Class A mishaps that have actually occurred over the life of the military aircraft training programs.

The EIS must be made to include a socio-economic and environmental justice report on potential impact to the socio-economic structure of Taos County, New Mexico. Finally the USAF must complete their consultations with the various Native American Indian Pueblos and resolve any issues regarding sacred and religious sites to the satisfaction of each tribal community consulted.

6

001089

It is clear that all of these issues must be addressed, re-addressed and resolved by the USAF before RBTI-Route D is allowed to move forward.

Sincerely,

Kathy Lee

Langley AFB, VA 23665-2769

Dear Major Adams:

BR-6 I am writing to request your firm support in opposing the selection of Alternative D under the U.S. Air Force's Realistic Bomber Training Initiative (RBTI). The Air Force is seeking to establish a new training route for low-level B-1 and B-52 bomber flights from bases in Texas and Louisiana. One of the proposed routes, Alternative D, traverses Philmont Scout Ranch in northeastern New Mexico's Colfax County.

Philmont is a 137,000 acre mountain backpacking and high adventure facility of the Boy Scouts of America. Each year, thousands of Scouts and their adult leaders from across the nation participate in two-week wilderness backpacking trips in the mountains of Philmont. Many of them also camp and work on conservation projects in the adjacent Valle Vidal Wilderness of the Carson National Forest.

The Air Force's proposed Alternative D will establish a military training route directly over most of Philmont. More than 2,600 flights each year some as low as 300 feet above ground level, are proposed for the segment over Philmont. As a former Philmont scout attendee, I have serious concerns about the impact of the Air Force's proposal on the health and safety of scouts attending Philmont and the potential effects of daily low-level flights on the ranch itself.

On any given day in the summer, as many as 5,000 Scouts and Scouters will be hiking and camping in Philmont's back country. Each day, several hundred of them will be engaged in activity such as rock climbing and rapelling, spar pole climbing, and mountain horseback rides. The sudden roar of jet engines has a high likelihood of distracting an inexperienced climber or causing a horse to bolt on a narrow mountain trail with resulting serious injury or death.

Appreciation and protection of the wilderness and our natural resources is a key part of the Philmont program. Scouts from around the world have a unique opportunity to see and experience wild life and native habitat. Noise and emissions from bombers cannot help but have a damaging effect on that wildlife, as well as Philmont's herds of buffalo, horses, cattle and burros. The disruptive effects of noisy bomber overflights on Philmont's famous living history programs, in which Scouts experience the lifestyles of the West's mountain men, homesteaders, lumberers and cowboys, are obvious.

Most of Philmont is mountainous with many peaks and a 10,000' to 12,000' range. Philmont has a tremendous fuel load of dead trees in its forests and is in the midst of a long-term drought. Unburned jet fuel finding its way to the ground or being dumped in an emergency over such terrain with campers using backpacking stoves for cooking, creates a potential for a serious fire that would endanger hundreds of lives. The possibility of a crash, however remote, is simply not acceptable for the safety of these Scouts.

001090

For these reasons, I seek your help in advocating the selection of a different RBTI route. I ask that you express your opposition to Alternative D to other defense officials who may be involved in this decision. Please act now, as the public comment period ends in June and a final decision will be made this year. You or a member of your staff may wish to contact Greg Dodd, Chief of Staff for Congressman Ed Pease of Indiana, who can provide additional information.

Philmont is the largest and most famous scout camp in the world. It is a national resource that has positively impacted the lives of hundreds of thousands of our nation's youth for more than sixty years. It deserves and demands our protection. Thank you for helping to see that Alternative D is not selected.

Sincerely,

Peter James Patrick Purcell
Eagle Scout with Silver Palm

Subject: Opposition to Air Force RBTI, Alternative D

Major Brent Adams
RBTI EIS Project Manager
HQ ACC/CEVPP
129 Andrews Street, Ste 102
Langley AFB, VA 23665-2769

Dear Major Adams:

BR-6 I am writing to request your firm support in opposing the selection of "Alternative D" under the USAF's proposed Realistic Bomber Training Initiative (RBTI) involving low flying B-52s and B-1s (as low as 300'). As one of several proposed southwestern routes, "D" traverses Philmont Scout Ranch in northeastern New Mexico's Colfax County. Philmont, truly a national treasure, is the 137,000 acre backpacking and training facility of the Boy Scouts of America. I do not protest RBTI since it is a valuable program – my only complaint, as a Philmont alumnus, is with the proposed route over Philmont.

Several years ago, the USAF ceased its low altitude F-16/F-111 flights over the Ranch as a result of Philmont protests. RBTI's multiple daily flights (up to 16) will create much more severe problems:

a) Program: Philmont is a transient community of 25,000 people with over 3,000 campers in Philmont's back country every day in the summer. Daily, several hundred of them are engaged in spar pole climbing, rock climbing and rapelling, and horse back riding. The sudden roaring of jet engines will distract climbers and bolt horses thereby creating injuries (or worse).

b) Environmental: Appreciation and protection of the wilderness are key parts of Philmont's program. RBTI is inconsistent with wilderness preservation. RBTI will have a damaging effect upon both the unique western wildlife and Philmont herds of cattle, horses, burros, and buffalo. The effect of the unburned portion of jet fuel in the engine exhaust or dumped fuel itself, vaporizing and falling to ground level is as yet unknown, but believed to be anything but beneficial.

c) Safety: The environmental impact study done for the USAF is seriously flawed when it describes Philmont as an "uninhabited" grassland. The smaller portion of Philmont's acreage is prairie. Most of Philmont is mountainous with many peaks in the 10,000 to 12,444' range. Philmont has a tremendous fuel load of dead trees in its forests, and is in the midst of a long term drought. Open fire bans are in effect now. A crashing bomber will create an epic fire of Yellowstone proportions. B-1s and B-52s do not have enviable safety records. The nature of the flights (weaving around mountain peaks and facing violent weather,

001091

including frequent, low-level wind shears) dramatically increases the chance of a crash. Unfortunately, Philmont does not have a well-developed highway system for evacuations in case of massive forest fires.

For the above reasons, I seek your help in advocating the selection of a different RBTI route, preferably one that is over a more sparsely populated, less environmentally sensitive area. You, or a member of your staff may wish to liaise with Rep. Ed Pease's (Indiana) legislative assistant, Greg Good, who has additional information on RBTI.

There is too much at stake to allow RBTI to overfly Philmont. Please act now – final route determination starts in June. Thank you for helping to see that alternative D is not selected.

William J. Leach
Assistant Scoutmaster, Troop 940

Re: Realistic Bomber Training Initiative – Oppose Proposal D

Dear Major Adams:

TY We attended the Public Hearing held in Angel Fire, NM and other community discussion groups.

We recommend that Proposal D NOT be implemented because of the detrimental effects on the environment and economy of the affected area.

Although not fully informed on Alternatives B and C, we believe Alternative A (no action) to be the best.

We appreciate your full consideration of this issue and the need for appropriate training areas.

Sincerely,

T. Scott Gibson

Dear Major Adams:

I am opposed to the Air Force's proposed RBTI known as Lancer – Option B in the DEIS. My concern(s) about the proposal and the DEIS are as follows:

~~We own 13,400 acres that will be in your flight path in Kent County,~~ Texas.

We have only two sources of income from this property, that being sale of cattle and hunting leases. Ranching is hard. Our hunters come from as

BR-4 far away as Virginia. They will not re-lease for hunting if your plan is implemented.

Our son, his wife and their four children live on this land and virtually run this ranch by themselves. It is necessary for them to do this in order to make a living. Please do not take our sources of income away and a lifestyle that is important and one that provides food for the country.

Stop this madness and use land that our country already owns! We are more important than the spotted owls.

Sincerely yours: Mrs. Billie Alderman

Dear Major Adams,

BR-6 Philmont Scout Ranch has been owned and operated by the Boy Scouts of America for over 60 years. The majority of its participants are high school aged young men and women Scouts and Explorers. There is also a smaller training operation for adult Scout leaders and their families. There are about 5000 people living and working on the ranch at any one time during the summer and smaller groups at other times of the year. I participated as an adult leader on five backpacking trips and returned as a staff member during five additional summers.

The current and former members of the Philmont Scout Ranch staff are worried about decisions to be made in selecting a route for the United States Air Force Realistic Bomber Training Initiative. As a member of the Philmont Staff Association, I was made aware of this threat to the wilderness experience enjoyed by 20,000 members of the Boy Scouts of America each summer. I feel the threat is in three areas.

First, there is a danger to safety. Scouts on the ranch work with horses, cattle, and burros which may be spooked by the loud noise. The Scouts also engage in some challenging events, such as rock climbing, in which a sudden loud noise may lead to accidents.

Second, there is a danger to health. During ten day backpacking trips, Scouts often get their water from streams and ponds. There is a strong chance that these water sources would be contaminated by jet exhaust and unburned fuel.

Third, it is a threat to the natural setting. The extreme noise made by the jets flying low overhead will interfere with the scouts encountering the natural world on its own terms. The loud noises will interfere with the wildlife. I worked at a camp in Ohio where the noise from maintaining a natural gas well by the local public utility company was enough to frighten many of the skunks in the area into spraying. I can easily imagine the same sorts of self-protection behavior by the wildlife at Philmont. I can also imagine the wildlife getting used to the noise, which may actually lower their chances for survival in other ways.

Philmont has been recognized as an example of how people can be brought to an appreciation of nature. I believe you would not set a training route over the

001098

Grand Canyon. Well, Philmont is an even more significant experience for many of our young people. Young men and women with Scout experience are considered valuable recruits by all branches of our military. I'm not sure that as many would be as willing to commit to military service if they perceive that the highlight of their Scouting career was diminished by the U. S. Air Force.

I am including a copy of arguments set forth by the Philmont Staff Association to help in your decision making. Thank you for your consideration.

Sincerely,

John Duckwood

John Duckworth

001098

TEN POINTS FOR OPPOSITION TO RBTI ALTERNATIVE D (OVER PHILMONT)

1. The EIS (Environmental Impact Statement) incorrectly concludes that very few population centers are affected. On any given day in the summer months, over 5,000 people will be living and camping directly under the flight path at Philmont.
2. Safety of horseback riders will be endangered. Philmont provides trail rides or pack trips for 7500 to 9500 mostly inexperienced riders each summer on steep and narrow mountain trails. As many as 165 inexperienced people may be on horseback on the ranch at various times during the day. The startle effect of a high-decibel low-level flight could easily cause one or more horses to spook and bolt with a novice rider aboard. With the number of flights proposed, it will be only a matter of time before Philmont experiences a serious injury or death due to a rider being thrown from or dragged by a startled horse.
3. Increased noise levels will interfere with staff trying to provide safety instruction to rock climbers, spar pole climbers, and rifle range shooters. The noise level of a B-52 at 300 feet is 117 decibels. Staff trying to teach safety techniques required in climbing rock faces or firing black powder rifles should not have to compete with such noise interference.
4. The high noise levels generated by B-1 and B-52 bombers flying only a few hundred feet above ground level are greater than being near a chain saw or a diesel train. Campers at Philmont will be exposed to such noise levels for more than six hours during a typical 12-day stay based on projected flight operations. This is not a true wilderness experience.
5. The possibility of a crash is very real. The EIS estimates the chances of a "Class A mishap" at one every 15 years for a B-1 on the training route that would include Philmont. Aside from the real risk to Scouts who might be in the path of an errant bomber, a crash on Philmont would have the potential of starting a serious forest fire that could devastate the ranch.
6. The EIS fails to mention any impact of flyovers on Philmont's two National Historic sites, The Kit Carson/Maxwell Abreu houses at Rayado and the Villa Philmonte.
7. The flights can be expected to have serious impacts on Philmont's wildlife and will overfly the habitats of at least three endangered species, the bald eagle, peregrine falcon, and Mexican spotted owl. The U.S. Fish and Wildlife Service has concluded that overflights at less than 1,000 feet will significantly impact these species.
8. No one has investigated the cumulative effects of the planned noise levels and vibrations on the hundreds of abandoned and the two active mines on Philmont.
9. No plane burns all of its fuel. At higher altitudes, unburned fuel dissipates in the atmosphere. At lower altitudes, one must expect that some unburned fuel will find its way to the ground and streams on Philmont. The effects of a plane in trouble at low altitude dumping fuel over Philmont with numerous cook stoves and campfires are easily imagined.
10. Philmont is a national treasure and provides a wilderness camping experience for thousands of Scouts, America's future leaders, every year. That experience should be preserved since alternative training sites exist which do not jeopardize the program experience offered by Philmont and the safety of thousands of young people participating in it each year.

Major Adams

I am strongly opposed to Air Force proposed RBTI in Texas. You, as EIS Project Manager, know how poor a study & hearing was conducted. You know the true impact this would have.

GE-22 This is why the Air Force tried to conduct the hearing so discreetly. There has not been straightforward honesty with the people in this area.

I hope you can live with yourself. Come out here yourself and get out in the country, conduct your study, then look us in the eye and tell us this will not affect our quality of life.

Waiting for your visit

Langley AFB, VA 23665-2769

Dear Major Adams:

TY According to the Realistic Bomber Training Initiative Draft Environmental Impact Statement, alternative D will incur the most impacts to existing airspace, noise levels (especially over thirteen special use land management areas such as state parks and wild and scenic rivers) and to the habitat of endangered bird species. For these reasons I am opposed to alternative D. However, there is a consideration that was not included in the RBTI EIS.

Humans and their activities have overwhelmed the natural environment to such a degree that most people don't even know what has been lost. People living in an urban/suburban environment seem to be inured to the relatively high background noise levels that are constantly there. Many do not seem to be bothered by the noise pollution, light pollution, unpleasant and hazardous air and the jumble of visual irritations that make up this environment. Even small towns have too much of this abrasive environment that seems to produce similar types of thoughts and actions.

To someone who accepts this environment as livable, it is no surprise that a few bombers screaming overhead would not arouse much concern other than perhaps being "highly annoyed," as stated in the RBTI EIS. Choosing to live in or to visit a natural environment is not equivalent to choosing among a variety of man-made environments. The natural environment offers input from and connections with the numerous interrelated life-forms from which we have separated ourselves. To send bombers or similar types of intrusions into natural settings makes it very difficult to connect with the rest of creation.

The area covered by alternative D includes many people who have rejected the urban/suburban lifestyle because of its separation from the natural world. Please, let us not modify this environment or other natural environments with any more of man's intrusive activities.

Sincerely,

Mary Ann Andera

Raton, NM

001102

June 13, 1999

Major Brent Adams
RBTI EIS Project Manager
HQ ACC/CEVPP
129 Andrews Street, Suite 102
Langley AFB, VA 23665-2769

Dear Major Adams:

BR-6 I am writing to request your support in opposing the selection of Alternative D under the U.S. Air Force's proposed Realistic Bomber Training Initiative (RBTI). The Air Force is seeking to establish a new training route for low-level B-1 and B-52 bomber flights from bases in Texan and Louisiana. One of the proposed routes, Alternative D, traverses Philmont Scout Ranch in northeastern New Mexico's Colfax County.

Philmont is a 137,000 acre mountain backpacking and high adventure facility of the Boy Scouts of America. Each year, thousands of scouts and their adult leaders from across the nation participate in two-week wilderness backpacking trips in the mountains of Philmont. Many of them also camp and work on conservation projects in the adjacent Valle Vidal Wilderness of the Carson National Forest.

The Air Force's proposed Alternative D will establish a military training route directly over most of Philmont. More than 2,600 flights each year, some as low as 300 feet above ground level, are proposed for the segment over Philmont. As a former Philmont staff member, I have serious concerns about the impact of the Air Force's proposal on the health and safety of Scouts attending Philmont and the potential effects of daily low-level flights on the ranch itself.

On any given day in the summer, as many as 5,000 Scouts and Scouters will be hiking and camping in Philmont's Backcountry. Each day, several hundred of them will be engaged in activities such as rock climbing and rapelling, spar pole climbing, and mountain horseback rides. The sudden roar of jet engines has a high likelihood of distracting an inexperienced climber or causing a horse to bolt on a narrow mountain trail with resulting serious injury or worst.

001102

Appreciation and protection of the wilderness and our natural resources is a key part of the Philmont program. Scouts from around the world have a unique opportunity to see and experience wildlife in active habitat. Noise and emissions from bombers cannot help but have a damaging effect on the wildlife, as well as on Philmont's herds of buffalo, horses, cattle and burros. The disruptive effects of noisy bomber overflights on Philmont's famous living history programs, in which Scouts experience the lifestyles of the West's mountain men, homesteaders, lumbers, miners and cowboys. are obvious.

Most of Philmont is mountainous with many peaks in the 10,000 to 12,000 feet range. Philmont has a tremendous fuel load of dead trees in its forests and is in the midst of a long term-term drought. Unburned jet fuel finding its way to the round or being dumped in an emergency over such terrain, with campers using backpacking stoves for cooking, creates the potential for a serious fire that would endanger hundreds of lives. The possibility of a crash, however remote, is simply not acceptable for the safety of these Scouts.

Philmont is the largest and most famous Scout camp in the world. It is a national resource that has positively impacted the lives of hundreds of thousands of our nation's youth for more than sixty years many of which serve in the armed forces after their scouting years and use skills they have learned at such places as Philmont. It deserves and demands our protection. Thank you for helping to see that Alternative D is not selected.

Sincerely,

Andrew J. Wahll

MR ANDREW J WAHLL
VERMOOD, MO

001103

Major Brent Adams

In response to the proposal for the RBTI in the TAOS AREA – it seems completely flawed and ill-conceived. I do not understand how the USAF could have proposed it – or stood by it. I have attended the public meetings and READ the EIS statements. This community is united in its

LU-2 opposition to this plan. The AF does not comprehend how many people live in the area to be devastated by this training. Your Public Relations people said 5 villages would be affected – this is nonsense – there are 5 villages on St. Rd. 522 that would be destroyed – was the rest of the state omitted?

CU-7 Christ in the Desert Monastery, Ghost Ranch, have existed for decades and would be very seriously impacted by the constant noise – these writers were also not noticed or considered in your study. There are thousands of people who live here and the quality of our lives would be utterly wrecked. Somehow we were not counted in your study. The study says that we may come to enjoy watching the training – it is insulting to every person here to make such a suggestion.

The study is very seriously flawed in its guess of how many people would be affected by the bombers

001103

The study suggests that there would be no serious impact economically — again, this is maliciously flawed. There were strong statements at the public meeting about the damage these flights do to livestock, wildlife, and recreation. The BLM, Forest Service, all TAOS government agencies have stated that harm would be done economically. The USAF has ignored these statements. For myself — I would have a haven which I have struggled to build, but could no longer live in, nor could I sell it. This is economic devastation.

BI-2 The EIS has also ignored the importance of the migratory fly ways along the Rio Grande and the Sangre de Cristo mountains. The BLM, Forest Service, and independent biologists have stated their opposition to these flights — these groups have been ignored by the USAF.

BI-5 This is a short list of the faults in this proposal — the faults are far too numerous and intentionally ignored — the danger to endangered species, whooping cranes, sea lions, and more, flights over wilderness, wild & scenic rivers, homes, and communities, established recreation such as Ghost Ranch, Christ in the Desert Monastery, Philmont Scout Ranch, and our quiet pristine mountains.

This plan must be dropped.

David Riedel

San Cristobal NM

001104

6-10-99

Dear Major Brent Adams,

I feel that the Environmental Impact Statement, Draft Stage, of the Realistic Bomber Training Initiative is unfair and unjust. My main concern is safety for myself and other neighbors who may be in potential harm.

AO-20 Continued exposure to tremendous noise (over 130 decibels) can cause stress and related injuries. That's why the German government has banned all low-level jet training in Germany.

AO-49 We also lose lives of military pilots. Since 1980, over 40 F-16 pilots have been killed. Once a plane crashes, it releases fuel & toxic chemicals that could present possible brush fires in dry West Texas.

Is it worth risking lives for unnecessary training? I pray not. I'd like to close with a quote from Admiral Eugene Carroll (Ret.) of the Center for Defense Information: the training continues because it "justifies flight hours, training hours, and it's fun for the flight crews."

Respectfully,

Julia West

RE: REALISTIC BOMBER TRAINING INITIATIVE
ENVIRONMENTAL IMPACT STATEMENT

Dear Major Adams:

BR-6 I am writing to express my opinions, for the public record, regarding the Air Force's proposed Alternative D for the Realistic Bomber Training Initiative. I write to express my opposition to Alternative D, but possibly not for reasons that have previously been stated to you.

So that no one will misunderstand my position, I would like to establish at the outset of this letter that I am one of the hundreds of thousands of men and women in this country whose lives have been positively impacted by their experiences at Philmont Scout Ranch. I first attended Philmont as a camper in 1970 shortly after I received the Eagle Scout Award. I had the privilege of working for four years on the Philmont Staff during college and law school. I have since been actively involved with the Philmont Staff Association, the organization for former staff members, and recently completed a four-year term as that organization's president. I am presently serving a three-year term as a member of the Philmont Ranch Committee. Having said all of that, the opinions expressed in this letter are just my own, but I wanted you to know that I have sufficient experience to express those opinions.

I have reviewed the entire Draft Environmental Impact Statement prepared by the Air Force for the RBTI. I respectfully disagree with the service's conclusion that selection of Alternative D would have "no likely effects to land use, recreation resources, or visual settings." *RBTI Draft EIS, pages 4-83.* Selection of Alternative D, with 2,660 additional annual flights, would have an adverse impact on the program of Philmont Scout Ranch, and on thousands of this nation's youth, that cannot be adequately described.

Document # 834160

001105

The problem with the Air Force's proposal to establish these flights over Philmont, aside from obvious safety concerns, is that they will, of necessity, destroy the Philmont experience, which is a truly unique national resource. I note that Philmont is listed in the EIS as only one of a number of "special land use areas"that might be impacted by these flights. I am not so concerned about the impact on those areas, quite frankly, because we have other national parks, national forests, state parks, grasslands, etc. We have no other Philmont. Philmont is unique in terms of the program and opportunities it provides to young people in this country. In the 60-+ years since Philmont was donated to the Boy Scouts of America by the late Waite Phillips, no other donor has come forth with a similar grant of property to serve the country's youth.

So that the Air Force, and the people of this country, can judge the impact that the RBTI proposal will have on Philmont, I enclose the following publications which I ask be included as part of the public record, and be **read and reviewed** by the people who will be making this decision. They are:

1. Philmont, Where Spirits Soar, and

2. Philmont, An Illustrated History.

These publications state in better words than I could ever use what Philmont means to the Boy Scouts of America and the citizens of this country. It changes people's lives – for the better.

I will rely on your honor as an officer in the service of our nation to see that these publications are routed to the people who will actually be making this decision so that the true impact of that decision will be known to them.

Sincerely,

Mark A. Stinnett

Langley AFB, VA 23665-2769

Dear Major Adams:

BR-6 I have just returned from a week's stay at Philmont Scout Ranch in Cimarron, N.M. While there I learned that the Airforce is considering the establishment of a Military Training Route which will fly directly over Philmont if the New Mexico route is chosen. This letter is written in the hope of dissuading this selection.

While recognizing the need for realistic training of pilots and crews, I also recognize the need for the wilderness experience which Philmont provides American youths across this nation. A two week trek through the beautiful mountains in this region, carrying a heavy pack, learning to be self-reliant and also learning the necessity for cooperation with the group, is of inestimable value not just for the individual, but for our country.

During WWII I was a pilot (a WASP) flying with the military, and I am well aware of the importance of flight training. However, as an individual who was introduced to the beauty of God's creation at an early age, I am also aware of the importance of protecting what is left of this beauty, as well as making sure it will always be there for future generations . I hope when my two grandsons (age six) and my two granddaughters (three & three & one half) reach their teen's, the skies over Philmont will still be free from the dangers and the environmental impact of low-level bombing runs .

I am enclosing a copy of a portion of an article which I read in the June issue of High Country, a Philmont newsletter. I would greatly appreciate your careful reading of these ten points of opposition stated here.. If you have never been to Philmont you may not be aware of the impact such a bomber training route would have on people, wildlife, and the countryside in general.

Over the years my husband has taken many young Scouts to Philmont and has also attended many week-long training sessions for Scout leaders which were held there. I have accompanied him on at least five training courses dating back to my first time in 1984. His first trek was in 1974 . The land and the experience was still the same when we were there ten days ago. I hope, and pray, that this route will be removed from consideration. Thank you..

Sincerely,

Eleanor M. Brown

Major Brent Adams, RBTI EIS Project Manager
HQ ACC/CEVPP
129 Andrews Street, Suite 102
Langley AFB, VA 23665-2769

Dear Sir

I feel that the Environmental Impact Statement (EIS), Draft Stage, of the Realistic Bomber Training Initiative (RBTI), is unfair and unjust. The first reason that it is unjust is because of the very loud noise these flights cause to all life. This very loud noise injure all living animals greatly.

BI-3

And the second reason that it is unjust is that there is danger to all on the ground below the flights as well as the danger to all of the aircraft that is not military such as the Border Patrol, Cooperate and private

BR-2

~~001108~~ or
001107

planes as well as other miscellaneous aircraft that do exist.

So please, Major Brent Adams, don't do it!

Yours truly,
Donald R Bryant

David L. Greenlees, M.D.

001108

12 June 1999

TO:
Major Brent Adams, RBTI
EIS Project Manager,
HQ ACC/CEVPP
129 Andrews St. Suite 102,
Langley AFB, Va. 23665-2769.

Dear Sir:

I write to protest the utter disregard and intransigent attitude that the U.S.Air Force and it,s personnel have exhibited in it,s discussions with the people of West Texas concerning training flights of aircraft over private terrain. As you very well know, these flights could be conducted over BLM and other U.S.Government lands without protest and to just as good a result. The position of the Air Force in this case is completely untenable and damaging to it's long-standing image of outstanding good repute and rapore.

As perhaps you are aware, the Davis Mountains are unique in many ways being a place of unusual beauty and charm not unlike the Baverian Alps in some ways. It's history is one of great interest and importance having played a major part in the wagontrails west, the Indian wars, the Civil War and home of the Buffalo Soldiers and more. McDonald Observatory sits on Mt.Lock and is an important asset not only to astronomy per se, but to NASA and the U.S. Air force. It is not inconceivable that sonic boombs from low-flying aircraft could damage delicate instruments in that facility.

AO-14

Be it that the above is true and should be considered in any decision affecting this area, My greatest concern and objection, is the beligerant attitude of both the the people sent to discuss the problem with the local people, and on the part of the Secretary of the U.S.Air Force who has refused to listen.

Even if this situation is decided in the favor of the U.S.AFF. I do not believe that you or I, have heard the last of this

Yours truly,
David L. Greenlees, M.D.

REALISTIC BOMBER TRAINING INTITIATIVE

Public Hearing Comment Sheet

Location__Taos, New Mexico

Date: June 6, 1999

Major Bret Adams, RBTI EIS Project Manager
HQ ACC/CEVPP
129 Andrews Street Suite 102
Langley AFB, VA 23665-2769

Dear Major Adams,

I am writing to you on behalf of my family and friends who reside in the Taos valley. We moved here because of the peace and quiet. This valley and these mountains are a beautiful example of the prisine condition of the wilderness. Also we love it here because of the abundant wildlife, we go bird watching, build bird and bat houses, and feel fortunate to have elk cross through our property. These are treasures found few places in the United States. Because they are treasures, we wish to safeguard them. We know they are fragile and we will fight to protect them.

Just because there is a war in another part of the world does not give us license to dishonor the wilderness areas of our country. Everyone knows what low flying flights would do to disrupt and damage northern New Mexico's wildlife, ecology and livestock. Animals can only panic when they hear this extremely high noise level. In many cases this is enough to cause low birth rates and disorientation of many species. There are people living in these areas as well, with children. What are they to do or think when six days per week, perhaps 10 flights a day, shock them out of their sleep?

BR-3

I must ask you, would you like to have these bombers flying over your home and family at this level? Just because a person lives out in the country, close to nature, does that cause him to lose his rights that only city people have. Would you fly over your city like this? There are already existing practice ranges where test can be made. The Air Force has many areas that it uses and can still use. It is unconscionable to take another, entirely pristine area of the rapidly diminishing wilderness in the United States and ruin that as well.

Please consider our plea. It is not just for ourselves but we ask this in the name of countless other species that will be adversely affected by these flights. We ask it in the name of future generations that will thank us for respecting the land and it's treasures.

Respectfully,
Shirley Randolph

Dear Major Adams:

I am writing to you to express my opposition to the Realistic Bomber Training Initiative Draft Environmental Impact Statement for Northern New Mexico.

When I first "discovered" Angel Fire, New Mexico, in July, 1992 I was totally overwhelmed by the natural beauty, the pristine environment and the genuine kindness of its residents. I was motivated to seek out a perfect condo so that I may live out my retirement segment of my life in Angel Fire. A reward to myself for having been a dedicated, energetic educator serving youth in urban areas for over thirty years. I have been able to experience the revitalization that occurs

001110

Page 2

after spending one or two months of my summer vacation at Angel Fire. I have witnessed the dedication of workers and realize that their wages barely offer them minimum wage. Yet their spirits flourish.

BR-4 Where will these northern New Mexico residents work if the tourist and Ski Industry at Angel Fire is extinct due to bombers flying overhead? Why should we become anxious over the possibility of experiencing a re-enactment of the tragic loss of lives - as in the Ariano disaster.

It is most distressing to me that you would permit or endorse any bombers flying over any portion of Northern New Mexico. There are vast parcels of space in

PD-4 other states that are less populated and whose wildlife and natural resources would be less affected, if at all.

As a person who cared for an elderly parent for fifteen years, I understand and respect the concept of PRESERVATION. I wonder what my

001110

Page 3

future life in Angel Fire be like if my senses are shattered by the deafening sounds of jets streaming by. Where will the workers be working if the area becomes deserted? This is not Silicon Valley. What will happen to our wildlife? Our natural resources?

Please now, utilize your planning time to find an alternate place, in a more desolate place. A place is out there. Give human beings the opportunity to preserve, love, and Cherish an area in which they thrive.

Thank you.

Sincerely yours,
Marie A. Solandra

Major Brent Adams
RBTI EIS Prj. Mgr.
HQ ACC/CEVPP
129 Andrews St., Suite 102
Langley AFB, VA 23665-2769

Dear Major Brent Adams:

BR-6 I am writing to request your firm support in opposing the selection of "Alternative D" under the USAF's proposed Realistic Bomber Training Initiative (RBTI) involving low flying B-52s and B-1s (as low as 300'). As one of several proposed southwestern routes, "D" traverses Philmont Scout Ranch in northeastern New Mexico's Colfax County. Philmont, truly a national treasure, is the 137,000 acre backpacking and training facility of the Boy Scouts of America. I do not protest RBTI since it is a valuable program -- my only complaint, is with the proposed route over Philmont.

Several years ago, the USAF ceased its low altitude F-16/F-111 flights over the Ranch as a result of Philmont protests. RBTI's multiple daily flights (up to 16) will create much more severe problems:

a) Program: Philmont is a transient community of 25,000 people with over 3,000 campers in Philmont's back country every day in the summer. Daily, several hundred of them are engaged in spar pole climbing, rock climbing and repelling, and horse back riding. The sudden roaring of jet engines will distract climbers and bolt horses thereby creating injuries (or worse).

b) Environmental: Appreciation and protection of the wilderness are key parts of Philmont's program. RBTI is inconsistent with wilderness preservation. RBTI will have a damaging effect upon both the unique western wildlife and Philmont's herds of cattle, horses, burros, and buffalo. The effect of the unburned portion of jet fuel in the engine exhaust or dumped fuel itself, vaporizing and falling to ground level is as yet unknown, but believed to be anything but beneficial.

c) Safety: The environmental impact study done for the USAF is seriously flawed when it describes Philmont as an "uninhabited" grassland. The smaller portion of Philmont's acreage is prairie. Most of Philmont is mountainous with many peaks in the 10,000 to 12,444' range. Philmont has a tremendous fuel load of dead trees in its forests, and is in the midst of a long term drought. Open fire bans are in effect now. A crashing bomber will create an epic fire of Yellowstone proportions. B-1s do not have enviable safety records. The nature of the flights (weaving around mountain peaks and facing violent weather, including frequent, low-level wind shears) dramatically increases the chance of a crash. Unfortunately, Philmont does not have a well-developed highway system for evacuations in case of massive forest fires.

001111

You or a member of your staff may wish to contact Gregg Dodd, Chief of Staff for Congressman Ed Pease of Indiana, who can provide additional information.

For the above reasons, we seek your help in advocating the selection of a different RBTI route, preferably one that is over a more sparsely populated, less environmentally sensitive area.

Philmont is the largest and most famous Scout camp in the world. It is a national resource that has positively impacted the lives of hundred of thousands of our nation's youth for more than sixty years. It deserves and demands our protection. There is too much at stake to allow RBTI to overfly Philmont. Please act now – final route determination starts in June. Thank you for helping to see that alternative D is not selected.

Sincerely,

Harold G. Hodges & Debbi L. Hodges

Richardson, TX

Dear Major Adams:

BR-6 While I am sure that you will recognize the following paragraphs as that of a form letter, I must tell you that I agree with their content and implore you to consider the detrimental effects of the RBTI program and the chosen site of the Philmont Scout Ranch. I am an Alumunus of the Ranch, as is my oldest son, Ian. I would be very sorry to hear of any calamity that might befall any of the scouts using this ranch or to any of its pristine wilderness areas because of the lack of foresight on the part of our military. Please do what you can to make sure that another, more appropriate site is chosen for this exercise, if it is deemed reasonable at all to conduct it.

Thanks very much,

Paul Meadows, MS

La Canada Flintridge, California

HEART O'TEXAS COUNCIL
BOY SCOUTS OF AMERICA

001114

Council No. 662 • Waco, TX

June 17, 1999

Major Brent Adams
RBTI EIS Project Manager
HQ ACC/CEVPP
129 Andrews Street Suite 102
Langley AFB, VA 23665-2769

Dear Major Adams:

BR-6

I am writing to request your firm support in opposing the selection of Alternative D under the U.S. Air Force's proposed Realistic Bomber Training Initiative (RBTI). The Air Force is seeking to establish a new training route for low-level B-1 and B-52 bomber flights from bases in Texas and Louisiana. One of the proposed routes, Alternative D, traverses Philmont Scout Ranch in northeastern New Mexico's Colfax County.

Philmont is a 137,000-acre mountain backpacking and high adventure facility of the Boy Scouts of America. Each year, thousands of Scouts and their adult leaders from across the nation participate in two-week wilderness backpacking trips in the mountains of Philmont. Many of them also camp and work on conservation projects in the adjacent Valle Vidal Wilderness of the Carson National Forest.

The Air Force's proposed Alternative D will establish a military training route directly over most of Philmont. More than 2600 flights each year, some as low as 300 feet above ground level, are proposed for the segment over Philmont. As a former Philmont staff member, I have serious concerns about the impact of the Air Force's proposal on the health and safety of Scouts attending Philmont and the potential effects of daily low-level flights on the ranch itself.

On any given day in the summer, as many as **5,000** Scouts and Scouters will be hiking and camping in Philmont's backcountry. Each day, several hundred of them will be engaged in activities such as rock climbing and rappelling, spar pole climbing, and mountain horseback rides. The sudden roar of jet engines has a high likelihood of distracting an inexperienced climber or causing a horse to bolt on a narrow mountain trail with resulting serious injury (or worse).

Appreciation and protection of the wilderness and our natural resources is a key part of the Philmont program. Scouts from around the world have a unique opportunity to see and experience wildlife in native habitat. Noise and emissions from bombers cannot help but have a damaging effect on the wildlife, as well as on Philmont's herds of buffalo, horses, cattle and burros. The disruptive effects of noisy bomber overflights on Philmont's famous living history programs, in which Scouts experience the lifestyles of the West's mountain men, homesteaders, lumberers and cowboys, are obvious.

Most of Philmont is mountainous with many peaks in the 10,000 to 12,000 range. Philmont has tremendous fuel load of dead trees in its forests and is in the midst of a long-term drought. Unburned jet fuel finding its way to the ground or being dumped in an emergency over

such terrain, with campers using backpacking stoves for cooking, creates the potential for a serious fire that would endanger hundreds of lives. The possibility of a crash, however remote is simply not acceptable for the safety of these Scouts.

For these reason, I seek your help in advocating the selection of a different RBTI route. I ask that you express your opposition to the Secretary of the Air Force and other defense officials who may be involved in this decision. Please act now, as the public comment period ends in June and a final decision will be made this year.

Philmont is the largest and most famous Scout camp in the world. It is a national resource that has positively impacted the lives of hundreds of thousands of our nation's youth for more than sixty years. It deserves and demands our protection. Thank you for helping to see the Alternative D is not selected.

Sincerely,

Jimmy D. Moore
Scout Executive

Philmont, truly a national treasure, is the 137,000 acre backpacking and training facility of the Boy Scouts of America. I do not protest RBTI since it is a valuable program -- my only complaint, as a Philmont alumnus, is with the proposed route over Philmont.

Several years ago, the USAF ceased its low altitude F-15/F-111 flights over the Ranch as a result of Philmont protests. RBTI's multiple daily flights (up to 16) will create much more severe problems:

a) Program: Philmont is a transient community of 25,000 people with over 3,000 campers in Philmont's back country every day in the summer. Daily, several hundred of them are engaged in spar pole climbing, rock climbing and rappelling, and horse back riding. The sudden roaring of jet engines will distract climbers and bolt horses thereby creating injuries (or worse).

b) Environmental: Appreciation and protection of the wilderness are key parts of Philmont's program. RBTI is inconsistent with wilderness preservation. RBTI will have a damaging effect upon both the unique western wildlife and Philmont herds of cattle, horses, burros, and buffalo. The effect of the unburned portion of jet fuel in the engine exhaust or dumped fuel itself, vaporizing and falling to ground level is as yet unknown, but believed to be anything but beneficial.

c) Safety: The environmental impact study done for the USAF is seriously flawed when it describes Philmont as an "uninhabited" grassland. The smaller portion of Philmont's acreage is prairie. Most of Philmont is mountainous with many peaks in the 10,000 to 12,444' range. Philmont has a tremendous fuel load of dead trees in its forests, and is in the midst of a long term drought. Open fire bans are in effect now. A crashing bomber will create an epic fire of Yellowstone proportions. B-1s and B-52s do not have enviable safety records. The nature of the flights (weaving around mountain peaks and facing violent weather, including frequent, low-level wind shears) dramatically increases the chance of a crash. Unfortunately, Philmont does not have a well-developed highway system for evacuations in case of massive forest fires.

For the above reasons, I seek your help in advocating the selection of a different RBTI route, preferably one that is over a more sparsely populated, less environmentally sensitive area. You, or a member of your staff may wish to liaise with Rep. Ed Pease's (Indiana) legislative assistant, Greg Good, who has additional information on RBTI.

There is too much at stake to allow RBTI to overfly Philmont. Please act now -- final route determination starts in June. Thank you for helping to see that alternative D is not selected.

Sincerely,

Scott Weeks

CHAPEL HILL, NC

Major Brent Adams
RBTI EIS Project Manager

TY I feel the Environmental Impact (RBTI) is unfair and unjust.

At 83 I live alone on Terlingua Ranch. Neighbors are a mile or two away. There is nothing like being awakened in the middle of the night that sounds like something is about to land on top of you. no chance of hiding or running somewhere. Where could I possibly go in the dark!

This is not what we need in the peace and quiet of the desert. Like the place rattling to pieces. Dishes rattling in the cabinets. What is going on! What a racket! I hope the Good Lord takes me home before I have to experience this kind of thing.

There is no need for anyone to live with the fear of crashes - day or night - property damages - wrecks. A man was killed by a bomber flying over him on the main highway.

Have a heart. Let us live in peace and quiet. There are more people out here than only one realizes. I thank God we live in America.

Sincerely

Ruth Bell

Major Brent Adams, RBTI EIS Project Manager
HQ ACC/CEVPP
129 Andrews Street, Suite 102
Langley AFB, VA 23665-2769

Major Adams:

We feel that the Environmental Impact Statement (EIS), Draft Stage, of the Realistic Bomber Training Initiative (RBTI), is unfair and unjust. Neither we nor anyone we know has ever been approached by representatives of the USAF and asked how we felt about low level training maneuvers being performed by high performance war machines over our heads on our private property. Neither were we ever asked for permission for these same machines to enter our property, which they have done repeatedly, to the detriment of our lifestyle and our quality of life.

BR-5 **BR-7**

We and most of the other residents of this and other rural areas choose to live here for the peace and quiet of the natural environment found in places like the Big Bend area of West Texas. This component of our lifestyle is totally shattered every time one of these planes makes a run through our skies. Having the quiet shattered by the rumble of a low flying jet in the daytime is one thing, but to be rudely awakened in the middle of the night by terrifying noises as these jets fly over our homes at low altitudes can be truly frightening. There is no warning, one minute you're sleeping soundly, then the next minute it sounds like the world is coming apart around you. Maybe the Air Force should fund a study to discover how many innocent civilians have died of heart attacks when surprised by one of these low level flights.

AO-1 We also question the findings that the exhaust emissions of these aircraft pose no pollution problem. I ask, has the Air Force actually tested the exhaust emissions of a B-52 flying at 100 feet and what portion of those emissions pollute the land over which that plane flies?

So, in response to the desire of the USAF to increase their training areas and number of flights over private land in West Texas and other areas, we would like to request that not only should any increased activities not be allowed but that existing flights and training routes for low level activity over private property be discontinued.

Sincerely,

James Hines Barbara Hines

Trip Jones

Dallas, TX

Major Brent Adams
RBTI EIS Projects Manager
HQ ACC / CEVPP
129 Andrews St, Suite 102
Langley AFB, VA 23665-2769

Dear Major Adams:

BR-6 *I just read of your plans to fly jets in 300' test patterns over Philmont Scout Ranch, so-called "Alternative D." Anyone writing a proper EIS would bother to do some research on Scouting's most sought-after and most utilized outdoor wilderness camping experience. Philmont has a history all unto it's own, and Scouts wearing the red jacket with the distinctive Philmont Bull represents usually 50 miles of hiking during a summer with a designated amount of conservation projects during the expedition.*

Doesn't 5000 persons per day using the Philmont, traversed by RBTI, Route D, who will be camping and living directly under the flight path mean anything? Need I mention the guarantee of 117 decibels caused by B-52's at 300 feet? How about the jet fuel jettisoned and open fires waiting to spark a fire in a forest normally overtaxed by drought conditions?

The Boy Scouts of America do not upkeep and actively maintain 137,000 acres of this mountain backpacking facility where thousands of adults and boys from across the nation wait years to challenge the trails (waiting list of 2-3 years) to see it ruined by a misguided bomber flight path and daily series of practice runs.

I haven't mentioned the endangered species impacted, such as bald eagle, peregrine falcon and Mexican spotted owl. How about the possibility of a "Class A Mishap" (calculated by the Air Force at one every 15 years) which could guarantee danger to Scouts and probably start an out-of-control fire which would endanger the rest camping there.

PLEASE ACT NOW AND ELIMINATE PHILMONT AS A TRAINING SITE FOR B-1 AND B-52 CREWS FROM ANDREWS A.F.B.

Thank you! ------Sincerely Yours, Trip Jones, Philmont attendee 1966 & 1968, Asst. Scoutmaster, Troop 80

Langley AFB, VA 23665 – 2769

Dear Major Adams,

BR-6 By now, I hope you have heard from many thousands of Scouters interested in preserving the tranquillity of Philmont Scout Ranch.

As a Father, Scout Leader and American patriot, I would like to ask you to find an alternative to the low-level missions over Philmont. The property is irreplaceable and invaluable to the lives of thousands of Scouts throughout its existence.

Your support will be greatly appreciated.

With sincere interest,

Chuck Bentley

TEN POINTS FOR OPPOSITION TO RBTI ALTERNATIVE D
(OVER PHILMONT)

001120

The EIS (Environmental Impact Statement) incorrectly concludes that very few population centers are affected. On any given day in the summer months, over 5,000 people will be living and camping directly under the flight path at Philmont.

Safety of horseback riders will be endangered. Philmont provides trail rides and pack trips for 7500 to 9500 mostly inexperienced riders each summer on steep and narrow mountain trails. As many as 165 inexperienced people may be on horseback on the ranch at various times during the day. The startle effect of a high-decibel low-level flight could easily cause one or more horses to spook and bolt with a novice rider aboard. With the number of flights proposed, it will be only a matter of time before Philmont experiences a serious injury or death due to a rider being thrown from or dragged by a startled horse.

Increased noise levels will interfere with staff trying to provide safety instruction to rock climbers, spar pole climbers, and rifle range shooters. The noise level of a B-52 at 300 feet is 117 decibels. Staff trying to teach safety techniques required in climbing rock faces or firing black powder rifles should not have to compete with such noise interference.

The high noise levels generated by B-1 and B-52 bombers flying only a few hundred feet above ground level are greater than being near a chain saw or a diesel train. Campers at Philmont will be exposed to such noise levels for more than six hours during a typical 12-day stay based on projected flight operations. This is not a true wilderness experience.

The possibility of a crash is very real. The EIS estimates the chances of a Class A mishap at one every 15 years for a B-1 on the training route that would include Philmont. Aside from the real risk to Scouts who might be in the path of an errant bomber, a crash on Philmont would have the potential of starting a serious forest fire that could devastate the ranch.

The EIS fails to mention any impact of flyovers on Philmont's two National Historic sites, The Kit Carson/Maxwell Abreu houses at Rayado and the Villa Philmonte.

The flights can be expected to have serious impacts on Philmont's wildlife and will overfly the habitats of at least three endangered species, the bald eagle, peregrine falcon, and Mexican spotted owl. The U.S. Fish and Wildlife Service has concluded that overflights at less than 1,000 feet will significantly impact these species.

No one has investigated the cumulative effects of the planned noise levels and vibrations on the hundreds of abandoned and the two active mines on Philmont.

No plane burns all of its fuel. At higher altitudes, unburned fuel dissipates in the atmosphere. At lower altitudes, one must expect that some unburned fuel will find its way to the ground and streams on Philmont. The effects of a plane in trouble at low altitude dumping fuel over Philmont with numerous cook stoves and campfires are easily imagined.

Philmont is a national treasure and provides a wilderness camping experience for thousands of Scouts, America s future leaders, every year. That experience should be preserved since alternative training sites exist elsewhere which do not jeopardize the program experience offered by Philmont and the safety of thousands of young people participating in it each year.

001121

Dear Major Brent Adams,

BR-6 I am writing to request your firm support in opposing the selection of "Alternative D" under the USAF's proposed Realistic Bomber Training Initiative (RBTI) involving low flying B-52s and B-1s (as low as 300'). As one of several proposed southwestern routes, "D" traverses Philmont Scout Ranch in northeastern New Mexico's Colfax County. Philmont, truly a national treasure, is the 137,000 acre backpacking and training facility of the Boy Scouts of America. I do not protest RBTI since it is a valuable program – my only complaint, as a Philmont alumnus, is with the proposed route over Philmont.

Several years ago, the USAF ceased its low altitude F-16/F-111 flights over the Ranch as a result of Philmont protests. RBTI's multiple daily flights (up to 16) will create much more severe problems:

a) Program: Philmont is a transient community of 25,000 people with over 3,000 campers in Philmont's back country every day in the summer. Daily, several hundred of them are engaged in spar pole climbing, rock climbing and rapelling, and horse back riding. The sudden roaring of jet engines will distract climbers and bolt horses thereby creating injuries (or worse).

b) Environmental: Appreciation and protection of the wilderness are key parts of Philmont's program. RBTI is inconsistent with wilderness preservation. RBTI will have a damaging effect upon both the unique western wildlife and Philmont herds of cattle, horses, burros, and buffalo. The effect of the unburned portion of jet fuel in the engine exhaust or dumped fuel itself, vaporizing and falling to ground level is as yet unknown, but believed to be anything but beneficial.

c) Safety: The environmental impact study done for the USAF is seriously flawed when it describes Philmont as an "uninhabited" grassland. The smaller portion of Philmont's acreage is prairie. Most of Philmont is mountainous with many peaks in the 10,000 to 12,444' range. Philmont has a tremendous fuel load of dead trees in its forests, and is in the midst of a long term drought. Open fire bans are in effect now. A crashing bomber will create an epic fire of Yellowstone proportions. B-1s and B-52s do not have enviable safety records. The nature of the flights (weaving around mountain peaks and facing violent weather, including frequent, low-level wind shears) dramatically increases the chance of a crash. Unfortunately, Philmont does not have a well-developed highway system for evacuations in case of massive forest fires.

There is too much at stake to allow RBTI to overfly Philmont. Please act now -- final route determination starts in June. Thank you for helping to see that alternative D is not selected.

Sincerely,

RICK HOLMAN
COPPELL, TX

TY To
Major Brent Adams
I am in much sympathy with the Air Force in this controversy with some organizations about AF training program.
Have lived near or in Alpine since 1982. Know of no extraordinary noise or pollution made by military aircraft since that time.
The complainers are (I suspect) are moved more by anti military attitudes. Our county judge Mrs Val Beard voices displeasure with the Air Force flying over her ranch. She could be in process of changing her mind.
Attended one of the anti-Air Force group meetings. A staff member of Henry Bonilla's organization was there to hear the complainers. They mainly wanted govt. funds to lobby & fight their cause. Most of their objections were grossly exagerated or non-existant. Wrote Mr. Bonilla of proceedings & that the great majority in attendance were not supporters of the Republican cause.
The military is one

001122

of the few (or only) Federal Depts. that works. After 2000 I hope the budget is available to put the military ~~to~~ in very high degree of efficiency as once it was. Vast superiority in technology, morale etc is absolute must for the U.S. to achieve & maintain global stability.

Enclose an item from a Sierra club. This is one of several groups which use the legalities of EPA, EDS & other govt agencies to hamstring any legislation or action that obstructs their whims or fantasies. These acts (EPA et al) could conceivably be used to grind to a halt any military action or offensive against ~~an~~ the enemy. Over Kill & misdirected legislation — or ~~fatuous~~ fatuous indication can destroy us internally.

Regard to Mrs Cook the lady who watches EPA. I think she has it together.

My prejudice is exposed. It was intential. Press on.

Sincerely Robert Posey

BIG BEND REGIONAL SIERRA CLUB
NEWSLETTER

Issue 35 **June 14, 1999**

AGENCIES CANCEL JUNE 23 MEETING

TY The Big Bend Regional Sierra Club was notified by John Gillen of the Texas Natural Resource Conservation Commission that a public meeting in Alpine, scheduled for June 23, 1999, has been postponed to a yet unspecified date. Co-sponsors of the meeting along with the TNRCC are the Environmental Protection Agency—Region 6, (EPA), and the National Park Service (NPS). The reason given was vague and had to do with incomplete plans on the BRAVO tracer study. The TNRCC did not care to come out to Alpine until the final details are worked out. Our guess is that it is not yet clear whether the North Central power plants of Texas Utilities will allow tracers to be put directly into their stacks. We will let you know when a new date has been set. The study itself will be underway in July.

BBRSC SENDS SHARP LETTER TO AIR FORCE

The Big Bend Regional Sierra Club responded to the Air Force's Environmental Impact Statement (EIS) concerning the Realistic Bomber Training Initiative with a sharply worded letter criticizing the process followed in creating the EIS, the presentation of the report, and the proposals contained in it.

The Process. The letter, drafted by Don Dowdey, chair of the Air Quality Committee, and signed by him and Fran Sage, Chair, pointed out that the EIS ignored the existing air quality problems in the Big Bend, gave little evidence of consultation with Trans-Pecos or Texas environmentalists or such agencies as Region-6 of the EPA, the National Park Service, the Texas Natural Resource Conservation Commission, and the Texas Parks and Wildlife Department. The BBRSC believes the public hearing process was used as a public relations exercise rather than a fact-finding attempt, as evidenced by the open house format in Alpine, and the statement of an Air Force official, reported in the Odessa American, that the Air Force will do what it thinks best for the pilot training regardless of negative comments.

The Presentation. The BBRSC also pointed out that the EIS consisted of vague maps, difficult to understand charts, and other inadequacies making it virtually impossible to understand the cumulative effects of the proposed flyovers.

The Proposals. The proposals fail to address Air Quality in Big Bend National Park, which is described by the Park Service as having "the dirtiest air among all western parks", ignore Guadalupe National Park, which is upwind of much of the proposed flight path, fail to mention wildlife restoration efforts in Black Gap and Elephant Mountain, and ignore ecotourism issues such as the potential problems of low-flying aircraft crossing roads and the loss of the quiet and clean air. The EIS contains no provisions for continuing monitoring or dialogue on environmental issues. Given the Air Force's innovative programs to do this in such areas as Nellis Air Force Base in Nevada and the Goldwater Range in Arizona, this failure is most disappointing. It tends to underscore the impression throughout the EIS that the opinions and experience of citizens in the Big Bend have not been, and will not be, important to the decision-making process.

LEGISLATOR VISITS WITH SIERRA CLUB MEMBERS

Representative Lon Burnam, Fort Worth, addressed 20 Sierra Club members Sunday, June 13, 1999, at a picnic lunch at Balmorhea State Park. Burnam gave his assessment of environmental legislation considered during the last session of the legislature. He said that the legislature was not generally supportive of environmental legislation and the main task was to prevent bad bills from being passed.

001122

Continued from page one

One of his examples was the radioactive waste legislation (HB1171). The original bill filed by Rep. Warren Chisum, Chair, House Environmental Regulation Committee, was not a good bill, but over time, as Chisum worked with the environmental community and heard from the public, the bill became vastly improved. Chisum has never been considered supportive of the environmental point of view. But as he worked on the bill, he became educated to the issues. The bill was altered, however, after it left Chisum's committee and became a disaster as it went through the Senate. The final version was unacceptable to Chisum, especially as it did not mandate that the state hold the license. Chisum, with the assistance of Speaker Pete Laney, was able to keep the bill from passing. Burnam used Chisum as an example of working on educating legislators on such issues as radioactive waste. Burnam gave credit to all the calls and contacts from the communities in helping to influence Chisum.

Burnam explained that there may be an interim study on radioactive waste legislation and there will be a Sunset Review of ~~several environmental agencies, including the General Land Board,~~ the Texas Parks and Wildlife Department, and the Texas Natural Resource Conservation Commission, which will soon include the functions of the Low-Level Radioactive Waste Disposal Authority. Burnam urged the Sierra Club members to work with their representative, Pete Gallego, to keep abreast of interim and Sunset developments. He said it was important to keep open lines of communication with one's representative.

There were 20 members present, including Teresa Kerley of Odessa who is forming a Sierra Club Group there, and Don Dowdey and Marilyn Brady who knew Rep. Burnam years ago in Ft. Worth. Hal Flanders also exchanged reminiscences from a former occasion when he had met Burnam.

001123

TY Major Brent Adams,

I am writing to express my Concern about the low flying aircraft we hear will be increasing over the next five months or year. Please leave Sup. A alone to keep the aircraft out of our farming/Ranching Community. We have a lot of livestock in this whole Area and have had the night mare of having to regd over 600 head of cattle that had broken out of 5 barb fences due to Aircraft + Jet works in previous years

001123

Not only is it expensive, but after spending money on Cowboys, Horses, Trucks + Trailers to gather the animals from as far as 30 miles, the cattle were dehydrated + had lost weight, for post.

Thank you for your Time

Helen Fossum
Agri West Farms, LLC

Pecos, Tx

From: Mickey George JUNE 15, 1999
Ruby, TX

001124

Dear Major Adams,

I would like to give you my input into the concern of my friends and neighbors about your proposed training flight routes.

Obviously the environmental and economic impact of such a change will continue to be debated — I'd like to talk about the human impact. I have friends that will be directly impacted by your decision - plus I manage property in this area. As you may know noise pollution and the continuous sounds of the urban areas has affected the quality of life for many city dwellers. The only option is an escape to the country. An escape in order to seek out those isolated regions of the country that offer some peace of mind and peace of environment. This change in training routes will shatter this hope for many individuals.

Also, you say that this change will be cost effective for the military due to the closer routes to the base of origin. This is absurd! Training should replicate the conditions of actual bombing etc. missions. You may have statistics that prove otherwise but I'm not aware of many "real life" bombing missions that are anything other than long range in reality. The further the bombers have to go the more realistic the training exercise. Please don't let $ get in the way of excellence in our military training.

PD-63

In good faith → Mickey George

Major Brent Adams
RBTI EIS Prj. Mgr.
HQ ACC/CEVPP
129 Andrews Street, STE 102
Langley AFB, VA 23665-2769

Dear Major Adams,

BR-6

I wish to register my strong opposition to the selection of "Alternative D" under the USAF's proposed Realistic Bomber Training Initiative (RBTI) involving low flying B-52s and B-1s (as low as 300') and ask you that add your firm support in opposing this proposal. As one of several proposed southwestern routes, "D" traverses Philmont Scout Ranch in northeastern New Mexico's Colfax County. Philmont, truly a national treasure, is the 137,000 acre backpacking and training facility of the Boy Scouts of America.

The Boy Scouts of America should be commended for the extensive opportunities they offer to our nations' young men. They provide positive role models, leadership opportunities and wholesome activities for youths. Many today scoff or make fun of the Scout ideals and activities, but we only need to remind ourselves of Columbine and other similar acts of despair to know that our youths are in desperate need for this type of guidance and values in their lives.

That is why I am so concerned about the proposed RBTI program. The Philmont Scout Ranch is a truly unique experience. It teaches both young men and women skills in cooperation, teamwork, outdoor physical activities, and respect for wildlife and the environment. The Scouts practice "no trace" camping, leaving no trash or other residual impact on this pristine wilderness when they leave. The proposed RBTI overflights are inconsistent with this use and will destroy the near spiritual nature of the Philmont experience. Truly, I remember over the past several decades, Philmont alumni speak of their experience in reverential terms.

Philmont is a transient community of 25,000 people with over 3,000 campers in Philmont's back country every day in the summer. Daily, several hundred of them are engaged in spar pole climbing, rock climbing and rapelling, and horse back riding. The sudden roaring of jet engines will distract climbers and bolt horses thereby creating injuries (or worse).

The environmental impact study done for the USAF is seriously flawed when it describes Philmont as an "uninhabited" grassland. The smaller portion of

001126

Philmont's acreage is prairie. Most of Philmont is mountainous with many peaks in the 10,000 to 12,444' range. Philmont has a tremendous fuel load of dead trees in its forests, and is in the midst of a long term drought. Open fire bans are in effect now. A crashing bomber will create an epic fire of Yellowstone proportions. B-1s and B-52s do not have enviable safety records. The nature of the flights (weaving around mountain peaks and facing violent weather, including frequent, low-level wind shears) dramatically increases the chance of a crash. Unfortunately, Philmont does not have a well-developed highway system for evacuations in case of massive forest fires.

Appreciation and protection of the wilderness are key parts of Philmont's program. RBTI is inconsistent with wilderness preservation. RBTI will have a damaging effect upon both the unique western wildlife and Philmont herds of cattle, horses, burros, and buffalo. The effect of the unburned portion of jet fuel in the engine exhaust or dumped fuel itself, vaporizing and falling to ground level is as yet unknown, but believed to be anything but beneficial.

Several years ago, the USAF ceased its low altitude F-16/F-111 flights over the Ranch as a result of Philmont protests. RBTI's multiple daily flights (up to 16) will create much more severe problems:

For the above reasons, I seek your help in advocating the selection of a different RBTI route, preferably one that is over a more sparsely populated, less environmentally sensitive area. You, or a member of your staff may wish to liaise with Rep. Ed Pease's (Indiana) legislative assistant, Greg Good, who has additional information on RBTI.

There is too much at stake to allow RBTI to overfly Philmont. Please act now -- final route determination starts in June. Thank you for helping to see that alternative D is not selected.

Sincerely yours,

Michael Riewe

Dear Major Adams:

I am opposed to the Air Force's proposed RBTI known as Lancer – Option B in the DEIS. My concern(s) about the proposal and the DEIS are as follows:

BR-3 I own 55,000 acres in Kent Co. and am concerned about property value decrease and the effect the noise will have on my cattle and hunting enterprise. If noise stress on livestock affects my production efficiency, it could very

BR-4 well put me out of business. If hunters will no longer renew their leases with me, it will be a great economic loss. Several of my current hunting leases have heard of the current RBTI proposal and are keeping abreast of the situation. I am a third generation rancher. My grandfather was one of the original settlers in Kent Co & received one of the 1st land grants in Kent Co. Ranching is a very fragile business enterprise & is tough even in good times. The military needs to train on federal land, not ours.

Major Brent Adams
RBTI EIS Project Manager
HQ ACC/CEVPP
129 Andrews Street
Suite 102
Langely AFB, VA 23665-2769

Dear Major Adams:

I attended both the Public Scoping Meeting for the RBTI held February 6, 1998 and the RBTI Public Hearing held March 8, 1999 in Big Lake, Texas. During the Public Scoping meeting, and in a letter to Major John Boyle, Dyess AFB, I expressed concern over what economic impact the potentially restricted airspace would be to the area. In the draft RBTI EIS, I only found cloud seeding mentioned in passing on page 4-37. No mention of any economic impact on the area except that it would benefit from the construction and maintenance of the Electronic Scoring Sites. No mention of anything of the concerns expressed in the enclosed letters from the Irion County Water Conservation District or the Association.

BR-2

Before and after the formal hearing the personnel took extra time to learn something of what the Association does and why the expansion of the TEXON MOA and potential restricted airspace would be detrimental to cloud seeding in this area. Col. Lynn Wheeless and Dwight Williams were particularly attentive to concerns expressed by my self and Aldis Strautins, Meteorologist/Program Director for the Association.

For Association background please refer to the enclosed letters. The FY 1999 budget is $654,540 which includes both local and State funding. Since 1996, the Association has gone from being entirely dependent on an outside contractor to owning the necessary equipment and hiring personnel to conduct an operational program. Equipment includes a radar which has been equipped with TITAN for cloud analysis, one Piper Aztec for both top and bottom seeding, and two Piper Comanche aircraft for base seeding. Future plans include the purchase on another aircraft for top seeding. Current staff includes a meteorologist/program manager and two full time and one part time pilots.

Figures from the U.S. Dept. of Agriculture Consolidated Farm Services office in Big Lake indicate that $621,839 was paid for Producers Cost-Share Programs. Producers match this amount and normally pay more for the programs. Even a straight 50% cost share would mean that $1.25 million was added to the area economy. These monies along with the Association budget reflect almost $2 million spent in the region.

AO-71 Agriculture and the oil and gas industry are the economic basis for the region. As stated in the letter to Major Boyle, a modest increase in rainfall has great economic impact. Limiting operations of the

001128

AO-71 Association with potentially restricted airspace would have great economic impact on the area and region.

I appreciate the fact that Col Lynn Wheeless and Lt Col Dale Garrett from Langley AFB, Maj. Greg Myers and Dwight Williams from Dyess AFB, and Charles Dobson from Barksdale AFB took time and were willing to visit with Association members, tour the facilities in San Angelo, and learn first hand what the operational program does and how it impacts the area. After the meeting, I felt that there was understanding of the concerns, a spirit of cooperation, and that if the expansion of the TEXON MOA has to be a reality, that there would be cooperation between the Air Force and the Association so that both would benefit.

Military preparedness is essential for national security. Continued economic growth for the area is also essential. Please take in consideration what the potential restricted airspace of the expanded TEXON MOA would do to the weather modification program and the effect on area economy.

Dear Major Boyle:

I attended the Public Scoping Meeting for the Realistic Bomber Training Initiative held February 6, 1998 in Big Lake, Texas. The Air Force personnel were very attentive and patient in explaining why the various proposals were being considered. I appreciate that practice is necessary to be ready to cope with whatever situation may arise and agree fully. I would like to comment on the RBTI Proposed Alternative C - Texon.

First a little background, in March 1996 seven local groundwater district signed an interlocal agreement forming the West Texas Weather Modification Association (WTWMA). This Association was formed for the purpose of rainfall enhancement through cloud seeding within the area. The seven groundwater districts are political subdivisions and contribute on a per acre assessment. Other entities which participate financially with the Association are the University of Texas System, City of San Angelo, and the State of Texas.

A permit for weather modification was issued from the State of Texas with a target area including Coke, Crockett, Glasscock, Irion, Midland, Reagan, Schleicher, Sterling, Sutton, Tom Green, and Upton Counties and an operational area including a 30 mile buffer in Andrews, Concho, Crane, Ector, Edwards, Howard, Kimble, Martin, Menard, Mitchell, Nolan, Pecos, Runnels, Taylor, Terrill, and Val Verde Counties. In 1996 the actual target area included Crockett, Glasscock, Irion, Reagan, Schleicher, Sterling, Sutton, and Upton Counties. The target area for 1998 added part of Tom Green County and removed Upton County.

Cloud seeding operations are conducted from May through September and include either base seeding at approximately 7000' or top seeding at approximately 20,000' on immature thunderstorms. Since cloud conditions (height, reflectivity, base temperature, etc.) are specific before any aircraft are launched, there is no set altitude, time of day or specific days that seeding occurs. It is my understanding that plans are for about 10 sorties a day to be flown between the hours of 9:00 AM and 9-11:00 PM on weekdays. Cloud seeding operations would occur during this same time. Weather systems do not limit themselves to weekends as this would be the only days that there would not be the possibility of sorties being flown. I understand the safety issue of not having two aircraft in the same area at the same time and the reasons behind having restricted areas. If the RBTI Proposed Alternative C - Texon is adopted it would result in the heart of the WTWMA program being off limits for seeding aircraft and split the remaining area into two separate areas.(See enclosed map.)

BR-2

001128

There are currently three other weather modification programs in the state, with more in the planning stages. The Colorado River Municipal Water District (CRMWD) at Big Spring has had a program since 1970, the High Plains Underground Water Conservation District #1 (HPUWCD) in Lubbock implemented a program in 1997, and the South Texas Weather Modification Association (Atascosa, Bee, Frio, Karnes, Live Oak McMullen, and Wilson Counties) also started a program in 1997.

Texas Tech University conducted a study in 1996 which demonstrated that if the rainfall of the High Plains could be augmented by a modest 21%, the 15 county area covered by the HPUWCD would realize an economic gain of about $350 million. This calculates to a return of $700 for each dollar expended of the $500,000 budget.

Using these figures as a basis, and considering that the dollar return may not be as great as the High Plains, a conservative return of $500 per dollar expended by the WTWMA would result in an economic gain of over $300 million. This is the reason that the WTWMA was formed, to help the economy of the region through increased rainfall.

If the RBTI Proposed Alternative C - Texon is implemented, there is a great probability that the WTWMA would have to cease to operate because of conflicts with restricted airspace in the expanded Texon MOA. It is my understanding that the current Texon MOA has posed little interference because of it's limited use. I would therefore respectively request that the RBTI Proposed Alternative C - Texon be not considered because of the existing WTWMA program and the adverse effect on increased economic gain for the region.

Thank you for the opportunity to comment on the RBTI Proposed Alternative C - Texon. If there are further questions or if more information is needed, please contact me at the above address and/or numbers.

Sincerely,

Scott Holland

Major John Boyle
RBTI EIS
% 7 CES/CEV
710 3rd Street
Dyess AFB, TX 76907

Dear Major Boyle:

After our phone conversation of February 6 regarding the Public Scoping Meeting for the Realistic Bomber Training Initiative held in Big Lake, Texas, I would like to submit comments on the RBTI Proposed Alternative C - Texon on behalf of the Board of Directors of the Irion County Water Conservation District.

The Irion County Water Conservation District (ICWCD) was instrumental in the formation of the West Texas Weather Modification Association (WTWMA) in 1996. The idea started with local landowners contacting board members and indicating that since the district was responsible for groundwater and rainfall recharges groundwater, the district should do everything possible to increase the amount of groundwater including cloud seeding. From there the idea grew and six other groundwater districts joined with the ICWCD to form the WTWMA to include the counties of Crockett, Glasscock, Irion, Reagan, Schleicher, Sterling, and Sutton. The University of Texas System, City of San Angelo, and the State of Texas also participate financially with the Association.

Cloud seeding involves aircraft "seeding" clouds with silver iodide either from cloud base or cloud top to enhance natural rainfall. Not every cloud is suitable for seeding, there are specific criteria of height, base temperature, and reflectivity that must be met before any cloud is considered for seeding. Base seeding occurs at about 7,000' and top seeding at about 20,000'. Weather systems determine the number of days and time of day that seeding is feasible. The WTWMA conducts seeding from May through September at the present but is applying for a permit which would allow year around seeding with favorable conditions.

BR-2 The RBTI Proposed Alternative C - Texon would put the entire ICWCD and the heart of the target seeding area of the WTWMA within the Texon MOA. Understanding that it is unsafe for aircraft to

001128

BR-2 operate in the same airspace, first priority would be given to military aircraft in the MOA not allowing the WTWMA aircraft access to seedable clouds. This would put the entire program in jeopardy and especially Irion County. If the program is restricted, especially in Irion County, the District cannot fulfill the desires of it's landowners and taxpayers who want, support, and help finance cloud seeding in the area.

According to a 1996 study done by Texas Tech University, a 21% increase in rainfall on the High Plains would result in a $350 million economic gain for a 15 county area. Irion County also is dependent on agriculture as the economic base. Any economic gain benefits not only the county but the entire region as well, including Goodfellow AFB in San Angelo.

By implementing this alternative, the environmental and economic impact of preventing us from promoting rainfall and enhancing recharge of groundwater would be significant. The Irion County Water Conservation District respectfully requests that the RBTI Proposed Alternative C - Texon not be considered as a viable alternative.

If you have any questions, or if more information is required, please contact me at the above address and/or numbers. I will be glad to provide any additional information.

Sincerely,

Loye Tankersley
Chairman

February 23, 1998

RBTI EIS
c/o 7 CES/CEV
710 3rd Street
Dyess AFB, TX 76907

Dear Sirs/Madam:

On February 6, 1998 representatives of the West Texas Weather Modification Association attended a public meeting in Big Lake, TX on the Realistic Bomber Training Initiative. The people hosting the meeting were informative and attentive to the questions and information about our Weather Modification project. The proposed Texon (Alternative-c) in the RBTI is of special interest to the West Texas Weather Modification Association.

Let us first give some background on our local program other programs in Texas and precipitation enhancement in general. The West Texas Weather Modification Association (WTWMA) started in 1996 when seven groundwater districts concluded that rain enhancement would benefit the local and state water supplies. Each groundwater district is assessed on a per acre basis to financially contribute to the program. The State of Texas, City of San Angelo and the University of Texas are also involved in financial support of the Rain Enhancement Program. Everyone that contributes to this program is a beneficiary from it.

The proposed Texon expansion covers a substantial area within the WTWMA's target area. In fact, the proposed Texon expansion will split the WTWMA's target area into two sections. The WTWMA's target area includes Coke, Crockett, Glasscock, Irion, Midland, Reagan, Schleicher, Sterling, Sutton, Tom Green, and Upton Counties and the operational area includes a 30 mile buffer in Andrews, Concho, Crane, Ector, Edwards, Howard, Kimble, Martin, Menard, Mitchell, Nolan, Pecos, Runnels, Taylor, Terrill, and Val Verde Counties. The Texon proposal will cover Irion, Reagan, Upton, S Sterling, W Tom Green, NW Schleicher, and N Crockett counties.

The WTWMA uses aircraft to disseminate the material used to enhance rainfall. Seeding agent is dispersed from aircraft flying either on or near cloud top or at or near cloudbase. For "on top" seeding, repeated passes through, or just above, the top of the growing convective tower are made to inject the burning AgI flares into the region of supercooled liquid water. The aircraft will typically be operating at an altitude of 18,000 to 22,000 feet above mean sea level but can range from 16,000 feet to 25,000 MSL. For "cloud base" seeding, the aircraft makes repeated passes through the updraft region feeding the growing convective cloud near or some distance below cloud base. Typically the altitude is 2,000 feet to 8,000 feet above ground level but can range from 500 feet to 10,000 feet above ground level. Smoke from the burning, wing-mounted flares is carried by the updraft into the supercooled regions of the storm, where additional ice nuclei are needed to freeze the supercooled water. When seeding with hygroscopic flares, the smoke from the burning, wing-mounted flares is carried into the core region of the cloud where the artificially-introduce condensation nuclei are needed for the growth of raindrops.

001128

The Texon MOA is the area of concern for the West Texas Weather Modification Association. The proposed increase in the Texon MOA will adversely affect the precipitation modification project for West Texas. Let me clarify what these affects will be. To seed the clouds effectively, the timely use of aircraft is necessary. This means if the MOA is closed when a seedable cloud is present or going to be present then we are missing seedable opportunities. Timing is essential! Also if the proposed RBTI Texon area is closed to other air traffic then getting from one side of our project target area to the other side will be inhibited and cost us precious time going around the MOA. Again timing is of great importance. Both of these scenarios would seriously reduce the seedable opportunities and in turn reduce the ability to augment the increase in water. This has ramifications from the local level all the way to the State level. Reductions in the amount of water the farmers and ranchers have to work with are more obvious. Also, Reduction in the recharge amount for the aquifers for the groundwater districts involved therefore a decrease for that whole population in said water district. Finally, it could reduce the replenishment of surface water, which involves the State of Texas. The State of Texas owns all the surface water in Texas. The proposed Texon MOA expansion encompasses a large area of water shed for three important surface water reservoirs: O. C. Fisher Reservoir, Twin Buttes Reservoir, and Lake Nasworthy. The reduction in water would have an adverse effect on both the local and state economies.

The proposed Texon MOA expansion (RBTI Alternative-C) will adversely affect the local residents, local counties, West Texas groundwater districts, the City of San Angelo and the State of Texas.

We would like to thank you for the opportunity to comment on the Realistic Bomber Training Initiative.

Sincerely,

Mr. Dale Bates	Mr. Gary Foster	Mr. Scott Holland

Re: RBTI DEIS Comments

Dear Major Adams:

I enclose the comments on the draft environmental impact statement for the Realistic Bomber Training Initiative that we are submitting on behalf of McCoy Land and Cattle Company, Emmett F. McCoy, Brian F. McCoy, Kaare J. Remme, Bill Goddard, L.R. French, Jr., an Marcia Fuller French.

Please make these comments and the referenced documents and exhibits, including the figures presented in the comments and exhibits, part of the administrative record in this case. As indicated in the comments, if you need copies of any of the referenced material or additional information, please let us know.

Thank you for the opportunity to provide these comments on the RBTI DEIS.

Sincerely,

HOLLAND & HART LLP

INTRODUCTION

A. The Commenters.

McCoy Land & Cattle Company, Emmett F. McCoy, Brian F. McCoy, Kaare J. Remme, Bill Goddard, L.R. French, Jr., and Marcia Fuller French ("Commenters"), by and through their undersigned counsel, hereby submit comments concerning the Draft Environmental Impact Statement ("DEIS") for the Realistic Bomber Training Initiative ("RBTI"), dated March 1999.

The Commenters either own ranching properties and residences that will be directly overflown and invaded by the proposed Air Force activities, or they live, own businesses, and recreate within the region to be adversely affected by the Air Force actions. *See* Figure 1 on the following page for a general location of some of these properties. Also, certain of the Commenters are members of regional and other associations dedicated to the preservation and protection of the Texas ranching culture and heritage.

Emmett F. McCoy, Brian F. McCoy, and Kaare J. Remme are residents of San Marcos, Texas and owners of the McCoy Land & Cattle Company. These individuals frequently visit, stay, work, and recreate on the land they own in Jeff Davis, Pecos, and Reeves Counties, Texas, and they frequently travel to and from the property by aircraft. These individuals also frequently enjoy the scenic beauty, bountiful wildlife and environmental resources, and tranquility of this unique country.

Bill Goddard is the owner of the Goddard Chinati Peak Ranch located in Presidio County, Texas. The ranch is engaged in a cattle operation and its employees rotate the cattle throughout the property. Wildlife is abundant on this scenic ranch and is a major source of enjoyment by Mr. Goddard and his family and invitees for both viewing and hunting. Mr. Goddard is presently investigating the feasibility of commercial hunting and tourism operations. Mr. Goddard will be adversely affected by the Air Force's RBTI expansion including, among other things, IR-178, which passes directly over his land and through his airspace. The RBTI will directly interfere with his use, enjoyment, employees' quality of life and safety, and economic operations associated with the land.

L.R. French, Jr. and Marcia Fuller French (Mrs. L.R. French, Jr.) own the Petan Ranch in Presidio County, Texas and the Rough Creek Ranch in Scurry and Kent Counties, Texas. Mr. and Mrs. French spend a substantial amount of time on the properties and operate commercial cattle and hunting operations. Mr. and Mrs. French frequently travel to the property using general aviation aircraft. Mr. and Mrs. French, their family, and invitees frequently enjoy the abundant wildlife, natural resources, peace, beauty, and tranquillity associated with the properties. Mr. and Mrs. French will be adversely affected by the Air Force's RBTI expansion, including IR-178 which passes directly over their Presidio County land and through their airspace, and the Lancer MOA which overlies all of the Scurry and Kent County land. The RBTI will directly interfere with their use, enjoyment, and economic operations associated with these properties.

001129

The Commenters specifically request that all of these comments and exhibits be included as part of the administrative record in this matter. *See County of Suffolk v. Secretary of Interior*, 562 F.2d 1368, 1384 & n.9 (2d Cir. 1977) (addressing scope of NEPA administrative record), *cert. denied*, 437 U.S. 1064 (1978); *Silva v. Lynn*, 482 F.2d 1282, 1283 (1st Cir. 1973) (same); *see also Thompson v. United States Dep't of Labor*, 885 F.2d 551, 555 (9th Cir. 1989) (administrative record consists of all documents and materials directly or indirectly considered by agency and includes evidence contrary to agency's position). The Commenters further request that all documents, articles, and reports cited in these comments be included as part of the administrative record in this case. If the Air Force is unable to locate the documents referenced by the Commenters that are not included as Exhibits to these comments, copies may be obtained by contacting the Commenters' counsel at the address listed at the end of these comments.

B. Summary.

The RBTI DEIS outlines the proposals by the Air Force to develop a large-scale bomber training area, threat emitter sites, electronic scoring sites, and military airspace changes for the Air Force in West Texas and New Mexico. Importantly, these proposals are presented as related to and cumulative with the Air Force's action described in the Final Environmental Assessment covering "Proposed Airspace Modifications to Support Units at Holloman Air Force Base, NM" dated June 9, 1997, related "Finding of No Significant Impact for Airspace Modifications to Support Units at Holloman Air Force Base, New Mexico," signed June 12, 1997, and subsequent April 1998 Final EIS on the Beddown of Additional German Air Force Units at Holloman Air Force Base, and the related May 1994 ROD for that FEIS.

The RBTI DEIS lacks the required objective and detailed analysis of environmental impacts that is mandated for an EIS. Because of these shortcomings, the DEIS does not satisfy NEPA's requirements and it cannot support the proposals of the Air Force and cooperating agencies to proceed with the actions outlined to implement the RBTI DEIS.

001129

COMMENTS

PD-2 **I. The Air Force's Statement of Need Based on the Present Location of Bomber Aircraft and Training Facilities Fails to Recognize the Underlying Purpose of the Proposed Action.**

The purpose and need section of the DEIS provides that B-1 aircrews at Dyess AFB and B-52 aircrews at Barksdale AFB need to develop new training airspace because existing training areas at La Junta, Colorado and Harrison, Arkansas at too remote from those Air Force bases and lack "realistic assets." DEIS, 1-7. In thus defining the need for the large-scale expansion of new military training airspace to support existing units stationed at Dyess AFB and Barksdale AFB, the Air Force fails to consider the potential to relocate bomber aircrews to other Air Force bases closer to those existing areas.

AO-72 **II. The DEIS' Flawed Baseline Needs to Incorporate the Correct Baseline Number of Flights.**

The baseline for the RBTI DEIS assumes the submission to and approval by the FAA of a modified IR-102/141 military training route complex for low-level, high-speed fighter and bomber traffic. However, the Air Force has not yet implemented nor has the FAA approved that route complex. Thus, the baseline for much of the RBTI DEIS where the RBTI proposal overlaps with IR-102/141 incorporates an artificially high baseline masking the actual significant change and environmental effects brought about by the RBTI proposals.

The DEIS's offhand statement that if the IR-102/141 changes are not approved, then "total sortie-operations for Alternatives B and C would be reduced likewise," DEIS at 2-17, is insufficient to address this deficiency in the baseline factual situation offered as the status quo in the DEIS. Moreover, this significant change in the baseline attributable to the IR-102/141 non-implementation also undercuts the cumulative effects discussion of the DEIS. That discussion then incorporates an artificially high baseline, as well as improperly excluding the aggregate effect of past activities from its analysis. *See infra* Section IV.

GE-10 **III. The DEIS Contains an Inadequate Discussion of Key Resources in the Affected Environment and Fails to Fully Evaluate Impacts of the Proposals.**

A. NEPA Requires A "Hard Look" at Environmental Impacts.

NEPA requires that an agency candidly disclose in its EIS the adverse environmental effects of its proposed actions. 42 U.S.C. § 4332(A)-(C). Federal agencies must ensure the scientific integrity of the EIS by considering appropriate studies and data, and identifying any methodologies used. 40 C.F.R. § 1502.24.

The agency must respond to credible opposing points of view, and it may not ignore reputable scientific opinion. *See, e.g., Seattle Audubon Soc'y v. Espy*, 998 F.2d 699, 704 (9th Cir. 1993); *Public Service Co. v. Andrus*, 825 F. Supp. 1483, 1496-99 (D. Idaho 1992); *see also Sierra Club v. Watkins*, 808 F. Supp. 852, 864-69 (D.D.C. 1991). An agency's NEPA analysis must expose scientific uncertainty regarding the risk of a proposed action and inform decisionmakers of the full range of responsible scientific opinion on the environmental effects of the proposed action. *Friends of the Earth v. Hall*, 693 F. Supp. 904, 926, 934 (W.D. Wash. 1988). It must consider the "degree to which the possible effects on the human environment are highly uncertain or involve unique or unknown risks." 40 C.F.R. § 1508.27(b)(5). An agency may not rely on conclusory statements unsupported by data, authorities, or explanatory information. *Neighbors of Cuddy Mountain v. USFS*, 137 F.3d 1372, 1379-81 (9th Cir. 1998).

BR-1

B. The Noise Impact of the Proposed Action Has Not Been Adequately Analyzed.

Although the area affected by the Air Force proposals is only sparsely populated, the region of influence overlays numerous special use areas and noise sensitive locations, including the Commenters' properties. Despite the adverse effect noise can have on such areas, in addition to the adverse effect noise can have on human experience of the enjoyment of nature and solitude, the DEIS fails to adequately analyze the noise impacts that would be created by the proposed action. The Commenters incorporate by reference the detailed comments of Dr. William Weida previously submitted, a copy of which is attached as Exhibit 1 to these comments. In addition, the Commenters raise the following points:

The Air Force's own experts acknowledge, both in litigation testimony and in their publications, that the "issue of the application of aircraft noise modeling methods to outdoor recreational settings . . . remains unresolved to this day." Sanford Fidell Decl. ¶ 41 (filed in *GOLD v. DOD*, No. 92-0189 S BLW (D. Idaho) (executed May 7, 1999)); *see also* Sanford Fidell & Laura Silvati, "Relating the Annoyance of Aircraft Overflights to Their Audibility by Outdoor Recreationists," paper presented at NOISE-CON 90, University of Texas, Austin, Texas, October 15-17, p.340 ("The well-known dosage-response relationship developed by Schultz (1978) for general transportation noise experienced in high population density areas, cannot be directly applied to the outdoor recreational case . . . ."). Moreover, the RBTI DEIS generally misrepresents and improperly relies on conclusions from the Forest Service wilderness aircraft overflight study that are inapplicable to the low-level, high-speed warplane noise effects that may be experienced over the Commenters' ranches and similar lands.

AO-54

1. The Inapplicability of the Air Force Noise Analysis to Park, Wilderness, and Similar Outdoor Recreation Settings.

That the Schultz curve on which the RBTI noise analysis is premised is not applicable to the prediction or determination of noise effects on outdoor recreation experiences is well established by the Air Force's own EIS statements, as well as the statements and publications of its scientists and the studies cited in the RBTI DEIS. In a paper delivered at the Air Force sponsored NOISE-CON 90 conference, Robin Harrison et al. stated that the Schultz curve assumptions and methodologies "are not appropriate in the assessment of the impact of aircraft overflights on wilderness visitors." Robin T. Harrison, Lawrence A. Hartmann, and William Makel, "Annoyance From Aircraft Overflights In Wilderness," NOISE-CON 90, University of Texas, Austin, Texas, October 15-17, 1990, pp.327-28. Similarly, the Forest Service overflight study notes that the "appropriateness of a long-term cumulative noise metric such as L_{dn} for purposes of predicting reactions to overflights by short-term visitors to recreation sites is questionable." *Id.* at 2-21.

As Air Force researches Fidell and Silvati have stated:

> Noise modeling techniques and assumptions originally developed for military airfield and urban airport planning are not readily adapted to Park and Wilderness settings . . . . The difference between residential and outdoor recreational exposure to aircraft noise, as well as the differences in purposes for characterizing aircraft noise exposure, are sufficiently great to suggest the need for an alternative approach to preparing aircraft noise contours. The alternative approach should provide the basis for answering the question "How far from here must an airplane fly if it is not to impact the area of interest?" rather than "How much noise does an aircraft flying here produce there?"
>
> In other words, the preferred means of modeling aircraft noise impacts in Park and Wilderness settings is from the perspective of the observer, not the source. Furthermore, since audibility is the issue of primary concern in low ambient noise conditions, explicit consideration must be given to signal to noise ratios rather than absolute sound pressure levels. These considerations suggest that observer-based audibility contours are more useful than source-based emission

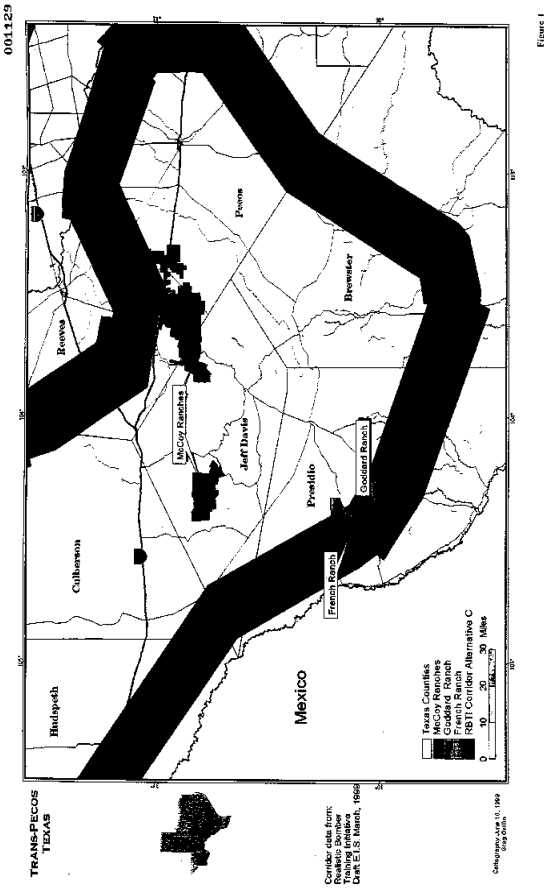

Figure 1

> contours for use in analysis of aircraft noise impacts in Park and Wilderness settings.

Fidell and Silvati, *supra*, at 341-342.

However, despite this wide recognition that the Schultz curve and general L_{dn} measurements are not readily applicable to quantifying noise from the outdoor recreationist's perspective, the Air Force fails to provide any alternative theoretically-based noise impact prediction methodology for the outdoor recreation, ranching, and private wilderness/wildlands at issue here. Nor does it follow the advice of its own consultants and apply an alternative observer-based approach to describing predicted noise impacts. The Air Force's failure to do so violates NEPA's requirement to ensure the professional and scientific integrity of the DEIS, it ignores its own consultants' reputable scientific opinion, and it fails to fully identify in the DEIS the "degree to which the possible effects on the human environment are highly uncertain or involve unique or unknown risks." 40 C.F.R. § 1508.27(b)(5).

AO-38

2. The Air Force Misapplies the Conclusions of the Forest Service Overflight Study.

The Air Forces specifically references and describes the Forest Service overflight study. RBTI DEIS at 4-56. However, it fails to note the limitations of that study and findings to both the ranching and recreational lands at issue in RBTI and the low-level, high-speed bomber overflights proposed.

As the Forest Service study readily acknowledges, "generalization of inferences drawn from these studies must be made with care" because of the unique conditions of the Forest Service research. Forest Service Report at 2-22. The Forest Service research looked at all types of aircraft overflights of wilderness areas (i.e. commercial, civilian, and military), not just the military aircraft performing bomber training exercises that are of concern for the RBTI DEIS. Indeed, the Forest Service study reported that the greatest problems with aircraft overflights arose in areas where "outdoor recreationists are most commonly exposed to the noisiest overflights; i.e., low-altitude, high-speed tactical military operations," exactly the type of operations that will occur with the RBTI proposal. Forest Service Report at 2-23. This point is overlooked by the RBTI DEIS.

Thus, contrary to the Air Force's summary, the Forest Service study compels the opposite conclusion: low-level bomber overflights may cause a serious impact on recreational visitors' experience and enjoyment of the areas of concern. The Air Force's summary also fails to acknowledge the Forest Service observation that visitors in wilderness setting are approximately 10 dB less

tolerant of noise than in residential settings. *Id.* at 2-22. Again, this initial calculation[1] suggests a much greater noise impact from the proposed action than is disclosed by the Air Force in the DEIS. Given this greater sensitivity to noise in the private wilderness and recreational land setting of the Trans Pecos region, it follows that even a small noise increase will have a disproportionately larger effect on recreation visitors' and ranch residents' and employees' experiences. The Air Force failed to disclose or adequately discuss this possibility in the DEIS.

AO-111

C. The Air Force Fails to Apply the Relevant Standards It Notes in Its Noise Assessment.

The DEIS notes that "areas exposed to DNL above 65 dB are generally not considered suitable for residential use." RBTI DEIS at App. G-6. However, residential land use issues, or noise contours from a public use airport (which is where the 65 dB L_{dn} figure is drawn from) are not the sole issue here for the recreational and outdoor ranching operations at issue. Thus, the EIS also notes that the L_{dn} of 55 dB was identified by EPA as the level requisite to protect the public health and welfare with an adequate margin of safety. *Id.* (citing EPA, *Information on Levels of Environmental Noise Requisite to Protect the Public Health and Welfare with an Adequate Margin of Safety*, EPA Document 550/9/74/004 (1972)). Nonetheless, the RBTI noise assessment fails to ever again discuss or indicate what the anticipated effects to public health, welfare, recreation, or the environment might be from the vast number of areas affected that will exceed the 55 dB level. There is no assessment or discussion in the DEIS of what the effect will be on public health, welfare, or outdoor recreationists, to name a few concerns, from widespread exceedances of EPA's suggested levels. Nor does the DEIS identify, as required by NEPA, what the environmental risk is that is posed by the removal or significant diminution of the "adequate margin of safety" EPA indicates is required to protect the public health and welfare at the L_{dn} 55 dB level.

[1] The Forest Service study made this calculation as an initial effort "for the sake of consistency with prior practice in residential settings to predict the prevalence of annoyance among wilderness visitors from knowledge of L_{dn} values." *Id.* at 2-21. Thus, the report noted that the tentative nature of its implication that "residents of urban communities will tolerate ten times more aircraft noise exposure than visitors to wildernesses before describing themselves as highly annoyed by the noise." *Id.* Nonetheless, this initial finding is consistent with other researchers' statements that the "fact that outdoor recreationists are exposed to aircraft noise without the benefit of the insertion loss of residential structures suggests that likelihood of a leftward shift of the X-intercept of the dosage response relationship by 10 dB or more." Fidell and Silvati, *supra*, at 340.

D. The Air Force Noise Analysis Contains Other Flaws.

It is apparent that serious aircraft overflight impacts can occur from Air Force combat training operations. For instance, the Air Force's own documents indicate that it "routinely has about $10 million in claims pending relating to aircraft overflight issues . . . . [T]he claims typically result in disbursements of about $3.3 million each year." U.S. Air Force, Human Systems Center, Environmental Planning Directorate, Brooks AFB, Texas, Final Report, *Requirements Analysis for Noise* at 16 (Oct. 31, 1996). Given the Air Force's own recognition of the substantial monetary damage claims that arise from its aircraft overflight operations, it is incongruous to suggest that its extensive bomber combat training operations in the Trans Pecos region would not have a similar significant environmental effect.

BR-1

Also, the Air Force claims that its L_{dn} noise assessment prediction methodology "has been shown to be applicable . . . to rural populations exposed to sporadic military aircraft noise," citing two works by Stusnick et al. for this conclusion. RBTI DEIS at 4-9. However, an examination of the Stusnick studies belies this overbroad assertion. The Stusnick studies were done in houses and a laboratory in southern Virginia, in an area where many homes were present and where streets and aircraft contributed to background levels of noise. This environment has little application of relevance to the vastly scattered ranching settlements and wide open spaces of the Trans Pecos region. Thus, the Air Force's assertion that its L_{dn} methods have been shown to be applicable to rural populations does not help support its attempt to use this technique to predict or describe noise effects to the wildlands, ranchlands, and outdoor settings of the Trans Pecos.

The Air Force's noise evaluation in the RBTI DEIS also fails to acknowledge the scientific shortcomings of the methods used, and therefore it fails to candidly disclose in the DEIS the risks of the proposed actions. For example, the Air Force itself has repeatedly acknowledged that its noise analysis methodology is an imperfect predictor of noise impacts and resulting annoyance. In its fiscal year 1996-97 Environment, Safety and Occupational Health Strategic Plan, the Air Force states that "the methods used to gather the information required [for NOISEMAP] is [sic] extremely vulnerable to litigation. The current data collection methods do not provide indisputable data. In fact, the accuracy of the data is totally dependent upon human interpretation and therefore, extremely vulnerable to human error." USAF FY 96/97 ESOH Strategic Plan at 1a. Under NEPA, the Air Force must disclose these shortcomings in its noise evaluation methodology in the RBTI DEIS, and it must account for the range of potential impacts that might occur given the uncertainty in the methodology and data collection methods for that methodology.

BR-1

Further, the Air Force itself has noted that "no quantitative dosage-response relationship has been developed for predicting annoyance in these circumstances [where Air Force operations are occurring over lands used for outdoor recreation purposes]." *Id.* at 1b. Again, the Air Force needs to disclose these shortcomings and consider the impact of these data gaps in its RBTI DEIS. Similarly, the Air Force acknowledged that it has no accurate method of predicting annoyance from the combined effects of exposure to subsonic operations and supersonic operations. *Id.* at 1c. And, the agency has also admitted that "there exists no systematic methodology for assessing the impacts of aircraft noise and sonic booms to humans, animals and structures. Environmental impact analysis process (EIAP) documents presently use a variety of noise description and assessment models/data bases, often being of questionable scientific value." *Id.* at 2d. As before, the Air Force must disclose these shortcomings of its EIAP methodology in the RBTI DEIS, and it must undertake further analyses of potential environmental impacts to account for the extremely large analytical shortcomings of the methodologies it has applied.

BR-3

E. The DEIS Fails to Adequately Assess Livestock Impacts.

The RBTI provides that the majority of the MTR and MOA expansions will be over rangeland, yet the DEIS includes a very small review of published articles on the affects of noise and aircraft disturbance to livestock, and suggests that while "range cattle have not been tested, [] historical interactions between cattle and numerous overflights have not indicated a problem." DEIS at 4-93. The DEIS further states that "[s]ome horses with riders have been reported to startle when surprised by a low aircraft overflight." However, the DEIS fails to address the potential health and safety problems involving traditional rangeland management.

The biggest concern with the DEIS's very minor rangeland section is that it first fails to fully acknowledge the numerous adverse affects of aircraft noise and overflights to domestic animals, and then it concludes that it is unlikely that there will be negative impacts to livestock or humans associated with managing those livestock. The DEIS omits a number of studies that document negative effects to livestock and domestic animals. These include:

1. Espmark et al. (1974) concluded that sheep and cattle had little negative response when exposed to low-altitude subsonic flights in their study. However, the authors also stated that animals under different environmental conditions would display other and more severe reactions than they reported. Espmark et al. also reported that impacts may be greater in gestating animals because they jumped backward in response to being startled. These potential gestational impacts are of great concern to the Commenters' cow-calf

operations. The authors also found that sheep reacted more strongly than cattle, and that cattle did not adapt to low level flights when subjected to 10 flights at elevations between approximately 150 and 650 feet AGL over a two day period. Finally, the authors noted that their study gives no clear indication about the effect of subsonic flights upon the animals, because they had "insufficient data due to the small number of overflights." (Espmark et al. 1974).

2. Kovalcik and Sottnik (1971) suggest that gradually increasing noise levels instead of immediate exposure to high intensity noise reduces the response by animals. They reported that in the case of immediate exposure to high intensity noise (about 105 dBA), livestock consumption of feeds declined, milk yield was reduced, and the intensity of milk release decreased (Kovalcik and Sottnik 1971). Because overflights would not commence gradually, this study suggests that some negative affect may occur. Moreover, the potential for decreased milk yields is again of great concern to the Commenters' cow-calf operations, especially where the calves and yearlings being grown for market are relying on the mother cow's milk yields for the bulk, if not total, of the first year's nutrition and weight gain.

3. In another study of dairy cows, Oda (1960) found that dairy cows had lowered lactation curves caused by high intensity noise.

4. Head et al. (1993) conducted a study on dairy cows using recorded jet aircraft noise, and reported no statistically significant effects; however, existing literature suggests that animal stress may be more pronounced when an object is seen. Casady and Lehmann (1966) pointed out that reactions to subsonic, low-level aircraft noise were more evident than reactions to sonic booms, and several other studies verify that animals respond to both auditory as well as visual stimulus from low-level flights (Bond 1971, Bell 1972). Additionally, in Head et al. (1993) researchers did not know the prior exposure of the cows they used in their study to jet noise exposure, but noted that jet noise was rare in the vicinity of their dairy research farm.

BI-9 [

F. The DEIS Fails to Adequately Assess Wildlife and Related Impacts.

1. The DEIS Fails to Adequately Consider Wildlife Impacts.

The area under the overflights is rich in wildlife species diversity. It is reported that more than 100 species of reptiles, amphibians, birds and mammals occur there. DEIS, Appendix H. Furthermore, the impacted area includes 36 threatened or endangered species. DEIS at 4-89.

The DEIS uses vague, non-specific language and over-generalizations to describe potential affects of overflights and noise on wildlife. Throughout section 4 of the DEIS, the authors state that because the noise activity and overflights are occurring "intermittently" or in "short duration," they will therefore have no significant impact. According to the document's own estimates, on just IR-178 under Alternative B, the MTR would sustain more than 1,100 additional sorties per year. The sound exposure level for a B-1 aircraft at 300 feet is reported as 117 dB and 110 dB for a B-52. DEIS, 4-6. As an estimate of noise impacts, this exposure could be multiplied at least 2 to 3 times a day on IR-178 and far greater within the MOA regions, but this is not done.

The most serious points lacking from this section that purportedly addresses the impacts of overflights on animals are as follows: (1) a large body of literature on studies of overflight impacts on animals has been overlooked; (2) literature that is referenced is sometimes used selectively to favor the conclusion that overflights and noise do not harm animals; (3) possible cumulative effects of overflights on animals are not properly addressed; (4) there is insufficient discussion in the DEIS of U.S. Fish and Wildlife Service observations and concerns about sensitive species, especially for alternatives other than Alternative D, although the Air Force acknowledges that it is currently in consultation with the U.S. Fish and Wildlife Service under Section 7 of the Endangered Species Act.

The RBTI DEIS does not report on noise level "peaks," or highs and lows of noise, but instead reports on average day-night sound levels, measured in onset-rate adjusted-monthly-day-night average sound levels (L_{dnmr}). This noise reporting system, and other "composite" noise metrics as well, are not necessarily useful for predicting noise exposure impacts on wildlife. To report on the peak noise levels in decibels (dBA), as well as average sound levels, is a more accurate way to measure potential affects to wildlife and habitat. Reporting on just average sound levels minimizes the true dBA level of the individual noise events and the frequency of those events, which is what needs to be evaluated for a legitimate assessment of the effects on wildlife. No reported studies conducted on the topic of aircraft and noise disturbance to wildlife or domestic animals link animal response to composite noise measurements such as L_{dnmr}. Nonetheless, wildlife managers generally treat an SEL of 95 dB as the level of concern for

001129

adverse startle effects to wildlife. The DEIS also fails to properly address this point of concern.

The RBTI DEIS lacks an approach or effort to ensure the professional scientific integrity of the document. The authors have not considered a large body of literature that exists on the subject of noise disturbance and aircraft overflight impacts to wildlife.

The use of selective literature in the DEIS to support the conclusion that there will be no significant impact to wildlife further documents the lack of a thorough and genuine disclosure of the available data, and an incomplete investigation of potential impacts. In addition, the DEIS lacks many citations to verify the statements asserted. While several studies are alluded to, and results briefly listed, there are often no citations of these studies for the reader to explore. Authors of the DEIS may want to refer to Bowles et al. (1994) as a start in their literature search.

The DEIS section discussing animal responses to overflights states broadly that "[f]or most species, past studies . . . show that wildlife habituates to the sporadic intrusion of low-altitude jet aircraft without negative effects on populations." DEIS at 4-92. There are several problems with this statement. First, the Air Force has previously acknowledged for this same area and for activities that form part of the purported RBTI baseline that: "In general, the long-term effects of aircraft overflights on wildlife are unclear. Reported animal responses vary greatly among species, and the ability of species to adapt to overflights also varies." U.S. Air Force, ALCM/Talon MOA EA at 4-25 (1997).

Second, the statement is inconsistent with the range of varying findings described in the research literature. For instance, the DEIS addresses mule deer and pronghorn antelope only in general passing, if at all, even though they are found throughout the region. Examples of studies that list variable responses to overflights are Workman et al. (1992), and Luz and Smith (1976). Workman et al. (1992) found that pronghorn would run when subjected to military jets flying at 5000 feet AGL, and Luz and Smith (1976) found a range of responses to low flying (150 to 400 feet AGL) helicopters, ranging from no change to running. Exclusion of such information suggests that the DEIS authors did not fully disclose the potential or likely effects of the proposed actions.

A study on how bighorn sheep react to helicopter overflights in the Grand Canyon (Stockwell et al. 1992) describes how sheep modify their behavior in the presence of aircraft, and decreased their foraging efficiency by 43% in winter and by 17% in summer in the presence of helicopter overflights. Effects of overflights on bighorn sheep are not discussed in the DEIS. However, other studies have reported the following: "Responses of bighorn sheep to low-level overflights (100 to 990 feet AGL) have included no response (Krausman and Hervert 1983), accelerated heart rates (Workman et al. 1992; MacArthur et al.

001129

1979), and abandonment of the area (Lamp 1989)." *See* ALCM/Talon MOA EA at 4-26. By broadly summarizing only a portion of the available literature, selectively reporting their findings, and then concluding that there will be no significant impact to wildlife from the proposed action, the Air Force failed to consider the range of respected scientific opinion available in the general literature on this point.

For instance, Krausman and Hervert (1983) reported that bighorn sometimes do not respond to fixed-wing aircraft (they did not evaluate jets) overflights between 100 and 990 AGL, but they also reported that 19% of sheep were greatly disturbed and ran from less than 330 feet to 1.2 miles. MacArthur et al. (1979) reported responses to overflight helicopters ranging from no response, to accelerated heart rate, to running when the aircraft was 490 to 660 feet AGL, well above range of some overflights under the proposed action.

Workman et al. (1992) reported accelerated heart rate in response to jet aircraft overflights, and the decibel levels were only 74 dBA, well below the noise that will accompany the overflights for the proposed action. An investigation of Lamp (1989) does not find the exact height of the overflight except to say that it is <3000 feet; this suggests that the height of the flights investigated which caused abandonment of the area may have been substantially higher than the 100 to 500 AGL flights of the proposed MTR modifications. Lamp (1989) only observed 11 low-level overflights, a very small sample by his own admission, and he considered his work a preliminary study.

Third, the Air Force's "habituation" statement is inconsistent with the lack of long-term studies to support such a conclusion. No long-term studies of overflights or noise are cited. It may be that bighorn sheep or other large mammals have only temporarily accelerated heart rates in response to low overflights, but the cumulative effects of short-term stress and increased heart rate should be discussed in the DEIS. Krausman et al. (1993a, b) and Weisenberger et al. (1996) found that accelerated heart rates were temporary and therefore concluded that those temporary changes would not be detrimental to populations. However, it should be acknowledged in the DEIS that accelerated heart rate is an indication of excitement or stress in animals. In addition, Weisenberger et al. (1996) suggested that interaction of noise with other environmental factors should be evaluated using free-ranging animals, instead of the captive animals that were used in their study.

On other points as well as the DEIS wildlife analysis is similarly overly-generic and flawed. The DEIS cites Ellis et al. (1991) to suggest that raptors, including peregrine falcons, are only temporarily affected by low-level overflights and to noise in general, in the form of "increased alert behavior, temporarily stopping current activities, increased heart rate." However, the FWS (1998) in its recent biological opinion on Air Force low-level, high-speed flight

001129

activities in the same areas cites studies that have determined that low aircraft overflights do disturb raptors, including flushing from nests and foraging areas. They also note studies which suggest that human activities within breeding and nesting territories may cause raptors to change home ranges. FWS concludes that a definitive information on the effects of overflights on peregrine falcons is not available.

By citing only two studies that support the conclusion of no impact, the authors of the EA use selective literature. In addition, there is no discussion of possible long-term effects of repeated short-term stress, which should be addressed.

Although the DEIS suggests that "habitat" will not be affected, e.g. DEIS at 4-97, 4-98, it should be noted that stress and disturbance to certain species can render their habitat unusable and therefore not suitable. The species may change home ranges or move out of otherwise suitable habitat due to stress from overflights and noise. This consequence is not adequately addressed or fully considered in the DEIS.

The DEIS fails to consider numerous factors and applicable studies, and did not weigh the potential significance of environmental effects of the proposed action in light of the intensity and context of probable effects. Information is drawn mostly from sources such as other military reports, internal government reports not subject to peer review, preliminary studies, studies not applicable to the proposed action, and telephone conversations to conclude that biological resources including protected species are not likely to be significantly impacted by the proposed action. A large body of literature on the topic of animal responses to overflights and noise is not cited, and some of the literature that is cited is used selectively to bolster the "no likely significant impacts" conclusion.

Information from USFWS that was available to the Air Force on the extent of critical habitats and nest sites of threatened and endangered bird species is used selectively, and sometimes omitted completely. In addition, only short-term responses by animals are discussed. The possibility of cumulative effects on wildlife from thousands of overflights each year is dismissed. However, the DEIS does not provide data to support this or many other "sweeping" conclusions of no significant impacts. In short, the DEIS wildlife and biological resources discussion lacks scientific credibility, and it does not indicate evidence that the authors conducted a thorough and genuine investigation of the likely aircraft-induced impacts to domestic animals and wildlife occurring in the overflight areas.

001129

CE-3

2. The DEIS Fails to Consider the Cumulative Impacts on Wildlife.

Although the DEIS identifies various factors that will impact wildlife in the region (e.g., noise from aircraft, construction activities, loss of habitat, etc.), it does not consider the cumulative impact of all these effects on the wildlife in the proposed area. While exposure to low flying aircraft and ground-disturbing activities may have a minimal impact on certain species or specific animals, the combined effect of all the stresses on the wildlife may have a significant impact. The cumulative, potentially synergistic, effect of all the potential stresses on wildlife must be adequately identified in order to adequately assess the true impacts on wildlife. *Cf. National Wildlife Fed'n v. FERC*, 801 F.2d 1505 (9th Cir. 1986) (acknowledging need to evaluate cumulative impacts of development on fish and wildlife).

In this instance, the Air Force failed to conduct the required cumulative impact analysis of a proper scope to include an evaluation of the impact of the proposed DEIS actions together with the other past, present, and reasonably future actions.

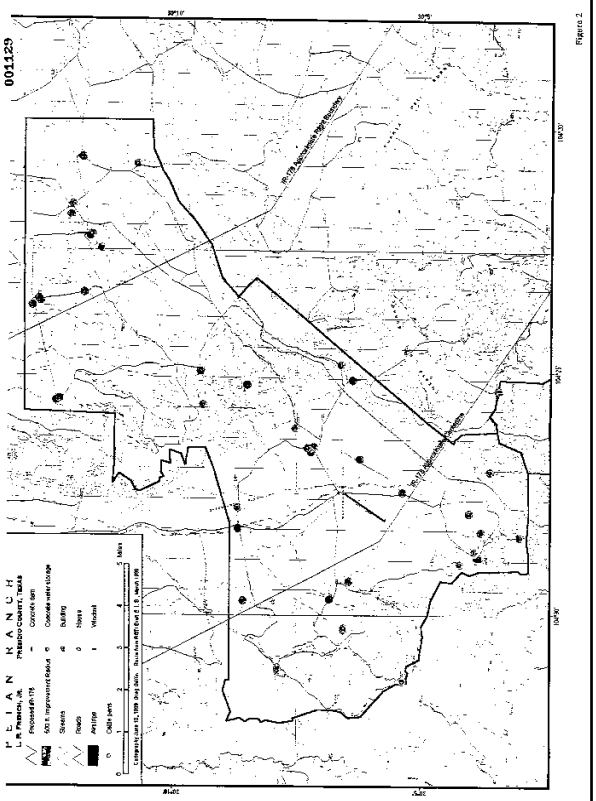
BR-3

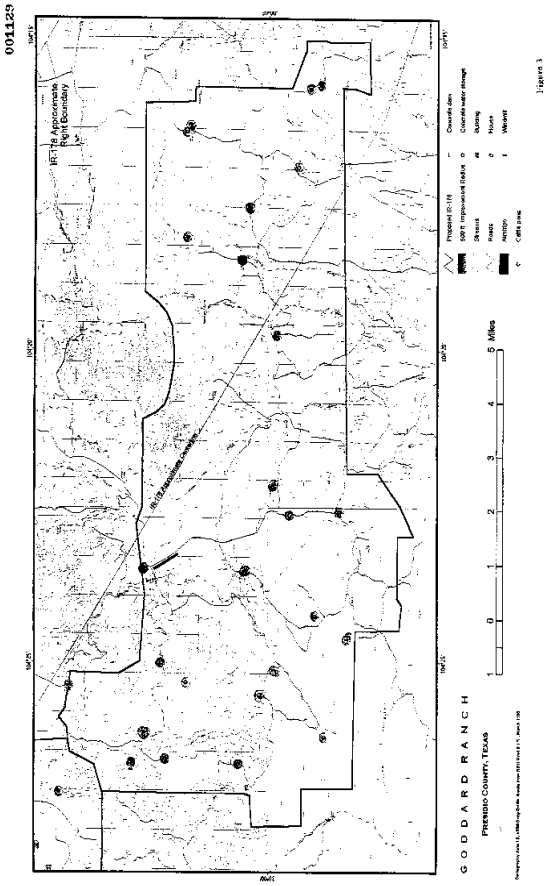
G. The DEIS Fails to Adequately Analyze the Impact of the Proposed Action on Traditional Lifestyles, Culture and Quality of Life.

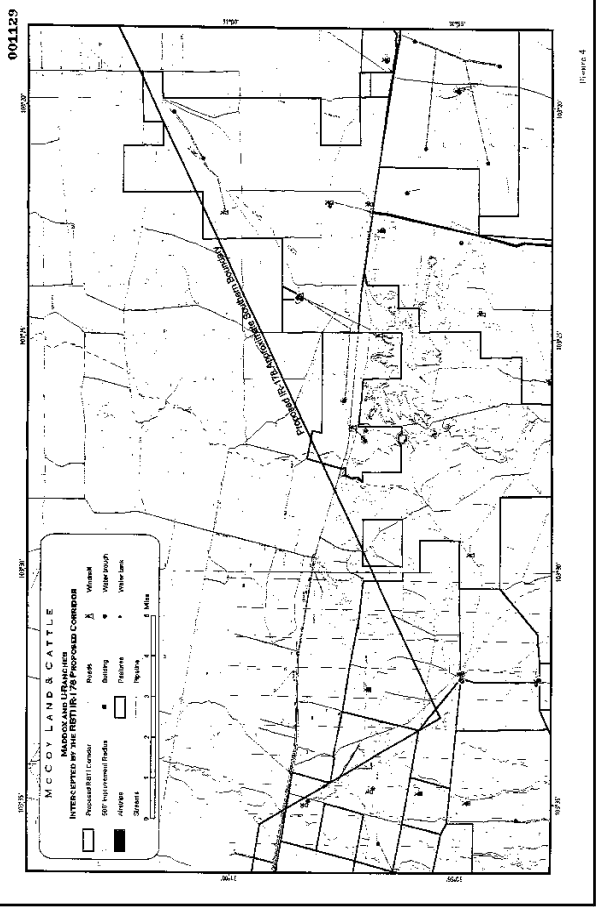
The RBTI DEIS fails to adequately describe or consider the myriad ranching activities occurring beneath the proposed low-level training activities. To identify these flaws, first a representative description of typical activities during the ranch production year is presented below, together with a discussion of the potential disruption and impact on these activities from the proposed actions. Second, the commenters have prepared detailed maps of their ranching properties (with the exception of Mrs. French's property) showing the location of sensitive structures and areas on these properties and relative location of the RBTI proposed airspace modifications of activities for Alternatives B and C. *See* Figures 2, 3, and 4 on the following pages. The DEIS fails to account for how these structures and the uses of them (including residential use) will be protected from the harmful (and in some instances of ranch houses potentially unconstitutional violations of the Third Amendment) intrusions of the proposed RBTI activities. All of these impacts and description of the existing environment are overlooked in the DEIS.

1. Fall Works.

At this time, cattle are gathered and moved by progression by the regular men to get them in position for the round-up. Potential overflight impacts may occur during horse shoeing, colt riding, "warming-up" of pastured horses, spreading out and sweeping cattle before the riders, trying to follow mountain trails (often precarious and requiring patience, caution, and an undisturbed







001129

environment), and allowing the cows and calves an undisturbed opportunity to "pair-up" at each new destination. The startle effect can cause injury to man and beast during shoeing, distract horses negotiating precarious trails, cause them to buck, scatter the cows, run the calves away from the gather or the drive, and run calves away from the "pairing-up" effort. A horse being shod can weigh 1,100 pounds. If the horse is startled, it could drag a nail across a farrier's leg and cause serious injury. Horseshoeing is a dangerous time to work with these animals, and not a time for startle effects and low-level disruptions by warplanes.

The scheduling of the works and hiring of extra cowboys and horses is next. They come from the local area as well as many other places around the country. A cook is hired along with the equipment needed to cook on the ground when necessary. Potential impacts: The startle effect and the cultural and heritage impacts can reduce the willingness to work in this environment, increase the risks to riders and horses through the startle effect, and make it less rewarding culturally to work here.

BR-3

Next comes the arrival of the extra crew and horses, setting up camp, and driving the remuda of approximately sixty horses to the first branding camp. Impacts: Horses are tricky to drive. The startle effect will scatter or stampede them. There is also a cultural/heritage impact of the noisy disruptions.

The daily gathering and driving of the cattle (the cows are now pregnant, with grown calves to be weaned). Some of these days are shipping days, when calves are sorted off and shipped to preconditioning pens. The cows -- weighing between 900 and 1,200 pounds -- are then palpated and examined by a veterinarian, and culled cows are sorted off and moved to holding pastures for later sale. This operation progresses for about one month. Then the culled cows are shipped, and the remaining cows are gradually driven back to their winter pastures. The first calf heifers are combined into a separate group for closer observation and for special nutrition and calving assistance. The calves in the preconditioning pens are sorted by size and sex into more marketable groups in preparation for satellite video auction sales. They are all vaccinated and inspected by a veterinarian, and fed preconditioning rations through weaning. Heifers and steers to be retained are selected and driven to their winter pastures. The extra cowboys are then paid off, and resume similar operations on other ranches in the area. Impacts: Startle effect on gathering, driving, and sorting; danger to veterinarian and animals during examinations. These individuals are trying to keep the animals calm during this process, yet still have to work with, examine, and sort them. The startle effect when sorting calves off cows and loading trucks can easily injure men and animals when tons of confined cattle are suddenly shifted. The startle effect on heifers can make observation difficult. The nature of the ranchers' cattle (tame, unlikely to stampede when gathered or corralled) is important to marketability, performance, and health. The startle

001129

effect will scatter them, and cause the negative training that careful handling seeks to avoid.

The preconditioning calves are re-sorted, weighed, and videoed for sale. After the sales have been conducted, the calf crop is sorted and weighed again and shipped after about 45 days of feeding and preconditioning. This concludes the Fall Works, usually about mid-December. Impacts: The calves are stressed from separation from the cows. Additional stress affects health and marketability from the learned behavior of fearing assembly and handling. How the ranchers handle them and how they learn to respond is important to their future performance. The ranchers try to reduce stress as much as possible, and train them to not fear assembly. This maintains their natural herding instinct, and improves controllability, health, and biological performance. The startle impact is carefully avoided by the cowboys for these reasons, because fleeing is a natural response to being startled and the handlers have to be very careful to avoid reinforcing it.

The formal forage and range condition analysis is usually conducted after the first freeze, when the grass plants have gone dormant. The range specialist is flown to the ranch, and helps perform a scientific survey of the permanent range trend monitoring sites. This survey provides the data necessary for assessing both the current forage availability and the long-term range condition trends. The data is then used for decisions pertaining to stocking rates and grazing distribution. The goal is to regulate and manage grazing to maintain and improve range condition. Impacts: The startle effect will prevent being able to control the distribution of the cattle. The distribution control will be lost not only in the portion of each pasture that is directly under the routes, but also in each entire pasture that a route crosses. The impact of the startle effect stems from both the danger and difficulty of driving the cattle, and the scattering of the cattle away from the zones to which they are moved. Overgrazing will occur in the areas to which the cattle are startled, and the harmful effects of under-utilization will occur in the zones from which they are startled. There is a similar impact from the unnatural distribution of wildlife that will occur. Wildlife such as deer and antelope help to both control and promote the forbs and brush that cattle do not consume. The aircraft exhaust emissions released at such low altitudes may also have a deleterious effect on the range. Large quantities of unburned or partially burned fuel will be carried straight to the ground by wake turbulence, without the opportunity to be dispersed into the larger volume of air at higher altitudes. This direct fuel and particulate absorption by the range can be very harmful. The invasion and proliferation of brush is a particularly difficult range management problem, and it has been determined that the higher CO levels help the brush to compete with the grass. The proliferation of brush is especially wasteful of groundwater and rainwater. The fuel and exhaust particulates dispersed at such low altitudes will settle directly onto any surface water, such as dirt tanks, streams, springs, and ponds.

AO-11

001129

2. Winter.

The cattle are fed supplemental feeds to maintain health and performance, and to aid digestibility of the dormant grass. This is done by several methods. In some areas the men drive trucks into the pastures, honk the horn, and wait for the cattle to approach. This takes time and patience, but it provides the assurance of consumption and offers the opportunity to count and observe the cattle. Self limiting feeds are also used, such as range blocks and liquid feed bins which the cattle walk to when they need supplementation. Impacts: The startle effect will drive the cattle away from feeding locations. There is also a direct danger to the men while either driving the feed trucks or standing among the cattle. Cows walking down the steep mountain trails for feed or water are also at risk of injury when startled or distracted. The cattle are also in the last trimester of pregnancy at this stage of production, and are more vulnerable to injury or disruption. This time is of special concern given the research findings cited in the literature of the potential adverse overflight effects on gestating animals. However, there are no steps proposed in the DEIS to mitigate, limit, or address these impacts.

The cattle are gathered and moved as necessary to properly utilize winter forage and water availability. Impacts: The startle effect poses a hazard to the men on horseback, and will scatter the cattle that they are gathering and driving. The mountain trails are dangerous and require undisturbed negotiation by the horses and cows, and the flat areas have many holes and other hazards. Lest one assume that there are fewer hazards to riders and horses in the flats, it must be said that there are actually more accidents there when horses are tripped by holes hidden in the grass. Because of the brush and numerous draws, the riders and cows will still be very difficult for the military pilot trainees to see and avoid in those areas.

At this time, the Commenters also deal with the management of hunters and other recreational groups. Impacts: The startle effects and noise will decrease the desirability of visiting the ranches for lease hunting and eco-tourism uses, and increase the hazards. The effects on wildlife distribution and numbers will decrease hunting and observation opportunities. The distraction of shooters is an additional hazard, along with the danger of hiking the many mountain trails. Sleep will be disturbed by the proposed night operations, and the buildings that the guests use will be subjected to structural damage. The quiet and serenity of this area are particularly desirable to guests, and they will be disrupted.

BR-4

The cows begin calving in December, and they must be frequently observed for nutritional assessments and any developing calving problems. This is accomplished either while feeding or on horseback. Impacts: The startle effects can disrupt observation, drive cows away from unprotected new-born calves, and endanger the riders.

001129

The heifers begin calving in December also. They require quiet and special attention. This is much more intensive than calving the cows, since it is essential to check the herd every few hours. The pastures selected for this purpose are usually close to a corral so that each heifer that begins labor can be penned and assisted as necessary. The heifers don't know how to protect the calves from the predators that haunt the calving areas, and some of them do not accept their calves right away, so it is necessary to pair them up and put them into a separate herd as soon as they calve. Impacts: The startle effect can disturb calving, drive the heifers away from the calving areas, and upset the horses. There will be an additional hazard to the men on foot among the penned heifers or assisting the calving.

Brush control herbicides are applied by ag-planes during the winter. The planes fly 125 feet above the terrain at 90 knots. These planes are focused on attempting to make a pellet drop every 1.5 foot for proper coverage. Impacts: It will be impossible for the very high-speed military aircraft to adequately see and avoid an agricultural chemical application plane. It would not be necessary for them to actually collide to cause a disaster, since the bombers wingtip vortices and/or wake turbulence alone would be sufficient.

Many repair and improvement projects are accomplished during the winter months. These include such things as windmill repair and maintenance, fence repair, corral repair, and roadwork. Impacts: The startle effect will be hazardous to persons working with tools or machinery, and especially to anyone atop windmills, buildings, ridges, or water tanks. The force of the jet wash from a heavy overflying bomber aircraft can be enough to topple windmills and fences, and damage other structures.

AO-2

Bulls are gathered, sorted, and examined in preparation for the start of the breeding season. Impacts: The startle effect will be dangerous for men on horseback or on foot around the bulls. The disruption while they are penned for examinations can be especially hazardous, and they can tear down the pens if they are all stampeeded together.

On March 15, the men begin driving the bulls and distributing them to the cow herds. Impacts: Bulls are hard to drive in a herd (harder to drive than cows), since they do not usually stay together well, and some of them will frequently stop to fight. The startle effect of the low flying jets will make the job more difficult and dangerous by startling both the bulls and the horses.

3. Spring Branding.

As calving is completed, the planning for spring branding begins. This involves contacting the extra cowboys, planning the schedule, and preparing the corrals and equipment. Impacts: The Commenters' reputations for having a good and pleasing work environment is important to their being able to get help when

needed. The hazards to men, horses, and equipment caused by the startle effects of the low flying, high-speed warplanes will put this reputation at risk. The disruption of the quiet and traditional environment by the noisy intrusions will also undermine the motivations for working at the Commenters' ranching operations. Cowboys are essential to these operations.

The regular hands begin gathering and driving cattle in preparation for branding, and the spring works crew is hired. Impacts: The startle effect will scatter the cattle being driven, run some of the calves off, and cause horses to buck or bolt.

The cook and branding crew arrive, horses are unloaded and shod, camp is set up, and the remuda of horses is driven to the first branding camp. Each day, the remuda is driven into a corral for selecting the horses to be used the next day. Colts are then ridden and trained as necessary to prepare them for the coming work. Impacts: The startle effect will make horseshoeing very dangerous, and it is a daily occurrence since shoes are often thrown during the drives. Horses can be hard to control and the low flying warplanes will surely scatter them. Once they are in their corrals or traps, they can be severely injured when caused to bolt into the wires by the startle effects. The riders who are training or "warming up" their selected horses are at particular risk from the startle effect because these horses are much less tame and not as acclimated to being ridden.

During the daily branding operation, cattle are gathered and penned and the calves are roped and branded. The branding operation is very fast paced, in order to minimize stress on the calves and keep them separated from the cows as short a time as possible. Two mounted cowboys heel rope calves and drag them to two pairs of flankers. About 130 calves per hour are worked this way, and the traditional techniques are carefully followed to minimize the risks of injury to men and animals. As each day's branding is completed, the calves are turned back out with their mothers while the mounted riders hold the herd together long enough to allow them to quietly pair up again. Impacts: The startle effects of the low flying bombers will cause a number of significant and dangerous disruptions. Horses can be expected to buck, and the men working on the ground among them and the cattle will be at risk. The drives will be disrupted, calves will be run off, and the opportunity to quietly pair the cows and calves up again will be disturbed. Most of the branding pens are located in remote areas and are very difficult to see from the air. This will increase the probability of direct overflights and the resulting hazards. There is no discussion in the DEIS of how pilots will either locate or avoid these operational facilities. Even if these effects are only infrequent, it will be far too often for the men, ranches, and livestock affected.

At each branding, dry cows (cows without calves) are sorted out of the herd. The cowboys hold the herd together with their horses, and one or two men

ride into the herd to cut the dry cows out. The dry cows are then driven to a separate pasture for later accumulation. Impacts: The startle effect poses a danger to the riders, and the cutting and sorting efforts will be wasted when the herd is scattered. The startle effect will also make it very difficult to succeed in driving the dry cows to another pasture. Once the herd has been scattered, it is likely that the whole day's work will be lost, since it is essential to avoid delays that prevent getting the branding done before it gets too hot. Overheated cattle will suffer considerable stress, and may even be killed.

As the spring works are concluded, the cowboys are paid off and they then load their horses and gear into trailers and move to other nearby ranches to continue the work. Impacts: The startle effects create a danger to the horses and men while the horses are being gathered, sorted, and loaded into the trailers. There is an additional risk of startling the drivers and horses while trailering.

The dry cows are gathered, driven to an assembly point, and loaded into trucks for shipment to a sale. Impacts: The startle effect poses a danger to men and horses, and can scatter the drive. There is a particular danger to startling the cows while they are being loaded. Men will be on the ground among them as they are driven up loading chutes into the trucks in 42,000 pound groups.

4. Summer Production.

Following the springs works, usually around late-April to early-May, the summer production period begins. These activities include: repairs, road work, maintenance, and special projects continue through the Summer. Potential impacts are: The startle effect creates the risk of injury to men working outside, especially when operating machinery and using tools.

Considerable time and effort are spent in assessing forage and water conditions, and gathering and moving cattle as necessary. Extra time and effort are applied to redistributing cattle to hold them in dirt tank areas as the thunderstorms start and water in ungrazed zones becomes available. This provides the ungrazed grasses the opportunity to be partially harvested to avoid lignation of the plants. At the same time, this practice allows the grasses in the improved waterings zones to be deferred and re-seed. Impacts: The startle effect will pose a risk to riders, horses, and cattle during the drives, and it will also cause the calves to be run away from the drive. It is often necessary to return to the herd on subsequent days to prevent their returning to the fresh grass in the areas that are being deferred, and the startle effect will drive them away. Aircraft are used regularly for range, distribution, and water assessments, and there will be a very serious risk of collision with the speeding warplanes. Almost all of the rain-clouds in the Trans Pecos region are cumulonimbus, very rapidly forming, and un-forecast. When combined with the orographic influence of the mountains and the frequent downbursts, the very low altitude bombers will be at much greater risk of collision with the terrain and obstructions. The resulting fires will

AO-6

pose additional risks to production, improvements, and firefighters, including making firefighting activities and operations more difficult.

During July, the men begin picking up the bulls at the end of the breeding season. This involves riding through all the herds, sorting the bulls off, and driving the bulls to pens where they can be loaded into trailers and hauled to the bull pastures. Impacts: The startle effects are very hazardous to horses and riders, and can scatter the bulls which are hard to drive anyway. Once the bulls have been accumulated into pens, there will be the additional risk of startling them into tearing the pens up or injuring the men who are loading the trailers.

Yearlings held over from the previous calf crop are gathered in the summer, loaded into trucks, and shipped to sales. Impacts: The startle effects can make riding and gathering very hazardous, and can scatter the drive. Yearlings are particularly energetic and can be trained by the disruptions to run away and be hard to handle. This is a serious disadvantage to both the Commenters and their customers. The startle effect will also make loading the cattle into trucks very hazardous. In addition, any yearlings scattered that cannot be found in time for the sale will have to be sold separately later. They bring a much lower price in small quantities.

The cowboys occasionally ride through the herds to inspect the cattle and brand any unmarked calves. Impacts: The startle effect poses a danger to riders and horses, and can scatter the calves, especially during branding operations.

Late summer is the time to begin the preparation and planning for the fall works and the marketing, preconditioning, and grazing decisions. Impacts: The startle effects that train our calves to run away and become harder to handle can affect their biological performance, reputation, and marketability. For instance, yearling operators who buy from the McCoy Land & Cattle Company value the animals' tameness and performance. They have been willing to pay a premium for these traits, and they will surely note any change.

Tourists and guests come to visit the ranches in the summer, and preparations are made to manage their visits. Impacts: The quietness, serenity, and remoteness are among the greatest attributes of this region. The noise, smoke, startle impact hazards, and disruptions to wildlife and birds will diminish the desirability of visiting here. Sleep will be disrupted by the noise, and the guest buildings themselves will risk structural damage. The startle effects will also pose a hazard to vehicle operators on ranch and public roads.

Predator control continues in the summer when necessary for the protection of calves and deer and antelope fawns. For instance, the McCoy ranches are currently working to preserve their antelope herds and do not allow hunting of that species. The predator control operations are done by State trappers and aircraft. Impacts: The aircraft used may be unable to see and avoid

BR-2

the very fast fighters, and collisions are a very real hazard. The antelope in particular are very vulnerable to losses through the startle effects, and the resultant increased need for predator control will place more pressure on the predators themselves.

BR-2

IV. The DEIS Fails to Consider the Full Scope of Cumulative Impacts for the Proposed Actions.

CE-2

The DEIS fails to evaluate properly the full scope of past, present, and reasonably foreseeable military training and other activities occurring in the same area and affecting the same area as the RBTI proposed actions. Under the applicable NEPA regulations, the scope of an environmental document must include the range of actions, alternatives, and impacts to be considered in that document. 40 C.F.R. § 1508.25. The impacts to be considered include those that are direct, indirect, and cumulative. *Id.* § 1508.25(c).

The CEQ regulations require the discussion of cumulative impacts in environmental impact statements. *See* 40 C.F.R. § 1508.7; *Thomas v. Peterson*, 753 F.2d 754-758 (9th Cir. 1985); *LaFlamme v. Federal Energy Regulatory Comm'n*, 852 F.2d 398, 402 (9th Cir. 1988) (individual project cannot be considered in isolation without considering the net impact that all projects in an area may have on the environment). The regulations define a "cumulative impact" as:

> The impact on the environmental which results from the incremental impact of the action when added to other past, present, and reasonably foreseeable future actions regardless of what agency (Federal or non-Federal) or person undertakes such other actions. Cumulative impacts can result from individually minor but collectively significant actions taking place over a period of time.

40 C.F.R. § 1508.7.

In this instance, the DEIS fails to adequately identify or discuss the impact of past Air Force activities in the region so that the aggregate cumulative effect of past, present, and reasonably foreseeable future actions may be identified. The DEIS cumulative impact discussions specifically do not include any consideration of the environmental impacts attributable to past federal actions. This failure to consider and evaluate the cumulative impact of recent federal actions in the same geographic area is entirely inconsistent with NEPA's cumulative impact assessment requirement.

The present DEIS does not properly consider or identify the cumulative impacts of these recent past actions together with the proposed and reasonably

foreseeable actions in the same EIS as required by the CEQ regulations and applicable case law. By doing so, the Air Force has thwarted the full disclosure and informed decisionmaking purposes of NEPA, and has understated the potential environmental impact of its proposals. The other past cumulative actions that must be considered in the cumulative impacts analysis in the DEIS include the increased overflights, noise, and training activities from the German Air Force expansion at Holloman Air Force Base and related activities in Southwestern Texas and New Mexico. These effects must be compared to the baseline existing before all of these past, present, and foreseeable future training increases occurred.

Several important cases elaborate on the cumulative impact analysis required by the CEQ regulations. First, in 1987 the Court of Appeals for the Ninth Circuit stated that 40 C.F.R. § 1508.7 requires that the agency "consider cumulative impacts of the proposed actions which supplement or aggravate the impacts of past, present, and reasonably foreseeable actions." *Oregon Natural Resources Council v. Marsh*, 832 F.2d 1489, 1497-98 (9th Cir. 1987), *rev'd on other grounds*, 109 S. Ct. 1851 (1989); *see* Terence L. Thatcher, *Understanding Interdependence in the Natural Environment: Some Thoughts on Cumulative Impact Assessment Under the National Environmental Policy Act*, 20 Envtl. L. 611, 624-625 (1990).

Second, the Fifth Circuit addressed the issue by stating a five element standard for what constitutes a "meaningful cumulative-effects study." *Fritiofson v. Alexander*, 772 F.2d 1225, 1245 (5th Cir. 1985), *abrogated on other grounds*, *Sabine River Auth. v. United States Dep't of Interior*, 951 F.2d 669 (5th Cir. 1992). The standard requires the EIS to identify:

> (1) the area in which effects of the proposed project will be felt;
> (2) the impacts that are expected in the area from the proposed project;
> (3) other actions—past, proposed, and reasonably foreseeable—that have had or are expected to have impacts in the same area;
> (4) the impacts or expected impacts from these other actions; and
> (5) the overall impact that can be expected if the individual impacts are allowed to accumulate.

The standard requires that "probable impacts be identified and considered." *Fritiofson*, 772 F.2d at 1245 n.15.

The DEIS contains primarily a superficial cumulative impact analysis that applies an inappropriate baseline and fails to meet the Fifth Circuit standards for

such an evaluation. In addressing cumulative impacts, the EIS separates the discussion into three elements: (1) an express dismissal of the need to analyze separately cumulative impacts of related yet past actions; (2) an identification of some reasonably foreseeable future actions; and (3) consideration of the possible cumulative effects of those limited future actions only. *See* RBTI DEIS at 5-2 to 5-4.

The EIS fails to meet the regulatory requirements and the standard expressed by the Fifth Circuit regarding cumulative impact analysis. It fails for two reasons. First, the depth of discussion is shallow. The discussion of cumulative impacts must demonstrate an analytical approach and identify and consider the impacts. Instead, the DEIS only briefly mentions and then dismisses potential cumulative effects.

Second, the DEIS arbitrarily limits itself to cumulative impacts from reasonably foreseeable actions. The regulations clearly state that an EIS must consider past and present actions, yet the Air Force expressly limited the review to future actions. Past actions are relegated to the baseline condition upon which the RBTI proposal rests. This is not allowed by the CEQ regulations. The choice of which cumulative actions to evaluate is not discretionary. Past actions that have a cumulative affect when combined with the proposed action must be evaluated. The wholesale increase in military warplay operations and more intensive overflights and mission profiles are substantial past actions that must be examined together with the proposed actions in the cumulative impact analysis. That analysis is not limited to the proposed action, but includes analysis of the proposed action's aggravation of past, present, and future actions. *Oregon Natural Resources Council*, 832 F.2d at 1497-98.

The RBTI DEIS lacks a legally adequate consideration of cumulative impacts. The brief DEIS discussion on cumulative impacts is vague and conclusory. Thus, the RBTI DEIS fails to meet the requirements of NEPA and must be withdrawn for revision of the cumulative impact analysis so that the public and agency decisionmakers are fully informed of the complete scope of environmental impacts from the proposed actions. Despite the wide range of potential adverse impacts and potential cumulative effects occurring from the past, ongoing, and planned actions in the proposed action area, when considered together with the additional stress imposed by the proposed RBTI actions, these adverse cumulative effects are not properly evaluated in the RBTI DEIS. Thus, the agencies have failed to identify and carefully review a relevant area of environmental concern, and the agency's evaluation is not reasonable in light of this improper analysis. Accordingly, the DEIS must be withdrawn or a proper supplemental DEIS prepared to fully evaluate the environmental impacts of the proposed actions.

V. The DEIS Fails to Consider the Full Scope of Connected and/or Cumulative Actions.

CE-2 The Air Force's RBTI proposals are connected to, or at least will have similar impacts to the same geographic area with, other Air Force actions not yet implemented, including the expansion of German Air Force operations out of Holloman Air Force Base and the modification or establishment of MTRs, refueling anchors, and MOA airspace for those operations. NEPA does not allow the Air Force to segment its environmental decisionmaking to consider only the impacts of the current proposal when it is related to, flows from, or has cumulative impacts with these recent proposals identified in other Air Force NEPA documents. *See Concerned About Trident v. Rumsfeld*, 555 F.2d 817, 827 (D.C. Cir. 1977) ("It is the essence and thrust of NEPA that the pertinent statements serve to gather in *one place a discussion of the relative environmental impact of alternatives.*) (emphasis added) (quoting *Natural Resources Defense Council v. Morton*, 458 F.2d 827, 834 (D.C. Cir. 1971)).

Moreover, the Air Force's approach of deferring the evaluation of environmental impacts impermissibly separates the consideration of connected or similar actions into different documents. The CEQ regulations require that connected or cumulative actions must be considered together in a single EIS. *Thomas v. Peterson*, 753 F.2d 754 (9th Cir. 1985); 40 C.F.R. § 1508.25(a)(1).

The following types of actions must be addressed in a single EIS:

> (1) Connected actions, which means that they are closely related and therefore should be discussed in the same impact statement. Actions are connected if they:
>
> (i) Automatically trigger other actions which may require environmental impact statements.
>
> (ii) Cannot or will not proceed unless other actions are taken previously or simultaneously.
>
> (iii) Are interdependent parts of a larger action and depend on the larger action for their justification.
>
> (2) Cumulative actions, which when viewed with other proposed actions have cumulatively significant impacts and should therefore be discussed in the same impact statement.

> (3) Similar actions, which when viewed with other reasonably foreseeable or proposed agency actions, have similarities that provide a basis for evaluating their environmental consequences together, such as common timing or geography. An agency may wish to analyze these actions in the same impact statement. It should do so when the best way to assess adequately the combined impacts of similar actions or reasonable alternatives to such actions is to treat them in a single impact statement.

40 C.F.R. § 1508.25(a).

Accordingly, because the RBTI actions are connected, similar, or cumulative actions to the earlier Air Force actions affecting the areas beneath IR-178 and related locations, including the Talon MOA and refueling anchor for GAF operations, a full evaluation of the environmental impacts of all of these actions must be considered in a single EIS. *See Thomas v. Peterson*, 753 F.2d at 758-759.

VI. The DEIS Fails to Contain An Analysis of the Potential Impact on Private Property Rights. BR-4

The Commenters' properties affected by the RBTI proposals include several ranch properties located in west Texas. There are private landing strips for civil aviation air travel access located on many of these properties. The ranch properties consist of variable topography that ranges from flat to gently rolling to rugged hills and mountains. The properties generally have adequate fencing, improvements, watering facilities, and other accouterments necessary to utilize the ranches as economic agricultural operations and also for economic recreational purposes, including lease hunting and eco-tourism. For such ranch properties in the Trans Pecos area, recreational hunting leases are a significant income or income potentially consumed by property owners.

Significant wildlife resources are present on the ranch properties and have important value implications that may equal or exceed the net income realizable from ranching operations. The market value of hunting leases in the Trans Pecos area ranges from $1.50 to $3.15 per acre for mule deer, javalina, quail, and varmints. Desert bighorn sheep are also present in the area and the market value for legally permitted mature rams of this species exceeds $50,000 per hunt.

From a property valuation and potential economic impact perspective, the Air Force's proposed uses of the ranch properties, and overflights of the homes located on these properties, for military warplane and bomber low-level, high-speed overflights, represents a significant change in use, intensity, and frequency

001129

of use over the previous use of the airspace overlying the property. This significant change in use has serious implications for the property value of both the houses located on the property and the overall ranch property.

The RBTI proposal is a major change of airspace use that has substantial implications to the landowners' value of the property, income stream, recreational use, and Texas ranching culture and lifestyles. For instance, the proposed military training uses will interfere with and cause a potentially dangerous situation in the use of private aircraft for agricultural, recreation access, and cattle operations to the subject properties. Private airstrips are major value components in improvements of remote west Texas ranches such as these in terms of utility, replacement cost, and marketability of the properties.

The rugged terrain and topography of the ranch areas which provides potential warplane pilot training challenges are the same features that make this area and these ranches desirable for recreational activities and locations on the subject properties. However, the proposed uses and overflights will adversely affect the income stream or consumptive use of the properties for such purposes (and residential purposes) by the current owners.

The value loss of the subject properties due to their proposed use as military aircraft training corridors will range between $26 to $105 per acre considering only current recreational leasing rates of $0.80 to $3.15 per acre per year and the capitalization rate of .03 or 3 percent return on area ranchland properties. Additional value losses due to reduced agricultural income and stigma effects for potential purchasers may also be realized.

Overall, the proposed Air Force bomber training activities will effectuate a transfer of wealth away from those properties (including both the ranch properties and ranch home properties) subjected to low-level, high-speed military warplane overflight activities, encroachments, loss of air rights, and the associated effects, to those properties that are not so encumbered. The properties not so encumbered include those over which the Air Force determined to locate its operations away from, such as several populated areas, and some other developed ranch and farm areas.

The definition of the highest and best use of the subject properties includes that use which is legal, achievable, and returns the highest rate of return or value to the property owners. The subject properties' highest and best use is as private recreational land, cattle ranching, and commercial recreational uses. Land prices in this west Texas area tend to capture and reflect the potential for future development of approximately 40-plus acre tracts as long-term land investments, semi-desert/mountain retirement sites, and weekend home sites. The rapid growth of the American southwest and in particular the San Antonio, El Paso, and Dallas/Fort Worth metropolitan areas as well as the growing popularity of the Trans Pecos region of Texas as a tourism destination has resulted in the

28

001129

subdivision of some larger ranch properties. The Arizona, Nevada, and New Mexico subdivision trends in the desert southwest have started to occur in west Texas.

The region's existing low levels of noise pollution, clean air, quiet clear skies, clean water and natural beauty has increased the potential and attractiveness for such development in the area. Private "wilderness" or nature retreats as a highest and best use is presented in an article by Wilson (1991). In his "Case for Environmental Real Estate Market," he concludes that "if environmental real estate is a contemporary market, real estate counselors need to recognize that supply and demand factors influence its value." The U.S. government's purchases, for condemnation at market value, of approximately 50 million acres of wildland and related areas for the national park system since 1970 is confirmation that such a market exists and is the highest and best use of land in particular areas, including the subject properties.

The increasing tourist pressure on the very limited number of Texas natural national parks (including Big Bend National Park) and state parks has created an increasing demand and increasing rents for recreational and hunting access to private lands. Hunting leases, camping sites, bird watching, eco-tourism, and hiking access "day" fees form a significant portion of the economic value of the subject properties.

Nature retreat/reserve use, agricultural operations and recreational income/rents (whether realized or consumed by the owners) all operate in concert as the current highest and best use of the subject properties. The importance of hunting and eco-tourism income is important to ranchland owners, including the owners of the subject properties, because this income stream is less volatile than agricultural income and has relatively lesser expenses associated with the activities thus generating a net operating income.

BR-2 The RBTI DEIS does not provide any specific analysis of how warplane overflights will avoid or give reasonable notice of being closer than 500 (or even 300) feet to any person, vessel, vehicle, or structure. Ranching employees, their horses, hunters, hikers, bird watchers, eco-tourists, recreational guests, and campers may be subject to excessive noise event exposures (even at a 500-foot overflight) on a random, uncontrollable basis. The value implications to the desirability, marketability, and mortgagability of these properties is serious.

The capitalized value of one bighorn sheep mature ram with a $50,000 present value in the current Texas sporting market is $500,000 ($50,000 ÷ .10 cap rate = $500,000) or $1,660,000 rounded at prevailing rates of return (.03 or 3% cap rates) on many ranches in Texas ($50,000 ÷ .03). The loss or migration of these sheep or potential populations equates to a significant loss of property value of the owners of the subject property.

29

001129

The potential for temporary disturbance to vacationers and others in the region has a concomitant long-term effect to private ranch owners who lease or charge access fees for hunting and recreation. However, the DEIS does not address this potential impact for private property value implications.

The RBTI DEIS discussions effectively discount the importance and value of traditional ranching, ranching families, and ranching as a way of life for owners, employees occupying the land full time, and visitors who pay to experience the Texas ranching culture. The Texas ranching culture, its equipment, livestock, and improvements are a way of life that has actual and realizable value for both the property owners and those recreational, nature tourism, and other guests who pay to experience and visit part of that culture and lifestyle.

Previously, the Air Force acknowledged that overflying military aircraft, even at 500 feet above ground level "may startle, annoy, or disturb sleep of people exposed to [such] noise levels." *See* USAF, ALCM/Talon MOA Final EA (June 9, 1997) at 4-11. The land use and value implications of this noise exposure, disturbance, and annoyance in regard to the highest and best use of the property can be severe.

Military jet aircraft overflights through private land airspace that occur at non-scheduled times can have serious economic implications to property values, including both land and residential (home) values. In the real estate appraisal literature, noise is considered to be unwanted sound and its impact on real property market values is compensible. The diminution in market value due to noise value can and should be found in the marketplace through effect on values, rental rates, or income. *See, e.g.*, Joe Kern, *Noise: Is It Compensible? How Is It Measured?*, 43(2) Real Estate Appraiser Journal 31-38 (1977). The dollar value required to cure or replace the areas affected by noise (unwanted sound) is the measure of the damage to the value of the property for special use properties such as the subject properties which are recreational and ranch properties.

BR-4 Research in the real estate appraisal literature has identified, reported, and developed the Noise Depreciation Sensitivity Index (NDSI) which provides an indication of the percentage change in property value per decibel change in the noise level for affected real properties. The NDSI was based on summaries of the results of studies from 13 different airports, and considered the impact of commercial aviation traffic on real estate values in the urban environment. The NDSI reported that the majority of the percentage change in property value per decibel (measured as the L_{dn} day-night average) was from .50 percent to .60 percent per decibel, with the mean value at .58 percent reduction in value per each decibel level increase in the noise impact. *See* Marvin Frankel, *Aircraft Noise and Residential Property Values: Results of a Survey Study*, The Appraisal Journal, January 1991, at 96-110.

30

001129

Applying the NDSI approach to representative properties in the region and the noise impact increases from the significant bomber overflight increases outlined in the DEIS, a property value impact to the subject properties of at least a 4 to 5 percent reduction from the RBTI actions, and a cumulative reduction of 12 to 13 percent, would be expected. This reduction is based on the mean per decibel reduction of .58 percent of value with a decibel level increase of approximately 7 dB on some portions of the RBTI routes that overlay ranching properties. *Compare* USAF, Proposed Expansion of German Air Force Operations at Holloman AFB, NM, FEIS (1998) at 3-17 (55 dB baseline for reference point 43) *with* RBTI DEIS at 4-31, 4-32, and 4-41 (62 dB noise level for equivalent route segment following proposed Alternative B or C). This reduction estimate is a tentative figure based on the poor data presented in the DEIS which is often missing information that would be used for a more descriptive valuation analysis. In other areas, background noise levels in sparsely developed desert areas of the southwest may be below 40 L_{dn}, and the FAA has previously concluded that 30 dB CNEL (a measure similar to L_{dn}) is a reasonable estimate of background noise levels in completely undeveloped desert and mountain areas.

Applying these previously accepted background noise level figures for the representative properties, and comparing them with the projected noise levels presented in the EA at page 4-4, yields a projected cumulative dB increase of approximately 22 dB from Air Force overflights depending on the particular route segment under consideration over the subject properties. Applying the .58 percent per decibel property value decrease factor to the 22 dB increase over natural background noise levels for the subject property yields a projected cumulative property value decrease of 12 to 13 percent for the subject properties.

Significantly, the actual property value decrease from the proposed actions could be significantly greater given the much greater annoyance with low-level, high-speed military training route overflight noise in rural and wilderness areas as measured by and acknowledged by previous Air Force research. As mentioned above, the NDSI figures were developed from surveys of airport studies using commercial airport traffic in urban environments. The Air Force has noted in other research and publications that overall annoyance of residents beneath military training routes averages 11.7 times greater than its model predictions. Researchers working for the Air Force have also stated that the general dosage-response relationship for annoyance from transportation noise applied by the Air Force cannot be directly applied to outdoor recreational settings. Thus, the anticipated property value impact likely would be higher here, and could be as high as a 25 percent or more decrease in value.

It is important to note again that the valuation depreciation estimates above are based on the poor and spotty information presented in the DEIS, and that the DEIS does not present complete (or even field-measured baseline data)

31

that would allow for a more descriptive assessment of negative property valuation impacts to be made. Significantly also, the Air Force in the DEIS analysis makes no effort to undertake such an evaluation of property valuation impacts to private property from its activities immediately above the ranching and other properties beneath the expanded routes, where such activities transit through the airspace of the affected properties.

GE-34

VII. The DEIS Fails to Contain an Adequate Discussion of Measures to Mitigate Adverse Environmental Impacts.

An "important ingredient of an EIS is the discussion of steps that can be taken to mitigate adverse environmental consequences." *Robertson v. Methow Valley Citizens Council*, 490 U.S. 332, 351 (1989). NEPA requires a "reasonably complete discussion" of possible mitigation measures. *Id; see also Citizens Advocates for Responsible Expansion v. Dole*, 770 F.2d 423, 432 (5th Cir. 1985) (EIS must include identification of measures to mitigate "to the fullest extent possible" harmful effects to environment). "Without such discussion, neither the agency nor other interested groups and individuals can properly evaluate the severity of the adverse effects." *Robertson*, 490 U.S. at 352. A reasonably complete mitigation discussion helps guarantee that the decisionmaking agency has taken a "hard look" at the environmental consequences of the proposed action. *Id.*

The CEQ regulations require that an EIS address mitigation measures in evaluating the proposed action, alternatives to proposed actions, and environmental consequences. 40 C.F.R. §§ 1502.14(f), 1502.16(h), & 1508(25)(b). The Air Force must address mitigation measures in explaining its decision. 40 C.F.R. § 1505.2(c). *See also* Department of the Air Force Environmental Impact Analysis Procedure Regulations, 32 C.F.R. § 989.22. According to the CEQ, the mitigation measures discussed in an EIS "must cover the range of impacts of the proposal." CEQ's Forty Most Asked Questions Concerning CEQ's NEPA Regulations, 46 Fed. Reg. 18026, 18031. Furthermore, "[a]ll relevant, reasonable mitigation measures that could improve the project are to be identified, even if they are outside the jurisdiction of the lead agency . . . ." *Id.*

The CEQ regulations define mitigation to include:

> (a) Avoiding the impact altogether by not taking a certain action or parts of an action.
> (b) Minimizing impacts by limiting the degree or magnitude of the action and its implementation.
> (c) Rectifying the impact by repairing, rehabilitating, or restoring the affected environment.

> (d) Reducing or eliminating the impact over time by preservation and maintenance operations during the life of the action.
> (e) Compensating for the impact by replacing or providing substitute resources or environments.

40 C.F.R. § 1508.20.

The Air Force's complete failure to address mitigation measures in the DEIS is in clear violation of NEPA's "reasonably complete" discussion standard. Despite the Air Force's recognition in the DEIS of several potentially adverse affects resulting from the proposed alternatives, there is no discussion of measures to mitigate these adverse effects, some of which are of significant magnitude. *See* DEIS, ES-3. This oversight on the part of the Air Force to include any discussion of measures to mitigate adverse effects violates NEPA's underlying purpose of requiring the decisionmaking agency to "conduct an exhaustive environmental review of the impacts of the proposed action" and to "mitigate to the fullest extent possible harmful effects to the environment." *Citizens Advocates for Responsible Expansion*, 770 F.2d at 432.

A. Airspace and Aircraft Operations.

The DEIS acknowledges that the establishment of new military airspace and increased military aircraft traffic will result in an increase in military sorties under each of the proposed alternatives. Even under the most favorable baseline flight numbers used by the Air Force, the number of sorties on Alternatives B and C will increase up to 6 flights per day, and under Alternative D up to 10 sorties per day. DEIS, ES-3. While the DEIS recognizes that the airspace impacted by its proposed alternatives is routinely used by civilian aircraft for travel, recreation, and ranch support purposes (including by Commenters), the Air Force has not proposed any mitigation measures to identify or avoid private airfields or aircraft, to post notices concerning when it will be using the proposed airspace, or to coordinate scheduling to avoid conflicts despite its recognition that such scheduling is necessary. *Id.* 4-28. Instead, the Air Force places the burden on civilians to obtain this information from non-military sources. *Id.* at 4-3.

B. Land Management and Use.

The DEIS states that noise levels resulting from its proposed alternatives will result in increases of up to 18 dB for Alternatives B and C, and up to 13 dB for Alternative D. *Id.* at ES-3. Furthermore, the DEIS acknowledges that this increase in noise level, which will result in impacts as high as an additional 16 DNL for some communities underlying its proposed routes, "could be perceived by some people as affecting their quality of life." *Id.*

In apparent response to this adverse effect on the local communities, the DEIS states that "all aircrews adhere to FAA avoidance rules" which includes avoiding "congested areas of a city, town, settlement, or any open-air assembly of persons by 1,000 feet" and "any person, vessel, vehicle, or structure by 500 feet." DEIS, 4-5. Although the Air Force has set forth in detail the specific flight paths for its bomber aircraft through the proposed MTRs, MOAs and ATCAAs, it has not made any effort to identify any of the categories of sites and structures identified in the FAA rules except for the largest cities in the area. Without any prior identification of these sites and structures, it is highly unlikely that Air Force pilots flying bomber aircraft at speeds as high as 550 knots at 300 feet AGL will be able to comply with FAA rules as well as other legal protections afforded to citizens who are subjected to such intrusive actions by the U.S. military. Even if such surveys are done prior to route approval, the failure to include this information in the DEIS defeats the purpose of the mitigation discussion requirement of allowing the public and decionmakers to gauge the true extent of anticipated effects.

C. Wildlife.

The DEIS states that the proposed alternatives would result in adverse impacts on wildlife and a number of threatened or endangered species including aplomado falcons, peregrine falcons, bald eagles and Mexican spotted owls. *Id.* at ES-4. Furthermore, the DEIS acknowledges that the U.S. Fish and Wildlife Service "considers low-altitude overflights as potentially significant to these species." *Id.* Despite this acknowledgment, the DEIS fails to explain how the Air Force proposes to protect these species and to prevent further decline in species' population levels and habitat.

D. Cultural Resources.

The DEIS states that the proposed alternatives could adversely impact one archaeological site under Alternative B, two under Alternative C, and five under Alternative D, *id.* at ES-5, as well as several additional sites listed on the National Register, *id.* at table 4.5-13. Despite this recognition and its acknowledgment and that the "impacts to these sites could be avoided in most cases or mitigated to insignificant levels," *id.* at ES-5., the DEIS contains no discussion whatsoever of how such impacts can or will be avoided or mitigated.

E. Recreation.

There is no discussion of potential mitigation measures (such as flight path adjustment or increases in minimum altitudes) for recreation impacts. The DEIS analysis should discuss mitigation measures based on the full scope of potential mitigation as described in the CEQ regulations. 40 C.F.R. § 1508.20.

F. Summary.

The shortcomings in the mitigation analysis identified here and similar shortcomings in other sections of the DEIS entirely undermine the public disclosure and informed decisionmaking purposes of NEPA. These shortcomings mandate that the DEIS be redrafted to contain the reasonably complete identification and discussion of possible mitigation measures required by NEPA. The development of these mitigation measures cannot be deferred until a Record of Decision is issued. NEPA must be complied with at this stage of the proposed action if decisionmakers and the public are to carefully consider detailed information on significant environmental impacts at the time the decision on the Air Force's proposals is made.

CONCLUSION

As set out above, the Air Force and cooperating agencies have failed to comply with the full scope of their NEPA obligations here. The myriad flaws in the DEIS noted in these comments have undermined NEPA's twin goals of informed decisionmaking and informed public participation. *California v. Block*, 690 F.2d 753, 761 (9th Cir. 1982). Furthermore, the DEIS shortcomings discussed here "are not mere legal nitpicking, but go to the heart of the NEPA process." *California v. Bergland*, 483 F. Supp. 465, 493 (E.D. Cal. 1980), *aff'd in part sub nom. California v. Block*, 690 F.2d 753 (9th Cir. 1982). Because the DEIS has failed in so many crucial respects to comply with the NEPA standards for EIS preparation and analysis, the Air Force should withdraw the DEIS and prepare a new DEIS that fully responds to the issues raised in these comments.

Respectfully submitted this 16th day of June 1999.

RE: RBTI Draft Environmental Impact Statement (DEIS)

Dear Major Adams,

Enclosed herewith, please find written comments on the RBTI DEIS prepared by H.E.P.A., Inc. on behalf of its membership which now totals over 900 persons. As you are probably aware H.E.P.A., Inc. is a non-profit corporation organized in 1998 primarily by residents of West Texas concerned about the proposed RBTI. Our membership is mostly concentrated in the area underneath the proposed Lancer MOA in what is referred to as Alternative B in the DEIS.

We have reviewed the DEIS in great detail and believe that it is not acceptable in its present form to serve its legal purpose under NEPA for reasons set out in detail in this response document. We remain adamantly opposed to implementation of Alternative B in the DEIS.

We trust that you will address the issues we are raising in this response document in the final EIS. Many of these very same issues were raised during the scoping process yet were not addressed in the DEIS.

Very truly yours,

John F. Oude, Chairman
H.E.P.A., Inc. Legal Committee

INTRODUCTION

This document compromises the written comments on the Realistic Bomber Training Initiative (RBTI) Draft Environmental Impact Statement (DEIS) submitted by H. E. P. A., Inc., P. O. Box 209, Snyder, TX 79550. This written comment document is organized in a fashion so that it tracts the DEIS released in March 1999 section to section and where necessary page references relate to pages in the DEIS and quotes are taken from the pertinent sections referenced in the DEIS.

Sources quoted or referenced in this written comment will be indexed in the Appendix to this document.

Chapter 1. PURPOSE & NEED FOR PROPOSED ACTION

1.1 INTRODUCTION

PD-41

The map in Figure 1.1-1 of the DEIS on page 1-1 is misleading in that it indicates B-1 and B-52 aircraft have to fly to Wyoming and Utah for current training. However, a lot of current training is done at bases closer to Dyess and Barksdale.

1.2.1 BOMBER AIRCREWS TRAIN FOR A VARIETY OF MISSIONS

On page 1-4 the DEIS states,

> "Currently, bombers are an integral part of the Air Expeditionary Force concept."

A USAF fact sheet titled "United States Air Force Expeditionary Force Experiment (EFX)1998" (H. E. P. A. Appendix L) states:

> "What is EFX 98?
>
> Air Force chief of Staff views EFX 98 as an experiment that combines live-fly, simulations and technologies into a seamless warfighting environment to rapidly evolve and mature:
>
> 1. Air Force Core Competencies
> 2. Applications of Decisive Air and Space Power
> 3. Improved Command and Control (C2) Capabilities.

> For the ASC2A, EFX 98 is both an opportunity and a challenge to provide a first of its kind experiment that combines live-fly missions, simulation and leading-edge technologies all focused on rapidly fielding improved warfighting capability."

Is the USAF proposing to conduct a "first of its kind experiment" over citizens, livestock, wildlife, and 9.2 million acres of private land?

1.3.1 NEARBY TRAINING ASSETS DO NOT SUPPORT REALISTIC COMBAT TRAINING

The Air Force states in 2.1.1 (page 2-8),

> " The overlapping area within approximately 600 NM was defined as the search area for identifying the alternatives. This distance represents the maximum extent that a B-52 or B-1 aircraft conducting a training sortie could travel & still achieve the defined training goal while minimizing transit time (refer to section 1.3.3). Individual units at bases must complete a specified number and type of sorties based on the mission, training program, available aircraft, and personnel. These sorties must be completed using allocated flying hours based on funding from Congress. Dividing the number of required sorties into the flying hours yields an average sortie duration."

The Realistic Bomber Training Initiative (RBTI) proposal seems to be based on the premise that both B-1 and B-52 must train on the same site. This site must be located within a 600 NM radius of overlap from both bases so described in Appendix A, Figure A-1.

In the DEIS Appendix A, Table A-1 and Table A-2 shows the maximum distance of B-52 and B-1 based on optimum average sortie duration (ASD) to be 617.5 nm and 600 nm respectively. Tables A-1 and A-2 show that every sortie spends 60 minutes in air refueling even though a B-1 has a range of intercontinental unrefueled, a B-52 has a range of 8,800 miles unrefueled. If these aircraft did not refuel every sortie, it would extend the maximum distance of 600 nm that was determined by the USAF to be the maximum outbound or inbound distance to meet optimum average sortie duration (ASD) goals. In essence, it would change **Figure A-1 Average Sortie Duration Radii from Barksdale and Dyess AFBs** to radii for B-52 of 678 nm and for B-1 of 660 nm.

PD-26

Do B-1 and B-52 air refuel every sortie? What is the nautical mile distance from Dyess AFB to Colony ESS in Wyoming; to Granite Peak ESS in Utah; to Melrose ECR in New Mexico; to Claiborne, Louisiana range; Davis-Monthan AFB, Arizona; Ellsworth AFB, South Dakota; Smokey Hill, Kansas; Fort Huachucha, Arizona; Peason and Fullerton Military Reservation, Louisiana; and Poinsett, South Carolina; Nellis AFB, Nevada; Everton ESS, Arkansas; and La Junta, Colorado?

What is the nautical mile distance from Barksdale AFB to the AFBs and ranges listed above?

What is the current percent utilization rate, number of sorties, and number of flight hours conducted at each of the above mentioned AFBs and ranges by B-1 and B-52 bombers?

There are at least 5 existing or scheduled FY99 sites that would appear to meet the Air Force criteria. These sites already have the Electronic Scoring Sites and Electronic Combat Ranges necessary (i.e. SEEK SCORE, MUTES, TRAINS and Mini-MUTES).

Smokey Hill, Kansas

Claiborne, Louisiana

Cannon AFB, New Mexico

Fort Huachucha, Arizona

Peason and Fullerton Military Reservation, Louisiana

Smokey Hill, Kansas is within the overlap radius of 600 nm to both bases. It is scheduled for integration into the Route Integration Instrumentation System (RIIS) in FY99.

Claiborne, Louisiana is within 40 miles from Barkesdale AFB and within the 600 nm radius of Dyess AFB. It is located on Federal land and is scheduled for integration into the RIIS in FY99. Both of the above sites contain SEEK SCORE, MUTES, and TRAINS with Mini-MUTES.

001130

Cannon AFB, New Mexico (Melrose Range) is also within the 600 nm radius overlap area. This range also contains all equipment necessary and is located primarily on Federal land. In 1993 aircrews from Barksdale were the second largest users of the Melrose Range.

Fort Huachucha, Arizona is part of the Joint Interoperability Test Command and is a major range and test facility base. It contains real estate at Willcox Dry Lake and Gila Bend. It has a variety of threat emitters and is free from air congestion. Fort Huachucha is within the 600 nm radius for Dyess AFB and is located on Federal Land.

The Fullerton and Peason Military Reservations are part of the huge complex making up Fort Polk. Fort Polk is within 100 miles of Barksdale AFB and within the 600 nm radius for Dyess AFB. It is part of the Joint Service Participation (JRTC). Air Combat Command currently provides air combat forces to include fighter aircraft at these locations. The " Reservations" already contain the equipment needed and are located on Federal land.

PD-4 If these alternative sites were considered, why were they not acceptable?
If these sites were not considered, why not?

1.4.1 A VARIETY OF LINKED AIRSPACE IS NEEDED TO SUPPORT TRAINING

PD-27 The margin note on page 1-12 says,

> "MTRs may be defined with floors below 300 feet, but RBTI bomber aircraft would not fly below 300 feet."

In what document will this guarantee be made?

4

001130

Chapter 2. DESCRIPTION OF PROPOSED ACTION AND ALTERNATIVES

2.1.2 ALTERNATIVE IDENTIFICATION METHODOLOGY

There is some confusion over the average sortie duration. In this section the Air Force states proposed average sortie duration of a B-52 is 4.6 hours (276 minutes) and a B-1 is 4.3 hours (258 minutes).

Fig 1.6-1 Comparison of Optimum, Current and Proposed Training for B-52 and B-1 Bombers shows proposed sortie duration of a B-52 is 350 minutes and a B-1 is 305 minutes.

PD-28 The sortie duration difference between the two is 74 minutes for a B-52 and 47 minutes for a B-1. Which is the correct information? Which duration were the noise studies based on? The amount of flight time in Lancer MOA and MTR has a direct bearing on all studies of noise, annoyance, etc. that were done for this proposal.

PD-29 The DEIS never stated the number of proposed sorties in the entire document, it only refers to sorties – operations ("during a single sortie, an aircraft may conduct several sortie operations"). If the Air Force will not disclose the number of proposed sorties - the citizens will have no idea of the total number of flight hours in the Lancer proposal.

We need this information to fully evaluate the DEIS.

2.1.3 ALTERNATIVES CONSIDERED BUT NOT CARRIED FORWARD

AF-30 On page 2-16 under the heading Move Bombers, the USAF indicates that this is not possible because the USAF would have to ask for Congressional or Presidential authorization. Why can't this authorization be requested?

5

001130

2.4.1 ELEMENTS COMMON TO ACTION ALTERNATIVES

Ground Operation's

On page 2-30 the DEIS says:

> "Emitters generate radio frequency (RF) emissions. The Air Force has established safe energy levels and separation distances for humans, fuels, and electroexplosive devices relative to different types of RF emitters."

According to USAF Current Technology Needs # 1419 and Needs # 1007 (H.E.P.A. Appendix E), safety research concerning RF radiation from emitter systems has not been finalized.

Need # 1419 says:

> "The issue of biological effects of ultra-wide band, fast rise time electromagnetic pulses will be the focus of technology development in FY97. The rapidly advancing development of emitter systems capable of producing these unusual pulse shapes dictates that data be gathered upon which to base health and safety standards for human exposure to such pulses. These studies, begun in FY94, will be greatly expanded in FY97 to include a wide range of candidate emitter systems being tested at various tri-Service facilities. In collaboration with Phillips Laboratory, Kirtland AFB NM, these studies will focus on whole animal exposures and will evaluate exposure effects on a wide variety of teratological, behavioral, biochemical, and physiological endpoints. This effort will incorporate detailed anatomic propagation studies to identify areas in the body subject to excess energy deposition. Algorithms to define direct microwave scattering from full complex, three-dimensional objects will be available in FY97. Algorithms for the full human body and specific organ calculations will be established in FY98. Preliminary studies with cell and subcellular preparations have been accomplished and further studies will continue. A study of tissue acoustic response to wideband signals will occur in FY97. The results of these investigations will be used to update the current interim guidance for safe human exposure to these emissions, which will be issued to the laboratories in FY97. A reassessment of wideband exposure standards will occur in FY00."

Early on in the scoping process we requested information on radio frequency hazards as it relates to the proposed emitter sites. We received **AF0SH Standard 161-9 Attachment 5** in response to that request. This document speaks of the biological effects of radio frequency radiation as follows:

6

001130

Biological Effects

"The preponderance of studies reported to date has not defined any deleterious health effects from exposure to RF energy below a SAR of 4W/kg. Studies that have been reported which show effects below a SAR of 4W/kg either report effects which are not considered hazardous, or effects which have not been substantiated by replication in other laboratories. Extensive research continues in order to establish the validity and true nature of these effects. SAM-TR-87-03 provides a critique and summary of the relevant. RF bioeffects literature to date, and is periodically updated to maintain currency with the extensive research underway in the world today."

Microwave Hearing Effect

"The so-called "microwave hearing effect" has been known for more than 30 years and consists of an audible sound which seems to originate within or near the head. The sensation is described as a clicking, buzzing, or chirping sound depending upon the pulse repetition rate and pulse width of the incident RF radiation. The mechanism responsible for the sensation is similar to that produced by ordinary sound. The pulse of RF energy appears to produce a thermoelastic wave or pressure wave described as a cochlear microphonic. This wave is conducted by inner ear structures to receptors, and then by nerve impulses to the brain as in ordinary sound perception. For 15 microsecond pulses the threshold for this response is approximately 700 mw/cm2. Most operational systems will not produce power densities in accessible locations that reach this threshold. This effect, of itself, is not considered to be hazardous. However, any reports of this effect should be treated as a possible overexposure and carefully investigated."

Ophthalmologic Considerations

"RF energy has been shown to produce cataracts in experimental animals when the exposure is sufficient to raise the temperature of the lens to around 41-degree Celsius. In rabbits, exposure for 1 hour to 2450 MHz radiation to 100 mw/cm2 is sufficient to induce a cataract."

Indirect Biologic Effects

"Electronic medical prosthetic devices such as artificial cardiac pacemakers can respond to pulsed RF radiation fields. Most modern devices are however, insensitive to the RF radiation levels encountered in areas where persons are allowed unrestricted access by this standard. Significant disruption of normal pacemaker function requires RF radiation signals having a primary frequency between 0.1 and 5 GHz, pulse widths of greater than ten microseconds, and electric field strengths greater than 200 v/m. It is, however, prudent for individuals dependent on such devices to recognize the possibility of interference and avoid controlled areas."

7

001130

Metal Implants

" Little is known concerning the interaction of RF radiation with metal implants such as cranial plates or orthopedic pins. However it is thought that the PELs in this standard provide adequate protection against harmful effects from any interaction with such implants, and no instances of adverse reaction to RF fields from metal implants have been reported."

"The PELs given in this standard are the result of extensive scientific research on the characteristic of RF radiation interactions with living organisms. The frequency dependent interactions of RF radiation with geometric and biological objects, including humans, have been published in the "Radiofrequency Radiation Dosimetry Handbook", SAM TR-85-73. Data in this handbook can be used to determine the incident power density as a function of frequency to limit whole body SARs to 0.4 w/kg or less and may also be used to extrapolate exposures causing effects in animals to those in man required to produce the same SAR."

The actual RF energy level and specific absorption rates (SAR) of the emitters were never discussed in the DEIS or in the information we received as the result of our request. What are these levels? The citizens must not be subjected to unknown emitter health hazards.

PD-30 The RF energy level and specific absorption rates (SAR) of emitters, radar jamming devices, MUTES, TRAINS, SEEK SCORE, Mini-MUTE, radar radio equipment or any other ground equipment or aircraft equipment that would involve the use of any type of radiation (nonionizing and ionizing radiation) must be disclosed to the citizens and addressed in the DEIS. What are they?

The Air Force sent letters to landowners in the targeted emitter site areas in 1997 requesting right of entry. The letter states:

> "The United States Air Force is considering development of electronic emitter sites in your area. The emitters are transmitting devices that simulate enemy radar ... "

However, the letter never stated anything about RF radiation emissions or that testing was not complete. Nor did it mention the potential health effects of microwave hearing, cataracts, pacemaker malfunction, metal implants or other unknown deleterious health effects. Most

8

001130

GE-27 people thought it was satellite operated. The letter was misleading and improper and permission for right of entry was improperly requested and or granted.

PD-30 The DEIS makes no mention of how radio frequency emissions would affect microwaves, cellular phone use, radio and television transmissions, private business mobile radio frequency and stations, etc.

These subjects need to be addressed. If emitter radio frequencies would in any way affect the above communication systems in current use, the citizens need to be aware of these issues.

2.4.2 ALTERNATIVE B:IR-178/LANCER MOA

Clarification is needed on the subject of the primary and secondary MTR's underlying the proposed Lancer MOA.

1.) Currently Reese 4, Reese 5 and Roby MOA have IR-178/128/180, IR-154, and VR-1116 underlying the MOA's. **Figures 2.3-1 Alternative A: No-Action** shows IR-178 segments ASAT, ARAS, AQAR, and APAQ underlying the proposed Lancer MOA. In the DEIS Appendix C, **Table C-1** shows the current altitude structure of these segments: ASAT (7000' MSL to 11,000'), ARAS (200' AGL to 7000'), AQAR (600' AGL to 7000'), and APAQ (200' AGL to 7000').

PD-31 **Table C-2 Proposed IR – 178 Corridor Altitudes and Widths Under Alternative B &C** do not show these segments. No other table in the DEIS concerning the Lancer Alternative makes reference to these segments.

However, on **Figure 2.4-4 Alternative B: IR –178/ Lancer MOA Proposed Airspace Modifications** these segments are not designated as eliminated airspace.

9

001130

PD-31 If there are in fact segments of IR-178 underlying the Lancer MOA that the Air Force plans to use - they have been totally deleted from this study. The citizens need clarification on this issue.

AO-73 **2.)** Were the primary and secondary MTR's –178/128/180, IR-154, and VR-1116 underlying the proposed MOA included in the studies on noise, annoyance etc. that were done for the Lancer MOA? The floor of IR-154 is the surface to 5000' MSL and will be used by F-16's

PD-32 that have a potential speed of Mach 2 (2 times the speed of sound). VR-1116 has a floor of 200' AGL and will be used by B-1 aircraft with a speed potential of Mach 1.2. These primary and secondary MTR's would have a cumulative noise impact with the Lancer MOA.

Can these MTR's, VR's and IR be utilized by aircraft in the RBTI? If not, why not?

IR-178/128/180 segments ASAT, ARAS, AQAR and APOQ have floors described above, but there is no information pertaining to use of these segments of the MTR.

We find no mention of the noise, annoyance, etc. related to these segments of IR-178 even though they underlie the proposed Lancer MOA and would certainly have a cumulative noise impact.

2.) Further clarification is needed relative to the statement on pages 2-32 that

> "Roughly 10 percent of the area outlined by the proposed Lancer MOA/ATCAA would consist of new airspace not currently covered by a MOA or MTR."

What is the percent of new cubic airspace used in the proposed Lancer MOA including the new ATCAA?

10

001130

Chapter 3. DESCRIPTION OF REGIONAL ENVIRONMENT

3.3 TRADITIONAL LIFESTYLES AND QUALITY OF LIFE

Under Ranching and Family on page 3-9 it states:

> "At the same time, a threat to their quality of life may also be seen as resulting from government acquisition of private land."

BR-7 Yes, it does. Peace, quiet, and solitude are a major part of the rural citizen's way of life, and one of our most valuable natural resources. The Federal domain in the United States covers a third of the nation at present, more than 700 million acres, a public trust unmatched in the world. (Ref: - National Geographic Society 1996). To see the government taking private land for use in military operations is a travesty of grave concern to the private property rights of all Americans. When 1/3 of the nation is not enough land to satisfy military operations you must question the validity of military needs vs. military wants. When the military has free reign to dictate over public and private lands, in a peacetime environment; it becomes an issue so frightening as to shake the very foundations that our country is based on.

The Lancer proposal would overlie 9.2 million acres of private land - making it the second largest Special Use Airspace within the United States.

BR-5 The Air Force proposal would subject citizens to combat conditions on their own private property. This property was bought and paid for by citizens through a lifetime and sometimes several lifetimes of hard work.

The citizens of Lancer pay tax dollars to fund Air Force training. The Air Force must not expect the citizens living under the Lancer proposal to make up for the financial shortcoming of funding from Congress.

11

001130

How much money is saved by the Air Force in going forth with RBTI in the Lancer proposal?

BR-4 What is the economic cost to the rural citizens underlying the proposal?

Why should rural citizens be asked to bear the economic burden of this proposal? Is anyone going to represent the citizens who are opposed to the RBTI proposal before us?

Chapter 4. AFFECTED ENVIRONMENT & ENVIRONMENTAL CONSEQUENCES

4.1 AIRSPACE AND AIRCRAFT OPERATIONS

4.1.1 METHODS AND APPROACH

Airspace Management

Table 2.4-3 Comparison of Existing and Proposed Area Under Alternative B: IR-178/Lancer MOA

shows that total proposed airspace is 10,897 square Nautical Miles. (14,416 square statute miles; 9,225,907 acres).

According to information published by Hill AFB, "The Utah Test and Training Range (UTTR) is the largest DOD Special Use Airspace within the Continental United States in comparing airspace starting at or near the surface.... UTTR encompasses 12,574 square nautical miles (16,651 square statute miles) of airspace. There are 2.3 million acres of Department of Defense land under UTTR airspace". The rest of the UTTR airspace overlies wilderness areas and national forests.

If approved, the Lancer proposal will be the second largest DOD Special Use Airspace within the Continental United States - 97 % of which will be over private land!!!!

12

001130

The citizens must know the maximum potential utilization rate by sorties and gross capacity of flight hours of the Lancer alternative.

Aircraft Noise Assessment Methods

At this point the DEIS begins discussions on the subject of noise which is a subject involved in many parts of the DEIS. H. E. P. A., Inc. and its consultant, Dr. William Weida, dispute in large measure all the data submitted in the DEIS on the subject of noise and the measurement of noise. In essence, H. E. P. A., Inc. believes that the USAF has significantly underestimated the noise levels that will be experienced by citizens living in the affected areas and their resulting annoyance to those noise levels. On this matter, therefore, H. E. P. A. is submitting a report entitled, "Comments on the Air Force Noise Analysis in the Realistic Bomber Training Initiative Draft Environmental Impact Statement" by Dr. William Weida in Appendix D. It is the opinion of H. E. P. A., Inc. that due to the flaws and misrepresentations on noise measurements contained in the DEIS that the DEIS is invalid.

BR-1

AO-74 Noise varies according to the type aircraft, its altitude and its speed. The DEIS never states at what speed its noise models were based on. The DEIS also fails to state what percent use of each altitude per aircraft that its noise model was based on.

AO-74 **Table 4.1.1 Representative A-Weighted Instantaneous Maximum (L Max) Levels at Various Altitudes** shows type of aircraft and altitude (feet AGL) but no aircraft speeds on which this table is based are shown.

AO-74 **Figure 4.1-2 Noise Levels From an Overflight Last Several Seconds** shows B-52 traveling at 350 knots at 500 feet AGL and B-1 traveling at 550 knots at 500 feet AGL. What speeds were

13

001130

AO-74 used to calculate the maximum (L max) levels at 300 feet, 1,000 feet, 2,000 feet, 3,000 feet, 5,000 feet and 10,000 feet? What speeds were used on F-16, Tornado, F-14, F-18, and B2 at each of the altitudes described in the chart? The table needs to include the same information on C-17, C-141, T-38, and T-1 since they will also be flying in Lancer. The table also needs to show the information based on 200 feet AGL since this is the MTR floor.

> "SEL's decrease as altitude increases and vary according to the type of aircraft, its altitude or distance from the observer, and its speed."
>
> "Integrated aircrew training is achieved when all members of the crew are working together as a team to perform the events and activities in sequence, and with the speed and pace of combat." (page 1-4)

What maximum speed is used in actual combat for B-52, B-1, F-16, Tornado, F-14, F-18, B-2, C-17, C-141, T-38 and T-1? We would assume that training would test upper and lower limits of

AO-112 the speed of each aircraft involved. The study has failed to show what noise conditions would result from the maximum airspeed of each aircraft involved at various altitude levels. What speed restrictions would apply to MTR, MOA, ATCAA?

H.E.P.A. Table 4.1 Maximum Speed of Aircraft:

Aircraft	Speed
B-1B Lancer	900 plus mph (Mach 1.2 at sea level)
B-52 Stratofortress	650 mph (Mach 0.86)
F-16 Falcon	1,500 mph (Mach 2 at altitude)
Tornado	1371.6 plus mph (Mach 1.8 +) *
F-14	1371.6 plus mph (Mach 1.8 +) *
F-18	1371.6 plus mph (Mach 1.8 +) *
B -2	High Subsonic *
C-17 Globemaster III	575 knots (Mach .875)
C-141B Starlifter	500 mph (Mach .66)
T-38 Talon	812 mph (Mach 1.08 at sea level)
T-1 Jayhawk	538 mph (Mach .73)

* Exact maximum speed not found

14

001130

AO-113 **Tables A-1 & A-2 Maximum Distance-Based on Optimum ASD from Barksdale AFB and Dyess AFB** refer to an airspeed of 420-mph enroute to IR, MTR, MOA and to base. This speed was for transit times to and from base and did not include low level high-speed combat training along MTR and in MOA. However, in **Fig. 4.1-2 Noise Levels From an Overflight Last Several Seconds**, the noise level for B-52 was calculated at 402 mph (61 % of the maximum airspeed), less than the enroute speed, not at "low-level high speed training" conditions.

AO-114 The citizens must be given the exact parameters of speed, altitudes, type aircraft, number of days the noise level was averaged over (260 flight days, or 360 days in a year), number and distribution of aircraft in airspan, number of sorties per day (not sortie operations). In essence the public needs to see the actual work paper prepared for the noise study.

Assessing Aircraft Noise Effects

Discusses annoyance, human health considerations, noise-induced hearing loss, speech interference, and sleep disturbance.

On the subject of "HEARING LOSS", the DEIS states on page 4-13:

> "Studies on community hearing loss from exposure to aircraft flyovers near airports showed that there is no danger, under normal circumstances, of hearing loss due to aircraft noise (Newman & Bettie 1985)."

Conditions of flyovers near airports in urban areas, and at low speeds necessary for take off and landings do not correlate in any way to rural settings of bombers and fighter planes capable of

AO-112 Mach 1.2 and Mach 2 airspeeds at 200 feet AGL conditions. Is it true that some maneuvers contemplated in the RBTI to be conducted in the proposed Lancer MOA could be done at full throttle? Were noise studies conducted for full throttle noise exposure? If not, why not?

15

001130

The DEIS states on page 4-13,

> "The conclusion of no risk to hearing loss as a result of low-altitude flight noise is also supported by a recent laboratory study that measured changes in human hearing from noise representative of low-flying aircraft on MTR'S (Nixon, et al. 1993). In this study, participants were first subjected to four overflight noise exposures."

A study based on 4 overflights cannot be compared to conditions of proposed Lancer project, which would consist of:

IR-178	2660 sortie operations
Lancer MOA	2350 sortie operations
IR-154	70 sortie operations
IR-128/180	150 sortie operations
VR-1116	30 sortie operations

These flight operations could last for an indefinite period of time. What are the cumulative effects for 25 years or more?

Dr. Alice H. Suter, Conference Consultant to the Administrative Conference of the United States: Noise and Its Effects (H. E. P. A. Appendix F) states the following:

> "Hearing loss is one of the most obvious and easily quantified effects of excessive exposure to noise. Its progression, however, is insidious, in that it usually develops slowly over a long period of time, and the impairment can reach the handicapping stage before an individual is aware of what has happened. While the losses are temporary at first, they become permanent after continued exposure, and there is no medical treatment to counteract the effect. When combined with presbycusis, hearing loss naturally occurring with the aging process, the result is a premature impairment that grows inexorably with age."
>
> "Because noise damages the ear's ability to perceive high-frequency sounds much earlier and more severely than the low-frequency sounds, individuals with noise-induced hearing loss are at a particular disadvantage in understanding speech."
>
> "As the hearing loss progresses, these individuals avoid social occasions and situations where they must listen at a distance, like church and theater. The eventual result can be loneliness and isolation."

16

001130

> "The laboratory allows for strict control of noise level and duration, but the durations are usually relatively short because of the time and expense involved. Also there is some controversy over the extent to which the results can be generalized to humans."

AO-126 The Air Force has used 2 studies that do not relate in any way to the Lancer proposal and concluded there will be "no hearing loss" to the Lancer citizens. Valid "same condition" studies must be cited in order that the "decision makers" have adequate information to make an informed decision. Was Dr. Suter's work considered in the DEIS? If not, why not?

On the subject of "SLEEP DISTURBANCE", the DEIS states on page 4-13:

> "Although considerable progress has been made in understanding and quantifying noise – induced annoyance in communities, quantitative understanding of noise – induced sleep disturbance is less advanced."

It further states on page 4-13:

> "To date, no exact quantitative dose-response relationship exists for noise-related sleep interference…"

If no conclusive studies have been completed on noise-related sleep interference in general or in rural, low altitude, high-speed conditions in specific, how can the Air Force assume "a limited number of noise-related awakenings"? Since "quality sleep is recognized as a factor in good health", the Air Force is assuming that the health of the citizens will not be jeopardized.

On page 4-14, the DEIS says,

> "Annoyance that may result from sleep disturbance is accounted for in the calculation of DNL, which includes a 10-dB penalty for each sortie occurring after 10:00 PM or before 7:00 am. No RBTI alternative generates a noise level of 65 DNL, so all noise levels would fall below the USEPA guideline of 45 DNL."

The above USAF statement seems to be in direct conflict with information contained in the Noise Control Act of 1972, which states on page 28:

> "An indoor L_{dn} of 45 dB will permit speech communication in the home, while an outdoor L_{dn} not exceeding 55 dB will permit normal speech communication at approximately three meters. Maintenance of this identified outdoor level will provide an

17

001130

> indoor L_{dn} of approximately 40 dB with windows partly open for ventilation. The nighttime portion of this L_{dn} will be approximately 32 dB, which should in most cases, protect against sleep interference."

AO-115 The citizens need clarification on the different sleep disturbance DNL used by the Air Force (45 DNL) and the one used by the Noise Control Act (32 DNL). Which is correct?

Was an additional 10 dB penalty assessed to account for sudden onset when considering sleep? disturbance?

Appendix G 1.2.1 states:

> "The highest A-weighted sound level measured during a single event in which the sound level changes value as time goes on (e.g., an aircraft overflight) is called the maximum A-weighted sound level or maximum sound level, for short. It is usually abbreviated by ALM, L_{max} or L_{Amax}. The maximum sound level is important in judging the interference caused by a noise event with conversation, TV or radio testing, sleep or other common activities".

However, the Air Force did not use maximum sound levels, but instead used DNL averaged levels as a basis for asserting their assumption of "limited number of noise related awakenings."

AO-26 Many hunters, recreationists and ranchers on roundups sleep outdoors and would not have a 20 dB noise insulation. Have these conditions been taken into consideration? If not, why not?

A similar concern was recently stated by the U.S. Fish and Wildlife Service in their response to the Draft EIS dated May 7, 1999 (H.E.P.A. Appendix O).

> "The discussion of Aircraft Noise Assessment Methods (pages 4-5 to 4-14, and pages 4-23 to 4-24) has limited relevance to assessing impacts on federal lands or resources, such as natural quiet (i.e., the natural soundscape unaffected by human noise sources), or on a park visitor's experience, which may range from a few hours to a few days at most and may occur mostly out of doors seeking such things as solitude, tranquility, and natural environment (including natural sounds). This limited relevance is probably also true for other outdoor recreation and natural areas. While the NPS is still evaluating the utility of noise metrics to assess impacts in the very wide variety of park units, some matters are becoming clear. The Department supports the use of Lmax and SEL metrics in combination with Percent Time Audible and one-hour Leq metrics which have proven to be important for assessing noise impacts on most park resources and visitors. The cumulative metric Day-Night average sound Level (DNL), which is an annualized 24-hour average relevant to residents of an area, has no relevance at all to impacts on a visitor's experience or

18

001130

> federal resources. For example, if a visitor's once-in-a-lifetime visit to a NPS area includes a 100+ dB aircraft event of even a few seconds, it may be one of the most memorable parts of the visit, regardless of the event's effect on the DNL. Whether that memory is positive or negative, it will not be part of the purpose of any of the parks in the study area, so it will detract from the intended visitor experience."

BR-1 Yet, the Air Force continues to use DNL as their standard of noise measurement in the DEIS. It should be obvious that the USAF continues to use DNL as it's standard because it tends to artificially "average down" the noise levels to intentionally understate the noise levels to be experienced by residents.

Dr. Alice Suter (H. E. P. A. Appendix F, page 20) states:

> "Noise is one of the most common forms of sleep disturbance, and sleep disturbance is a critical component of noise-related annoyance. A study used by EPA in preparing the Levels Document showed that sleep interference was the most frequently cited activity disrupted by surface vehicle noise (BBN, 1971). Aircraft noise can also cause sleep disruption, especially in recent years with the escalation of nighttime operations by the air cargo industry. When sleep disruption becomes chronic, its adverse effects on health and well-being are well-known."
>
> "As a result of many years of research on the effects of noise on sleep, it is clear that intermittent and impulsive noise is more disturbing than continuous noise of equivalent energy … "

AO-26 The Lancer project must not go forward without definitive sleep disturbance studies based on maximum sound levels and without divulging the information criteria used to calculate the DNL levels. Was Dr. Suter's work on this subject considered? If not, why not?

In regard to Air Force use of studies on annoyance, human health, hearing loss, speech interference and sleep disturbance-

1.) The studies used were for urban settings not rural settings.

2.) Assumptions with no verifiable studies were considered accurate.

3.) Many studies that had totally opposite conclusions were not considered.

19

001130

Dr. Alice Suter's report (H. E. P. A. Appendix F, pg. 3) states:

> "Noise has a significant impact on the quality of life, and in that sense, it is a health problem in accordance with the World Health Organization's (WHO) definition of health. WHO's definition of health includes total physical and mental well-being, as well as the absence of disease. Along these lines, a 1971 WHO working group stated: 'Noise must be recognized as a major threat to human well-being.' (Suess, 1973)
>
> The effects of noise are seldom catastrophic, and are often only transitory, but adverse effects can be cumulative with prolonged or repeated exposure. Although it often causes discomfort and sometimes pain, noise does not cause ears to bleed and noise-induced hearing loss usually takes years to develop. Noise-induced hearing loss can indeed impair the quality of life, through a reduction in the ability to hear important sounds and to communicate with family and friends. Some of the other effects of noise, such as sleep disruption, the masking of speech and television, and the inability to enjoy one's property or leisure time also impair the quality of life. In addition, noise can interfere with the teaching and learning process, disrupt the performance of certain tasks, and increase the incidence of antisocial behavior. There is also some evidence that it can adversely affect general health and well-being in the same manner as chronic stress."

On the subject of "HEALTH", the DEIS states on page 4-14:

> "The potential for noise to affect physiological health, such as the cardiovascular system, has been speculated; however no unequivocal evidence exists to support these claims (Harris 1997). Conclusions drawn from a review of health effect studies involving military low-altitude flight noise with its unusually high maximum levels and rapid rise in sound level have shown no increase in cardiovascular disease (Schwartze and Thompson 1993). Additionally, claims about flyover noise producing increased mortality rates and increases in cardiovascular death, adverse effects on the learning ability of middle-and low-aptitude students, increase in admissions to mental hospitals and adverse affects on pregnant women and the unborn fetus are similarly unsupported (Harris 1997)."

AO-108

The Air Force uses two studies Schwartze & Thompson 1993 and Harris 1997 to conclude that there are no health related hazards to low-altitude high-speed flight noise. The Air Force has dismissed the many other studies (without even a cursory examination or mention of the merits of these studies) that generated completely different conclusions to the two above mentioned studies. Schwartze & Thompson 1993 and Harris 1997 must be attached in the appendix so the public will be aware of the evidence the studies are based upon.

We are including references here to three studies done in Germany which draw negative conclusions which were apparently ignored in the DEIS.

001130

These German studies have recently been conducted that address in specific military low-altitude flight noise and health effects.

The study "Acute Circulatory Effects of Military Low-altitude Flight Noise", Michalak, et al. (H. E. P. A. Appendix J) states the following:

> "In the general population unexpected low-altitude flight noise with fast level increase to very high maximal levels often leads to a shock reaction with serious physical effects. Examination of reactions of important functional systems (e.g. cardiovascular) must take place in a real-life situation where the noise exposure is not an expected event."
>
> "An analysis of low-altitude flight noise effects has to take into account dependence of noise impact on several factors. One of these is age."
>
> "Low-altitude flight noise differs from noise from other sources in that it involves very high maximal sound levels and a fast noise level increase at high flight speeds. It has been suggested that noise from low-flying combat aircraft produces strong and potentially dangerous physiological reactions when the noise level rapidly increases.
>
> For this reason we studied the dependence of various circulatory indices (e.g. blood pressure) and of behavioural shock reactions on the speed of noise level increase and on the maximal noise level. The effects of noise on humans often do not decrease with longer exposure time (habituation), but rather increase (sensitization). In animal experiments, there is a relatively rapid conditioning of effects of low-altitude flight noise (Beyer 1983). Conditioning means an increase in sensitivity. Therefore in this investigation of the acute effects of low-altitude flight noise, we also consider the question of sensitization, that is, whether physiological reactivity is changed by repetitive noise stimulation."
>
> "Since the maximum systolic blood pressure increase was the most striking feature of this investigation, we give the individual maximal values for emphasis: Two persons, i.e. 4% of the total group, had blood pressure increases of more than 40 mm Hg after four low-altitude flight noise exposures with Lmax = 106 dB(A) – twice with a slow and twice with a fast level increase.
>
> Behavioural shock reactions were evident only after the two noise exposures with fast level increase. Both exposures led to shock reactions in 10 to 20% of the subjects."
>
> "The results of the control tests are presented in Fig. 7. Noise exposure with a slow level increase did not cause any shock reactions or subjective complaints. Fast level increases, however, resulted in obvious behavioural shock reactions which were observed in 1 to 3 person per group at Lmax = 106 dB(A) and higher levels. Two subjects reacted so intensively to the second exposure with 112 dB(A) that a repetition would have been medically unethical. Because of the low number of subjects in this group, an additional exposure of four persons to 110 dB(A) and a fast level increase, one subject discontinued

001130

> participation in the experiment because of sickness. In this case the heart rate was raised by 21 beats per minute."

Another study done in Germany by Ising, *et al.* titled "Annoyance and Health Risk Caused by Military Low-altitude Flight Noise" (H. E. P. A. Appendix J) states the following:

> "Summary. Effects of noise of low-flying military jet aircraft were investigated from demoscopic and epidemiological points of view. Areas with different low-altitude flight noise exposure were compared with one another as to subjective annoyance, casual blood pressure and ear symptoms. With the same energy equivalent sound pressure level (Leq), the subjective disturbance caused by military low-altitude flight noise was essentially greater than that due to ordinary flight noise (in the neighbourhood of civil airports). A comparison of several areas revealed that frequencies of ear symptoms (tinnitus lasting more than one hour and permanent hearing threshold shifts of >30 dB) were higher only in areas where maximal flight noise levels considerably exceeded 115 dB(A) accompanied by rapid noise level increases. Blood pressure measurements yielded significantly higher values (group difference 9 mm Hg systolic) in girls living in these highly exposed areas."
>
> "Humans exposed to low-altitude flight noise suffer annoyance, long-term health risks (partly due to continual annoyance), acute functional reactions and possible acute health risks. Recent research on low-altitude flight noise confirms that its effects – especially in quantitative respect – differ from those caused by other types of noise. The public continually complains about annoyance due to low-altitude flight noise although its energy equivalent continuous noise level is comparatively low compared with that of other types of noise. Furthermore, there is public fear of eventual noise-induced health risks.
>
> The intense effects of low-altitude flight noise can be related to its physical characteristics. The unusual physical features of this type of noise are the extremely high maximal sound level and the very rapid increase in sound level in the case of a direct overflight. The maximal sound levels of the most frequent overflights are in the range of 100 to 115 dB(A), but higher levels of up to 125 dB(A) occur, although much less often. Level increases up to 75 db/s and beyond (200 dB/s and more, Spreng, et al. 1988) were measured.
>
> Maximal levels of more than 100 dB(A) with rapid level increases are rarely produced by other environmental noise sources. Levels of 100 dB(A) may be found for instance in the immediate vicinity of civil airports, but here the level increase speed is markedly lower and special noise protection measures are usually taken.
>
> The annoyance due to overflights increases with the maximal sound level and the frequency of occurrence of single overflight events. In spite of the fact that very loud overflights can cause very strong effects, annoyance can be estimated approximately by means of the energy equivalent continuous sound pressure level (Leq) measured in low altitude flight areas. However, the increase in annoyance with Leq is considerably greater in the case of low-altitude flight noise as compared with other noise, e.g. civil aviation noise.
>
> As well as causing the usual effects due to ordinary noise (e.g. acute disturbances in work, communication, recreation and sleep), low-altitude flight noise also causes sleep disturbances even during quiet nights which follow days in which there are many overflights. In the case of small children extreme anxiety states may occur. Overflights interrupt communication of any kind and those with high sound levels and rapid sound level increase are very often accompanied by behavioural shock reactions.

001130

> The space and time unpredictability of low-altitude overflight noise contributes substantially to the high reactivity of those people exposed to that noise. Near airports, there is, of course, no such space unpredictability because of fixed air corridors.
>
> Such effects are claimed by the majority of those people temporarily or permanently resident in low-altitude flight areas."
>
> "In common types of jet aircraft, a speed increase of 20% beyond 420 kn (778 km/hr) leads to a noise level increase of about 12 dB."
>
> "Any analysis of the effects of low-altitude flight noise has to be based on the physical peculiarities of this kind of noise, its extraordinary high maximal levels and rapid level increases.
>
> In general the principle of energy equivalence is used as a basis for the measurement of varying noise. However, the physiological effects of noise are more intense at higher time discontinuity (e.g. Brandenberger et al. 1980; Follenious et al. 1980). As stress research has shown (e.g. Selye 1976), the compensability of stress effects is strongly attenuated when the momentary exposure exceeds certain threshold, or in other words, when the controlling range is exceeded at the input.
>
> In the context of adaptation characteristics, maximal level and level increase speed are main determinators of reaction intensity. In case of a fast increasing noise, it is conceivable that neuronal circuits cannot adapt and this could lead to an intense and also longer lasting reaction of the autonomic nervous system. Therefore, the unusually high maximal levels and the rapid level increases have to be taken into consideration in any assessment of the potential health effects of this stressor. For the same reason, the effects of low-altitude flight noise are more intense than might be expected from its Leq.
>
> The immediate effect of low-altitude flight noise exposure is annoyance. Furthermore, an acute health hazard for risk persons must be taken into account (Ising and Michalak 1990). In addition, long-term exposure may lead to health risks in both auditory and non auditory domains."
>
> "*Auditory effects*. The ear is protected by mechanisms which are activated by high sound levels (e.g. reduction of sound transmission into the inner ear by the stapedius reflex, decrease of the oscillation amplification of the basilar membrane by a reduction in the active motion of the stereocilia of the outer hair cells which is mediated by efferent nerve fibres).
>
> Since military low-altitude flight noise reaches its maximal level in a short time, several adaptation processes and reflex protection mechanisms are unable to function completely effectively, so that a damage risk to the inner ear is higher than with slowly increasing noise."
>
> "*Non-auditory effects*. Acute stress-induced blood pressure increases in animals can lead to chronically increased blood pressure after long-term noise stress (Peterson et al. 1981) Furthermore, Schächinger et al. (1988) provide empirical data from a prospective study that persons with a high blood pressure reactivity to mental stress have an increased risk for the later development of hypertension. Thus, the size of acute blood pressure responses to noise stimuli seems to determine a possible long-term effect of chronic noise exposure."

001130

Another study "Specific Features of Military Low-Altitude Flight Noise: Criteria for Risk of Damage and Physiological Effects" by M. Spreng (H. E. P. A. Appendix J) states:

> "Compared with other forms of environmental sound, the sonic impact of military low-altitude flight is characterized by
> - high maximum levels (up to 125 dB lin)
> - rapid, impulsive rises in pressure level (up to 111 dB/s)
> - high concentration of energy in frequency range 0.8 – 4 kHz
> - secondary follow-up oscillations (approx. 30%) up to ca. 90% of the primary maximum level.
>
> **Assessing risk of cochlear damage by means of maximum level and impact time**
>
> "The predominant effect of impulse sound of this kind are irreversible changes and damage to the particularly sensitive, fine, hair-like protein processes of the sensory cells in the basal area of the cochlea, near the stapes.
>
> "Animal experiments have demonstrated that even relatively low sound levels and also relatively brief impact times affect these stereocilia, leading to disarray, fusion, wrinkling, even tilting and disruption, accompanied by changes in the membrane."
>
> "We can see clearly from morphological changes found in animal experiments that such damage does occur to the stereocilia."
>
> "As one might expect, noise from low-altitude flying also influences other physiological functions of the human being."
>
> "That is why low-altitude flight noise, which reaches considerable levels from virtual silence at a high rate of increase, can be expected to exert a particularly pronounced influence on vegetative parameters."
>
> "It is above all the single flight events which clearly illustrate those extreme vegetative changes provoked by low-altitude flight noise such as ISING and MICHALAK recorded in 1990 [2], and which must be classified as dangerous in relation to risk groups."

Why were the results of these studies ignored in the DEIS and a determination of "no impact" made without considering these works? They appear to clearly indicate several significant human health dangers that could be produced by the RBTI.

24

001130

On page 4-14 of the DEIS the Air Force states:

> "The potential for noise to affect physiological health, such as the cardiovascular system, has been speculated; however no unequivocal evidence exists to support these claims."

However, the above cited studies by Michalak et al., Ising et al., and Spreng are evidence that studies have been conducted to address low-altitude military flights and the concluding evidence states that there are negative health effects. The Air Force is negligent in not citing these studies but instead claiming no evidence exists.

NEPA regulations Section 1502.22 Incomplete or Unavailable Information states:

> "When an agency is evaluating reasonably foreseeable significant adverse effects on the human environment in an environmental impact statement and there is incomplete or unavailable information, the agency shall always make clear that such information is lacking.
>
> (a) If the complete information relevant to reasonably foreseeable significant adverse impacts is essential to a reasoned choice among alternatives and the overall costs of obtaining it are not exorbitant, the agency shall include the information in the environmental impact statement.
>
> (b) If the information relevant to reasonable foreseeable significant adverse impacts cannot be obtained because of overall costs of obtaining it are exorbitant or the means to obtain it are not known, the agency shall include within the environmental impact statement:
>
> 1. A statement that such information is incomplete or unavailable;
>
> 2. a statement of the relevance of the incomplete or unavailable information to evaluating reasonably foreseeable significant adverse impacts on the human environment.
>
> 3. A summary of existing credible scientific evidence which is relevant to evaluating the reasonably foreseeable significant adverse impacts on the human environment, and
>
> 4. the agency's evaluation of such impacts based upon theoretical approaches or research methods generally accepted in the scientific community. For the purposes of this section, 'reasonably foreseeable' includes impacts which have catastrophic consequences, even if their probability of occurrence is low, provided that the analysis of the impacts is supported by credible scientific evidence, is not based on pure conjecture, and is within the rule of reason."

25

001130

EPA 1974 "Information on Level of Environmental Noise Requisite to Protect Public Health and Welfare With an Adequate Margin of Safety" states the following:

> "Until more information exists, judgments of environmental impact must be based on the existing information, however incomplete. The most simple approach is to assume that animals will be at least partially protected by application of maximum levels identified for human exposure."

By ignoring present research, the USAF appear to be violating both NEPA and EPA regulations.

The RBTI must not go forward until these issues are properly studied and all relevant data addressed in an unbiased way. The health, hearing ability, and quality of life of all citizens in the Lancer MOA are at risk.

A comparison of **Table 4.1-1 "Representative A-Weighted Instantaneous Maximum (Lmax) Levels at Various Altitudes," Figure 4.1-3 "Representative A-Weighted Sound Exposure levels at Various Altitudes"** and **Figure G-1 "Typical A –Weighted Sound Level of Common Sounds"** indicate a wide variance in sound levels based on same criteria. None of the tables indicate what airspeed was used for the data.

- Indicates information was not available in the DEIS.
* No information was given in the DEIS on C-17, C-141, and T-38 aircraft that will be using the Lancer airspace.

NOTE: Keep in mind that the human threshold for pain is around 120 dB.

Footnote #1 to Figure 4.1-3 states:

> "The values shown represent average sound levels. These levels may vary by ½ dB depending on the application of power and speed."

However, a comparison of the three DEIS tables shows sound level variances of up to 12 dB. For example, a B-52 at 10,000' is shown to have a dB of 71 on one table and a dB of 83 on another

001130

table. Which table is correct? Which table was the noise study based on? Why is there a noise variance of 12dB, when the Air Force has stated only ½ dB variance would occur depending on application of power and speed? An explanation is needed on all inconsistencies in the above tables.

Thus far the Air Force has not disclosed the number of sorties to be flown in Lancer - only sortie operations. The Air Force also gives no breakdown of kinds and number of sortie operations or speeds of aircraft that were used to calculate the noise levels in the Lancer proposal.

The Air Force Environment, Safety and Occupational Health (ESOH) Technical Planning Integrated Product Team (TPIPT) was created to address ESOH needs within all mission support areas. The Air Force is fully aware that it is lacking in noise models that fit the rural environment of the Lancer proposal -as verified by their own documented list of "Current Technology Needs". (H. E. P. A. Appendix A.)

The citizens of Lancer feel the Air Force has presented a false "no impact" outcome for the DEIS in order to go forward with the RBTI.

AIR COMBAT COMMAND

NEED	TITLE
1410	A New Method is Needed to Gather Defensible Aircraft Operational Data for Use in Determining Noise Levels for Aircraft Beddowns/Realignments and the Air Insulation Compatible-Use-Zone Program
1411	A Quantitative Dosage-Response Relationship for Predicting the Effects of Noise Is Required
1412	Methods Are Needed to Assess the Annoyance Of Sporadic Exposure to Sonic Booms and the Combined Annoyance of Noise Exposure of Subsonic and Supersonic Operations

001130

1413	Model Updates to the Assessment System for Aircraft Noise (ASAN) for Prediction of Noise Exposure from Military Aircraft Operations and the Resulting Impact to Humans, Animals, and Structures.
252	The AF, in Many Cases, Must Reduce Mission Rates Because of Community Noise Concerns
450	Need Analytical Methods to Determine Environmental Impacts of Sonic Boom from Launch Vehicles and Sonic/Supersonic Airplanes through Air Propagation and Underwater Propagation.

In 4.1.1 the DEIS states under "AIRCRAFT EMISSIONS & AIR QUALITY" on page 4-14:

> "Because military aircraft are mobile… they commonly contribute little to the total emissions in a region. This is especially true since they fly at altitudes where emissions would tend to be dispersed and not result in effects on human health or visibility."

Yes, usually aircraft fly at altitudes where emissions would disperse. However, the RBTI proposal is unusual in that it proposes to fly at low levels at high speeds that create greater emissions. In the proposed Lancer MOA emissions would increase in all areas overflown. In some cases the increase is as great as 19,900%. Even though the Air Force has assured us that these added emissions would be in attainment of NAAQS standards – any increase in emissions is still of great concern to the Lancer citizens. Are there any cumulative effects of these emissions over a number of years?

AO-1

H.E.P.A. Table 4.1-2 The Net Increase and % Increase in Emissions Resulting From the Lancer Proposal
(Reference Table F-1 and F-2)

Total Emissions (tons/year)

MTR/MOA	CO		VOC		NOx		SOx		PM_{10}	
	Net Increase	Percent Increase	Net Increase	Percent Increase	Net Increase	Percent Increase	Net Increase	Percent Increase	Net Increase	Percent Increase
IR-178	154.86	59%	16.12	44%	298.7	59%	40.41	58%	35.6	46%
Proposed Lancer MOA	56.4	1880%	3.4	1700%	27.9	3100%	8.3	2075%	1.99	19,900%

001130

What company did the Air Force contract to test the baseline emissions in each of the 26 counties involved in the Lancer proposal? The final report from this company must be attached to the DEIS. Did the emissions for baseline include secondary MTR'S, vehicles, oil field etc. (i.e. all emissions)?

AO-70

The DEIS states on page 4-34,

> "Added emissions in AQCR 153, 210, 211 and 218 would be dispersed over hundreds of miles and thousands of feet of altitude. Such dispersal would likely preclude ground – level concentration of criteria pollutants leading to exceedences of the NAAQS… Mails modeling confirms that Alternative B aircraft operations would not cause potential exceedences of the NAAQS or PSD Class I Standards (Table 4.1-12)."

In the DEIS Appendix F Pages 16-20 show some of the criteria used to determine the USAF conclusions. However, Appendix F consists totally of charts and tables with no explanations at all. The airspeeds used to calculate emissions at 300 feet altitudes were less than the airspeeds used for enroute to MOA and MTR (Table A-1 and Table A-2). Several questions need to be answered concerning the data.

AO-62

1.) Why did the Air Force not use maximum airspeeds for the emissions data?
Example: F-16 maximum speed = 1,500 mph, USAF used 575 mph (38 % power)
2.) What does the heading Flight Frequency mean and why did the Air Force use the flight frequency they used?
3.) Why was data excluded on F-18, F-14, T-38, C-17, C-141? These planes will be flying in the Lancer airspace also.
4.) How was the 1 – hour concentration calculated?
5.) What does the number of aircraft types designate?
6.) Does the data include several planes flying in formation and several sortie operations over the test area in the averaged period of time?

001130

AO-62

7.) Since emissions increase with airspeed, this data should reflect the maximum emission exposure to the Lancer citizens and it does not.

F-16 airspeed used was 38 % of maximum.

B-1 airspeed used was 70 % of maximum

B-52 airspeed used was 61 % of maximum

Tornado airspeed used was 35 % of maximum

8.) Why was the altitude of 500' used for F-16 and Tornado instead of 200'?

9.) Why did the baseline Altitude Data on Alternative A use 200' AGL and projected emissions in Alternative B and C use 300' AGL?

10.) How can the citizens compare the increase in emissions from baseline data unless the projected emission is based on the same AGL of 200'?

The USAF states in the DEIS on page 4-36,

"Since the results of analysis show that emissions from the projected sortie-operations represent a fraction of regulatory standards and all affected areas are in attainment, Alternative B would not lead to nonconformance for any criteria pollutants. Consequently, a conformity analysis is not required."

The USAF also states in Table 2.6-1 under "Aircraft Emissions" on pages 2-60:

"Aircraft emissions produce minimal quantities of criteria pollutants and ground level concentrations of pollutants are fractions of Federal and State standards."

AO-66

However, the following USAF generated "Current Technology Needs" documents # 1417 and # 992 (H. E. P. A. Appendix B) state that the USAF is not in compliance with NAAQS Air Quality Standards. In fact, USAF is using JP-8 jet fuel on almost all its bases and JP-8 jet fuel has not been tested for atmospheric releases of criteria and hazardous air pollutants. (See Need #'s 1417 and 992)

001130

NEED	TITLE
Need # 1937	Drop-in Replacement for Halon 1301 and Halon 1211 on the B-2 Spirit
Need # 1939	Replacement of Hydrazine Used As A Fuel in the Emergency Power Unit of the F-16
Need # 535	Alternative Methods for Purging Fuel Tanks
Need # 165	Drop-In Replacement for Halon 1301 Fire Suppressant for B-1B
Need # 1417	Analyze JP-8 Fuel to Speciate All Criteria and Hazardous Air Pollutants Called For in the CAA That Result From Combustion and Volatilization
Need # 992	Emissions Data Required for All Air Force Aircraft Using JP-8
Need # 943	Develop an Alternative Nontoxic Monopropellant for Hydrazine for the F-16 Emergency Power (EPU)
Need # 413	Real-Time Detectors for Sub 1.0 ppb Hydrazine Fuel Vapor Monitoring at CCAS and VAFB

The USAF has also failed to disclose that the "F-16 Emergency Power Unit" currently employs Hydrazine, a hazardous material as the propellant. Hydrazine is toxic at low levels and it is suspected to be a carcinogen and mutagen. The Clean Air Act (1990 Amendments) lists Hydrazine as a "Hazardous Air Pollutant". (H.E.P.A. Appendix B) which states,

"The lethal concentration (LC_{50}) – a calculated concentration of a chemical in air to which exposure for a specific length of time is expected to cause death in 50 % of a defined animal population."

AO-95

Lethal concentrations causing death was never discussed in the DEIS. In fact, Hydrazine was never even mentioned in the DEIS. Why not?

AO-117

The USAF has also failed to disclose that B-1, B-2, F-16, and other aircraft use Halon 1211 and 1301 as a fuel tank inerting agent and fire suppression systems. The Clean Air Act calls for a complete phase out of the production of Class I substances (Halons) by January 1, 2000. Halon

001130

1211 and 1301 are among the most potent ozone depleting materials being manufactured at this time. Furthermore, a total U.S. production phaseout by the year 1995 has been directed by Presidential order. However, the USAF Need # 1937 (H.E.P.A. Appendix B) document states that the USAF has an existing stockpile of Halon 1301 and 1211 to last for the next 200 and 150 years respectively. The F-16 consumption is estimated to be 16 lbs/sortie. Halon (Bromomethane) is listed as a hazardous air pollutant by the 1990 Amendments of the Clean Air Act and is toxic to humans and animals. (H.E.P.A. Appendix B)

AO-1

The Air Force felt it unnecessary to inform the citizens of Lancer of the health and environmental effects of NOx, CO and SOx emissions since the present proposal does not exceed regulatory standards. However, since the Lancer proposal will be the second largest Special Use Air Space in the United States, we can reasonably expect many future proposals to come. In 1993 The Utah Test and Training Range complex saw 24,898 sorties by all users. The utilization rates for FY 1995 included 1,996 bomber sorties (not sortie – operations, but sorties). The citizens need to be aware now of the health and environmental effects of increased emissions of NOx, CO and SOx and what this will mean to them.

The Environmental Protection Agency Fact Sheet # EPA420-F-97-010 (April 1997) states the following:

"NOx is harmful to human health and the environment. Nitrogen dioxide, a form of NOx, can reduce pulmonary function and increase airway irritation in healthy people as well as individuals with pre-existing pulmonary conditions. The risk of respirator illness appears to increase in children exposed to nitrogen dioxide. NOx contributes to acid rain, which affects both terrestrial and aquatic ecosystems, including acidification of waters, reductions in fish populations, damage to forests and wildlife, soil degradation, and damage to materials, monuments, and buildings. NOx is also a precursor to ozone, which affects both biological tissues and man-made materials. Ozone affects human pulmonary and respiratory health and causes damage to forests and vegetation. NOx emissions could also form secondary particulate matter, which causes detrimental health and welfare effects."

001130

"CO also has significant human health effects. CO enters the blood stream through the lungs and reduces the delivery of oxygen to the body's organs and tissues. Persons with heart disease are especially sensitive to CO and may experience chest pain when breathing CO. Infants, elderly persons, and individuals with respiratory diseases are also particularly sensitive. CO can affect healthy individuals, impairing exercise capacity, visual perception, manual dexterity, learning ability and the ability to perform complex tasks."

"SO_2 contributes significantly to the formation of acid rain, which harms lakes and streams, and can damage trees, crops, historic buildings, and monuments. Adverse health effects associated with high concentrations of SO_2 include effects on breathing, respiratory illness, and aggravation of existing respiratory and cardiovascular disease. Asthmatics, the elderly, and children are most susceptible to the health effects of SO_2."

"In May 1996, EPA announced its decision not to revise the existing health-based or primary national ambient air quality standards for SO_2. EPA believes that the current standards provide adequate nationwide protection from adverse health effects associated with sustained, low-level exposure to SO_2. EPA also believes that the current health-based standard, in conjunction with the existing 3-hour welfare-based standard, provides substantial protection for most asthmatics against acute, short-term peak exposures to SO_2."

"However, EPA remains concerned that some asthmatics in very localized situations may be repeatedly exposed to short-term peak SO_2 levels of concern while engaged in mild physical activity. Therefore, EPA is today proposing a new Intervention Level program to address the potential health risks posed by short-term peak levels of SO_2 in specific, localized circumstances."

On the subject of "AIR CRAFT SAFETY" found in the DEIS on page 4-16

"For the major aircraft types using the primary and secondary airspace (B-1, B-52, F-16 and Tornado), Class A mishap rates are quite low. (Figure 4.1-7) Based on the flying hours for the different major aircraft types under each alternative, these mishap rates are used to compute a projection of the estimated years between Class A mishaps in each affected MTR and MOA. Actual mishaps result from many factors, not merely the amount of flight time by an aircraft."

In the DEIS page 4-54, Table 4.1-23, the Air Force states:

"The probability of a B-1 Class A mishap on proposed IR-178 would be 0.08 percent per year and for B-52's, the probability would be 0.03 percent. The probabilities of Class A mishaps in all other primary airspace would be even lower."

001130

The Air Force defines a Class A Mishap as an accident that results in a loss of life, permanent total disability, and total cost of more than $ 1 million, or destruction of the aircraft beyond repair.

In Table 4.1-13 Estimated Class A Mishaps for Primary Airspace for Alternative B, the DEIS shows projected years between mishaps on IR-178 to be 13 years for B-1, 38 years for B-52 and projected years between mishaps in Lancer MOA/ATCAA to be 27 years for B-1, 583 years for B-52. No safety data is given for the other aircraft types that will be using Lancer airspace (F-16, B-2, C-17, C-141, T-38, T-1 or Tornado).

AO-116

However, the data provided by the Air Force Safety Center at Kirtland AFB shows very different statistics than the Air Force is stating in the DEIS. (H. E. P. A. Appendix C) Kirtland AFB compiles USAF peacetime incident data on USAF Aircraft.

1.) B-1 statistics show that in the last 12 years (1987-1998) there were 12 Class A major accidents (1 per year), 6 destroyed aircraft (.5 per year), 6 pilot fatalities, 11 other fatalities, and 1 major accident for every 24,245 hours flown (233,451 actual hours flown in 12 years).

2.) B-52 statistics show in the last 43 years (1956-1998) there were 97 Class A major accidents (2.25 per year), 76 destroyed aircraft (1.76 per year), 100 pilot fatalities, 311 other fatalities, and 1 major accident for every 76,958 hours flown (7,464,991 actual hours in 43 years).

3.) F-16 statistics show that in the last 24 years (1975-1998) there were 246 Class A major accidents (10.25 per year), 234 destroyed aircraft (9.75 per year), 66 pilot fatalities, 101 other fatalities and 1 major accident for every 22,814 hours flown (5,612,324 actual hours flown in 24 years).

4.) C-17 statistics show that in the last 3 years (1996-1998) there were 3 Class A major accidents (1 per year), -0- destroyed aircraft, -0- fatalities, 1 major accident for every 30,053 hours flown (90,159 actual hours flown in 3 years).

001130

5.) C-141 statistics show that in the last 33 years (1966-1998) there were 34 Class A major accidents (1.03 per year), 16 destroyed aircraft (.48 per year), 34 pilot fatalities, 161 other fatalities, 1 major accident for every 296,420 hours flown (10,078,291 actual hours flown in 33 years).

6.) T-38 statistics show that in the last 37 years (1962-1998) there were 189 Class A major accidents (5.1 per year), 183 destroyed aircraft (4.9 per year), 75 pilot fatalities, 134 other fatalities, 1 major accident for every 329,742 hours flown (12,200,458 actual hours flown in 37 years).

7.) T-1 statistics show that in the last 7 years there were –0- Class A major accidents in the 276,647 hours flown.

8.) Tornado- (Not available)

H.E.P.A. Table 4.1-3 CLASS A MAJOR ACCIDENTS AS REPORTED BY KIRTLAND AFB

	# Years	# Class A Major Accidents	# Class A Accidents Per Year	# Aircraft Destroyed	# Per Year Destroyed	Total Pilot Fatalities	Total Other Fatalities	Hours of Per Major Accident
B-1	12	12	1	6	.5	6	11	24,454
B-52	43	97	2.25	76	1.76	100	311	76,958
F-16	24	246	10.25	234	9.75	66	101	22,814
C-17	3	3	1	0	0	0	0	30,053
C-141	33	34	1.03	16	.48	34	161	296,420
T-38	37	189	5.1	183	4.9	75	134	329,742
Tornado	Not	Available						
F-18	Not	Available						
F-14	Not	Available						

Since the majority of B-1 and B-52 flight time would occur over the new RBTI area, the citizens can anticipate 3.25 crashes per year from these two aircraft alone. Air Combat Command Safety Statistics on low-level high speed training are maintained at Kirtland AFB also. However, these statistics are not available to the public and the USAF has chosen not to mention or use these flight safety statistics in the DEIS. Logically, the potential of military aircraft accidents and crashes is greatly increased by low altitude flight training.

001130

"In addition to the direct effects from an aircraft crash (i.e., damage to the aircraft and the point of impact) there may be secondary effects, such as fire and environmental contamination. The extent of these secondary effects is situational dependent and difficult to quantify." (DEIS page 4-16)

The USAF failed to mention in the DEIS that military jet air crashes pose a toxic danger. Carbon based composite materials are highly toxic when burned. They chemically alter and are dispersed over a wide area at crash sites. The release of the material is biologically malignant and should be treated like asbestos. We are sure the USAF is aware of post crash management techniques – sites have to be sealed and there could be downwind contamination posing dangers to the public in the area of such incidents. According to an article by Lt. Col. Ezequeil Parrila, Langley AFB, Virginia, "As far as the physical hazard, bloodborne pathogens can be a serious problem along with composite materials and other burning substances."

AO-49

A USAF Memorandum concerning "Response to Aircraft Mishaps Involving Composite Materials (Interim Guidance) (H. E. P. A. Appendix C) states the following:

"The current guidelines for response to aircraft mishaps involving composite materials were developed in 1993 by the USAF Advanced Composites Program Office (ACPO). These guidelines were developed prior to the introduction of the B-2 and C-17 into the Air Force inventory. Because these weapon systems contain much greater amounts of composite materials than those in the inventory at the time of the development of the guidelines, both the ACPO and the Air Force Safety Center have expressed concerns over their adequacy. There is also renewed interest in composite fiber hazards resulting from aircraft recovery crews working at a recent aircraft mishap site without recommended protective equipment (details "Official Use Only"). As a result of these concerns, the Industrial Hygiene Branch was requested to provide updated guidance on health hazards and protective equipment requirements for recovery operations associated with composite aircraft mishaps."

"There are two distinct phases of an aircraft mishap: initial response and recovery. Initial response teams face the probability of an aircraft fire. As the composite material burns, gases, vapors, and solid particles are released into the smoke plume. Fire fighting personnel may be exposed to toxic gases and fibers in the smoke or fibers present on parts when performing rescue operations."

"The amount of fibers and dusts generated will dictate the hazard. In addition, because aircraft debris is frequently handled, there is the possibility of personnel receiving composite fiber splinters."

001130

"Insoluble fibers with diameters of less than 3-um, length greater than 5-um, and an aspect ratio (length/width ratio) of greater than 3:1 may have the most significant disease potential, and are considered the most hazardous [17]."

"Fire fighting personnel will normally be adequately protected when they respond to an aircraft fire involving composite materials. However, recovery teams may be formed from other organizations who do not maintain adequate protective equipment. It is important these teams be protected as they move or modify the aircraft wreckage. Until we obtain additional sampling data on the hazards present during recovery operations, personnel disturbing or moving aircraft parts should wear the following…"

"Have other hazards been identified, such as large quantities of spilled jet fuel or location of radioactive parts, such as depleted uranium?"

Table 1 of this document shows that all aircraft using the proposed Lancer airspace contain hazardous composite fiber.

The DEIS implies on page 4-27 under "Aircraft Safety" that bird strikes will not be a problem and says, "No bird-aircraft strikes have been recorded during the past 11 years in the primary MOAs. This low rate may be the result of two factors. First, aircraft in MOAs predominantly operate at altitudes above which most bird-strikes occur (e.g., 3,000 AGL). Second, the lands underlying the MOAs lack areas that attract large concentrations of birds." The DEIS further states on page 4-36, "Neither the existing nor proposed airspace in Alternative B overlies or intersects any major migration flyways or water bodies where birds congregate." H. E. P. A. believes these statements are completely false. Much of the area in the proposed Lancer MOA lies in the central flyway for migratory birds and furthermore much of the area is in the wintering grounds for the Sandhill Crane. In fact, the USAF was appraised of these facts and specifically the danger associated with Sandhill Cranes at a March 1998 hearing referred to in the attached correspondence from David Haukos, Regional Migratory Bird Management Specialist, dated February 25, 1998 (H.E.P.A. Appendix O). Why were the facts presented at the March 1998 meeting not addressed in the DEIS?

BI-2

001130

The omission of this reference is either gross negligence or intentional in light of the fact that this letter refers to a presentation made on March 11, 1998 at the Air Force Southwest Region Airspace/Range Management Council Meeting in Santa Fe, N.M. Does the USAF believe that 300,000 – 400,000 annual wintering Sandhill Cranes in Lynn County, TX do not constitute a "large concentration of birds"?

BI-11

H.E.P.A. believes that the USAF has further misrepresented the nature of its cooperation with other agencies. As an example, in 4.3.1 page 4-85, the DEIS states,

> "The Air Force and the USFWS are currently in consultation under Section 7 of the Endangered Species Act regarding RBTI". (page 4-85)

Yet in the attached correspondence from the U.S. Department of the Interior, Fish and Wildlife Service, dated May 7, 1999, (H.E.P.A. Appendix O) the USFWS specifically denies that it is in current consultation with the Air Force on this matter, saying:

> "We request that the discussion about threatened and endangered species be clarified and corrected. The references to an on going consultation with the U.S. Fish and Wildlife Service (Service) are in error."
>
> "Thus, the statements that the Air Force is currently in consultation with the Fish and Wildlife Service (pg.4-85) should be corrected."

How does the USAF explain this blatant misrepresentation of the truth?

AO-118

No mention was made in the DEIS of the accident rate of jet fuel spills during air to air refueling. In the DEIS Appendix A, Table A-1 and Table A-2 show that every sortie spends 60 minutes in air refueling even though a B-1 has a range of intercontinental unrefueled, a B-52 has a range of 8,800 miles unrefueled. What is the accident rate of jet fuel spills during air to air refueling?

BR-2

No mention was made in the DEIS of the "see and avoid" regulation used by all private aircraft in military air space. Currently aircraft fulfilling the Texas Bollweevil Eradication Program,

001130

spraying crops for weeds and aerial spraying of mesquite, and other private aircraft use this air space.

An article entitled, "In the Blink of an Eye' by Lt. Col. Dennis Selvig, USAF (RET), Sumter, South Carolina (http://www.acc.af.mil/public/combat-edge/May99/debrief.htm) states the following concerning the dangers of "see and avoid":

> "This is a true story of what I experienced several years ago as an F-15 Instructor Pilot at Luke AFB AZ. After this harrowing sortie, I learned how a pilot's alertness impacts the ability to quickly process immediately available information. Maintaining a ready state of mind can make the difference between life and death. Read on to find out why…"
>
> "I don't know if you know how big an F-5 is at 1 mile range and pure nose on. Try to imagine your refrigerator. Take that fridge down the highway a mile, drop it off, and drive back to where you started. Look back. Kind of small down there, isn't it? I couldn't see anything at a mile. As we were closing into each other, I saw a dot… then a dot with wings and a tail. My next image was of an F-5 right beside me, the left about 20 feet and slightly low. The pilot was hunched over in the cockpit, and I could see the back of his helmet as he flashed by. His shock wave jolted me in my cockpit. I must have had an angel flying with me that day—our jets were definitely too close for comfort.
>
> At the debriefing, I asked him why he was hunched over when he went by. He said, 'Because I thought your wing was going to cut my head off! That was a minus 2-G push over.' I felt kind of stupid about not taking any action to avoid the situation, but then I realized he was able to do something only a second or so before we met – probably because he had a little bigger image to see."
>
> "Things that are coming at you 'fast' aren't where you see them—they're closer. OK, still with me? Hang in there while I explain another lesson from safety school. It takes a finite amount of time for an image to travel from your eyeballs back along your optic nerve to your brain. Then you have to process that image. Closing in at 800 knots, the approaching aircraft would be at your front doorstep in just 'a blink of an eye.' Therefore, we need to realize that what we see out there coming at us at supersonic closure is really a lot closer than it seems due to our limited image processing/reaction time."
>
> "After all, a lot can happen in just a 'blink of an eye.'"

001130

4.1.3 Alternative B: IR-178/Lancer MOA

AIRCRAFT NOISE

> "Noise levels in the proposed Lancer MOA/ATCAA would increase from less than 45 DNL to 46 DNL in response to added sortie – operations…. With flight activities restricted to above 3,000 feet AGL, cumulative and single overflight noise levels would remain low." (DEIS page 4-29)

H. E. P. A. has compiled the following data out of the DEIS as cited:

H.E.P.A. Table # 4.1-4-Compilation of Data from Air Force Figure 4.1-3 and Figure G-1 at Unknown Speeds

	% Night	At 3,000	At 20,000
B-2	-	98	73
B-1	20 %	98	70
B-52	15 %	86	56
F-16	7 %	87	56
F-14	1 %	93	60
F-18	1 %	96	62
Tornad	7 %	85	60
T-38	1 %	-	-
C-141	1 %	-	-
C-17	1 %	-	-

\- No information given in the DEIS.

Is 85-98 dB considered low? The proposition that there are "low levels" seems preposterous.

Table 4.1-9 Projected Average Daily Sortie–Operations and Noise Levels Alternative B is shown on page 4-30. This table shows only 2 increases in DNL noise level in the entire Lancer proposal.

> IR-178 would increase by 1 DNL.
>
> Lancer MOA would increase by 1 DNL.

Table 2.2-1 & Table B.2 shows IR-178 annual sortie – operations would increase by 1,100 operations at 200 feet AGL and Lancer MOA would increase by 2,244 operations at 3,000 feet AGL.

001130

The baseline data for Reese 4 MOA was 3 sortie operations per year at 10,000 feet MSL. The baseline data for Reese 5 and Roby MOA was 103 sortie operations per year at 12,000 feet MSL.

PD-33

The baseline data for IR-178 was 1,560 sortie operations per year at 200 feet AGL. This baseline data apparently includes sortie-operations, which are not scheduled to take place until some future year. How can these be validly included in "baseline" calculations? This systematically underestimates all new and proposed activity by falsely raising "baseline" data.

AO-119

The Air Force expects the citizens to believe there will only be 1 DNL increase of noise when there will be a 70 % increase in sortie operations in IR-178 and a 2116 % (a 21 fold increase) increase in sortie operations in Lancer MOA at a significantly lower floor. This conclusion by the USAF appears to be an intentional misrepresentation or gross negligence and in any event should invalidate the DEIS.

Furthermore the statement, "Under the proposed Lancer MOA/ATCAA, the percent of highly annoyed would remain very close to that as under existing Reese 4, Reese 5, and Roby MOA's (less than 1 percent)," on page 4-29, is a complete misrepresentation of the facts.

How can the USAF believe they can fly 2,350 sortie – operations at 3,000 feet AGL and the citizens will not be any more annoyed than by 106 sortie operations at 10-12,000 MSL? The USAF needs to go forward with their noise research - Needs # 1410, 1411, 1412, 252, 1413, and 450 as soon as possible, but in any event before a final EIS is prepared.

La Junta, Colorado has 705 baseline sortie operations per year (Table 2.2-1 –IR-150 and IR-177/501.) USAF factsheet on La Junta ESS (www.nellis.af.mil/range/99rs/lajunta.htm), Colorado states:

> "The site has numerous noise complaints towards low level aircraft flying through IR's."

001130

Yet the Air Force states in the DEIS that the 2,350 sortie operations in the Lancer MOA would create less than 1 percent annoyance.

In reference to noise effects on recreation in National Forests, the DEIS states:

> "low altitude, high-speed aircraft were reported as the most annoying types of aircraft to hear or see" (DEIS page 4-56)

In reference to possible damage to structures the DEIS states on page 4-127,

> "Sound exposure levels would range from less than 86 to 116 dB. Studies indicate that low altitude overflights, even with noise levels above 120 dB, do not usually cause damage to buildings."

BR-1 Why would the noise exposure to buildings be any different than the noise exposure to citizens? The citizens will not experience noise on a DNL average; they will experience it as one deafening single blast of sound—just as buildings would. The DEIS should always assume that people in rural settings are outdoors, not insulated by buildings. Apparently, this was not done in the DEIS. Why not?

BR-1 A B-52 at 200' AGL (Figure G-1) produces a noise level of 121 dB at unknown airspeed. The human threshold for pain is 120 dB. The citizens want to know how many blasts of painful sound per day they are expected to tolerate—not the average DNL over a year. This again illustrates that the noise data used in the DEIS is fatally flawed so as to invalidate the DEIS.

The proposed emitter site locations in IR-178 are located along Interstate Highways, Principal Highways, and Farm to Market roads where a majority of traffic would be located. Emitter site locations # 81 and # 54 in Brewster County on Hwy. 118 (Hwy. 118 is designated a Texas Scenic Route); # 91 and # 93 in Pecos County along on Hwy. 285 (a Principal Highway); # 55 in Presidio County along FM Road 169; # 88 and # 89 in Reagan County along Hwy 61 (a Principal Hwy), and Hwy 33 and within 2 ½ miles of Big Lake; # 59 and # 60 in Reeves County along

001130

Hwy 285 (a Principal Hwy), and Hwy 17 (a Principal Hwy), within 7 miles of Interstate 20 and in the middle of Lake Toyah.

These Interstates, Principal Highways and FM Roads may look insignificant to some, but they are arteries to commerce for the rural people who live in the area. If aircraft traffic is to be centered around the use of the emitters, it certainly appears that a lot more citizens will be annoyed and a lot more citizens will be startled while driving thus jeopardizing their safety. The recreationist and tourists using Big Lake and Lake Toyah have a high potential of being annoyed also. The proposal flies over Interstate 10 for approximately 83 miles in IR-178 segment ST, RS, and NO at 400 feet AGL. It also flies over Interstate 20 for approximately 44 miles in IR-178 segments TU, VAVB, ACAD, AJAK at as low at 400 feet AGL.

How many people traverse these Interstates, Principal Highways and FM roads every day? How many citizens fish and boat on Big Lake and Lake Toyah? Did the Air Force research these considerations in their annoyance study?

The same is true of Lancer MOA. The emitter sites # 67 and # 65 in Borden County are located along Hwy 669 and FM Road 1610 within 3 miles of Lake JB Thomas; # 72 in Garza County along Hwy. 84 (a 4-lane divided highway); # 64 and # 95 in Scurry County between Hwy. 180 (a principal highway) and Fm Road 611, and Hwy. 84.

The startle effect of a motorist on an Interstate, Principal Highway, or FM Road has a great potential of being a major safety hazard – endangering lives and property.

001130

How many citizens traverse these principal highways and FM roads everyday? How many citizens fish and boat on Lake JB Thomas? Did the Air Force consider this in their annoyance and safety studies? If not, why not?

AO-120 The annoyance data supplied by the Air Force can not be accurate because it is based on urban, not rural, noise models. The data failed to take into consideration the placement of emitters on Interstates, Principal Highways and FM Roads. The data failed to consider the annoyance and safety of motorists experiencing the startle effect where MTR's cross Interstates, Principal Highways and FM Roads.

AO-14 The studies failed to consider (Table 4.2-5 Emitter and Electronic Scoring Site Land Use Under Alternative B) that air flight emitter traffic from emitters # 61, #62, # 60, # 64, # 66, # 82, and # 95 are within ½ mile to residential areas and towns; # 55, # 65, # 67 are within 1 mile to residential areas.

The studies of noise, annoyance, health effects, safety, hearing loss, etc. never mention **sonic boom effects** even though at least 6 aircraft using the airspace have supersonic capabilities. The information relating to speed was consistently misused, ignored, or not designated throughout the DEIS. If the Air Force will be using the proposed airspace for "high speed, low altitude Realistic Bomber Training", the citizens expect "high speed" to be taken into consideration in every facet of the studies included in the DEIS. The only speed designated in the entire study was on Table A-1 and Table A-2.

In Appendix **G 1.3.2 Land Use Compatibility,** the DEIS states,

> "In June 1980, and ad hoc Federal Interagency Committee on Urban noise published guidelines (FICUM 1980) relating Day – Night average sound levels to compatible land

001130

> uses… Since the issuance of these guidelines, federal agencies have generally adopted these guidelines for their noise analysis."

Table G-1 Land Use Compatibility with Yearly Day – Night Average Sound Levels shows FICUM 1980 regulations with explanatory notes. These guidelines pertain to urban noise and land use compatibility not rural noise and land use compatibility. In Table 2.6-1 the Air Force states "no likely effects to land use, recreation resources or visual settings" under Alternative B.

However, in the Air Force published "Current Technology Needs # 252" (pg. 19) the USAF states "The USAF land use planning guidelines have not been updated in 20 years."

As stated in USAF **Needs # 1413 Model Updates to the Assessment System for Aircraft Noise (ASAN) for Prediction of Noise Exposure from Military Aircraft operations and the Resulting Impact to Humans, Animals and Structures**

> "The animal impact studies will divide the efforts into studies on domestic animals and wildlife. Domestic studies will focus on the evaluation of economic loss and mitigation of adverse effects."

BR-4 If the USAF has no defensible or reliable studies on animals and wildlife how can they state the land use is compatible with RBTI? If the Air Force has no studies evaluating the economic loss of domestic animals and wildlife, they must not go forward with the RBTI until such studies are completed.

The economic viability of these 26 counties is dependent on livestock, farming related to livestock, cotton, oil and the hunting industry. If range cattle studies have not been conducted in "same condition" environments, then the land use compatibility is unknown. It would be reckless and irresponsible not to complete range cattle studies before the EIS is completed.

001130

In **4.2.1 Methods and Approach**, the DEIS states under NOISE EFFECTS ON COMMUNITIES AND LAND USE on page 4-56,

> "Another way to evaluate noise effects on land use is to assess the amount of change in noise levels that would occur as a result of an action…in general, most people can clearly notice a change of 3 DNL. Changes of 3 DNL or more, even below 65 DNL, can be perceived by people as a degradation of their noise environment (FICON 1992) or negatively affecting their quality of life."

Many tables throughout the DEIS refer to the noise DNL baseline in the Lancer MOA to be <45 (less than 45 DNL).

AO-121 The actual baseline # DNL was never given in the DEIS.

> "Ambient noise levels without aircraft operations can range from 34 to 45 DNL in rural areas and 32 to 54 DNL in wilderness areas." (Pg. 4-23)

The DEIS on page 4-23 the side bar states:

> "Ambient noise levels in wilderness areas can range from 20 to 60 DNL and are influenced by the sounds of nature such as thunderstorms, insects chirping, storms, and wind."

A baseline of <45 could actually be 20-34 DNL in our rural area. If the proposed Lancer MOA DNL is 46, an increase of 12-25 DNL would occur. Throughout the entire DEIS, the Lancer MOA change from baseline DNL is continually referred to as a change of <1DNL or 1 DNL. (Table 4.1-11, 4.1-9, 4.1-6, 4.1-4).

A change of 3 DNL can be perceived by people as a degradation of noise environment and quality of life. An increase of 12-25 DNL would degrade the noise environment and quality of life of all citizens, livestock, and wildlife under the 2.8 million acres of Lancer MOA by an unbearable amount.

The Air Force has grossly misled the citizens by using the term less than 45 DNL.

> "Under the proposed Lancer MOA/ATCAA, the percent highly annoyed would remain very close to that as under the existing Reese 4, Reese 5, and Roby MOA's (less than 1 percent)." (DEIS page 4-29)

48

001130

The Air Force must rectify all statements in the final DEIS to reflect the true increase in DNL and the percent highly annoyed.

The Air Force has continually used DNL instead of SEL to determine the annoyance and sleep disturbance percentage. In 1992, FICON recommended use of SEL (Sound Exposure Level) to determine sleep disturbance.

> "In 1992, the Federal Interagency Committee on Noise (FICON) recommended an interim dose-response curve to predict the percent of the exposed population expected to be awakened as a function of the exposure to single event noise levels expressed in terms of SEL." (DEIS page 4-29)

In the DEIS the Air Force states, "…revealed SEL as the best noise metric predicting noise-related awakenings." Yet throughout the DEIS, the Air Force has used DNL to reflect this disturbance, in order to make the annoyance and sleep disturbance appear to be less than it will be.

Appendix G states:

> "The maximum sound level is important in judging interference caused by a noise event with conversation, TV, sleep or other common activities." (1.2.1, page G-3)

Why wasn't maximum sound level used to determine noise interference?

In **4.2.3 Alternative B: IR-178/Lancer MOA**, the DEIS states under "AIR SPACE & FLIGHT OPERATIONS"

> "The primary land use outside population centers is livestock grazing. Approximately 86 percent of the land under the airspace associated with this alternative is privately owned rangeland used for grazing livestock (Figure 4.2-3). Approximately 11 percent of the remaining land is used for agricultural production."

Even though 86 % of the land under the Lancer Alternative is used primarily for grazing livestock, only a cursory 2-3 paragraphs is devoted to livestock in the entire DEIS. The Air Force has stated on page 4-93 of the DEIS "Range cattle have not been tested ... ," however in

49

001130

Table 4.2-15 they state "no likely effects to land use…" These two statements contradict each other – if one statement is true, then the other statement cannot be true.

BR-3 The Air Force "conclusion" has no basis in studies and no studies were put forth to substantiate their conclusions. The RBTI must not go forward without substantiated studies of "like kind conditions," –range cattle in a rural environment. Not to do so would be jeopardizing the economic viability of all citizens who use 86 % of the land under the proposal for livestock grazing.

In 4.2.3 under "EMITTERS AND ELECTRONIC SCORING SITES", page 4-65, the DEIS says,

> "All the emitters are located in remote, rural areas…"

If the Air Force considers locations along Interstate 10, Interstate 20, Principal Highways # 285, # 61, # 17, # 84, # 180 remote locations, I suppose the above statement could be true. Most people would not consider main traffic thoroughfares to be remote. Why not do a traffic use study on these main thoroughfares before concluding the percent of annoyed population? The Air Force never once mentioned the safety hazards of the "startle effect" to motorists along these traffic arteries.

AO-120

The emitter sites themselves may not be dangerous to motorists. The fact that airplanes will be flying over these sites at 300 feet AGL and 3,000 feet AGL is the danger.

On page 4-66, the DEIS states,

> "None of the sites are located in or adjacent to recreation areas."

Yet according to Appendix D which contains maps of emitter site locations, we find the following:

50

001130

LU-5

1.) Site # 88 and # 89 are within 2 ½ miles of Big Lake

2.) Site # 59 is on Lake Toyah

3.) Site # 65 is within 3 miles of Lake J.B. Thomas

How does the USAF define the word "adjacent?" Why are these emitter site locations not considered adjacent to recreation areas?

On page 4-66, the DEIS states,

> "There are no identified scenic resources or vistas within visual range of any site."

LU-6 Yet sites # 81 and # 54 are located right on Hwy. 118 which is designated as a Texas Scenic Route. How does the USAF reconcile this apparent conflict?

On page 4-66, the DEIS states,

> "While recreational uses such as horseback riding may occur on the parcels, the sites are privately owned and not generally available for public use."

Throughout the DEIS the Air Force continually discriminates against rural private property owners. Is it permissible to disturb private property owners riding horseback for work, but not the public riding in a recreation area? Is the duty of the government to protect the health and safety of its citizens to a lessor degree if they are on private property than if they are on public land?

LU-7

The DEIS states,

> "The Air Force purposely modified the IR-178 corridor to eliminate airspace over Big Bend National Park" (page 4-62)

Why? If the RBTI impacts are negligible, why move it off Big Bend National Park?

51

001130

LU-8 Is it okay to fly over rural citizens who live there permanently, but not over visitors on vacation who can go home and forget about it?

Air Force training is to protect the public and should be conducted over the 700 million acres of public land (National Geographic map "Federal Lands", October 1996) which comprises 1/3 of the Continental United States – a public trust unmatched in the world. To do otherwise is to discriminate against rural private property owners – making them bear the burden of living under combat conditions to expedite Air Force training. If the USAF is unable to locate a map of existing public land, H. E. P. A. can send one.

The DEIS states under "AIR SPACE & FLIGHT OPERATIONS" on page 4-68,

> "Land under most of the affected airspace has been subject to military jet overflights for more than 40 years. Low-level military aircraft are part of the existing environment." (Page 4-68)

This statement is a gross distortion of the facts.

Referring to **Table 2.4-3 Comparison of Existing & Proposed Area Under Alternative B: IR-178/Lancer MOA**

-1,907 statute square miles or 1,220,480 acres have never been overflown before.

-4,007 statute square miles or 2,564,480 acres have been overflown by 106 sortie operations per year at 10-12,000 MSL, not 3,000 AGL.

-Of the 10,897 square nautical miles in the Alternative B proposal,

13 % has never been overflown

28 % has had 106 sortie operations per year at 10-12,000 MSL

41 % (3.8 million acres) of the total proposed airspace has had light use or no use.

AO-3 We have no way to determine how long IR-178 has been overflown or the incremental increases of flights over the last 40 years. The Air Force will need to supply that corrected information.

The vast majority of land under the proposed Lancer MOA has been very lightly overflown at

001130

altitudes much higher than the proposed floor of 3,000' AGL and often by non-jet aircraft. USAF statements in the DEIS to the contrary are gross misrepresentations of the facts.

The DEIS covers the subject of "Wildlife" in 4.3.2 and then again in 4.3.3. The general discussions on wildlife do not adequately deal with the subject of specific game animals; namely, quail, white-tailed deer, mule deer, Sandhill Cranes, ducks, geese and turkey. These game animals are not only important in and of themselves, but they also are the foundation of the important hunting industry existing in the eight-county area underlying the proposed Lancer MOA (Alternative B). It would appear that the USAF conducted no studies on any of these game animals even though many of the concerns cited in the scoping meetings and in written

BI-12 comments made at that time related to wildlife. This DEIS is grossly lacking in any meaningful research on how the proposed RBTI will affect populations of our game animals in the overflown areas. Was any research conducted by the USAF on the aforementioned game animals specifically in the areas under the proposed RBTI? If so, no copies of that research have been cited or furnished to the public. If not, why not?

In 4.3.3 "Environmental Consequences" on page 4-95, the DEIS states,

> "The results of analysis, as presented below, demonstrates that neither airspace operations, construction, nor emitter and Electronic Scoring Site operations would significantly impact biological resources."

This statement is completely unfounded, represents a major flaw in the DEIS and renders the conclusions of the DEIS invalid.

Further, Appendix G seems to contradict the "no impact" conclusion of the DEIS relating to wildlife by stating the following:

> "The greatest impact to wildlife from aircraft overflights is from the visual effect of the approaching aircraft and the concomitant subsonic noise. Studies have shown that wildlife react to visual stimuli (e.g., aircraft overflights) that are below 1,000 feet AGL (Lamp 1989, Bowles 1995). Aircraft overflights and the associated noise can affect wildlife directly. Wildlife responses may include increased movement after an overflight, avoiding or leaving areas where overflights occur, changes in foraging patterns, and arousal of species-specific defensive behaviors (e.g., flight, aggression). Noise from aircraft overflights may also have indirect affects on wildlife such as masking. Masking occurs when noise interferes with the perception of a sound of

001130

> interest. For example, masking may affect predator avoidance and the detection of social signals (Bowles 1995).
>
> The effects of noise from aircraft overflights are difficult to assess because a number of adaptive responses may be involved, making the overt behavioral or physiological changes in response to noise highly variable. These responses include the acoustic startle, the orienting response, and other species-typical and individual strategies for coping with novelty, species-typical defensive behaviors, and responses conditioned by previous exposures to noise."
>
> "The primary concern with aircraft overflights, and the associated noise, is the startle effect."

This data clearly indicated potential problems that are not adequately addressed in the DEIS. How can this data be reconciled with the DEIS's statement of "no significant impact" on page 4-19?

BI-13
BR-4 The DEIS states that wildlife habituate to low-altitude aircraft; Appendix G states wildlife responses may include avoiding or leaving areas where overflights occur. Which position is correct? If wildlife leaves the area overflown in the RBTI, the property owners will suffer severe economic consequences. Why was this contingency not addressed in the DEIS?

Air Force Current Technology Need # 1413 Model Updates to the Assessment System for Aircraft Noise (ASAN) for Prediction of Noise Exposure from Military Aircraft Operations and the Resulting Impact to Humans, Animals, and Structures states the following:

> "**1.5 Need Description:** Because USAF requires the ability to conduct flight operations at its airfields, weapons ranges, and in designated airspace. This requirement is met by aircraft/mission realignments, acquiring and maintaining airspace, preventing or controlling encroachment of airfields and weapons ranges. Performance of this mission is dependent upon the ability to describe and assess, in a timely and defensible manner, the magnitude and impact of subsonic and supersonic noise, particularly noise impacts associated with Military Training Routes (MTRs) and Military Operating Areas (MOAs). New and refined methods of analysis are needed 1) to ensure Environmental Law requirements can be met without prolonged controversy, 2) to be consistent with mission requirements, and 3) to ensure Air Force actions in response to environmental issues are based on legally defensible, state-of-the-art description and analysis methods."
>
> "A major part of the USAF-EIAP effort involves the prediction of aircraft noise effects around air bases in over 350 MOAs, in restricted areas and along more than 600 MTRs, encompassing approximately one half million square miles of domestic airspace. The USAF must be able to predict aircraft noise levels in exposed areas, the effects of both subsonic aircraft noise and sonic booms on the populations, the dynamics of animal wildlife, health, and welfare of domestic animals, and damage to conventional and non-conventional structures."

001130

In order to satisfy Need # 1413, the U. S. Air Force/U. S. Fish and Wildlife conducted a literature search of information pertaining to animal hearing and the effects of aircraft noise and sonic booms on domestic animals and wildlife. The resulting document is entitled "Effects of Aircraft Noise and Sonic Booms on Domestic Animals and Wildlife: A Literature Synthesis." (H. E. P. A. Appendix G)

The following tables taken from the above mentioned literature synthesis sum up the negative effects to animals and wildlife.

Species	Type of noise	Effect
Domestic livestock:		
Various species	Sonic boom (80-370 mN/m2); low-level subsonic flights (50-200 m) (Nixon et al. 1968; Bond et al. 1974; Espmark et al. 1974).	Startle reaction
Dairy cow	Exploding paper bags (Ely and Petersen 1941)	Cessation of milk ejection
	General noise (105 dB) (Kovalcik and Sottnik 1971)	Reduces feed consumption, milk yield, and rate of milk release
	Tractor engine sound (97 dB) (Broucek et al. 1983)	Increased glucose concentration and leukocyte counts in the blood; reduced level of hemoglobin
	General noise (1 kHz, 110 dB) (Broucek et al. 1983)	Increase in glycemia, nonesterified fatty acids, creatin; decrease in hemoglobin and, thyroxin concentration

001130

Goat	Jet noise (Sugawara et al, 1979)	Reduced milk yield
Swine	General noise (108-120 dB) (Borg 1981)	Influence on hormonal system: increase of plasma 11-OH-corticosterone and catecholamines; decreased corticosteroid level
	General noise (93 dB) (Dufour 1980)	Aldosteronism (excess secretion of aldosterone from the adrenals)
	Recorded aircraft noise (120-135 dB) (Bond et al. 1963)	Increased heart rate
Sheep	White noise (100 dB) (Ames and Arehart 1972)	Higher heart rate and respiration rate; lower feeding efficiency
	White noise (90 dB) (Ames 1978)	Decreased thyroid activity
	General noise (4 kHz, 100 dB) (Ames 1978)	Increased number of corpora lutea; more lambs/ewe
Wild ungulates:		
Reindeer	Sonic booms (35-702 Pa) (Espmark 1972)	Slight startle responses: raising of head, pricking the ears, scenting the air
Caribou	Low-altitude aircraft (<200 ft): fixed-wing, helicopter (Klein 1973)	Running and panic behavior
	Low-altitude aircraft (<500 ft): fixed-wing, helicopter (Calef et al. 1976)	Escape or strong panic reactions
	General noise (Calef 1974)	Increased incidence of miscarriages; lower birth rates
Pronghorn	Low-altitude helicopters (150 ft, slant range of 500 ft; 77 dBA) (Luz and Smith 1976)	Running
Laboratory rodents and rabbits:		
Various species	General noise (150 Hz-40 kHz, 132-140 dB) (Anthony and Ackerman 1957)	"Anxiety-like" behavior
Guinea pig	General noise (128 dB SPL) (Beagley 1965); simulated sonic booms (130 dB) (Hajeam-Chargois et al. 1970)	Anatomical hearing damage; hearing loss
Mouse	Simulated sonic booms (Reinis 1976)	Auditory damage; inner ear bleeding
	Intermittent noise (110 dB)	Decrease in circulating eosinophils; adrenal

56

001130

	Intermittent noise (110 dB) (Anthony and Ackerman 1955)	Decrease in circulating eosinophils; adrenal activation
	Recorded subway noise (105 dB SPL) (Busnel and Holin 1978)	Longer time interval between litters; lower weight gain of young; increased incidence of miscarriage, resorption and malformations
	Continuous, high-intensity jet engine noise (127 dB); random onset noise (103-110 dB); high-frequency noise (113 dB) (Nawrot et al. 1980)	Decreased pregnancy rate (all groups); decrease in number of implantation sites per litter and fetolethal effects (high-intensity jet noise)
	General noise (106 dB) (Ishii and Yokobori 1960)	Teratogenic effects
Rat	General noise (105 dB SPL) (Moller 1978; Borg 1979, 1981)	Hearing loss; damage to inner ear structure
	General noise (80 dB SPL) (Borg 1978a,b,c)	Vasoconstriction
	General intermittent sound (Buckley and Smookler 1970)	Rise in blood pressure; hypertension
	Recorded thundercisps (98-100 dB SPL, 50-200 Hz) (Ogle and Lockett 1966)	Increased urinary excretion of sodium and potassium; excretion of oxytocin and vasopressin
	Electric buzzer (110 dB) (Sackler et al. 1959)	Decreased adrenal , body, thymus, spleen, liver, pituitary, ovary, and uterine weights; slight gain in thyroid weight; increased production of ACTH; inhibition of gonadotrphin, ovarian hormones, and possible inhibition of the thyrotrophic and thyroid hormones
	General noise (1 kHz, 95 dB) (Fell et al. 1976)	Suppressed thyroid activity
	General noise (120 Hz, 95-105 dB) (Jurtshuk et al. 1959)	Reduced glutathione levels in blood, increased adrenal weights and ascorbic acid; decrease in total adrenal cholesterol
	Intermittent noise(95 dB)(Hrubes and Benes 1965)	Increased secretion of catecholamines in the urine; increased free fatty acids in the blood plasma; increased weight of the adrenals; inhibition of growth
	General noise (92 dB) (Gamble 1982)	Persistent vaginal estrus prolonged vaginal cornification; higher preweaning mortality of young
	White noise (102-114 dB) (Friedman et al. 1967)	Change in the hypothalymus
	Electric bell (95-100 dB) (Zondek and Isacher 1964)	Enlarged ovaries; persistent estrus; follicular hematomas
	General noise (Zondek 1964)	Decreased fertility
omestic rabbit	White noise (107-112 dB) (Nayfield and Beach 1981)	Increased adrenal weights; decreased spleen and thymus weights

57

001130

	(Nayfield and Beach 1981)	thymus weights
	White noise (102-114 dB) (Friedman et al. 1967)	Change in the hypothalymus; higher plasma cholesterol and plasma triglycerides; fat deposits in the irises of the eyes; more aortic atherosclerosis and higher cholesterol content in the aortas
	Electric bell (95-100 dB) (Zondek and Isacher 1964)	Enlarged ovaries; persistent estrus; follicular hematomas
Chinchilla	Simulated sonic booms; general noise (65-105 dB) (Carder and Miller 1971, 1972; Reinis 1976)	Hearing loss; outer cell damage of the cochlea
Wild rodents:		
Desert kangaroo rat	ORV noise (78-110 dB SPL) (Brattstrom and Bondello 1983)	Temporary threshold shift in hearing
House mouse (feral)	Aircraft (110-120 dB) (Chesser et al. 1975)	Increased adrenal weights
Cotton rat	Recorded aircraft noise (110 dB SPL) (Pritchett et al. 1978)	Increased body weights; increased secretion of ACTH
	High-pitched whistles (Hepworth 1966)	Enlarged ovaries; persistent estrus; follicular hematomas
Carnivores:		
Domestic cat	Noisy laboratory (Liberman and Beil 1979)	Hearing threshold shifts; loss or damage to hair cells of inner ear
	General noise (100-1,000 Hz) (Miller et al. 1963)	Hearing threshold shifts
Domestic dog	Sudden loud noises (Stephens 1980)	Increase in plasma corticosteroid concentrations
Farm-raised mink	Simulated sonic booms (167-294 mN/m2) (Travis et al. 1974)	Brief startle reaction
Wolf/grizzly bear	Low-altitude fixed-wing aircraft and helicopters (Klein 1973)	Startle reaction; running
Aquatic mammals:		
Beluga whale	Boat traffic (Acoustical Society of America 1980)	Easily displaced
Pinnepeds	Sonic booms (80-89 dBA SPL) (Jehl and Cooper 1980)	Startle reactions
Elephant seal	Impulse noise created by a carbide pest control cannon (115.6-145.5 dBA) (Stewart 1982)	Alert behavior

58

001130

The Air Force funded the above study and was clearly aware of the stress-related effects to wildlife and animals. However, the DEIS determined a "no impact" conclusion.

Dr. Robert H. Horwich, Ph.D. in his summary, "Effects of Aircraft Noise on Wildlife and Domestic Animals" (H. E. P. A. Appendix H) states the following:

> "Environmental Impact Statements (EIS) rarely consider the effect of aircraft noise on wildlife due to the lack of field data and we must therefore rely on laboratory studies or limited field observations. The bibliographic abstracts and the literature synthesis compiled by the U.S. Fish and Wildlife Service in 1988 provides a great deal of information on the available subject. This research indicates the serious nature of noise affecting animals with few resulting benefits. These effects could result in long term population survival problems for wild species and health and production problems for farm animals. Thus, the burden of proof that there will be no adverse effects on wildlife, must fall on the Air National Guard.
>
> A sudden, unfamiliar sound such as aircraft noise, alarms an animal or human and activates the sympathetic nervous system, giving first a short term flight or fright response commonly found in many vertebrae species. This general pattern includes activation of the neural and endocrine systems, resulting in increased physiological stress, which when prolonged may even result in death and a lowered reproduction rate. Such effects, in response to noise include startle reactions, cessation of milk ejection, reduction in feeding and milk yield, increased glucose concentration and leukocytes with reduced hemoglobin, increased adrenal secretion, increased heart rate, decreased thyroid activity, increased miscarriages and lower birth rates, hearing loss due to anatomical damage, longer inter litter birth intervals, lower weight gain in young animals, decreased pregnancy, vasoconstriction, decreased organ weights, increased adrenal weight, higher mortality of young, and enlarged ovaries.
>
> The research done on the effects of noise on animals indicates major potential for problems from low-level aircraft flight noise which fall into four main categories: 1) short term responses of alarm and disturbance of feeding, 2) effects on the development of embryos and young animals, 3) direct injury from high intensity noise, and 4) long term anatomical and physiological responses to stress.
>
> 1. **Short Term Alarm Responses** – Short term stress responses are the initial responses to the visual and auditory stimulation of the low flying aircraft. Hoofed mammals such as caribou, big horn sheep, pronghorn antelope, and domestic sheep, goats and cattle respond to airplanes with startled panic responses. Secondarily they show reduced feeding and feeding efficiency which may have a major effect during the winter when physical resources are minimal. In domestic livestock this has resulted in a cessation of milk ejection, reduction of milk production and an affect in the meat. Game birds and birds in general, responded to low-level flight noise in startled flight similar to hoofed mammals. Birds respond to the overhead silhouette of an aircraft as they would to a predator.

59

001130

2. Effects on Development – Experiments with noise on animals have indicated that noise, both has deleterious effects on the development in a number of animal species from invertebrates to mammals including primates. Effects ranged from increased mortality, decreased feeding, reduced longevity, reduction in eggs, and reduced embryo viability.

3. Direct Ear Injury- Noise can induce seizures in mammals and can have a permanent effect on the ear, damaging hair cells in the cochlea of the inner ear. This can result in permanent hearing loss.

4. Long-term Physiological Stress – A variety of long term physiological effects resulting from low flying aircraft noise have been induced in a number of mammalian species. All of these effects are directly related to stress."

EPA, 1974, "Information on Levels of Environmental Noise Requisite to Protect Public Health and Welfare With an Adequate Margin of Safety" states the following concerning animals:

"Noise produces the same general types of effects on animals as it does on humans, namely: hearing loss, masking of communications, behavioral, non-auditory physiological effects.

The most observable effects of noise on farm and wild animals seem to be behavioral. Clearly, noise of sufficient intensity or noise of aversive character can disrupt normal patterns of animal existence. Exploratory behavior can be curtailed, avoidance behavior can limit access to food and shelter, and breeding habits can be disrupted. Hearing loss and the masking of auditory signals can further complicate an animal's efforts to recognize its young, detect and locate prey, and evade predators. Competition for food and space in an 'ecological niche' results in complex interrelationships and, hence, a complex balance.

Many laboratory studies have indicated temporary and permanent noise-induced threshold shifts. However, damage-risk criteria for various species have not yet been developed. Masking of auditory signals has been demonstrated by commercial jamming signals, which are amplitude and frequency modulated.

Physiological effects of noise exposure, such as changes in blood pressure and chemistry, hormonal balance and reproductivity have been demonstrated in laboratory animals and, to some extent, in farm animals. But these effects are understandably difficult to assess in wildlife. Also, the amount of physiological and behavioral adaptation that occurs in response to noise stimuli is as yet unknown.

Considerable research needs to be accomplished before more definitive criteria can be developed. The basic needs are:

- More thorough investigations to determine the point at which various species incur hearing loss.
- Studies to determine the effects on animals on low-level, chronic noise exposures.

60

001130

- Comprehensive studies on the effects on animals in their natural habitats. Such variables as the extent of aversive reactions, physiological changes, and predator-prey relationships should be examined.

Until more information exists, judgments of environmental impact must be based on the existing information, however incomplete. The most simple approach is to assume that animals will be at least partially protected by application of maximum levels identified for human exposure."

The EPA stated the above in 1974. More information did exist in 1988 with the Manci literature synthesis, however, the USAF chose to ignore it—even though the USAF funded the study.

BI-9 H. E. P. A. has cited sufficient data to conclude that the USAF should have been aware that the RBTI could cause significant damage to wildlife and animals in general.

In regard to livestock, the Air Force states the following in DEIS page 4-93:

"The effects of aircraft overflights and their accompanying noise on domestic livestock have been the subject of numerous studies since the late 1950's. These studies have examined the effects on a wide range of livestock including poultry, cattle, sheep, pigs, goats, and mink. Exposure to multiple real and simulated overflights at all altitudes provided the basis for testing the animals response. Several general conclusions are drawn from these studies:" (page 4-93)

"Overflights do not increase death rates or reduce productivity rates (e.g., birth rates and weights) among domestic livestock." (Page 4-93)

"Most large mammals, such as cattle and sheep, show no signs of startle or agitation." (Page 4-93)

"Domestic livestock, especially when in corrals, barns, or under other restrictions, habituate to overflights and noise, even near busy airports where noise is loudest and most infrequent." (Page 4-93)

BR-3 What definitions are being used for domestic livestock and range cattle? What distinctions is the Air Force making between the two? What air speeds and AGL criteria were used in these studies? If studies have been made on animals exposed to "real and simulated overflights at all altitudes", these studies must be cited.

61

001130

The DEIS states on page 4-93,

"Range cattle have not been tested, but historical interactions between the cattle and numerous overflights have not indicated a problem. For example, cattle have grazed under heavily used military space at Avon Park Range in Florida, Saylor Creek Range in Idaho, and Smokey Hill Air National Guard Range in Kansas for decades. At these training ranges, grazing cattle have been subject to upwards of 100 overflights per day, many as low as 100 feet AGL. No evidence exists that the health or well being of the cattle has been threatened. The animals, including calves, show all indications of habituating to the noise and overflights."

BR-3 What evidence has been gathered on these cattle? Who gathered the evidence and over what time span? Was this an actual scientific study or a mere observation? Was evidence gathered before overflights and after several years of overflights with a result comparison? If the Air Force is using the above information as a basis for their conclusion of "no impact on range cattle", they must cite the studies and include in the DEIS Appendix. This information needs to be available for review by all citizens.

The following is a cursory list of range cattle criteria that need to have answered on a "before overflights" and "after several years of overflights" (BO/ASYO) basis.

1.) Was the hearing ability of the cattle tested BO/ASYO?
2.) Were sleep patterns tested BO/ASYO?
3.) What were the conception rates BO/ASYO?
4.) Was feed consumption tested BO/ASYO? Did feed consumption drop off ASYO?
5.) Did milk production remain the same BO/ASYO?
6.) What were the weaning weights of calves BO/ASYO?
7.) Were abortion rates the same BO/ASYO?
8.) How much sickness, weight loss, and percent death were experienced in weaning calves BO/ASYO?
9.) What percent death loss was there BO/ASYO?
10.) How much vaccine and what kind was required to keep cattle healthy BO/ASYO?

62

001130

11.) Did the average daily gain on yearlings remain the same BO/ASYO?
12.) Did yearlings eating habits, sleeping habits, and vaccine requirements remain the same BO/ASYO?
13.) Did cows heat cycle remain the same BO/ASYO?
14.) Were producers able to use the same ratio of cow to bulls BO/ASYO – or did they need more bulls to breed the same number of cows?
15.) Did labor related costs increase due to more care required for doctoring sick cattle, repairing fences and pens torn down due to startle effect, regather cattle that have scattered due to noise, etc?
16.) Did vet costs increase due to cattle being injured due to startle effect?
17.) Did medical related expenses increase due to injury of cowboys thrown from horses, falling off windmill towers, etc.?
18.) What was the number of injuries to livestock BO/ASYO?

BR-3 All of the above questions need to be answered for horses, sheep, pigs, goats, and wildlife. The citizens asked these same questions during scooping and they were never addressed in the DEIS. This amounts to a fatal flaw in the DEIS, invalidating its conclusions.

If the Air Force has studies on the above list of items, they must cite the studies & attach in appendixes so they are available to all citizens. A blanket statement of "no evidence exists that the health or well being of cattle has been threatened" is not enough – especially since it is preceded by "range cattle have not been tested."

63

001130

The DEIS states,

> "A large bibliography of studies of aircraft noise on large stock has consistently minimized the effects of noise and vibration in the health and well being of many animal species. Without exception, these studies failed to provide conclusive evidence of any serious effect except trauma due to panic reaction." (G-13)

H.E.P.A. takes great issue with this statement. The Air Force itself has cited the study by Manci et al (H.E.P.A. Appendix G) entitled "Effects of Aircraft Noise and Sonic booms on Domestic Animals and Wildlife: A Literature Synthesis". A careful reading of the Manci study and the attached tables show numerous evidence of "serious effect" (see pages 53-57 of this report). Perhaps the DEIS believes that this evidence, produced in a study funded by the USAF, was not "conclusive". If that is the case then the USAF, having seen clear evidence of "serious effects", should conduct further, more "conclusive" studies before proceeding to prepare a final EIS.

BR-3

Further, the DEIS admits,

> "Infrequently some livestock startle in reaction to the rapid onset of an aircraft noise, but usually these animals have not been previously exposed to such noise." (Page 4-93)

Stress and trauma are very real concerns for all livestock producers. They can make or break an operation. The following is an article published in Ford Dodge Animal Health's "Cow/Calf Herd Health Guide." Fort Dodge Animal Health is a leading manufacturer of biological and pharmaceuticals engaged in the research and therapeutic products for the animal care industry.

> "Respiratory and reproductive diseases cost cow/calf producers millions of dollars a year in reduced productivity, infertility, delayed conception, medical treatment and death loss. Understanding how these diseases impact your business is your first step toward preventing them.
>
> **Bovine Respiratory Disease Complex**
>
> Bovine Respiratory Disease Complex (BRDC), or "Shipping Fever", is a general term for the pneumonia commonly seen in freshly weaned calves. The syndrome may be caused by several disease agents or other interacting factors.
>
> Stress is a major contributor to BRDC. Stressful events such as weaning, dehorning, shipping and weather changes can compromise the animal's immune system, making it susceptible to disease-causing viruses and bacteria. Although stress cannot be eliminated entirely from the cow/calf operation, it can be reduced through careful handling and sanitary conditions.

64

001130

> "....calves which survive respiratory disease often don't grow as fast or as large as calves which have never been infected. Affected heifers may also calve later than their healthy herd mates.
> The following respiratory diseases contribute to BRDC:
>
> - **Bovine Viral Diarrhea (BVD).** This is one of the most costly diseases of cattle. Signs include scours, nasal discharge, coughing and fever. BVD can also cause infertility, abortion and birth defects. Type 2 BVD is a severe form of this virus which can cause hemorrhaging and death in young calves and adult cows.
> - **Infectious Bovine Rhinotracheitis (IBR).** Also known as "Rednose", this highly contagious virus causes respiratory disease, abortions and infertility. Signs include inflamed nasal passages, fever, rapid breathing, deep cough and loss of appetite.
> - **Parainfluenza Type 3 (PI_3).** This is a common, mild respiratory disease which suppresses the animal's immune system, allowing other diseases to develop. The virus is shed in nasal and eye secretions, and infects nonvaccinated animals through the mouth and nasal passages.
> - **Bovine Respiratory Syncytial Virus (BRSV).** A sometimes fatal, stress-related infection which can cause mild to severe respiratory disease and reduce the animal's resistance to other diseases. Signs include coughing, high fever and runny eyes and nose.
> - **Haemophilus somnus.** H. somnus is a bacterial infection implicated in a variety of respiratory, neurological and reproductive disorders. H. somnus can be the primary cause of respiratory disease, or it can be an underlying infection that is masked by other disease-causing agents. Signs of H. somnus include fever, coughing, nasal discharge, labored breathing and abortion. Death without symptoms can occur.
> - **Pasteurella haemolytica and Pasteurella multocida.** These highly infectious bacteria are the major cause of pneumonia, and the most commonly found pathogens in cattle dying of respiratory disease. P. Haemolytica and P. multocida multiply quickly in the presence of stress, poor weather, or primary viral infections. Signs include depression, lethargy, loss of appetite and high fever. Death can occur suddenly with few signs of disease, or the animal can survive only to become a "poor doer" due to the lung damage caused by this disease."

A study by Waynert et al. "The Response of Beef Cattle to Noise During Handling" (H. E. P. A. Appendix K) concludes the following:

> "Noise is often overlooked as a potential source of fear for cattle during handling."
>
> "Fear causes both behavioural and physiological changes in cattle. A stimulus that is of high intensity, is novel, or presented suddenly, may be considered frightening (Wood-Gush, 1983)."

65

001130

> "Noise as a cause of fear in cattle is often overlooked, though some noise may be more irritating to cattle than people, since cattle can hear sounds of much higher frequencies than humans (Kilgour and Dalton, 1984)."
>
> "It has been shown that noise contributes to transport stress in calves (Francesco et al., 1990). Observations at slaughter plants indicate that animals held overnight in noisy yards were more agitated, and following slaughter were found to have more bruising, than animals kept in a quieter environment (Eldridge, 1988). Noise, such as the sound of a truck horn, was shown to increase the heart rates (HR) of free-ranging cattle (Arave et al., 1991), while cattle habituated to the sounds and sights of cars and trucks will readily graze along highways and seldom react (Grandin, 1997). This seems to indicate that it is the suddenness, novelty and the unexpected nature of sounds that elicit the fear response."
>
> "Heifers exposed to the playback recordings of the combined sounds of humans shouting and metal clanging (Noise) had higher heart rates and moved more during the testing period than their counterparts who were exposed to no recorded sounds (Silence) (Table 1). We believe the elevated heart rates and the increased movement are indicative of an increased level of fear experienced by the Noise heifers. Increased HR and escape movements are the normal components of the fear response in cattle and most other ruminants, thought Kilgour (1975) reported that one cow among 50 became immobile in response to a fearful situation during an open field test. In our two trials, the HR and the number of peaks were significantly correlated ($r_s = 0.48$ and $r_s = 0.47$, Spearman's rank order correlations, Trials 1 and 2, respectively), suggesting that both measures may be indicative of the level of fear. Alternatively, more movement may cause HR to rise due to a physiological response and not in response to fear. However, if HR increased simply due to a physiological response brought about through increased movement, then some aspect of the Noise treatment must have initially caused the Noise group to move more than the Silence group. We believe fear was a likely cause of the increased movement and therefore fear, either directly or indirectly, led to an increase in HR"

A study by Hyun, et al. "Growth Performance of Pigs Subjected to Multiple Concurrent Environmental Stressors" (H. E. P. A. Appendix K) concludes the following on pigs:

> "**IMPLICATIONS** Animal environments are complex and frequently comprise several stressors at once. Despite this, whether stressor effects on growth performance of pigs are additive, antagonistic, or synergistic was not known. This information is needed to better manage animal environments. The present data show that the detrimental effects of high ambient temperature, regrouping and reduced space allowance are generally additive. Therefore, removing a single stressor from a complex environment containing multiple stressors may substantially improve growth performance of pigs. This is important because some stressors are uncontrollable and therefore may be present even under optimal management."
>
> "Swine have the potential to reach mature market weight in 140 d or less, yet in the United States the average is 180 d. The factors that contribute to this lag in growth have not been fully defined, but environmental stressors are widely acknowledged to have an important role. The effects of many single stressors and a few two-stressor complexes have been reported for swine. Although the results indicate that stressors such as high

66

001130

> ambient temperature (Close et al., 1978; Lopez et al., 1991; Nienaber et al., 1991; Xin and DeShazer, 1992), regrouping (McGlone and Curtis, 1985; Bjork et al., 1988) and restricted floor space (Kornegay and Notter, 1984; Kornegay et al., 1993a, b; NCR-89 Committee on Confinement and Management of Swine, 1993), reduce feed intake and weight gain, it is difficult to extend information from single-stressor studies to production settings because pigs usually experience several stressors at once. Recently, the effects of six concurrent stressors and effects of sequential stressors on performance and several physiological and pathological traits in chicks were reported (McFarlane et al., 1989a, b; Johnson et al., 1991). When factorial combinations of six stressors were imposed, the effects generally were additive. For example, the percentage depression in feed intake and growth increased linearly as the number of simultaneously imposed stressors increased. Whether the effects of multiple concurrent stressors in swine are additive, synergistic, or antagonistic is not known."
>
> "To understand how different stressors that are present simultaneously influence growth performance, pigs were subjected to a factorial arrangement of treatments involving three stressors. The resultant data confirm previous studies that show that when presented alone high ambient temperature, reduced space allowance, and regrouping depress growth, feed intake, and feed conversion efficiency. The important finding was that when these stressors were presented together, as is often the case in typical swine production systems, the effects were generally additive. Because the effects were additive, these data indicate that removal of a single stressor can have substantial beneficial effects on the growth performance of pigs if the effects of the individual stressors are known."

Another study on pigs was done by Hick et al., "Behavioral, Endocrine, Immune, and Performance Measures for Pigs Exposed to Acute Stress" (H. E. P. A. Appendix K). The findings are as follows:

> "Stress represents the reaction of the body to stimuli that disturb its normal physiological equilibrium or homeostasis, often with detrimental effects (Khansari et al., 1990). One response to acute stressors is activation of the hypothalmic-pituitary-adrenal (HPA) axis, resulting in elevated corticotropin-releasing hormone (CRH). Corticotropin-releasing hormone stimulates the anterior pituitary to release ACTH and other peptides. Elevated ACTH stimulates the release of glucocorticoids from the adrenal cortex into the blood of stressed farm animals (Dantzer and Mormède, 1983). Shipping (Nyberg et al., 1988; Parrott and Mission, 1989), social stress (Parrott and Mission, 1989, electrical stimulation and heat stress (Becker et al., 1985), and feed and water deprivation (Houpt et al., 1983; Parrott and Mission, 1989) can increase plasma cortisol concentration in pigs. During the production and marketing of pigs, a number of stressful situations lead to production losses and pathological disease. Pigs are exposed to many environmental stressors (e.g., heat, cold, mixing, weaning, noise, and shipping) that can increase disease susceptibility and impair immune function (Kelley, 1980, 1985).
>
> Stress has possible effects on behavior, growth, endocrine, and immune measures. The objectives of this study were to determine the effects of relevant acute stressors (heat, cold, and shipping) on pig performance, physiology, and behavior."

67

001130

A study conducted by Scanga et al., "Factors Contributing to the Incidence of Dark Cutting Beef" (H. E. P. A. Appendix K) states the following about the economic cost to the beef industry from dark cutting beef resulting from stress:

> "The 1995 National Beef Quality Audit (NBQA) reported that dark cutting beef carcasses (dark cutters) result in a loss of $6.08 per animal harvested in the United States (Smith et al., 1995). Dark cutters result from preharvest stress, which depletes muscle glycogen stores and thus reduces the glycogen needed to produce the lactic acid that reduces the pH of postmortem muscle. The abnormally high pH (>6.0) increases the light-absorption and water-binding abilities of postmortem muscle and results in an undesirable, dark, firm, and dry cut lean surface (Lister, 1988). Even though this is understood at the clinical level, the stress factors that induce the condition are not as clear. Weather, growth promotants, genetics, disposition, and handling practices before harvest all may play a role in creating the dark cutting condition (Hedrick et al., 1959; Smith et al., 1993; Voisinet et al., 1997)."

A study by Stoebel et al., "Repeated Acute Stress During the Follicular Phase and Luteinizing Hormone Surge of Dairy Heifers (H. E. P. A. Appendix K) states the following:

> "These results suggest that brief stress can disrupt the preovulatory luteinizing hormone surge in the cow and that this effect may have significant implications for dairy management."
>
> "Studies have indicated that in large animals ovulation can be disrupted by periods of stress such as that encountered during transportation or severe climatic conditions, (2, 7)."

BR-3 Stress and trauma caused by overflights can seriously affect the health & well being of livestock. The USAF either knew of these negative studies or intentionally failed to address them or was grossly negligent in not properly researching the potential impact of the RBTI on animals.

4.4.1 Methods and Approach

LAND VALUES

The DEIS states,

> "Most direct and indirect socioeconomic effects associated with implementation of any action alternatives (Alternative B, C, or D) would occur in the immediate vicinity of where Electronic Scoring Sites and Emitter Sites would be constructed and operated." (DEIS page 4-109)

001130

Why does the Air Force consider most socioeconomic effects to occur around emitter sites? 86% of the land under the proposed Lancer MOA (Alternative B) is rangeland used for grazing livestock and "Range cattle have not been tested"! Furthermore, the whole subject of our existing hunting industry is not even mentioned, much less addressed. This is a socioeconomic effect which certainly does not only occur in the immediate vicinity of the emitter or scoring sites. This is a fatal flaw of the DEIS and invalidates its conclusions.

BR-4

On page 4-109, the DEIS states,

> "Other factors related to socioeconomics were identified during the public scoping period. Concerns were expressed that air craft overflights could effect land values, or economic pursuits such as ranching and tourism. Questions regarding land value near airports have been asked in many U. S. communities over the years and research has been conducted determining and quantifying the economic effect of noise around airports in urban settings. However, RBTI involves aircraft noise in a rural setting. The variability of land value due to the diversity of land uses, locations, and improvements makes it difficult to quantify potential impacts, if any, that might be associated with aircraft overflights."

BR-4 The whole subject of land values under the proposed Lancer MOA is extremely important, yet the USAF apparently intends to ignore the whole subject because it is "difficult" (see quote above) to study. In fact there are existing studies on how noise effects land values, both rural and urban. The USAF apparently does not feel that urban studies on the noise impact to real estate values noise are valid in rural settings, yet curiously, the basic noise research they use is almost entirely urban and the USAF intends to apply it in rural settings.

In the previously cited report by Dr. William Weida (H. E. P. A. Appendix D), Dr. Weida states,

> "Solid noise research has been available for years and has been made know to the Air Force. The results of this noise research are unambiguous – noise from aircraft operations lowers property values."

By failing to address these facts presented by Dr. Weida and others, the USAF has produced a flawed and incomplete DEIS.

001130

Furthermore, the subject of land values must deal with the potential loss of income from hunting and other recreational activities which will be negatively impacted by the RBTI. Dr. John S. Baen, the University of North Texas in Denton, TX., has studied this subject extensively. Dr.Baen recently filed a Declaration in the case of McCoy Land & Cattle Company et al VS. German Air Force , et al, in U.S. District Court, Pecos, TX. Division (H.E.P.A. Appendix N) on the subject of land valuation impacts from low-altitude jet overflights resulting in loss of hunting income. In this Declaration, Dr. Baen indicates property values for rural land much like that to be overflown by the RBTI will be significantly reduced as a result of the increased noise levels. Dr. Baen actually presents a formula for determining the cost of land value as a result of diminished hunting "lease" income.

BR-4 Since the USAF is a party to this lawsuit, it was well aware of this issue of lost hunting income and Dr. Baen's work. Yet, the USAF chose to ignore the works of Dr. Baen and others in the DEIS. Why? It appears to be obvious that loss of hunting will result in diminished land value. How could the USAF avoid this conclusion?

Further in March 1985 the FAA commented in Aviation Noise Effects (p101)

> "The bottom line is that noise has been shown to decrease the value of property approximately 1% decrease per decibel."

Example: 2.83 million acres Lancer MOA @ $250/acre average = $ 708,473,500.

A 12% decrease[1] in value would be $ 85 + million decrease in property values for the Lancer MOA alone. This would not include the land value decrease in the 6.4 million acres under the Lancer MTR.

* 1 based on projected noise of 46 DNL and a base noise of <45 DNL equaling an actual 20-34 DNL in our rural area.

001130

Yet the USAF has dismissed the subject of rural land value decrease in one sentence,

> "In the present instance, given the rural nature of the region and the history of military use of the associated airspace (see Section 3.4), changes in numbers or types of overflights are not expected to produce measurable impacts on the economic value of the underlying lands."

The USAF must acknowledge the potential major negative impacts on property values or conduct appropriate studies on rural land value before going forward with a final DEIS. The economic livelihood of all citizens underlying the Lancer proposal is in extreme jeopardy.

BR-4 Is it possible the USAF has never had to address this issue before because other major training areas are on Federal and State land? Has the USAF paid compensation to anyone for noise-related damages to property? If so, details should be released to the public. Landowners under the proposed RBTI should be advised if the USAF intends to compensate them for reduced land values and damages to be associated with the RBTI, and if so, how much.

Other studies state that the decrease in rural land values would be far greater than on urban land values.

> "It is possible, however, that a recreationalist or rancher could be startled if an overflight took place at a specific point of time, but such an event is difficult to predict. In a MOA, the operations are random and widely dispersed. The random nature of operations and the wide altitude structure within the MOA make it unlikely that any one location would be overflown repeatedly. Therefore, no significant adverse consequences to economic activities can be expected." (page 4-109)

This is a fairly confusing dismissal of adverse economic effects. This statement seems to compare the likelihood of startle effect to adverse economic activities. This statement also seems to associate the likelihood of any one place being overflown repeatedly with adverse economic activities. H. E. P. A. believes that there is a significant probability that some areas will have a much higher concentration of overflights than others will. These areas could suffer significant damage.

001130

The reality is 9.2 million acres of private land will be overflown with 7,524 plus sortie operations (traffic on VR-196/197, VR 116, IR-102/141, IR-128/180, IR-154, IR-178, IR-192/194, Lancer MOA) per year. The likelihood of repeated overflights in certain areas is quite high.

LIVESTOCK

At present, the Air Force has no study to evaluate economic loss due to domestic animals as stated in the USAF Current Technology Need # 1413. Air Force **Need # 1413 - Model Updates to the Assessment System for Aircraft Noise (ASAN) for Prediction of Noise Exposure from Military Aircraft Operations and the Resulting Impact to Humans, Animals, and Structures** (H.E.P.A. Appendix A) states:

> "The animal impact studies will divide the efforts into studies on domestic animals and wildlife. Domestic animal studies will focus on the evaluation of economic loss and mitigation of adverse effects."

The eight counties underlying the MOA graze a total of 236 million range animals as shown in H.E.P.A. Table 4.1-1 below. The MOA would cover 61% of the total acreage in these counties.

209 million cattle and calves

1.3 million milk cows

11.4 million sheep and lamb

14.2 million ewes / year and older

The 18 counties underlying the MTR routes graze a total of 771 million range animals. The MTR would cover 26 % of the acreage in these counties.

369 million cattle and calves

2.4 million milk cows

213.8 million sheep and lambs

156.6 million ewes 1 year and older

29.5 million angora goats and kids

001130 ~~001130~~

These livestock numbers would be low - since most ranchers reduced their inventory due to drought conditions in 1996 & 1998 and have not been able to stock back to full capacity.

The Texas Agricultural Statistics Service published the following information.

H.E.P.A. Table # 4.1-5 Livestock Inventory In Counties Underlying Lancer Proposal **

MOA	Texas Cattle Inventory						Texas Sheep & Wool						Texas Angora Goats

001130

These figures represent at least 344 million animals underlying the Lancer MOA and MTR airspace that would be affected by the overflights. These livestock numbers represent an enormous monetary investment by all livestock owners. In addition, these livestock numbers represent a primary economic source of income to the citizens living under proposed Lancer airspace.

The 1997 Census of Agriculture shows the market value of all livestock sold in the counties underlying the proposed Lancer MOA and MTR-178 to be $52.3 million and $125.7 million respectively.

If the noise stress of overflights negatively affects our livestock as the studies suggest, the citizens living in these counties would bear a severe economic hardship.

Larry White, Extension Range Specialist, Texas A & M University/Texas Agricultural Research & Extension Center states the following in the Total Ranch Management Handbook, 1989:

> "What is the biggest problem in agriculture today? How many of you know of ranches surviving on traditional agricultural enterprises? Most ranches considered to be making a go of it "have other sources of income" (gas and oil, etc.). In fact, over half of the cattle produced in the United States are produced from herds of less than 50 cows where the owner lives and works in town (Smith 1986).
>
> "Traditional ranching is financially unattractive. Most ranchers have been living on the increasing value of their land. Many ranchers in this situation continue to borrow heavily against their land values and in essence are living off their children's future inheritance and not really making a living from ranching."
>
> "The U.S. Department of Agriculture reports that as of January, 1985, of the nation's 2.2 million farms and ranches nearly 70,000 were technically insolvent. Another 73,000 had debts equaling 70% to 100% of their assets, meaning insolvency was imminent. A further 222,000 farms and ranches had debts equaling 40% to 70% of their assets, therefore, face severe financial stress. The situation was particularly acute among the nation's 679,000 family-run commercial farms and ranches (annual sales of $50,000 to $500,000). Nearly one third of these farms had significant financial problems (Lukas 1985)."

001130

> "Many ranches surviving today are generally supported by additional non-traditional agricultural sources of income. Currently gas, oil, recreation and/or land investment provide for the continuation of ranch ownership. Many traditional ranches, however, continue ranching as a desired life style and to continue ownership of the land. The economic outlook for these ranchers wishing to provide a livelihood for themselves and their families from traditional agricultural enterprises is often bleak."

An article published by the Beef Organization (H. E. P. A. Appendix M) states the following:

> "Cattleman take good care of their animals for two reasons: First, they are in the cattle business because they like animals. Second, keeping animals healthy, strong and free of stress and injury is in their own economic interest. Any type of abuse or neglect or harmful practice is counter productive. If cattlemen are to remain in business and remain on their farms and ranches, they must be efficient producers. That requires proper feeding, health maintenance, care and handling. Management of cattle involves hands-on care. Cattlemen and cattlewomen, not machines, monitor, feed and care for their livestock."
>
> "Management practices and feeding and handling programs followed by cattle producers are no accident: they are a result of years of research and experience."
>
> "Animals that receive the best care are the most productive. Health and reproductive and productive traits continue to be the most readily measurable and most practically useful indicators of compatibility between farm animals and the environment in which they reside."
>
> "Cattlemen are experts in animal care. Training and experience have taught them to recognize any potential problems in nutrition, health, comfort or stress, and the necessary steps to take, ensuring proper care of their animals. They view this responsibility as both a moral obligation and an economic necessity."

All rural agricultural based communities in Texas have seen recent decline in revenues from both agriculture and the petroleum industries. The drought conditions of 1996 and 1998, coupled with low cattle prices have put many livestock producers in critical economic conditions. If Air Force overflights result in less efficient livestock production or add additional expenses to operations, it could put many producers out of business.

2nd, 3rd & 4th generation ranchers are a declining resource. We all wondered if would make it through the drought—and some of us didn't. We all wonder each year if we will make it through low cattle prices—and some of us don't. Now we all wonder if we will survive the negative financial impacts RBTI will place on our livestock & hunting enterprises—and a lot of us won't.

001130

The Lancer proposal must not go forward based on the USAF acknowledgement of lack of studies in Current Technology Need #1413 and the proven potential of overflights to severely damage our rural economy.

HUNTING INDUSTRY

Wildlife was discussed briefly in the DEIS, but hunters and the hunting industry were never mentioned.

As stated by Judon Fambrough, Texas Real Estate Research Center in the "Texas Wildlife Management Handbook" page I-C17, (all references to the "Texas Wildlife Management Handbook" refer to a publication that can be accessed at http://agpublications.TAMU.edu/pubs/ewild/)

> "Deer hunting is big business in Texas. Lease hunting for deer remains one of the few constant sources of revenue for many Texas landowners following the recent decline in revenues from both agriculture and petroleum industry. Texas landowners have a unique position for lease hunting. Unlike other states, Texas has little state-owned land available for public hunting."

As stated by Jack Thigpen, Extension Economic Development Specialist, Texas A & M University in the "Texas Wildlife Management Handbook" page I-C5:

> "Nearly all of the land (97 percent) in Texas is privately owned. Fee-access recreation, especially the leasing of hunting rights, on Texas farm and ranch land has become big business. Although exact figures are not available, calculations show that more than $100 million is spent annually to lease land for hunting. Revenue from hunting lease activity challenges some traditional agricultural activities in total cash receipts for the state. In 1982, for example, total receipts for sheep, lambs, wool, hogs and pigs was less than $200 million. The estimated total annual value of wildlife in Texas is $100 to 350 million. In addition, wildlife and hunting leases have been estimated to contribute an average of $55 per acre to deer range land values, which amounts to $4.2 billion across the state."
>
> "Rural communities also benefit from fee-access activities. Although there is little data on the direct effects, increases in retail trade and lodging during hunting season are well know."

76

001130

As stated by Albert Ward, Sutton County Extension Range and Wildlife Committee, Sonora, Texas on the "Hunting Lease Impacts on Rural Communities' Economics" "Texas Wildlife Management Handbook", page I-C7 through I-C12,

> "There is a lack of comprehensive data available about the contribution that hunting makes to the economy of rural communities in Texas. This report attempts to compile some of the available information, particularly as it pertains to Sutton County. It is recognized that the methods used leave the quantitative values of the results open to question, but they represent the best information available at this time."
>
> "We conclude that hunting contributes about $1.2 million in lease income and $2.0 million in non-lease income, a total of almost $3.2 million, to the economy of Sutton County each year. If certain other local purchases made by individual hunters and the results of the "Multiplier Effect" were added to this, the net impact on the county's economy would be shown as several times greater."
>
> "While participating in a Chamber of Commerce director's meeting, I became painfully aware of the lack of data concerning the contribution hunting makes to the economies of rural communities in Texas: specifically to that of Sutton County. I found a corresponding lack of recognition of the present importance and potential of this source of revenue for merchants as well as ranchers."
>
> "If the total experience is not favorable, they (hunters) may not return. They certainly will not encourage their friends to become new hunters in the area. This would be a loss to the community as a whole, not just the ranchers."
>
> "We estimated $ 1,160,415.50 in lease income and $ 1,996,894.49 in non-lease income." "The true significance of these figures can only be fully appreciated when viewed in a relation to the whole."

- "**Agricultural income** in Sutton county has been reported to be about $ 15 million per year (Dallas Morning News, 1984). The $ 1.2 million estimated here indicates that about 8 percent of this county's agricultural income comes from hunting."
- "**Retail sales** have been estimated at $ 31.3 million per year in Sutton County (Standard Rate & Data Service, Inc., 1985). By applying our estimate of $ 2.0 million, we feel that purchases by hunters represent at least 6 percent of our retail sales."
- "**Service station sales** are shown to be nearly $ 2.8 million annually in Sutton County (Standard Rate & Data Service, Inc., 1985). Comparing this to the almost $ 0.3 million estimated here in fuel expenditures, we conclude that hunters account for about 11 percent of Sutton County's service station sales."
- "**Food** accounted for $ 15.88 average expense per hunter day, or $ 454,850.84 estimated spent in Sutton County. This almost $ 0.5 million in food sales represents 7 percent of the $ 6.7 million county total (Standard Rate & Data Service, Inc., 1985)"

77

001130

- "**Alcoholic beverages** and related items represent the remaining $7.89 average expense per hunter day in the combined category. It may be said, then, that hunters contribute about $225,993.27 per year to this industry in Sutton County."
- "**Hotels and motels** were utilized by 9.1 percent of the hunters in Berger's (1974) statewide study. This suggests gross receipts (including tax) of $ 780,000. It may be, then, that motels in Sutton County receive about 5 percent of their revenues from hunters."
- "**Restaurants** were the source of food for 15.1 percent of hunters statewide as reported by Berger (1974). This is about 2 percent of the $ 6.2 million annual county total for such establishments as estimated by Sales & Marketing Management (1984)."

> "The numbers that we have assembled in this paper leave no doubt that hunting is of great economic importance to Sutton County, Texas. In all likelihood, our figures are reasonably representative of the situation in a number of rural communities in Texas. It would not be difficult for ranchers or others to develop similar statistics that would demonstrate the significance of outdoor recreation in their home communities. In Sutton County, there is the potential to increase income considerably from hunting. This will require a joint effort by ranchers and merchants indeed the whole community. It is hoped that this report will give a small push in that direction. It is also hoped that it may serve as "food for thought", encouraging similar effort in other counties."

According to Charles W. Ramsey, Extension Wildlife Specialist, Texas A & M University, "Texas Wildlife Management Handbook" page I-C13:

> "The first requirement in the development of a hunting lease enterprise is a good understanding of what is being offered for sale. A successful enterprise provides more than just access. It provides the opportunity for enjoyable outdoor experiences."
>
> "Many little things external to the hunt itself contribute to a enjoyable trip."
>
> "Plush overnight facilities are not mandatory for a successful hunting lease. Some hunters prefer to camp out or bring recreational vehicles."
>
> "The point is that purchasing a hunting lease, for most hunters is investing in a opportunity for a pleasant experience, not purchasing a commodity. Management of the hunting lease enterprise to ensure that the customer has a pleasant experience is the key to successfully dealing with hunters."

How many hunters will pay to hunt under low-level, high-speed combat conditions? How many hunters will invest in a hunting lease to experience the noise levels proposed in the Lancer Alternative? How many hunters would classify hunting under combat conditions to be a pleasant experience? How can landowners sell hunting leases under the Lancer proposal when there are

78

001130

hunting leases available all over the state of Texas that include peace and quiet as part of the package?

According to John K. Thomas, Department of Rural Sociology, Texas A & M University "Texas Wildlife Management Handbook" page I-C23:

> "Texas has one of the most extensive lease hunting systems in the nation."
>
> "In 1988, the Texas Parks and Wildlife Department sold more than 12,000 licenses to private landowners and operators (i.e., persons and groups who have a legal arrangement with a landowner to use a parcel of land for particular purposes). Licensees sold an estimated $ 100 million in hunting leases. As a result of this leasing activity, the annual value of Texas wildlife, particularly white-tailed deer and other game species, on lands leased for hunting has been estimated to vary between 100 and 300 million dollars. (Pope et al. 1984). In addition, the recreational value of wildlife produces a multiplier effect on land values. The presence of wildlife on leased land contributes slightly more than $ 4 billion to land values. However, these leasing, wildlife and land estimates are based partly on expenses reported by hunters and do not include the supply – side aspect of leasing activity in Texas. Therefore, data provided by landowners and operators on sales of hunting leases could enhance understanding about lease economics in Texas."
>
> "Finally, some comment is necessary about the lease income reported by operators. Most estimates of leasing activity in Texas are three to five times the amount reported by respondents to the survey."

The citizens under Lancer proposal will also lose the recreational value of wildlife that produces a multiplier effect on land values. Even a 3 % decrease in land value could mean a loss of value of $69-100 million dollars (based on a conservative estimate of average land value).

As stated by William C. Gartner, Director of Institute of Outdoor Recreation and Tourism, Utah State University, "Texas Wildlife Management Handbook" page I-D1:

> "Marketing recreational hunting is different than for almost any other product. What is marketed is not a tangible product, but an experience."
>
> "In the case of hunting, the producer is the owner or lessee of the land containing wildlife, and consumers are the hunters. The product, however, is quite different, as it involves tangibles."
>
> "If the product were indeed a harvested animal, then hunters would violate almost all economic assumptions regarding human behavior. Either our economic theories are invalid or there is another product, which is actually being sold. I think most of you in

79

001130

the business of selling hunting rights realized that very early that what you are selling is experiences. The quantity and quality of game and your land help, but do not determine the end experience."

"As shown, the number of hunters has remained relatively stable; however, the number of outfitters has sharply increased. There are now more businesses competing for a piece of a pie which hasn't increased in years."

How can citizens under the Lancer proposal possibly market an outdoor hunting experience under RBTI conditions without experiencing a significant loss of income?

James Graman, Department of Recreation and Parks, Texas A&M University states in the "Texas Wildlife Management Handbook" page I-D5:

"Much publicity has focused on the fact that in many parts of Texas lease hunting produces income for ranchers and farmers that equals or exceeds that from crop and livestock production. Recent articles about the revenue potential of lease hunting have appeared in several newspapers and magazines in Texas, and even in such national publications as the Wall Street Journal. "

"In a time of lagging prices for agricultural commodities, income from recreation can mean the difference between a profitable and an unprofitable operation."

"What is the product of lease hunting if it is not wildlife? Twenty-five years of research on Americans' recreation behavior tells us that it can best be described as "recreational experience."

"In addition to an activity package, hunters frequently demand a particular setting in which to engage in their activity."

"Participating in outdoor recreation seems to be the desire to achieve some combination of the various psychological experiences listed in Table 1."

How will the RBTI effect the value of this "recreational experience"? The DEIS is silent.

Jack Thigpen, Charles Ramsey & Jim Stribling, Texas A&M University states in the "Texas Wildlife Management Handbook" Hunter Expenditures to Rural Communities and Landowners, Section VIII:

Summary and Conclusions

"In summary, it appears that hunters spent about $7 million during 1988-89 in Gillespie County. Using a conservative income multiplier, these expenditures can be calculated to bring an economic impact of $9 to $12 million annually to the county. Of the average

80

001130

hunter expenditures, 61 percent went to community businesses and the remaining 39 percent to landowners for leasing payments. The temporal distribution of total hunters expenditures was 55 percent during deer season, 28 percent during the summer and fall."

If Albert Ward and Texas A&M University are able to compile data showing the contribution that hunting makes to the economy of a rural Texas community, we are sure the Air Force is capable of compiling a similar study on the lands underlying the proposed Lancer alternative. Why was this not done?

BR-4 Hunting income loss was a very real economic concern of citizens in the scoping phase, yet it was never addressed or even mentioned in the DEIS, while abundant data and studies exist to show its economic importance. Why were these concerns ignored in the RBTI DEIS? H. E. P. A. feels that this omission is a breach of the NEPA regulations.

SCHOOL TAX ROLLS

The negative economic impact to land values would also have a cumulative effect on our school systems by lowering the value of our tax rolls. Wade Warren, Managing Editor, Snyder Daily News, April 9, 1999, wrote an article that exemplifies the problem many rural schools are facing. The USAF never addressed this issue in the DEIS.

"Heating and cooling systems throughout the district are facing major problems, and most electrical systems don't come close to meeting today's demand or safety standards.

Earlier this month, SISD director Lawton Taylor presented the board with a list of only two items—electrical, plus heating and air conditioning needs—and the bill totaled $3.6 million.

Faced with a projected shortfall of income of up to $1 million due to declining values on the oil and gas tax roll, and a drop in state funds due to declining enrollment, the district is facing a uphill battle to make any improvements at all."

"The bottom line is that there is not an abundance of money out there to start attacking the problems facing the district."

"The total value of the 1998 Snyder ISD tax roll in 1998 was just over $451 million dollars. In 1982, the total value was over $2.5 billion.

81

001130

In 16 years, the school district has lost 82 percent of its tax roll.

The district is saddled by the maximum tax rate allowed by law right now — $1.50 per $100 valuation.

If it was allowable, it would take an increase of 90 cents on the tax rate to raise enough money to complete the necessary improvements just to bring the district's electrical, heating and cooling needs up to today's standards."

BR-4 H. E. P. A. contends that decreases in property values discussed herein above could cause a devastating drop in the value of the school tax rolls. Why was this not addressed in the DEIS?

MEDICAL COST AND PROPERTY DAMAGE

AF-15 Who will be responsible for medical costs due to injury by the startle effect? Who will be responsible for the property damage to structures?

Many reports by individuals now living under low-level, high-speed training suggest that the citizens would be expected to bear these economic burdens. A few examples are listed below.

Mainichi Daily News, April 6, 1997 reports:

"The Mainichi Daily News reports that a Japanese woman who suffered a three-month injury after falling off a horse that panicked because of noise made by a U.S. fighter jet has received about 6.9 million yen in damages.

According to the article, Japan's Defense Facilities Administration Agency paid the damages Friday. The U.S. military will later repay the Japanese government, officials said.

The accident, which occurred Aug. 25, 1995, at a camping school in Yamagata Prefecture, occurred when the 40-year-old woman from Tokyo's Shinjuku-ku was riding a horse reined by an instructor. The horse reacted violently and threw the woman when a low-flying U.S. fighter flew by, causing her to break her thoracic vertebrae, which took three months to heal. The U.S. Air Force Base in Misawa, Aomorie Prefecture, initially admitted that one of its planes was flying nearby, but denied that the planes noise caused the accident. However, the U.S. military later decided to pay the damages after reviewing a study by the National Research Institute of Police Science, the article reports. That study included a videotape shot by a camping school participant that showed the U.S. fighter and the noise at the scene."

82

001130

If the injury had not been on videotape, would the USAF have paid this claim? Few citizens carry video cameras as a standard piece of everyday work attire.

Cowboy Magazine, July 1992, reports in an article titled, "Ridin' Point":

"Back in 1984 and '85, I had a riding contract for the McDowell Ranch near Wisdom Mont., in the infamous Big Hole Valley in the southwestern corner of the big sky state. The Big Hole is infamous because of its bogs, badger holes and mosquitos big enough to bite you through a bale of hay.

There was one other hazard I found out about the hard way. It came from a most unexpected place and repeatedly came at the most unexpected times and most always with disastrous results. That malady was low-flying Air Force fighter planes. And folks, when I say low flying, I mean really low flying.

When I first moved over to the Big Hole, the first thing I noticed about the house was that most every window was cracked. Concerned about the coming winter, I asked the owner about repairing those cracked windows.

'You'll have to learn to live with them,' he told me. 'I'm just plum tired of replacing broken windows every time they fly a low-level training mission.'

The rancher explained that the house, which sat near Highway 43, was directly in the flight path of the simulated attack route of fighter planes launched from Maelstrom Air Force Base in Great Falls, Montana. The rancher said that after he had replaced hundreds of dollars worth of windows, he had gone to Maelstrom and complained to the commander.

'He seemed to think it was kinda funny,' the rancher related. 'He told me that their 'war game' consisted of flying attack missions on the Air Force base at Salt Lake City, Utah, and the sparsely populated Big Hole Valley with its surrounding mountains offered a perfect approach route. Salt Lake radar could not detect the attacking aircraft until they were already over the target.

'Any time the attacking pilot reached Salt Lake without being detected, the defending squadron commander would have to buy his attacker a case of beer.'

It seems that no one ever even thought to buy windows for all the farm and ranch houses they flew over. Nor did the pilots or their commanders ever consider the other damage they inflicted on people and livestock on the ground. If you've never been in the path of a jet airplane, flying at the speed of sound a few feet off the ground, let me tell you it's a sobering experience and one that you'll never forget if you live through it.

My first encounter in the Big Hole area came one day while I was riding a three-year-old colt while checking cattle along Steel Creek, north of Wisdom, Montana. I'm jogging along this little ridge overlooking the flooded pastures. The colt is doing well. He's sensible and has never given me any trouble. He's had about 60 days riding and is

83

001130

starting to watch cattle pretty good. It's early in the morning and the sun is just peeping over the Pioneer Mountains to the east.

Out of the corner of my eye I see movement, and I pull up on the colt and turn my head. What I saw made my heart stop. There, below me, about ten feet above the sagebrush was a jet fighter plane. I could clearly see the pilot and he could see me. He gave me a thumbs-up sign and was out of sight about the time the sound hit.

I knew it was coming so I took a deep breath and braced myself. When that supersonic sound wave hit that colt, it was just like you'd jabbed him with a cattle prod. He bogged his head and let out a bawl and blew the cork. I looked down and could clearly see our shadow on the ground, far below. The colt made about four big old looping jumps before I could get his head up and fortunately I was able to ride out that storm and stay seated.

The colt was spooky and jumpy the rest of the day, and I noticed that even weeks later, whenever a plane would fly over, he'd sorta squat and freeze, waiting to get blasted by that supersonic sound.

The two years I cowboyed in the Big Hole, I survived several more low level fly-bys, and I weathered every one okay. But I lived in fear of the time and the day when I would be blasted from behind and be blown from the saddle. Luckily that never happened. I left the Big Hole in the fall of '85 with all my bones intact, but I never did get those windows repaired.

Low level jet plane flights are devastating. Whether it's broken windows or busted up cowboys, it's not something we should have to live with. I don't know where the Air Force and the National Guard can practice those low level flights, and I don't now if they even have to, but I can tell you this. It is hard on the animals on the ground and the people who live in the path of such flights.

If you're in the proposed corridor of those low level flights, write your congressman or representative. It's hard enough being a rancher or trying to make a living as a working cowboy without having to fend off attacks from 'friendly' aircraft."

Custer County Action Association, February 1992, states the following:

"Penrose-area rancher William Shade testified at the Aug. 2 scoping hearing in Penrose that this horse died as a result of a low-altitude military overflight on Feb. 26, 1992. The horse was in an enclosed space (a stall). Westcliffe-area rancher Kevin Mitchell, during his Aug. 3 testimony in Westcliffe, stated that animals react much differently when in enclosed spaces than in wide open spaces.

Shade testified at the Aug. 2 hearing that COANG and other military have continuously flown over his home, even though the flight path is three miles to the east. He has called the COANG hot-line numerous times, and a COANG representative did not bother to look at the video of this dead horse, nor of the over-flights."

84

001130

The Associated Press, December 1997, in an article titled, "Pilots Apologize for Sonic Boom" states:

"Two Navy pilots have apologized to a woman who was seriously injured in a fall from a horse caused by sonic booms from their jets.

Annette Trent suffered three broken ribs, a concussion and broken teeth when she was thrown from her spooked horse Dec. 1. Even her helmet was cracked in the fall. 'I just kind of went clunk and was temporarily knocked out,' she told the Lahontan Valley News and Fallon Eagle Standard.

The pilots were flying outside a supersonic operation area at the time, a violation of military policy. They visited her home just outside Fallon the day after to apologize.

'I was kind of angry and I'm concerned how I'm going to work. I felt better after (the pilots) came to apologize,' Trent said.

Anne McMillan, a spokeswoman for the Fallon Naval Air Station, said at least 10 residents reported property damage after the sonic booms rumbled through Fallon.

Lt. Greg Hicks, public affairs officer for the Naval Strike and Air Warfare Center, said an initial investigation shows the pilots may have lost sense of where they were.

The pilots believed they were flying east of Fallon within the supersonic operation area, Hicks said, adding they were involved in a simulated air-to-air combat exercise at the time."

The Times-News, February 1998, in an article titled "Critics Raise Questions about Range Proposal" states:

"Who will pay for any damages from sonic booms? That's what Castleford School Superintendent Kelly Murphey wants to know.

Murphy and others in southern Idaho recently received copies of the U.S. Air Force's final version of a study of the environmental effects of a proposed electronic combat and conventional bombing range complex spread over 1 million acre in eastern Owyhee County."

"'This document shows that the Air Force can balance training with the environment and traditional land uses,' said Col. Billy Richey, spokesman for the 366th Wing."

"Two years ago, a sonic boom damaged the Castleford school gym. Though jets from the Mountain Home Air Force Base were flying that day, Air Force officials disavowed responsibility and would not compensate the district.

The officials who came out from Mountain Home to investigate were nice and treated folks at the school well, Murphey said.

85

001130

'But I'd rather have a dollar recourse for what happened,' he said.

The school's insurance company eventually paid for the repairs."

The Lubbock Avalanche Journal, April 1999, in an article titled, "Sonic Boom Shakes City" states:

"A deafening boom about 4:15 p.m. Friday rattled windows from Idalou to far South Lubbock County, startling residents and prompting a flood of calls to emergency agencies.

That sound was a sonic boom, according to reports from the Federal Aviation Administration to Lubbock police and the National Weather Service.

The FAA reported that a B1 bomber caused the noise, police said. The plane's origin could not be determined.

A few buildings sustained broken glass and dislodged signs, but the Lubbock Fire Department and the Lubbock County Sheriff's Office received no reports of major damage.

'The phones lit up,' a fire dispatcher said. 'We got calls from all over town. It was pretty hairy there for about 10 or 15 minutes.'

South Lubbock resident Corinne Lawson said people in her neighborhood came running outside after the noise.

'That hit, and it shook my car,' she said. 'My friend told me it nearly knocked her plum out of her chair.'"

AF-15 Did the Air Force offer to pay the citizens of Lubbock for broken windows and sign damage? IR-178, the closest MTR route to Lubbock, is 36 miles away.

According to the 1998-99 Texas Almanac, the average weekly wage of the citizens under the MOA is $372 per week. The rural citizens cannot afford to pay the cost of medical and property damage due to overflights. The U. S. Department of Health and Human Services document entitled, "The 1999 HHS Poverty Guidelines" (http://aspe.hhs.gov/poverty/99poverty.htm) states the poverty level guidelines for a family size of four is $16,700 per year ($324 per week) and a family of five is $19,520 per year ($379.55 per week). The rural citizens underlying the

86

001130

proposed Lancer MOA are at or near the U. S. Department of Health's guidelines for poverty levels. The rural citizens must not be expected to bear the economic burden of land value decrease, livestock stress, hunting industry decline or medical costs and property damage due to the overflights of the proposed Lancer MOA. The information in this paragraph seems to

SE-6 contradict the findings of the DEIS in 4.4.1 found on page 4-111. Why did the DEIS use 1990 census data when more recent data were available? It would appear that the effects of the RBTI would fall disproportionately on low-income populations.

COST/BENEFIT STUDY

In order for the USAF to effectively evaluate the socioeconomic impact of the RBTI proposal, a cost benefit analysis must be completed.

The Atlanta Journal, January 1998, article titled, "Atlanta Area Airport Found Beneficial In Recent Study" indicates the knowledge gleaned from a similar analysis.

"The Atlanta Journal reports that a recent study shows that the benefits of the DeKalb-Peachtree airport proposal outweigh the costs to area residents whose property will lose value due to the project.

The article says that a recently completed county-funded study of DeKalb-Peachtree Airport has concluded that the overall benefits to DeKalb residents and business owners of the airport outweigh the costs, most of which are borne by airport-area homeowners."

"Among the economic and fiscal benefits the researchers noted were 762 aviation and 271 non-aviation-related jobs directly provided by the airport's tenants, an estimated 7,300 jobs brought into DeKalb, $130 million in personal income for DeKalb residents each year and $8.9 million in taxes annually for various county governmental agencies. The primary negative impact of the airport on county residents mentioned in the report was the devaluation of airport-area property because of aircraft noise.

The report explains that the findings are based on reviewing similar national studies, surveying area real estate agents and appraisers and examining sales data on the properties next to the airport over a nine-year period. The researchers determined that the airport has a 'modest' impact on property owners—a net loss of $68 million in fair market value. They also estimated that the county loses at most $1.2 million annually in property taxes because of this devaluation. Using these figures, the researchers concluded that the airport's economic benefits to the county outweigh its costs by a 16-to-1 ratio, and its fiscal benefits outweigh the costs by a 7-to-1 ratio."

"As for the four alternate development plans, the researchers determined that the first two options—maintain the the current size or expanding the airport—would be viable for the

87

county. The third option—reducing the level of service—would result in the airport losing money because of businesses leaving and then needing more money from the county. The report shows that the final alternative—closing the airport—could be a disaster. The county could lose $20 million to $25 million in redevelopment expenses, lose or have to pay back Federal Aviation Administration grants and lose tax funds while the property is being redeveloped over a probably 10-15 year period. Additionally, the county could lose many of the estimated 7,300 jobs generated by the airport."

H. E. P. A. believes that a cost/benefit study will show many millions of dollars loss to the

GE-1 citizens under the Lancer airspace and zero economic benefits. Why wasn't a cost/benefit study done specifically on the area underlying the proposed Lancer MOA? Why should residents under the RBTI overflights be forced to bear the economic losses discussed herein simply to save money for the general taxpayers?

Presidential Executive Order 12898 – Environmental Justice states the following:

"Environmental justice is a movement promoting the fair treatment of people of all races, income, and culture with respect to the development, implementation, and enforcement of environmental laws, regulations, and policies. Fair treatment implies that no person or group of people should shoulder a disproportionate share of the negative environmental impacts resulting from the execution of this country's domestic and foreign policy programs."

SE-5 Was this Presidential Executive Order 12898 considered? If not, why not?

THE NEPA PROCESS

The DEIS (back side of cover sheet) states the NEPA Process as follows:

"NEPA – the National Environmental Policy Act of 1969 – is our national charter for protecting the environment. The goal of NEPA is to consider all appropriate environmental factors when making decisions, not basin decisions solely on technical and economic factors, involve the affected and interested public early in the environmental analysis process, seek less environmental damaging ways to do our jobs, and document in plain language for the decisionmaker (in this case the Air Force) and the public the environmental process we used for RBTI. The product that we use to document our analyses is the Environmental Impact Statement, or EIS. This is the highest level of analysis prepared under NEPA and we are using it for RBTI. Compliance with NEPA guidance for our EIS preparation involved several critical steps:"

Making the Air Force the final decisionmaker of its own proposal is in essence asking the fox to guard the chicken coop. The citizens believed our government was based on a checks and

GE-3 balance system. However, the NEPA process in this case puts the Air Force in the position of being "all powerful." Short of going to the courts for an unbiased decision, the citizens have no recourse.

As stated in the NEPA, Part 1500 – Purpose, Policy, and Mandate:

"Sec. 1500.1 Purpose.

(a) The National Environmental Policy Act (NEPA) is our basic national charter for protection of the environment. It establishes policy, sets goals (section 101), and provides means (section 102) for carrying out that policy. Section 102(2) contains "action-forcing" provisions to make sure that federal agencies act according to the letter and spirit of the Act. The regulations that follow implement section 102(2). Their purpose is to tell federal agencies what they must do to comply with the procedures and achieve the goals of the Act. The President, the federal agencies, and the courts share responsibility for enforcing the Act so as to achieve the substantive requirements of section 101.

(b) NEPA procedures must insure that environmental information is available to public officials and citizens before decisions are made and before actions are taken. The information must be of high quality. Accurate scientific analysis, expert agency comments, and public scrutiny are essential to implementing NEPA. Most important, NEPA documents must concentrate on the issues that are truly significant to the action in question, rather than amassing needless detail.

(c) Ultimately, of course, it is not better documents but better decisions that count. NEPA's purpose is not to generate paperwork—even excellent paperwork—but to foster excellent action. The NEPA process is intended to help public officials make decisions that are based on understanding of environmental consequences, and to take actions that protect, restore, and enhance the environment. These regulations provide the direction to achieve this purpose."

H.E.P.A. believes that the NEPA process was not properly followed in the DEIS.

PUBLIC OPINION

The USAF and the FAA should be made aware of the nature of the public opinion against the RBTI in general and specifically Alternative B.

In the time leading up to the deadline for these comments, H. E. P. A. has not been made aware of support for the RBTI by any elected official in the eight counties under the proposed Lancer MOA. On the contrary, an overwhelming number of elected official, public and quasi-public bodies representing the citizens living under the proposed Lancer MOA have gone on record in oppositions to the RBTI. H. E. P. A. has included these letters and resolutions of opposition in H. E. P. A. Appendix I.

The following is a list of opposition letters and resolutions:

1) Post Independent School District
2) Garza County Commissioners Court
3) Vick Burk, President, Rotan ISD Board of Trustees
4) Dr. Jerry Marshall, Mayor, City of Rotan
5) Judge Bobby McGough, Stonewall County

In addition the following public officials were present at the April 7, 1999 public hearing in Snyder, TX to express opposition to the DEIS and the RBTI:

1) Ricky Fritz, County Judge, Scurry County
2) Buddy Baldridge, Jayton Girard ISD, Kent County
3) David Holt, Mayor, City of Snyder
4) Greg Henley, Tahoka ISD
5) Van L. York, County Judge, Borden County
6) Mike Braddock, County Commissioner, Lynn County
7) W. Calloway Haffaker, City Attorney, Tahoka
8) Tommy Stanaland, County Judge, Kent County
9) Jerry Marshall, Mayor, City of Rotan
10) Robby Robinson, County Attorney, Fisher County
11) Gregg Pruitt, City of Rotan Development Board
12) State Representative David Counts (letter read by Mayor David Holt)

CONCLUSIONS

In concluding it's comments on the DEIS, HEPA believes that the DEIS as prepared falls significantly short of it's intended task under NEPA. HEPA believes that the DEIS is

disingenuous at best and at worst an intentional misrepresentation of the facts. The subcontractor hired by the USAF to prepare the DEIS apparently conducted no research in the areas to be most impacted by the RBTI and instead simply searched through old research papers for studies which favored the position of the USAF. The DEIS has almost entirely omitted data which indicated the possibility or probability of serious negative effects from the RBTI. Many of these instances have been cited by HEPA in their response.

HEPA believes that significant and credible evidence exists to suggest that great harm could and indeed will result if the RBTI is approved and implemented. This evidence clearly indicates probable damage to local property values, the hunting industry, ranching, human and animal health and wellbeing, the environment and local economies. The costs to the residents under the proposed RBTI are not calculated or are simply dismissed as insignificant.

This report is therefore sadly lacking in fulfilling its requirements under NEPA. It can best be described as a rather obvious attempt by the USAF of pretending to do an EIS while intentionally refusing to take a hard look at the issues. We think this DEIS is not what Congress had in mind when it passed The National Environmental Policy Act.

I. INTRODUCTION

A. The Commenters

The Western Environmental Law Center submits these comments on behalf of a coalition of local, municipal, and tribal governments opposed to the Realistic Bomber Training Initiative, including: Town of Taos, County of Taos, Village of Taos Ski Valley, Taos Pueblo, Rio Arriba County Commissioners, Pueblo of Picuris, City of Eagle Nest, City of Las Vegas, Quay County Commissioners, Guadalupe County Commissioners, Union County Commissioners, County Commissioners of Mora, Town of Clayton, San Miguel County Commissioners, Town of Red River, City of Espanola, Colfax County Commissioners, Angel Fire Village Council, and Harding County Commissioners.

The commenters request that these comments, and all attachments be included as part of the administrative record. The commenters further request that all documents, articles, and reports cited in these comments and attached expert testimony be included as part of the administrative record of this action. *See County of Suffolk v. Secretary of Interior*, 562 F.2d 1368, 1384, n.9 (2nd Cir 1977) (addressing scope of NEPA administrative record), *cert. denied*, 437 U.S. 1064 (1978); *Silva v. Lynn*, 482 F.2d 1282 (1st Cir. 1973) (same); *see also Thompson v. United States Dep't of Labor*, 885 F.2d 551, 555 (9th Cir. 1989) (administrative record consists of all documents and materials directly or indirectly considered by agency and includes evidence contrary to agency's position).

If the Air Force is unable to locate the referenced documents not included as attachments to these comments, copies may be obtained by contacting the undersigned counsel.

001131

B. Summary

As discussed further below, the DEIS fails to fulfill the requirements of the National Environmental Policy Act ("NEPA"). At the outset, the Air Force fails to acknowledge many vital resources affected by Alternative D of RBTI, rendering later discussions of impacts insufficient. Further, the DEIS uses a DNL metric (an average of noise exposure) and therefore, the impact of the extremely loud episodic noise events that will be caused by the proposed action are insufficiently addressed. In addition, the authors of the DEIS treat numerous issues in a cursory fashion, or include only information and studies that are favorable to the proposed action. Finally, the Air Force has failed, to date, to comply with the Endangered Species Act, which requires formal consultation for Alternative D.

C. Background and Affected Environmental Values

Alternative D of RBTI, the Northern New Mexico route, calls for 2,660 flights per year at 200 to 500 feet over nine in New Mexico counties and 4 Texas counties including: Rio Arriba, Taos, Colfax, Mora, San Miguel, Guadalupe, Quay, Harding, and Union Counties in New Mexico, and Dallam, Hartley, Oldham and Deaf Smith counties in Texas. The bombers would eventually end up in the proposed Mount Dora Military Operating Area, with the town of Roy directly below the war game activities.

This route effectively creates a low-level bomber tour of some of the most beautiful and sensitive wildlife areas in Northern New Mexico. The bombers will fly over or very near the Chama River Canyon Wilderness Area, Carson National Forest, Santa Fe National Forest, the Rio Grande Wild and Scenic River, the Latir Peak Wilderness Area, the Wheeler Peak Wilderness Area, the Taos Pueblo Blue Lake Wilderness Area, Villanueva State Park, Valle

Vidal, the Urraca State Wildlife Area, the Moreno Valley, the Elliot Barker State Wildlife Area, the Colin Neblett Wildlife Area, Sumner Lake State Park, Vermejo Park, Philmont Scout Ranch, the Las Vegas National Wildlife Refuge, Cimarron Canyon State Park, Chicosa Lake State Park, Clayton Lake State Park, Kiowa National Grassland, and Rita Blanca National Grassland.

The area beneath Alternative D supports an abundant and diverse array of wildlife. Toward the western part of the route, variations in elevation have created four life zones: alpine, subalpine, mixed coniferous, and transition zones. These area are typified by aspen parklands and spruce-fir forests, where wildlife such as blue grouse, Rocky Mountain elk, mule deer, pronghorn, mountain lion, black bear, bison, wild turkey, and snowshoe hare are found. The eastern part of the route, with its vast grasslands, supports populations of pronghorn, bighorn sheep, wild turkey, and mule deer. The area's playas, or intermittent lakes, provide habitat for waterfowl and shorebirds, such as Canada and snow geese, eared greb, sandhill crane, and migrating ospreys. The gorges of northern New Mexico, such as the Rio Grande Gorge and Canadian River Gorge, support a wide variety of raptors, including peregrine falcons, ferruginous hawks, and bald and golden eagles.

Northern New Mexico is prime habitat for many of these species, and irreplaceable in many respects, due to its vast expanse of unbroken wilderness and isolation from human intrusion. The Air Force's proposed action would forever change the nature and character of the lands beneath Alternative D, adding the imprint of man where little existed before, destroying a quiet way of life for many small communities, and causing irreparable damage to wildlife and habitat.

II. THE AIR FORCE FAILED TO COMPLY WITH THE NATIONAL ENVIRONMENTAL POLICY ACT

A. The Legal Requirements of the National Environmental Policy Act.

"Section 101 of NEPA declares a broad national commitment to protecting and promoting environmental quality." Robertson v. Methow Valley Citizens Council, 490 U.S. 332, 348 (1989), citing 83 Stat. 852, 42 U.S.C. § 4331. "The sweeping policy goals announced in § 101 of NEPA are . . . realized through a set of 'action-forcing' procedures that require that agencies take a "hard look' at environmental consequences.'" Id. at 350, citing Kleppe v. Sierra Club, 427 U.S. 390, 410 n.21 (1976). NEPA's main "action-forcing" procedure comes in the form an environmental impact statement ("EIS"), a detailed statement on environmental impacts that must be prepared before an agency undertakes any "major Federal action[] significantly affecting the quality of the human environment." NEPA § 102(2)(C), 42 U.S.C. § 4332(2)(C).

Thus, NEPA "ensures that the agency, in reaching its decision, will have available, and will carefully consider, detailed information concerning significant environmental impacts." Robertson v. Methow Valley Citizens Council, 490 U.S. 332, 349 (1989). See also Vermont Yankee Nuclear Power Corp. v. Natural Resources Defense Council, 435 U.S. 519, 553 (1978) ("NEPA places upon an agency the obligation to consider every significant aspect of the environmental impact of a proposed action"). "These procedural provisions of NEPA 'are designed to see that all federal agencies do in fact exercise the substantive discretion given them. These provisions are not highly flexible. Indeed, they establish a strict standard of compliance.'" Sierra Club v. Watkins, 808 F. Supp. 852, 859 (D.D.C. 1991), quoting Calvert Cliffs' Coordinating Comm., Inc. v. United States Atomic Energy Comm'n, 449 F.2d 1109, 1112 (D.C.

Cir. 1971).

The Council on Environmental Quality ("CEQ") has promulgated regulations implementing NEPA that are binding on all federal agencies. 40 C.F.R. § 1500.3; Robertson v. Methow Valley Citizens Council, 490 U.S. at 354.

B. The DEIS Contains an Inadequate Discussion of Key Resources In the Affected Environment.

The DEIS contains a woefully inadequate description of the land, communities, and wildlife existing beneath Alternative D. This fatal flaw in the DEIS renders all later discussions of impacts to people and resources wholly inadequate, as the Air Force has failed to acknowledge or recognize the existence of many local attributes.

LU-2 For instance, the DEIS lists 8 communities lying beneath the Alternative D: Ocate, Anton Chico, Mosquero, Wagon Mound, Clayton, Roy, Abbott, Mt. Dora. However, numerous additional small communities lie below this flight path that are mentioned nowhere in the DEIS, including: Cebolla, Nutrias, Amalia, Naranjos, Ojo Feliz, Levy, Salana, Mills, Colmor, Taylor Springs, Farley, Gladstone, Sofia, Bueyeros, Clapham, Thomas, Des Moines, and Grenville, to name just a few. Countless other communities lie just off the flight path and would be affected by the slightest deviation off course by Air Force pilots.

BI-14 The Air Force's description of wildlife also is lacking. The DEIS, in its description of wildlife affected by Alternative D, blithely states that the wildlife consists of "those species associated with mixed grasslands. . . . many of these wildlife species are habitat generalists able to adapt to a range of habitats." DEIS at 4-101. This statement is patently false, as demonstrated

by the Air Force's own list of "Represented Wildlife Species." DEIS, Appendix, at H-5. Big game, such as bighorn sheep, elk, and pronghorn, all listed in this table, require specialized habitats and cannot simply move from one habitat type to another. For instance, Rocky Mountain Bighorn sheep inhabit steep mountain slopes and cliffs and will not acclimate to low-land prairies. Schemnitz Comments (attached at E).

BI-15 Not only does the DEIS fail to recognize the variety of wildlife in northern New Mexico, but it also fails to acknowledge that the land beneath alternative D is prime habitat for many species, and its destruction or impairment is irreparable. As explained by the Fish and Wildlife Service, the area below the Mount Dora MOA "provides some of the best antelope hunting opportunities within the state. We are concerned that creation of the Mt. Dora MOA will negatively impact individuals hunting in this area." FWS 2/11/98 letter to Air Force (attached at T) at 1. Yet, no mention is made of this prime antelope hunting ground in the DEIS.

GE-35 Moreover, the DEIS gives little information to provide the general public an understanding of the communities and wildlife areas the Air Force intends to fly over. The maps in the DEIS contain no topographical lines and few natural landmarks. A detailed, blown-up map of the area is necessary to inform the public fully of the impacts entailed in RBTI and to allow meaningful comment on the proposed action. Attached is a more detailed map prepared by a local Taos resident showing communities and natural landmarks beneath Alternative D (attachment H). The Air Force, however, is obligated under NEPA to review on its own the area beneath this airspace to determine precisely what resources and communities are affected.

Lack of detail and knowledge of the area aside, the description of area resources in the DEIS is misleading to the general public. The document states that historically 90% of area

001131

under D has been subject to low-level flights. DEIS at 4-106. While the current active flight path IR 109 covers much of the same territory as the proposed IR-153 (Alternative D), this route, by the Air Force's own admission in the DEIS, has had substantially less activity than that which is now proposed. In fact, as the DEIS states, areas under IR-153 will experience up to 10 additional sorties per day. In addition, currently smaller and less noisy aircraft use this airspace.

A further flaw in the DEIS is its lack of full description of the proposed training activities. While the DEIS states the total number of proposed annual flights (2,660), and the daily average (10) to be expected over the flight path, the Air Force completely neglects to give information on "surge potential." As described by Air Force personnel, "surge events" are "periods in which flying units simulate wartime operations by striving to generate the maximum number of sorties possible." E-mail dated 2/11/98 from Roy Barker of the Air Force to Carol Torrez of FWS (attached at T). Surge events can generate a tremendous increase in daily flights. For instance, the proposed German Air Force expansion at Holloman AFB (GAF) entailed an average of 32.17 sorties per 24-hour period over several flight paths. Fax dated 1/28/98 from Roy Barker of Air Force to Carol Torres of FWS at 4 (attached at T). The surge potential for these same flight paths was estimated at 315 sorties per day. *Id.*.

AO-76 The DEIS fails to state whether and when surges are proposed, and the duration of potential surges. Consequently, the Air Force failed to discuss the potential impacts of surges. Given the dramatic increase in sorties that a surge entails, impacts to humans and wildlife can be expected. Obviously, surges would cause a great increase in noise level and human annoyance to residents living under and near the flight path. Economic impacts can be expected as well. Surges over wildlife areas during high tourist season are sure to discourage those who are

001131

overflown from returning to the areas for a "wilderness experience." Wildlife also will be greatly impacted. Surges are sure to heighten "startle impacts," and interruptions of breeding, nesting, and foraging, as discussed below. The DEIS is incomplete and inadequate without full disclosure of surge potential information.

Finally, the description of route segment GH is misleading and veils a potentially dangerous situation. In order to move the flight path away from the Angel Fire Ski Area, the Air Force has not routed the flight path further to the east, as one might expect. Instead, the Air Force has removed from the flight path the airspace to the right of the "centerline," leaving the "centerline" of segment GH on the extreme right of the proposed airspace. This creates a potentially dangerous situation. For example, a pilot flying within the permitted airspace of segment FG, but 1 or 2 nm to the right of the "centerline," will exit segment FG at a location to the right of segment GH, and over the Angel Fire Ski Area. The EIS buries this information in the appendix, where a table of airspace corridor width illuminates the truth of matter. DEIS,

AF-33 Appendix, at C-6 (showing segment GH right of centerline width as "0"). The Air Force must address directly the problem of segment GH and alter it in a manner which provides for safe flight.

C. The DEIS Fails to Evaluate Fully Impacts of RBTI Alternative D.

Under NEPA, an agency must honestly address the various uncertainties surrounding the scientific evidence upon which it relies in its environmental evaluations. The agency has a duty to respond to credible opposing points of view, and it may not ignore reputable scientific opinion. *See, e.g., Seattle Audubon Soc'y v. Espy*, 998 F.2d 699, 704 (9th Cir. 1993); *Public Service Co. v.*

001131

Andrus, 825 F. Supp. 1483, 1496-99 (D. Idaho 1993); *see also Sierra Club v. Watkins*, 808 F. Supp. 852, 864-69 (D.D.C. 1991). An agency's NEPA analysis must expose scientific uncertainty regarding the risk of a proposed action and inform decisionmakers of the full range of responsible scientific opinion on the environmental effects of the proposed action. *Friends of the Earth v. Hall*, 693 F.Supp. 904, 926, 934 (W.D. Wash 1988). Also, federal agencies are responsible for overseeing and ensuring the accuracy of environmental impact statements produced by contractors. 40 C.F.R. § 1506.5(c).

In this instance, the Air Force failed to perform a thorough noise analysis, and failed to consider or address adequately the wide range of scientific opinion from studies indicating that the proposed action could result in significant environmental impacts, including impacts to threatened and endangered species such as peregrine falcons, spotted owls, and bald eagles; big game such as bighorn sheep and elk; recreational opportunities, wilderness areas, and wildlife habitat generally; ranching and livestock; socioeconomic impacts; and safety concerns. *See*

GE-24 Attachments A-G (expert statements). The cited studies in the DEIS do not represent the full range of scientific opinion and research available from which conclusions may be drawn. The DEIS ignores numerous studies from which contrary conclusions may be reached. In addition, many of the cited studies, which observed livestock near airports and captive animals, are inapposite to the current situation which concerns a rural and wilderness environment. Finally, several studies are used to support conclusions that the authors themselves did not reach. See Statements of White, Sweat, and Schemnitz (attached at C, D, E, respectively).

001131

BR-1 1. The DEIS Fails to Address Adequately the Noise Impact Of the Proposed Action.

The proposed alternative D flight path lies above numerous small communities, special use areas, and noise sensitive locations, as discussed above. Despite the adverse affect noise can have on residential quality of life, wildlife, and human enjoyment of nature and solitude, the DEIS fails to adequately analyze the noise impacts that would be created by the proposed action. This inadequate analysis is due largely to the use of an inappropriate noise evaluation metric that is an averaging measure designed for use in urban, and not wilderness or rural, settings. The attached comments of Dr. William Weida and George Schulze thoroughly address this issue. Attachments A and B. *See also* excerpt from "Centennial Airport Noise and Land Use Study" (attached at I) (giving explanation of aircraft noise terminology and effects).

The analysis in the DEIS relies heavily upon DNL,[1] an sound averaging metric which does not reflect episodic events of extremely high noise levels created by low-level fly-bys. Instead, DNL averages sound levels over a 24-hour period, and then over a year broken up into monthly averages. Because the DNL metric is used for assessing impacts, the impact of individual high noise episodes is masked. Contrary to the Air Force's assertion that DNL is a widely accepted metric for aircraft noise (DEIS at 4-9), DNL has never been accepted for situations like the one presented here. DNL, is useful in situations where noise is fairly constant throughout the day — for instance, for measuring noise in residential areas beside a highway or airport. Here, however, the area affected is either rural and wilderness with little background noise disturbance, and the proposed action calls for extreme episodic spikes in noise levels. It is

[1]The authors of the DEIS actually rely on Ldnmr, but refer to it as DNL for convenience. DEIS at 4-9. The commenters will do the same here.

001131

plain to see, that averaging is not helpful to understanding impacts in such a situation, but instead merely masks the true nature of the noise events.

A proper analysis must include both episodic and average data in order to provide the decisionmaker and the public with an accurate picture of the noise impact of the proposed action. *Attison v. Department of Transportation*, 908 F.2d 1024 (D.C. Cir. 1990) (noise impact from airport analyzed using the data portraying the average increase in noise, and the episodic increase in noise).

In addition to averaging the noise impact over time, the DEIS also averages the sound level of the noise event over the corridor affected by the fly-by, instead of giving the maximum noise level experienced directly beneath the aircraft. Yet, a person or animal being flown over does not experience the *average* noise over a 10 mile wide corridor, but the maximum episodic noise level. Thus, for purposes of determining the noise impact on recreation and wildlife, the use of average data should be disregarded and episodic measurements should be used instead.

The Air Force uses NOISEMAP and ROUTEMAP to calculate DNL and associated noise annoyance. The Air Force fails, however, to acknowledge the *known* scientific shortcomings of the agency's noise methodology, and therefore fails to candidly disclose in the DEIS the impacts of the proposed actions. The Air Force has long know that NOISEMAP fails as a predictor of noise impacts and resulting annoyance. In a document prepared by Air Force contractors in the 1990, the Air Force acknowledges that NOISEMAP and ROUTEMAP consistently under predict noise by as much as *6 to 12 times*. Generic Environmental Impact Statement (attached at J) at 4-7 - 4-8. More recently, in its fiscal year 1996-97 Environment, Safety and Occupational Health Strategic Plan, the Air Force states that "the methods used to gather the information required [for

11

001131

NOISEMAP] is extremely vulnerable to litigation. The current data collection methods do not provide indisputable data. In fact, the accuracy of the data is totally dependant upon human interpretation and therefore, extremely vulnerable to human error." USAF FY 96/97 ESOH Strategic Plan at 1a. (Attached at K). Under NEPA, the Air Force must disclose these shortcomings in its noise evaluation methodology in the DEIS, and it must account for the range of potential impacts that might occur given the uncertainty in the methodology and data collection methods for that methodology.

Further, the Air Force itself has noted that "no quantitative dosage-response relationship has been developed for predicting annoyance in these circumstances [where low-levels flights are occurring over rural private lands and public lands used for outdoor recreation]. Id. At 1b. The Air Force further admitted that "there exists no systematic methodology for assessing the impacts of aircraft noise and sonic booms to humans, animals and structures. Environmental impact analysis (ETAP) documents presently use a variety of noise description and assessment models/data bases, often being of questionable scientific value." Id. at 2d. The Air Force must disclose this lack of scientific data in the DEIS, acknowledge that it has no accurate method of predicting annoyance, and undertake further analysis of potential environmental impacts in order to fully assess impacts in compliance with NEPA.

In any event, even with its faulty data, methodology, and use of averaging to mask

AO-111 extreme episodic noise events, the calculated DNL metric comes to 64, (DEIS at 4-47), a level significantly higher than the EPA standard of 55 identified as "requisite to protect public health and welfare with an adequate margin of safety." DEIS Appendix at G-12. The Air Force's explanation for not achieving the requisite 55 DNL is that "financial and technical resources are

12

001131

not available to achieve that goal." *Id.* Thus, it is clear, that the Air Force is proposing a trade-off — Air Force training at the expense of the public health and welfare. First, the "No Action" Alternative is one way to achieve below 55 DNL without undue financial or technical resources. Second, if the Air Force is unable to achieve a requisite level of safety even with all the mathematical maneuvers, it is clear that the proposed action presents a serious threat to the health and welfare of the people of New Mexico.

As stated above, averaging of noise levels is inappropriate for assessing the impacts of episodic noise events. Yet no meaningful singe event noise exposure data is provided in the DEIS. Instead, the authors merely assert:

> These sortie-operations could generate noise levels (SELs) ranging from 86 to 116 dB, the same as under baseline conditions. Such events could last from 7 to 10 seconds for a person directly under the flight path.

DEIS at 4-46 - 4-50. The exact same information given for alternatives B and C. DEIS at 4-33, 4-42. Given the variation in terrain, and the variations in altitude, both within each flight path and between alternative flight paths, each segment of each flight path should have a different Lmax or SEL metric. These calculations were either never carried out or are not disclosed in the DEIS. This episodic data is essential. The Air Force's failure to provide this data, alone, renders the DEIS inadequate under NEPA, and is indefensible, particularly in light of the Air Force's own admission that "[a]ircraft noise was the most common potential effect mentioned by the public." DEIS at 2-57.

AO-122

In addition, the authors of the DEIS treat all areas as equal in assessing noise impacts. The DEIS fails to take into account that, depending on the current use of the land, different areas

13

001131

will experience different noise *impacts*, even with the same noise levels. For instance, the Forest Service Report to Congress on the Potential Impacts of Aircraft Overflights of National Forest System Wilderness" concludes that visitors in a wilderness setting are approximately 10dB *less* tolerant of noise than in residential settings. 1992 Forest Service Report to Congress on Potential Impacts of Aircraft Overflights of National Forest System Wilderness (July 1992) ("FS Report") at 2-22 (attached at L). Many segments of alternative D lie over wilderness areas. For instance, segments BC and CD lie over the Rio Grande Wild and Scenic River area. This segment, at only 4nm wide, will experience the heaviest traffic with 2,660 annual sorties. Clearly, this area is much more susceptible and sensitive to noise intrusion. The DEIS authors fail to recognize this and seriously analyze this issue in any meaningful way.

LU-3

AO-124 Finally, the Air Force's entire discussion of noise impacts is based on the assumption that the primary impact to humans is "annoyance." DEIS at 4-11. Again, the DEIS fails to disclose a wealth of scientific studies contrary to the Air Force's conclusion. Attached at M is a bibliography of "Medical Effects of Noise" The attached statement of Glen Schulze discusses many of these studies, which analyze, among other things: pediatric behavior, psychiatric problems, sleep disturbance, speech interference, performance interference, and hypertension.

2. The DEIS Fails to Adequately Assess Wildlife and Related Impacts.

a. Birds

BI-16 Like the DEIS's consideration of noise impacts, the discussion in the DEIS on impacts to birds, particularly raptors, tells only half a story. The DEIS states that impacts to raptors from low-level aircraft "were found to be brief, insignificant, and not detrimental to reproductive success. DEIS at 4-106. However, the authors of the DEIS fail to recognize a vast body of

14

001131

scientific study that contradicts those studies cited.

> Studies that have investigated the effects of low-level aircraft overflights on birds have determined that such flights disturb raptors (Manci *et al.* 1987). Disturbances include interrupting nesting activities by flushing from nesting and roost, displacing birds returning to nests, flushing or displacing birds from foraging areas, provoking interactions with sympatric raptors, and exposing eggs and nestlings to predators and extreme heat.

German Air Force Expansion Biological Opinion ("GAF BO") (attached at N) at 88.

Similarly, where the DEIS asserts that low-level flights have little impact on wintering bald eagles (DEIS at 4-107), it fails to recognize the numerous studies that have documented the susceptibility of wintering and breeding bald eagles to disturbance. *See* GAF BO at 97. Low-level flights cause a high incidence of flushing of nesting eagles, and startle those eagles that are nesting or foraging. GAF BO at 97-98.

> Flushing by eagles alters behavior, can disrupt foraging and reduce food intake thus lowering the carrying capacity of the site, and can force eagles to use areas where food and habitat are marginal (Stalmaster 1983). Disturbance that adversely affects activity budgets reduces time available for productive activities, such as foraging, and increases energy expenditures (Stalmaster and Kaiser 1997).

GAF BO at 98.

Furthermore, many studies demonstrate that startle effects on nesting birds differ from individual to individual. While some individuals may accommodate, many others will not. Statement of Clayton M. White ("White Statement") (attached at C) at 2. Some individual peregrines may demonstrate extreme startle effects, leaving the nest each time an aircraft passes. *Id.*. *See also* GAF BO at 93 ("Peregrine responses vary widely, depending on the individual bird and the context of the stimulus."). Moreover, "[a]lthough habituation appears to occur in some species, habituation to unpredictable and dramatic changes in sound levels is unlikely." GAF BO at 92.

15

001131

Studies also have found that some individuals not only will fail to accommodate, but instead will become increasingly sensitive over time. White Statement at 3; GAF BO at 92 ("animals may sensitize rather than habituate to the disturbance."). This is particularly true of ferruginous hawks, a sensitive species that inhabits the region of Alternative D. White Statement at 3. The Air Force must recognize this scientific uncertainty and address the probability that low-level flights will have adverse impacts on raptors.

Contrary to the DEIS statement that startle effects are insignificant (DEIS at 4-106), over time these individual startle responses can take a toll on populations or species. The extreme situation of mortality or nest abandonment is not needed to have long term effects on a species.

Discussing peregrine falcons, the FWS has stated that "the point at which human activity becomes excessive could be indicated long before abandonment, by smaller broods, more frequent reproductive failure, or unreliable recruitment of new breeding birds." GAF BO at 94. Similarly, for spotted owls, the FWS has cautioned the Air Force that low-level flights within a 1/4 mile of spotted owl nest/roost sites during the breeding season (March 1-August 31) could "disrupt[] breeding attempt altogether or displacing a nesting female, and thus causing mortality to eggs and chicks. . . .This type of disturbance over the long-term could cause suppressed reproductive success." GAF BO at 89.

Furthermore, the DEIS miscites certain literature for the proposition that there will be no reproductive impact on bird species. For example, one cited study examined mean or average responses of pairs of peregrines and, according to the study authors, the conclusion of "no reproductive impact" was for individual pairs and cannot be applied to a species or populations. White Statement at 3; Sweat Statement at 1-2. Furthermore, none of the literature cited

16

001131

examined affects on raptors from B-1s or B-52s, but others types of aircraft instead, and the studies are therefore not determinative of the impact of the proposed activity. Clayton Statement at 3.

AO-19 In addition to failing to recognize the wealth of scientific studies regarding long term avian impact, the Air Force significantly underestimates the probability of bird strikes. Brushing these concerns aside, the DEIS states the bird strikes "would be expected to remain minimal" because "[a]ircrews would employ the Bird Avoidance Model when planning sorties." DEIS at 4-107. Yet, the proposed route and training activities specified in the DEIS are in direct conflict with bird avoidance measures. Specifically, these measures include "no low-level night flying, [and] avoidance of significant bodies of water by at least 1 NM and 2000 feet AGL." GAF BO at 87. The proposed action, however, calls for 15-20% of all flight activity at night, flies over the Rio Grande and two wintering bald eagle sites, and very near Eagle Nest Lake, Santa Rosa Lake, and McAlister Lake , Chicosa Lake, Sumner Lake, Ute Lake and Conchas Lake. Thus, if the Air Force intends to carry out Alternative D, it cannot simultaneously employ bird avoidance methods. Consequently, the Air Force must realistically assess the probability of bird strikes and estimate the number of strikes anticipated based on empirical data.

BI-17 Moreover, the DEIS is patently wrong where it states that Alternative D does not "overlie or intersect any major migration flyways or water bodies where birds congregate. DEIS at 4-50. First, as stated above, the proposed route flies over or near several bodies of water and two known wintering bald eagle sites (DEIS at 4-107). Second, snow geese and sandhill crane migration pathways pass through northern New Mexico in the area of the proposed flight path of Alternative D. (Migration Maps attached at U).

17

001131

Finally, any discussion of impacts must recognize that all restrictions already in place for other New Mexico Air Force flight paths — such as the restrictions imposed for GAF — that cross proposed alternative D must be imposed here. *See* GAF BO. It appears that the Air Force, however, does not intend to abide by these restriction, since the appropriate table in the Appendix does not reflect the necessary rises in altitude to accommodate known nests and wintering habitat. DEIS Appendix at C-6. Clearly, if the restrictions are not imposed, the proposed actions will have even greater impacts to raptors and other birds. Accordingly, the DEIS must state with specificity whether restrictions will be in place, and analyze impacts accordingly.

b. Mammals

BI-9 In discussing impacts on big game and mammals, the Air Forces fails again to recognize the wealth of literature that runs contrary to the DEIS's conclusion that big game and mammals will "habituate" and experience no adverse impacts. DEIS at 4-106. The attached statements of Ken Sweat and Sanford Schemnitz discuss many of these studies. For example, studies have found that low-level flights reduce foraging efficiency in big horn sheep, and cause adult big horn sheep to range 2 to 5 times further in a day than they normally would. Sweat Statement at 2, Schemnitz Statement at 5. Studies of caribou, which can be translated to other ungulates, have found an increase in calve mortality caused by low-level flights immediately post-calving period. *Id.*

Contrary to the conclusions of the DEIS authors (DEIS at 4-106), these impacts are not short in duration. A loss of foraging efficiency and over-exertion due to running from flights would have severe consequences for big game population underneath the proposed flight path, particularly in winter when resources are scarce and wildlife must conserve energy. Sweat

18

Statement at 2, Schemnitz Statement at 6.

Under NEPA, the DEIS must acknowledge these contrary studies and the probability that large mammals beneath the flight may be significantly adversely affected by the proposed actions.

3 The DEIS Fails to Consider Cumulative Impacts on Wildlife

NEPA and the CEQ regulations require the discussion of cumulative impacts in EISs. 40 C.F.R. § 1508.7; *Thompson v. Peterson*, 753 F.2d 754-758 (9th Cir. 1985); *LaFlamme v. Federal Energy Regulatory Comm'n*, 852 F 2d 398, 402 (9th Cir. 1988) (individual project cannot be considered in isolation without considering the net impact that all projects in an area may have on the environment). The regulations define a "cumulative impact" as:

> The impact on the environment which results from the incremental impact of the action when added to past, present, and reasonably foreseeable future actions regardless of what agency (Federal or non-Federal) or person undertakes such other actions. Cumulative impacts can result from individually minor but collectively significant actions taking place over a period of time.

40 C.F.R. § 1508.7.

The Ninth Circuit has held that 40 C.F.R. § 1508.7 requires an agency to "consider cumulative impacts of the proposed actions which supplement or aggravate the impacts of past, present, and reasonably foreseeable actions. *Oregon Natural Resources Council v. Marsh*, 832 F.2d 1489, 1497-98 (9th Cir. 1987), *rev'd on other grounds*, 109 S.Ct. 1851 (1989).

The Fifth Circuit, in a well-cited opinion, set a five-prong standard for what constitutes a "meaningful cumulative effects study." *Fritiofson v. Alexander*, 772 F.2d 1225, 1245 (5th Cir. 1985); *see also, City of Carmel-By-The-Sea v. U.S. Dept. Of Transp.*, 95 F3d 892, 902 (9th Cir.

1996) (adopting the *Fritiofson* standard). The standard requires the EIS to identify:

> 1) the area in which effects of the proposed project will be felt;
>
> 2) the impacts that are expected in the area from the proposed project;
>
> 3) other actions — past, proposed, and reasonably foreseeable — that have had or are expected to have impacts in the same area;
>
> 4) the impacts or expected impacts from these other actions; and
>
> 5) the overall impact that can be expected if the individual impacts are allowed to accumulate.

City of Carmel-By-The-Sea, 95 F.3d at 902. The standard requires that "probable impacts be identified and considered." *Fritiofson*, 772 F.2d at 1245 n15.

The Air Force has failed completely to undertake a meaningful cumulative effects analysis. The scope of the so-called cumulative effects analysis in the DEIS "includes the boundaries of the affected areas for the action alternatives." DEIS at 5-1. In other words, the Air Force looks only to the area directly beneath the proposed RBTI flight path to determine cumulative impacts. The Air Force concedes that other flight paths cross the proposed route. Yet, instead of addressing the cumulative and synergistic impact of all these flight paths, the Air Force merely plays a numbers game, adding up the number of other flights crossing the RBTI path. For instance, for segment RS, which currently experiences 3,876 annual sorties, the Air Force states that combined sortie-operations with the proposed Alternative D route will be 6,336 sorties annually. DEIS at 2-51. No consideration is given to how this impacts target species, or how the many intersecting flight paths in New Mexico together affect target species, beyond RBTI boundaries.

BI-18

This type of analysis flies in the face of both letter and spirit of NEPA. Wildlife don't

recognize the artificial boundaries drawn by the Air Force on a map. Birds, big game and other wildlife will roam beneath this airspace and under other Air Force airspace as well. A meaningful cumulative impact study must look at the region as a whole.

For years, both the U.S. Fish and Wildlife Service and the New Mexico Department of Game and Fish have requested such an analysis. Below are just a sampling of the agencies comments on this subject:

> The proposed actions at Cannon AFB will increase use of some of the same airspace affected by the RBTI and GAF proposals. The Service has expressed concern about the additive impacts of all military overflights within this airspace. An increasing number of MTRs and MOAs and *an increasing number of military aircraft flying low-level training missions may at some point create a significant impact on the wildlife of New Mexico.* To date, no NEPA analysis concerning this type of activity has addressed the incremental increases in such low-level military flights. Instead each EA or EIS adopts a "piecemeal" approach, restricting the analysis to the immediate project and assumes that an adequate analysis of existing MTRs and MOAs was completed in previous NEPA documents. This approach may obscure the issue of increasing low-level flights over larger areas each year.

Letter of Aug 4, 1998 from FWS to USAF (attached at T)

> We are concerned that an increasing number of MTRs and MOAs and an increasing number of military aircraft flying low-level training missions may at some point create a significant impact on wildlife in New Mexico. . . . This piecemeal approach may obscure the issue of low-level flights over larger areas each year. Since much of the southwestern United States is covered by a variety of MOAs and MTRs, the potential for aircraft disturbance of wildlife is broad and the scope of the analysis should also be broad to effectively address this issue. The simple conclusion that additional impacts is low is not adequate.

Internal FWS Memorandum date 9/11/97 (attached at T).

> Several branches of the military have created MOA's, training routes and other flight corridors throughout New Mexico during the past decade. Each time a proposal has been reviewed by our office, we have requested that a cumulative impact analysis be completed. Each time this request has been ignored. This is in direct violation of the Council on Environmental Quality regulations of the National Environmental Policy Act. Again, we request that a cumulative impacts analysis be completed for this proposal.

> The cumulative impacts analysis needs to be broad in both time and space. At a minimum, a disclosure of all low-level flight zones, MOA's and other flight corridors utilized during the past 10 years (and any that are proposed within the foreseeable future) needs to be available for public review. This cumulative impacts analysis should be broad enough to cover the entire state of New Mexico.

Letter from NM Dept of Game and Fish to USAF of 2/11/98 (attached at T).

Thus, the agencies have stressed that it is "important to analyze how each action within the ROI [region of influence] combine with each other to impact each resource. Cumulative effects can arise even when absolutely no relationship or synergism exists between the proposed action and other actions expected to occur." Aug 4 Letter from FWS to USAF (attached at T).

Accordingly, any meaningful cumulative impacts analysis must address the impacts in the region — in this case, due to the numerous flight paths in the area, that region is New Mexico as a whole. The analysis must address how all these low-level flights cumulatively impact the relevant species. The DEIS does not even approach an undertaking of this scope. None of these actions are addressed in a meaningful way in the cumulative impact section of the DEIS

There is enormous potential for significant cumulative impacts from the numerous Air Force low-level flight paths over New Mexico. For instance, according to FWS, peregrine falcon nest sites under existing Air Force air space could represent more than 50% of the available habitat in the State. GAF BO at 92. As shown above, each flight path can potentially take its toll on peregrines through startle affects, nest abandonment, interference with reproduction, and bird strikes. For example, the FWS expects that the German Air Force expansion will result in "some take of American peregrine falcons." GAF BO at 94. Likewise, such a take can be expected with RBTI and other Air Force actions in New Mexico. With 50% of all peregrine

001131

habitat covered by Air Force low-level flights, there is a great potential for adverse cumulative impacts to peregrine populations in New Mexico.

Similarly, there is a great potential for adverse cumulative impacts to other species as well, like elk and bighorn sheep. The Air Force has dozens of low-level flight paths over New Mexico. See Map of MTRs in New Mexico (attached at O)[2]. This airspace is likely to cover significant amounts of available habitat for many species such as elk, bighorn sheep, pronghorn and others that require specific habitats for survival.

BI-18 Accordingly, a meaningful cumulative impacts analysis must assess impacts to wildlife resulting from all Air Force low-level flights in New Mexico.

4. The DEIS Fails Adequately to Evaluate Potential Impacts on Recreational Use of the Affected Area

The DEIS states that the proposed low-level bomber activities "would not likely affect" recreation resources. DEIS at 4-81. At the same time, the DEIS incongruously admits that "all special use land management areas under proposed IR-153 would experience changes in noise levels greater than 10 DNL (at 4-81), and that even a change of only 3 DNL "can be perceived by people as a degradation of their noise environment or negatively affecting their quality of life." DEIS at 4-56. Clearly, a change in average sound level of over 10 decibels must be considered a negative impact to areas that are set up as places of solitude and wilderness.

The Air Force seems to justify its farcical "not likely to affect" conclusion by stating that

[2]Page 3-10 of the DEIS shows a map of New Mexico with purported present day training airspace. This map is obviously inaccurate, as it does not even show as currently in use the airspace that overlaps with proposed Alternative D.

001131

low-level military flights have existed in this area for forty years. DEIS at 4-82. Yet, by the Air Force's own admission, the existing level of Air Force activity has never approached that which is proposed now. Up to 19 additional sorties per day (DEIS at 4-81) is not "part of the existing environment." (DEIS at 4-82). The Air Force's inane reasoning — stating that because there are some flights now, an additional 19 with accompanying 10 decibel noise level increase, will have no affect — is akin to stating that because it is raining now, a torrential flood will be cause no harm.

The Air Force attempts to support its "not likely to affect" conclusion by citing a 1992 Forest Service Report to Congress on the Potential Impacts of Aircraft Overflights of National Forest System Wildernesses (July 1992). DEIS at 4-56. However, as this Forest Service study readily acknowledges, "generalization of inferences drawn from these studies must be made with care" because of the unique conditions of the Forest Service research. Forest Service Report at 2-22 (attached at L).

The Forest Service study simply does not provide the support the Air Force sees in it. The Forest Service research looks at *all* types of aircraft overflights of wilderness areas, not just the military aircraft performing combat training exercises that are of concern here. Indeed, the Forest Service study reported that the greatest problems with aircraft overflights arose in areas where "outdoor recreationists are most commonly exposed to the noisiest overflights; i.e., low-altitude, high-speed tactical military operations," exactly the type of operations that will occur

LU-3 with the RBTI proposal. Forest Service Report at 2-23. Thus, contrary to the Air Force's assertion, the Forest Service study compels the opposite conclusion: low-level overflights may cause a serious impact to recreational visitors' experience and enjoyment of special management

001131

LU-3 use areas.

The Air Force also failed to acknowledge the Forest Service conclusion that visitors in wilderness settings are approximately 10 dB *less* tolerant of noise than in residential settings. *Id.* at 2-22. Again, this finding suggests a much greater noise impact from the proposed action than is disclosed by the Air Force in the DEIS.

5. The DEIS Fails to Evaluate Potential Impacts on Ranching and Livestock

BR-3 The DEIS fails entirely to evaluate impacts to ranchers resulting from loss or harm to livestock due to startle effects from low-level flights. In fact, the DEIS never mentions the numerous large and small ranching operations that existing beneath the airspace of Alternative D. In the many small communities in northern New Mexico left unacknowledged by the DEIS, residents operate small cattle and other livestock operations. Large ranching operations, like the Bell Ranch outside Tucumcari, also exist beneath the flight path. Yet, the Air Force fails in the DEIS to acknowledge the existence of any of the ranching operations. Consequently, the DEIS does not even contain a section discussing impacts to ranching.
